INDEX

- **Periodic Table of the Elements** 4
- **Some Basic Concepts of Chemistry** 5-125
  - Significant figures, Units for Measurement 5
  - Atomic, Molecular and Equivalent Masses 8
  - Mole Concept and Molar Mass 26
  - Laws of Chemical Combinations 86
  - Percentage Composition and Molecular Formula 93
  - Stoichiometry Calculation. 120
  - Empirical Formula for Molecular Formula. 125
- **Structure of Atom** 126-233
  - Atomic Number, Mass Number, Atomic Species 126
  - Atomic Models 139
  - Dual Nature of Electron 142
  - Uncertainty Principle 164
  - Schrodinger Wave Equation 173
  - Electronic Configuration and Shape of Orbital's. 178
  - Quantum Number 192
  - Bohr's Model for Hydrogen Atom 209
  - Isobars and Isotopes 230
  - Line Spectrum of Hydrogen 230
  - Filling of Orbital's in atom 232
- **Classification of Elements and Periodicity in Properties** 234-285
  - Valency and Oxidation State. 234
  - Periodic Laws 238
  - Atomic and Ionic Radii 247
  - Electro negativity 257
  - Ionization Energy 262
  - Electron Affinity 280
  - Nomenclature of Elements with Atomic Number > 100 285
- **Chemical Bonding and Molecular Structure** 286-421
  - Hybridization 286
  - VSEPR theory 302
  - Magnetic behavior of Molecules 333
  - Bond order, Bond Length, Bond Angle, Bond Energy 341
  - Fajan's Rule 372
  - Dipole moment 385
  - Hydrogen Bonding 396
  - Ionic, Covalent and Coordinate Bonding 402
  - Molecular Orbital Theory 409
  - Formal Charge 415
  - Valence Bond Theory 416
  - Types of Overlapping and Nature of Covalent Bonds 417
  - Application of Molecular orbital Theory 421
- **States of Matter** 422-499
  - The Gas Laws 422
  - Ideal Gas Equation and Related Gas Laws. 442
  - Real Gases 472
  - Kinetics Molecular Theory of Gases and Molecular Collisions 481
  - Molecular Speeds. 489
  - Liquefaction of Gases. 498
  - Intermolecular Forces 499
  - Behavior of Real Gases : Deviation From ideal Gas Behavior 499
- **Thermodynamics** 500-624
  - Thermodynamics Terms 500
  - First Law of Thermodynamics and Application 549
  - Second Law of Thermodynamics and Entropy 562
  - Heat of Reaction 566
  - Bond Energy 609
  - Gibbs Energy Change and Equilibrium 615
  - Enthalpy and standard Enthalpies For Different Types of Reaction 623

@apna_pdf

- **Chemical Equilibrium** **625-705**
  - Law of Chemical Equilibrium and Equilibrium Constant. 625
  - Law of Mass Action 652
  - Activation Energy, Standard free Energy 655
  - Degree of Dissociation 657
  - Vapour Density 671
  - Le-Chatelier Principle and It's Application 671
  - Application of K_p and K_c 679
  - Relation Between Equilibrium Constant (K), Reaction Quient (Q) and Gibb's Energy 702
- **Ionic Equilibrium** **706-806**
  - Arrhenius Theory 706
  - Solubility and Solubility Product Constant 708
  - Acid, Bases and Salts 735
  - Buffer Solution 756
  - Hydrogen Ion Concentration - pH Scale 765
  - Common Ion Effect 804
- **Redox Reactions** **807-842**
  - Oxidation Number and Oxidation State 807
  - Redox Reaction, Types of Redox Reaction 825
  - Method for Balancing Redox Reaction 838
  - Oxidising and Reducing Agent 841
- **Hydrogen** **843-861**
  - Heavy water 843
  - Hydrogen peroxide 845
  - Properties of Hydrogen 851
  - Hardness of Water 859
- **The Main Group Elements** **862-1044**
  - Alkali Metals 862
  - Alkaline Earth Metals 881
  - Boron Family 905
  - Carbon Family 924
  - Allotropes of Carbon 938
  - Nitrogen Family 948
  - Oxygen Family 986
  - Halogen Family 1009
  - Noble Gases 1032
- **Hydrocarbons** **1045-1149**
  - Alkanes 1045
  - Alkenes 1079
  - Alkynes 1121
  - Hybridisation 1139
  - Structure of Benzene 1149
- **Environmental Chemistry** **1150-1169**
  - Water Pollution 1150
  - Air Pollution 1154
  - Types of Pollution and Pollutants 1160
  - Layer of Atmosphere 1166
  - Green Chemistry 1168
- **The Solid State** **1170-1232**
  - Amorphous and Crystalline Solids 1170
  - Crystal Structure 1173
  - Classification of Crystalline Solid 1195
  - Packing Efficiency 1196
  - Defects in Crystal 1205
  - Bragg's Equation 1213
  - Density of Unit Cell 1215
  - Closed Packed structure 1222
  - Electrical Properties 1232

@apna_pdf

01.

Some Basic Concepts of Chemistry

1. Significant figures, Units for Measurement

1. Using the rules for significant figures, the correct answer for the expression $\frac{0.02858 \times 0.112}{0.5702}$ will be

(a) 0.005613 (b) 0.00561
(c) 0.0056 (d) 0.006

JEE Main-29.06.2022, Shift-II

Ans. (b) : $\frac{0.00285 \times 0.112}{0.5702} = \frac{0.003200}{0.5702}$
$= 0.00561$

2. Manganese (VI) has ability to disproportionate in acidic solution. The difference in oxidation states of two ions it forms in acidic solution is_____.

JEE Main-27.06.2022, Shift-I

Ans. (3) : Disproportionation reaction of manganese in acidic solution –

$$3MnO_4^{2-}(aq) + 4H^+(aq) \longrightarrow 2\overset{+7}{Mn}O_4^- + \overset{+4}{Mn}O_2 + 2H_2O$$

So, difference in oxidation state of product ions of-
Mn = (+7) – (+4) = 3

3. The units of surface tension and viscosity of a liquid respectively are

(a) $kg\ m^{-1}\ s^{-1}$, $N\ m^{-1}$ (b) $N\ m^{-1}$, $kg\ m^{-1}\ s^{-1}$
(c) $kg\ m^2\ s^{-1}$, $N\ m^{-2}$ (d) $N\ m^{-1}$, $kg\ m^2\ s^{-1}$

TS-EAMCET 09.08.2021, Shift-I
WB-JEE-2015

Ans. (b)

$$\text{Surface tension } (\gamma) = \frac{F}{L} \text{ or } \frac{W}{A}$$
$$= Nm^{-1}$$

$$\text{Coefficient of viscosity}(\eta) = \frac{F}{A\frac{dV}{dx}} = \frac{N}{m^2\frac{ms^{-1}}{m}}$$
$$\eta = N\,m^{-2}s$$
$$\eta = kg\,ms^{-2}\,m^{-2}s$$
$$\eta = kg\,m^{-1}\,s^{-1}$$

4. Given the numbers : 161 cm, 0.161 cm, 0.0161 cm. The number of significant figures for the three numbers are

(a) 3, 4 and 5 respectively
(b) 3, 3 and 4 respectively
(c) 3, 3 and 3 respectively
(d) 3, 4 and 4 respectively

BITSAT 2009
NEET 1998

Ans. (c) : Each has three significant figures. All non-zero number are significant 161 has 3 significant and leading zero are not significant they are nothing more then place holder, the number 0.161 and 0.0161 has 3 significant figure.

5. The prefix 10^{18} is

(a) giga (b) kilo
(c) Exa (d) nano

BITSAT 2015, 2006

Ans. (c) : Exa is a decimal unit prefix in the matric system.
Exa = 10^{18}, Giga = 10^9
Kilo = 10^3, Nano = 10^{-9}

6. Match List-I with List-II

List-I (Parameter)		**List-II (Unit)**	
A.	Cell constant	1.	$S\ cm^2\ mol^{-1}$
B.	Molar conductivity	2.	Dimension less
C.	Conductivity	3.	m^{-1}
D.	Degree of dissociation of electrolyte	4	Sm^{-1}

Choose the most appropriate answer from the options given below

	A	**B**	**C**	**D**
(a)	3	1	4	2
(b)	3	1	2	4
(c)	1	4	3	2
(d)	2	1	3	4

[JEE Main 2021, 31 Aug Shift-II]

Ans. (a) : Cell Constant = $\frac{\text{Length}}{\text{Area}} = \frac{m}{m^2} = m^{-1}$

Conductivity (K)= $\frac{1}{\rho} = Sm^{-1}$ or ohm^{-1}

Molar conductivity (Λm) =

$$\frac{K}{C} = \frac{Sm^{-1}}{\text{Mol. liter}^{-1}} = \frac{Sm^{-1}}{\text{Mol } m^{-3}}$$
$$= Sm^2mol^{-1}$$
Or
$$= Scm^2\ mol^{-1}$$

Degree of dissociation

$$= \frac{\text{amount of dissociated substance}}{\text{Total amount of Substance}}$$

So, dimensionless quantity.

@apna_pdf

7. The number of significant figures in 0.00340 is….. .

[JEE Main 2021, 25 July Shift-II]

Ans. (3) : Significant figure is the digits of a number that are used to express it to the required degree of accuracy, starting from the first non – zero digit.

So, counting these numbers, we find that the number of significant figures in 0.00340 is 3. The significant figures of 0.00340 are '340'

8. For a A + B products the rate of the reaction is given by Rate = K [A] $[B]^2$. The units of rate constant (K) will be______

(a) mol $L^{-1}S^{-1}$ (b) L $mol^{-1}S^{-1}$

(c) mol^2 $L^{-2}S^{-1}$ (d) mol^{-2} L^2S^{-1}

AP EAPCET 20.08.2021 Shift-II

Ans. (d): The rate constant is expressed as relationship between the rate of a chemical reaction and the concentrations of the reacting substance.

$\therefore$ Unit of rate constant for n^{th} order = $(mol)^{1-n}(lit)^{n-1}s^{-1}$

Given rate = K [A] $[B]^2$

$$\therefore n = 1+2 = 3(\text{third order reaction})$$

Unit are $(mol)^{1-3}(lit)^{3-1}s^{-1} = mol^{-2}lit^2s^{-1}$

for zero order rate constant = mol $lit^{-1}.s^{-1}$

First order rate constant = s^{-1}

Second order rate constant = mol^{-1} lit s^{-1}.

9. The number of significant figures in 50000.020×10^{-3} _______.

JEE Main 26.02.2021, Shift-I

Ans. (7) :

No. of significant figure in 50000.020×10^{-3} is 7.

10. The value of which of the following unit of concentration will not change with the change in temperature?

(a) Molarity (b) Molality

(c) Normality (d) Formality

GUJCET-2019

Ans. (b) : Molality = $\dfrac{\text{Moles of solute}}{\text{Mass of solvent in kg}}$

Molality of concentration will not change with the change in temperature because in molality both moles of solute and mass of solvent are independent of temperature.

Thus, molality is independent of temperature.

Molarity (M) is the amount of a substance in a certain volume of solution. Molarity is defined as the moles of a solute per litres of a solution.

Normality is a measure of concentration equal to the gram equivalent weight per litre of solution.

Formality is a substance's total concentration in solution without regard to its specific chemical form.

11. Which of the following is the correct unit of angular momentum of an electron in an orbital of an atom?

(a) J-s (b) J / s

(c) W / s^2 (d) W s

(e) J s^2

Kerala-CEE-2019

Ans. (a) : Angular momentum of an electron in an orbital of an atom (L) = mvr

Now, $L = mv \times r = kg.ms^{-1} \times m$

$= kg\ m^2s^{-1}$ .....(i)

We know that,

$1\ Joule = kgm^2s^{-2}$

So, multiplying and dividing equation (i) by $\dfrac{s^{-1}}{s^{-1}}$ -we get

$$L = kgm^2s^{-1}\times\frac{s^{-1}}{s^{-1}}$$

$$= kgm^2\frac{s^{-2}}{s^{-1}}$$

L = J-s

Hence, the unit of angular momentum of an electron in an orbital in J-sec.

12. The SI unit of electrochemical equivalent is

(a) J s^{-1} (b) kg C^{-1}

(c) kg m s^{-2} (d) kg $m^{-1}s^{-2}$

MHT CET-03.05.2019, SHIFT-I

Ans. (b) : Electrochemical equivalent is the mass of the substance deposited to one of the electrodes when a current of 1 ampere is passed for 1 second.

The SI unit of electrochemical equivalent weight is kg C^{-1}

13. The absolute zero temperature is 0 Kelvin. In ºC unit which one of the following is the absolute zero temperature?

(a) 0ºC (b) –100ºC

(c) –273.15ºC (d) –173.15ºC

NDA (II)-2018

Ans. (c) : Zero Kelvin (–273.15ºC) is defined as absolute zero.

14. What is the SI unit of density?

(a) g cm^{-3} (b) g m^{-3}

(c) kg m^{-3} (d) kg cm^{-3}

MHT CET-2018

Ans. (c) : Mass per unit volume is called density. The SI unit of density is kg m^{-3}.

15. Which symbol replaces the unit of atomic mass, amu?

(a) u (b) A

(c) M (d) n

MHT CET-2018

Ans. (a) : u symbol represent the unit of atomic mass, amu.

Where, a = Atomic mass number

m = Molecular mass of the molecule.

n = Number of atoms

16. Which one of the following statements is not correct?

(a) The hydration enthalpies of alkali metal ions decrease down the group

(b) Lithium halides are some what covalent in nature

(c) Alkali metals react with water liberating oxygen gas

(d) KO_2 is paramagnetic

AP EAMCET-2017

@apna_pdf

Ans. (c): Alkali metal reacts with water to give metal hydroxide and hydrogen.

$$\underset{\text{alkali metal}}{2M} + 2H_2O \longrightarrow 2MOH + H_2(g).$$

17. Which of the following has the dimension if $[ML^0T^{-2}]$?

(a) Coefficient of viscosity (b) Surface tension
(c) Vapour pressure (d) Kinetic energy

WB-JEE-2017

Ans. (b) : Surface tension is the tendency of liquid surface at rest to shrink into the minimum surface area possible. The surface tension is given as:

$$\text{Surface tension} = \frac{\text{Force}}{\text{Length}}$$
$$= \frac{MLT^{-2}}{L}$$
$$= [ML^0T^{-2}]$$

18. Which one of the following is not a unit of energy?

(a) lit-atm (b) kg m^2s^{-2}
(c) Nm (d) kg.ms^{-2}

UPTU/UPSEE-2016

Ans. (d): Kg. ms^{-2} is a unit of force and other three options are the units of energy.

19. Consider following unit values of energy

I. 1 L atm II. 1 erg
III. 1 J IV. 1 kcal

Increasing order of these values is–

(a) I = II = III = IV (b) I < II < III < IV
(c) II < III < I < IV (d) IV < I < III < II

BCECE-2013

Ans. (c):

- Energy is the capacity to do work.

$R = 0.0821$ L atm mol^{-1} k^{-1}
$R = 8.314 \times 10^7$ ergs mol^{-1} k^{-1}
$R = 8.314$ mol^{-1} k^{-1}
$R = 0.002$ Kcal mol^{-1} k^{-1}

$$\because\ 1\text{ L atm} = \frac{R}{0.0821}\text{mol K}$$

- $1\text{ erg} = \dfrac{R}{8.314\times10^7}\text{mol K}$
- $1\text{ J} = \dfrac{R}{8.314}\text{mol K}$
- $1\text{ kcal} = \dfrac{R}{0.002}\text{mol K}$

Hence, option (c) is correct answer.

20. Dimension of universal gas constant (R) is

(a) $[VPT^{-1}n^{-1}]$ (b) $[VP^{-1}Tn^{-1}]$
(c) $[VPTn^{-1}]$ (d) $[VPT^{-1}n]$

J & K CET-(2012)

Ans. (a) : From the gas equation,

$$PV = nRT$$
$$R = \frac{P\times V}{n\times T}$$
$$R = [VPT^{-1}n^{-1}]$$

21. Which of the following represents the smallest quantity?

(a) 1230 ng (b) 1.230×10^{-4}g
(c) 1.230×10^{-6}kg (d) 1.230×10^{4}μg

UPTU/UPSEE-2011

Ans. (a) : (a) 1230 ng = 1230×10^{-9}g = 1.230×10^{-6}g
(b) 1.230×10^{-4}g = 1.230×10^{-4}g.
(c) 1.230×10^{-6}kg = $1.230 \times 10^{-6} \times 10^{3}$g
= 1.230×10^{-3}g
(d) 1.230×10^{4}μg = $1.230 \times 10^{4} \times 10^{-6}$g
= 1.230×10^{-2}g
Thus, 1230 ng is the smallest quantity.

22. How is 0.0120 written as a scientific notation?

(a) 120×10^{-4} (b) 1.2×10^{-2}
(c) 12×10^{-3} (d) 12.0×10^{-3}

UPTU/UPSEE-2011

Ans. (b) : 0.0120 is written as 1.2×10^{-2}, ie. decimal is moved two places towards the right so that there is only one non-zero digit before the decimal point and the exponent of 10 is –2 in the scientific notation.
Scientific notation is a form of representing in simpler form.

23. For a reaction of type A + B → products, it is observed that doubling concentration of A causes the reaction rate to be four times as great, but doubling amount of B does not affect the rate. The unit of rate constant is

(a) s^{-1} (b) s^{-1} mol L^{-1}
(c) s^{-1} mol^{-1} L (d) s s^{-1} mol^{-2} L^2

VITEEE- 2010

Ans. (c) : For a reaction -

$$A + B \rightarrow \text{product}$$

Let the initial rate be R
And order with respect to A be x and B be y. Thus, rate law can be written as,

Rate, $R = [A]^x\,[B]^y$ ....(i)

After doubling the concentration of A, rate becomes 4R,

$4R = [2A]^x\,[B]^y$ ....(ii)

After doubling the concentration of B, rate remains R,

$R = [A]^x\,[2B]^y$ ....(iii)

From equation (i) and (ii), we get

$$\frac{R}{4R} = \left(\frac{1}{2}\right)^x \Rightarrow \left(\frac{1}{2}\right)^2 = \left(\frac{1}{2}\right)^x$$

So, x = 2

From equation (i) and (iii), we get

$$\frac{R}{R} = \left[\frac{1}{2}\right]^y \Rightarrow \left(\frac{1}{1}\right)^0 = \left(\frac{1}{2}\right)^y$$

So, Y = 0

Hence, the rate law is, rate $R = [A]^2[B]^0$

This clearly shows that the order of this reaction is 2 and for second order reaction units of rate constant are mol^{-1} Ls^{-1}.

24. The charge on an electron in Coulombs is–

(a) 1.602×10^{-19} (b) 1.062×10^{-19}
(c) 1.620×10^{-19} (d) 1.006×10^{-19}

BCECE-2009

@apna_pdf

Ans. (a) : Coulomb is the SI unit of electric charge which is define as the amount of charge delivered by an electric current of one ampere in one second.
The charge on an electron is
$= -1.60217663 \times 10^{-19}$ coulomb.

25. In colloid particles, range of diameter is
(a) 1 to 1000 nm (b) 1 to 1000 cm
(c) 1 to 1000 mm (d) 1 to 100 km

BCECE-2008
UPTU/UPSEE-2006

Ans. (a) : Colloid is a mixture, in which insoluble particles of one substance suspended in another substance, range of diameter in colloid particles is 1 to 1000 nm.
Colloidal particle range in diameter from 1 to 1000 nanometers and can be solid, liquid, or gases.

26. In which of the following number all zeros are significant?
(a) 0.0005 (b) 0.0500
(c) 50.000 (d) 0.0050

BITSAT-2008

Ans. (c) : If zero is used to locate the decimal point it is considered as a significant figure. In 50.000, all zero are significant.

27. Which one of the following set of units represents the smallest and largest amount of energy respectively?
(a) J and erg (b) erg and cal
(c) cal and eV (d) lit-atom and J
(e) eV and lit-atom

Kerala-CEE-2007

Ans. (e) : SI unit of energy is Joule.
Converting other units of energy into joule, we find-
1 eV = 1.6×10^{-19} J
1 cal = 4.186 J
1 erg = 10^{-7} J
1 lit - atom = 101.3 J
Smallest and largest amount of energy are eV and lit-atom respectively.

28. Which of the following, is not a unit of pressure?
(a) Atmosphere (b) Torr
(c) Pascal (d) Newton

JIPMER-2004

Ans. (d) : • The force per unit area is called pressure it is denoted by P. Here, Atmosphere, Torr and Pascal, these three are unit of pressure.
• Newton is not the unit of pressure. It is the unit of force.
So, the correct option is Newton.

29. The value of amu is which of the following?
(a) 1.57×10^{-24} kg (b) 1.66×10^{-24} kg
(c) 1.99×10^{-23} kg (d) 1.66×10^{-27} kg

UP CPMT-2003

Ans. (d) : 1 amu is defined as $\left(\frac{1}{12}\right)^{th}$ of the mass one carbon-12 isotope atom. As per the definition of atomic mass unit,

$$1 \text{ amu} = \frac{1}{12}\frac{12}{N_A} \text{g}$$
$$1 \text{ amu} = \frac{1}{6.023\times10^{23}} \text{g}$$
$$1 \text{ amu} = 1.6 \times 10^{-27} \text{ kg}$$

30. The radius of an atomic nucleus is generally expressed in units of:
(a) Debye (b) Coulomb
(c) Fermi (d) Tesla

AP-EAMCET (Medical), 2001

Ans. (c) : The radius of atomic nucleus is expressed in fermi.
1 Fermi = 10^{-13} cm

31. A colloidal system has particles of which of the following size?
(a) 10^{-9}m to 10^{-12}m (b) 10^{-6}m to 10^{-9}m
(c) 10^{-4}m to 10^{-10}m (d) 10^{-5}m to 10^{-7}m

(NEET-1996)

Ans. (b) : A colloidal system has particles of 10^{-6} m to 10^{-9} m size. Colloidal system consist of dispersed of dispersed phase and dispersion medium.
So, option B is correct.

32. The dimensions of pressure are the same as that of
(a) force per unit volume
(b) energy per unit volume
(c) force
(d) energy

NEET-1995

Ans. (b): Pressure $= \frac{\text{Force}}{\text{Area}} = \frac{\text{Mass}\times\text{acceleration}}{\text{Area}}$
Dimensional formula,
$$= \frac{M\times LT^{-2}}{L^2} = ML^{-1}T^{-2}$$
$\text{Energy} = \text{work} = \text{force}\times\text{displacement}$
Energy per unit volume $= \frac{ML^2T^{-2}}{L^3}$
$= ML^{-1}T^{-2}$
Dimension of pressure is $ML^{-1}T^{-2}$ which is same as the dimension of energy per unit volume.

2. Atomic, Molecular and Equivalent Masses

33. Arrange the following in the order increasing mass (atomic mass O = 16, Cu = 63, N = 14)
I. One molecule of oxygen
II. One atom of nitrogen
III. 1 × 10^{-10} gram molecule of oxygen
IV. 1 × 10^{-10} g of copper
(a) II < I < IV < III (b) I < II < III < IV
(c) III < II < IV < I (d) IV < II < III < I
(e) II < IV < I < III

AIIMS-2016
Kerala-CEE-2011

@apna_pdf

Ans. (a) : Comparing the masses, we get correct order of increasing mass is (II) < (I) < (IV) < (III)

(I) 1 molecule of oxygen = O_2

$\therefore$ Mass of O_2

$$= \frac{16\times2}{N_A} = \frac{32g}{N_A} = \frac{32}{6.22\times10^{23}} = 5.3\times10^{-23}\,g$$

(II) Mass of 1 atom of Nitrogen = $1.66\times10^{-24}\times14$

$= 23.2\times10^{-24}\,g$

(III) 1×10^{-24} gm molecule of oxygen = 1×10^{-10} moles of O_2

Mass of 1×10^{-10} gm molecule of oxygen $1\times10^{-10}\times32$

$= 3.2\times10^{-9}\,g$

(IV) Mass of copper = $1\times10^{-10}\,g$

Comparing the masses in (I), (II), (III) and (IV)

We get, (II), < (I), < (IV), < (III)

Therefore, answer is (II) < (I) < (IV) < (III)

34. 1.520 g of hydroxide of a metal on ignition gave 0.995 g of oxide. The equivalent weight of metal is :

(a) 1.52 (b) 0.995

(c) 19.00 (d) 9.00

BITSAT-2011

BCECE-2008

Ans. (d) : Let E be the equivalent weight of the metal

So, $\frac{E+17}{E+8} = \frac{1.52}{0.995}$

[17 is equivalent weight of OH and 8 is equivalent weight of oxygen]

$\Rightarrow 0.995E + 17\times0.995 = E\times1.52 + 8\times1.52$

$\Rightarrow 0.525E = 16.915 - 12.16 = 4.755$

$\therefore E = \frac{4.755}{0.525} = 9$

35. In acidic medium, the equivalent weight of $K_2Cr_2O_7$ (Mol. wt. = M) is

(a) M (b) $\frac{M}{2}$

(c) $\frac{M}{3}$ (d) $\frac{M}{6}$

WBJEE-2012

UPTU/UPSEE-2009

Ans. (d) : An equivalent weight of a solution is defined as the molecular weight of the solute divided by the valence of the solute. Equivalent weight is used for predicting the mass of substance that react with one atom of hydrogen is acid –base analysis.

Balanced chemical reaction of $K_2Cr_2O_7$ in acidic medium will be-

$$K_2Cr_2O_7 + 14H^+ + 6e^- \rightarrow 2K^+ + 2Cr^{3+} + 7H_2O$$

In the above reaction, oxidation state of chromate ion is changing from +6 to +3, i.e. the transfer of 6 electrons is taking place.

$\therefore$ Equivalent weight = $\frac{M}{6}$

36. Assertion : The normality of 0.3 M aqueous solution of H_3PO_3 is equal to 0.6N.

Reason: Equivalent weight of H_3PO_3

$$= \frac{\text{Molecular weight of } H_3PO_3}{3}$$

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS-2018, 2013, 2011

Ans. (c): H_3PO_3 is a divalent. This is because it has two ionizable hydrogen atoms bonded to two oxygen atom and one non-ionizable hydrogen atom bonded directly to phosphorus.

$\therefore$ Equivalent weight = $\frac{\text{Molecular weight}}{\text{Valency factor}}$

(Where, valency factor = no. of replaceable H^+ ions)

equivalent weight = $\frac{M}{q}$, since, no. of replaceable H^+ ions in H_3PO_3 = 2

37. 0.79 gm of a metal oxide is obtained from 0.5 gm of the same metal upon oxidation. Equivalent weight of the metal will be which of the following?

(a) 10 (b) 13.8

(c) 20 (d) 40

Tripura JEE-2022

Ans. (b) : Mass of metal + mass of oxygen = mass of metal oxide

Mass of oxygen = 0.79 – 0.5

= 0.29

$$\frac{\text{Mass of metal}}{\text{Mass of oxygen}} = \frac{\text{Eq. wt. of metal}}{\text{Eq. wt. of oxygen}}$$

$$\text{Eq. wt. of metal} = \frac{0.5}{0.29}\times8$$

$$\text{Eq. wt. of metal} = 13.79 \simeq 13.8$$

38. What amount of conc. H_2SO_4 solution should be used to prepare 500 m*l* of 0.5 M H_2SO_4? (The concentration of H_2SO_4 solution being used is 90% and molecular mass of H_2SO_4 = 98.079 g. mol^{-1})

(a) 22.06 g (b) 24.52 g

(c) 11.03 g (d) 27.24 g

AP-EAPCET-23.08.2021, Shift-I

Ans. (a) : Given that-

V = 500 ml

C = 0.5 M

Concentration of H_2SO_4 solution being used is 90%

So, $C = \frac{0.5\times90}{100} = 0.45\,M$

Molecular weight of H_2SO_4 = 98.079 g/mol

@apna_pdf

$$\therefore\ C = \frac{n(\text{moles})}{V(\text{volume})}$$

$$\text{or } C = \frac{\text{weight}}{\text{m.weight}} \times \frac{1}{V(\text{Volume})}$$

Putting the value we get-

$$0.45 = \frac{\text{weight/amount}}{98.079 \times 0.5}$$

Amount of $H_2SO_4 = 0.45 \times 0.5 \times 98.079 = 22.06$ gm.

39. When 1 : 2 equivalence ratio of the gases X and Y are heated to 573 K – 673 K at 200 – 300 atm in the presence of $ZnO - Cr_2O_3$ catalyst, methanol is formed. Here, the gases X and Y are ____ and ____ respectively.

(a) CO_2 & H_2 (b) CO & H_2

(c) CH_4 & O_2 (d) CH_4 & $H_2O_{(g)}$

AP EAPCET 24.08.2021, Shift-I

Ans. (b) : $CO + 2H_2 \xrightarrow[573K-673K]{ZnO+Cr_2O_3} CH_3OH$

CO and H_2 are heated to 573 K – 673 K at 200 - 300 atm in the presence of $ZnO - Cr_2O_3$ catalyst, methanol is formed. This process is used to prepare methanol on an industrial scale.

40. 3.7 gm of a gas at 25°C occupies some volume. At 17°C, 0.184 gm hydrogen gas occupies same volume when pressures of both gases are same. What will be the molecular weight of the gas?

(a) 41.98 (b) 20.67

(c) 20.94 (d) 41.34

Tripura JEE-2021

Ans. (d) : Given, Amount of gas = 3.7g

Here, volume and pressure of both gases are same.

As we know, PV = nRT

P and V are same for both gases.

So, $n_1T_1 = n_2T_2$

$$\frac{w_1}{M_1}T_1 = \frac{w_2}{M_2}T_2$$

$$\frac{3.7}{M_1} \times 298 = \frac{0.184}{2} \times 290$$

$M_1 = 41.33$ g

41. 12.3 g of 1-bromopropane is treated with alcoholic KOH. What mass of propene is obtained if yield is 50%?

(a) 6.05 g (b) 12.3 g

(c) 4.2 g (d) 2.1 g

Assam CEE-2021

Ans. (d) :

$$\underset{12.3g}{CH_3-CH_2-CH_2-Br} \xrightarrow[KOH]{alc} \underset{50\%\ x\ g?}{CH_3-CH=CH_2}$$

$$121\text{ g} \rightarrow 41\text{ g}(100\%)$$

$$1\text{ g} \rightarrow \frac{41}{121} \times \frac{50}{100}(50\%)$$

$$12.3\text{g} \rightarrow \frac{41}{121} \times \frac{50}{100} \times 12.3$$

$$= 2.06 = 2.1\text{g}$$

42. Vapour density of a metal chloride is 83. If equivalent weight of the metal is 6, its atomic weight will be 1

(a) 12 (b) 24

(c) 18 (d) 60

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) : Valency of metal,

$$(n) = \frac{2 \times \text{vapour density}}{\text{Equivalent weight of metal} + 35.5}$$

$$= \frac{2 \times 83}{6 + 35.5} = 4$$

The atomic weight of metal is equal to the product of the equivalent weight of metal and valency.

Atomic weight of metal = n × equivalent weight of metal

⇒ 4 × 6 = 24

Hence, the correct option (b).

43. A 40% by mass sucrose solution is heated till, it becomes 50% by mass. Calculate the mass of water lost from 100 g of the solution is

(a) 10 g (b) 15 g

(c) 20 g (d) 25 g

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (c) : 40% sucrose solution means it contains 60% water. After heating, till 50% by mass sucrose remains.

$$\text{Thus, \% water lost } = \frac{0.4}{0.5} \times 100 = 80$$

Water lost = 100 – 80 = 20 g

Hence, option (c) is correct.

44. What will be the mass of one atom of ^{12}C?

(a) 1 amu (b) 1.9923×10^{-23}g

(c) 1.6603×10^{-22}g (d) 6 amu

WB-JEE-2020

Ans. (b) : Mass of ^{12}C = 12 gm

6.022×10^{23} atoms are present in 12 g of carbon -12 element.

Mass of 6.022×10^{23} atom = 12 gm.

$$\text{Mass of 1 Atom} = \frac{12}{6.023 \times 10^{23}}$$

$$= 1.993 \times 10^{-23}\text{ gm}$$

45. In a flask, the weight ratio of CH_4(g) and SO_2(g) at 298 K and 1 bar is 1:2. The ratio of the number of molecules of SO_2(g) and CH_4(g) is

(a) 1:4 (b) 4:1

(c) 1:2 (d) 2:1

COMEDK-2020

Ans. (c) : Let mass of CH_4(g) =1g

Number of moles of CH_4 (n_{CH_4})= $\frac{1}{16}$

Number of molecules of CH_4(g)= $\frac{1}{16} \times N_A$

Let the mass of SO_2(g)=2g

Number of moles of SO_2(g)(n_{so_2})= $\frac{2}{64}$

@apna_pdf

Number of molecules of $SO_2(g)$= $\frac{2}{64}\times N_A$

Ratio of number of molecules of $SO_2(g)$ and number of molecules of $CH_4(g)$ =

$$\frac{2}{64}\times N_A : \frac{1}{16}\times N_A \Rightarrow \frac{1}{32} : \frac{1}{16} \Rightarrow 1:2$$

46. Equivalent mass of $K_2Cr_2O_7$ in acidic solution is equal to

(a) molecular mass/2 (b) molecular mass/4
(c) molecular mass (d) molecular mass/ 6.

COMEDK-2019

Ans. (d) : The given reaction occurred in acidic medium is :

$$K_2Cr_2O_7 + 14H^+ + 6e^- \longrightarrow 2K^+ + 2Cr^{3+} + 7H_2O$$

In the above reaction, you can see that 1 molecule of $K_2Cr_2O_7$ is releasing 6 electrons and molecular weight of $K_2Cr_2O_7$=294 g/mol

∴Calculation of equivalent weight

$$= \frac{\text{Molecular wt. of } K_2Cr_2O_7}{\text{Acidity}}$$

Equivalent weight = $\frac{\text{Molecular wt. of } K_2Cr_2O_7}{6}$

47. Equivalent weight of $KMnO_4$ is equal to

(a) one-sixth its molecular weight
(b) its molecular weight
(c) one-fifth its molecular weight
(d) half is molecular weight.

COMEDK-2019

Ans. (c) : $2KMnO_4 + 3H_2SO_4 \rightarrow$
$K_2SO_4 + 2MnSO_4 + 3H_2O + 5[O]$

Since, mass of oxygen are available from $\frac{2\times 8}{5\times 16} = \frac{1}{5}$ mol. wt. of $KMnO_4$

Therefore, equivalent weight of $KMnO_4$

= $\frac{1}{5}$ × molecular weight.

Thus equivalent weight of $KMnO_4$ is one fifth its molecular weight.

48. Assertion: Molecular weight of a compound is 180, if its vapour density is 90.

Reason: Molecular Weight = $\frac{\text{Vapour density}}{2}$

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Morning)

Ans. (c): Relation between molecular weight and vapour density is,

Molecular weight of compound = 2 × vapour density
= 2 × 90
= 180

Hence, assertion is correct but reason is incorrect.

49. In acid medium MnO_4^- is reduced to Mn^{2+}, by a reducing agent. Then the equivalent mass of $KMnO_4$ is given by :
(M = molecular mass)

(a) M/2 (b) M
(c) M/5 (d) M/3

Manipal-2019

Ans. (c) :

$$\underset{\text{O.N.}=+7}{\underset{\downarrow}{MnO_4^-}} + 8H^+ + 5e^- \rightarrow \underset{\text{O.N.}=+2}{\underset{\downarrow}{Mn^{2+}}} + 4H_2O$$

In acidic medium, Mn^{+7} goes to Mn^{+2} state and hence there is a net gain of 5 electrons.

Now, equivalent weight

$$= \frac{\text{molar mass}}{\text{number of electrons gained or lost}}$$

So, equivalent weight = $\frac{M}{5}$

50. The equivalent weight of oxalic acid in $C_2H_2O_4.2H_2O$ is

(a) 45 (b) 63
(c) 90 (d) 126

NDA (I)-2019

Ans : (b) Given, Oxalic Acid ($C_2H_2O_4.2H_2O$)

We know that,

$$\text{Equivalent weight} = \frac{\text{Molecular weight}}{\text{n - factor}}$$

$$= \frac{126}{2} = 63$$

Hence, equivalent weight of oxalic acid ($C_2H_2O_4.2H_2O$) is 63.

51. 1 mol of $FeSO_4$ (atomic weight of Fe is 55.84g mol^{-1}) is oxidised to $Fe_2(SO_4)_3$.
Calculate the equivalent weight of ferrous ion

(a) 55.84 (b) 27. 92
(c) 18.61 (d) 111.68
(e) 83.76

Kerala-CEE-2018

Ans. (a) : 1 mol of $FeSO_4$ is oxidised to $Fe_2(SO_4)_3$.

Change in oxidation number = 1(+2 → +3)

The atomic mass of Fe = 55.84

$$\text{Equivalent mass} = \frac{\text{Atomic mass}}{\text{Change in oxidation state}}$$

For the charge, $Fe^{2+} \rightarrow Fe^{3+}$ i.e. (3 – 2 = 1)

The equivalent mass = $\frac{55.84}{1}$ = 55.84

52. In the standardization of $Na_2S_2O_3$ using $K_2Cr_2O_7$ by iodometry, the equivalent weight of $K_2Cr_2O_7$ is :

(a) Molecular weight/2
(b) Molecular weight/6
(c) Molecular weight/3
(d) Same as molecular weight

Manipal-2018

@apna_pdf

Ans. (b) : The reaction between $Na_2S_2O_3$ and $K_2Cr_2O_7$ is as shown below.

$$26H^+ + 3S_2O_3^{2-} + 4Cr_2O_7^{2-} \rightarrow 6SO_4^{2-} + 8Cr^{3+} + 13H_2O$$

The oxidation state of chromium in $K_2Cr_2O_7$ change from +6 to +3.
The net change in oxidation number per formula unit is 6.
Hence,

$$\text{The equivalent weight of } K_2Cr_2O_7 = \frac{\text{Molecular weight}}{6}$$

53. A certain amount of a metal whose equivalent mass is 28 displaces 0.7 L of H_2 at STP from an acid. Hence, mass of the element is :

(a) 1.75 g (b) 0875 g
(c) 3.50 g (d) 7.00 g

Manipal-2018

Ans. (a) : $\text{Moles of } H_2 = \frac{\text{given volume}}{\text{volume at STP}}$ … (i)

$\text{Equivalent weight} = \frac{\text{molar mass of metal}}{\text{valency}}$ … (ii)

Gram equivalent metal = gram equivalent of H_2
From (i) & (ii) –

$$\frac{\text{Weight of metal}}{\text{Equivalent wt. of metal}} = \text{Moles of } H_2 \times \text{Valency factor}$$

$$\Rightarrow \frac{\text{Weight of metal}}{28} = \frac{\text{given volume}}{22.4} \times 2$$

$$\Rightarrow \frac{\text{Weight of metal}}{28} = \frac{0.7}{22.4} \times 2$$

Weight = 1.75 gm

54. The masses of oxygen which combine with a fixed mass of hydrogen to form H_2O and H_2O_2, respectively, bear the simple ratio 1:2.
The above statement illustrates which of the following laws?

(a) Law of definite composition
(b) Law of multiple proportions
(c) Gay Lussac's law of gaseous volumes
(d) Avogadro's law

COMEDK-2018

Ans. (b) : The masses of oxygen which combine with a fixed mass of hydrogen to form H_2O and H_2O_2, respectively bear the simple ratio 1: 2. It illustrates the law of multiple proportions.
The law of multiple proportions can be defined as if two elements form more than one compound between them, the mass ratios of the second elements that combine with a fixed mass of the first element will always be the ratios of small whole numbers.

55. The number of times the comparative mass of a neutron is heavier than an electron is

(a) ~1842 (b) ~182
(c) ~102 (d) ~4050

J & K CET-(2018)

Ans. (a): Mass of neutron = 1.008665 amu
Mass of electron = 0.00055 amu
Hence, Neutron is 1842 times heavier than an electron.

56. What is the formula mass of anhydrous sodium carbonate? [Given that the atomic masses of sodium, carbon and oxygen are 23u, 12u and 16u respectively]

(a) 286 u (b) 106 u
(c) 83 u (d) 53 u

NDA (II)-2018

Ans. (b) : Chemical formula of anhydrous sodium carbonate- (Na_2CO_3)
= 2 × [Atomic Mass of Na + Atomic mass of C + 3 × Atomic mass of oxygen]
$=2\times23+12+3\times16=106\ \mu$

57. A sample of oxygen contains two isotopes of oxygen with masses 16 u and 18 u respectively. The proportion of these isotopes in the sample is 3 : 1. What will be the average atomic mass of oxygen in this sample?

(a) 17.5 u (b) 17 u
(c) 16 u (d) 16.5 u

NDA (II)-2018

Ans. (d) : Given,
Two isotopes of oxygen with 16u and 18u. The proportion is given, 3:1
∴ Percentage composition of isotopes of oxygen is 75% and 25%.
Now, we know that
Average atomic mass of element=

$$\frac{(\text{Atomic mass of I}^{st}\text{ isotope} \times \text{Percentage Isotop})}{100} +$$

$$\frac{(\text{Atomic mass }2^{nd}\text{ isotope} \times \text{Percentage of }2^{nd})}{100}$$

$$= 16 \times \frac{75}{100} + 18 \times \frac{25}{100}$$

= 16.5u
Hence, the average atomic mass of oxygen is 16.5u .

58. Assertion : Equal moles of different substances contain same number of constituent particles.
Reason: Equal weights of different substance contain the same number of constituent particles.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2017

Ans. (c): Equal moles of different substances contain same number of constituent particles. But equal weights of different substances do not contain the same number of constituent particles. Hence, Assertion is correct but reason is incorrect.

@apna_pdf

$$\text{Number of moles} = \frac{\text{Weight}}{\text{Molecular weight}}$$

$$\text{Number of moles} = \frac{\text{Number of particle}}{N_A}$$

Where, N_A = Avogadro's number

59. 4 g of copper was dissolved in conc. HNO_3. The copper nitrate thus obtained gave 5 g of its oxide on strong heating the equivalent weight of copper is

(a) 23 (b) 32
(c) 12 (d) 20

BITSAT-2017

Ans. (b) : Given that, 4 g of copper gave 5 g of its oxides means one g of oxygen combines with 4 g of copper.

∵ Eq. wt of oxygen = 8,
Therefore, 8 g of oxygen combine with
= 4 × 8 g of copper = 32 g
Hence, equivalent weight of copper = 32

60. The most abundant elements by mass in the body of a healthy human adult are Oxygen (61.4%); of healthy Carbon (22.9%), Hydrogen (10.0%); and Nitrogen (2.6%). The weight which a 75 kg person would gain if all ^1H atoms are replaced by ^2H atoms is

(a) 15 kg (b) 37.5 kg
(c) 7.5 kg (d) 10 kg

[JEE Main-2017]

Ans. (c) : Given that –
Percentage of mass of oxygen (W_O) = 61.4 %
Percentage of mass of carbon (W_C) = 22.9 %
Percentage of mass of hydrogen (W_H) = 10 %
Percentage of mass of nitrogen (W_N) = 2.6 %
Weight of the person (W) = 75kg.
Mass of H^1, W_H = 10% of 75kg
= 7.5 kg
Since

${}_1H^2$ is double mass of ${}_1H^1$

Mass of H^2, W_{H^2} = 15kg

Increase in mass $\Delta w = W_{H^2} - W_{H^1}$
= 15 kg – 7.5 kg
= 7.5 kg

61. The compound $Na_2CO_3 . xH_2O$ has 50% H_2O by mass. The value of "x" is

(a) 4 (b) 5
(c) 6 (d) 7
(e) 8

Kerala-CEE-2017

Ans. (c) : Molar mass of Na_2CO_3 = 106 unit
(23 × 2) + 12 + (3 × 16)
Number of moles (per unit charge) = 50% of 106 is 106/2 = 53 gm

$\frac{53}{18} = 2.94$ mol

Total moles of H_2O = 2 × 2.94 = 5.89 ≅ 6.00

62. What mass of calcium chloride in grams would be enough to produce 14.35 g of AgCl? (Atomic mass Ca = 40, Ag = 108)

(a) 5.55 g (b) 8.295 g
(c) 11.19 g (d) 16.59 g

Manipal-2017

Ans. (a) : Given, weight of AgCl = 14.35 g
Molecular weight of AgCl = 143.32 g mol^{-1}

$$\underset{111g}{CaCl_2} + 2AgNO_3 \rightarrow Ca(NO_3)_2 + \underset{2\times143.5g}{2AgCl}$$

$CaCl_2$ required to produced 2×143.5g of AgCl = 111g
$CaCl_2$ required to produced 14.35g of AgCl

$$= \frac{111\times14.35}{2\times143.5} = 5.55 \text{ g}$$

63. The mass of oxygen that would be required to produce enough CO which completely reduces 1.6 kg Fe_2O_3 (at. mass Fe = 56), is :

(a) 240 g (b) 480 g
(c) 720 g (d) 960 g

Manipal-2017

Ans. (b) : $3C + \frac{3}{2}O_2 \rightarrow 3CO$

$Fe_2O_3 + 3CO \rightarrow 2Fe + 3CO_2$

1 mol of Fe_2O_3 ≡ 3 mol of CO ≡ $\frac{3}{2}$ mole of O_2

160 g of Fe_2O_3 require $O_2 = \frac{3}{2}\times 32 = 48$ g

1.6 kg of Fe_2O_3 require O_2 = 480 g

64. What is the actual volume occupied by water molecules present in 20 cm^3 of water?

(a) 20 cm^3 (b) 10 cm^3
(c) 40 cm^3 (d) 24.89 dm^3

MHT CET-2017

Ans. (d) : Given,
Density of water = 1 g/cc and volume = 20 cm^3 = 20cc.

$$\text{Density} = \frac{\text{Mass}}{\text{Volume}}$$

Mass = 1× 20 = 20 g

So, no. of moles of water $= \frac{20}{18} = 1.11$ moles

1 moles occupies 22.4L
∴ 1.11 moles occupies 24.89L, i.e.
24.89 dm^3 (1 lt = 1dm^3)

65. 0.126 g of an acid is needed to completely neutralize 20 mL 0.1 (N) NaOH solution. The equivalent weight of the acid is

(a) 53 (b) 40
(c) 45 (d) 63

WB-JEE-2017

Ans. (d) : Gram equivalents weight of Acid = Gram equivalents of weight Base

$$\frac{0.126}{E_{Acid}} = \frac{20}{1000}\times 0.1$$

$$\frac{0.126\times1000}{20\times0.1} = E_{Acid}$$

E_{Acid} = 63 g/equivalent

@apna_pdf

66. When 2.46 g of a hydrated salt (MSO_4xH_2O) is completely dehydrated 1.20 g of anhydrous salt is obtained. If the molecular weight of anhydrous salt is 120 g mol^{-1}, what is the value of x?

(a) 2 (b) 4
(c) 5 (d) 6
(e) 7

Kerala-CEE-2016

Ans. (e) : $\underset{2.46g}{MSO_4.xH_2O} \xrightarrow{\Delta} \underset{1.20g}{MSO_4} + \underset{x\,g}{H_2O}$

Molecular weight of $MSO_4{\cdot}xH_2O$ = 120g + x × 18g

(120g + x.18g) of $MSO_4{\cdot}xH_2O$ on complete dehydration gives 120g of MSO_4

$$1\text{g gives} = \frac{120}{120+18x}$$

Then, 2.46g of $MSO_4{\cdot}xH_2O$ gives $\frac{120\times2.4\text{g}}{120+18x\,\text{g}}$

$$\frac{120\times2.46}{120+18x} = 1.20$$

$$\frac{295.2}{120+18x} = 1.20$$

295.2 = 1.20 × 120 + 1.20 × 18x

295.2 = 144 + 21.6x

295.2 – 144 = 21.6 x

$$x = \frac{151.2}{21.6} = 7$$

67. The following reaction occurs in acidic medium
$KMnO_4 + 8H^+ + 5e^- \rightarrow K^+ + Mn^{2+} + 4H_2O$
What is the equivalent weight of $KMnO_4$?
(Molecular weight of $KMnO_4$ = 158)

(a) 79.0 (b) 31.6
(c) 158.0 (d) 39.5

TS-EAMCET-2016

Ans. (b) : Given that,

$KMnO_4 + 8H^+ + 5e^- \rightarrow K^+ + Mn^{2+} + 4H_2O$

$KMnO_4$ acts as oxidising agent in acidic medium.

$$\therefore \text{Equivalent weight of } KMnO_4 = \frac{158}{5}$$

= 31.6 g/equivalent.

68. A bivalent metal has an equivalent mass of 32. The molecular mass of the metal nitrate is

(a) 124 (b) 156
(c) 64 (d) 188

COMEDK-2016

Ans. (d) : Atomic mass of metal = Eq. mass × valency
=32×2 = 64

As metal M is bivalent, formula of its nitrate will be $M(NO_3)_2$.

Molecular mass of $M(NO_3)_2$= 64 +2(14+48)
= 64+124=188

69. 8.50g of NH_3 is present in 250 mL volume. Its active mass is

(a) 1.5 ML^{-1} (b) 2.0 ML^{-1}
(c) 1.0 ML^{-1} (d) 0.5 ML^{-1}

UPTU/UPSEE-2016

Ans. (b):

$$\text{Acive mass} = \frac{\text{Given mass of compound}}{\text{molecular mass of compound} \times \text{volume of solution}}$$

Active mass is defined as number of g mol per litre. It is also known as molar concentration molarity.

$$[NH_3] = \frac{8.50\,g}{17\,g/mol \times 250mL} \times 1000mL$$

$$[NH_3] = 2.0\,mol/L$$

70. Sulphur forms the chlorides S_2Cl_2 and SCl_2. The equivalent mass of sulphur in SCl_2 is

(a) 8 g/ mol (b) 16 g/mol
(c) 64.8 g/mol (d) 32 g/mol

AIIMS-2015

Ans. (b): Equivalent mass of sulphur

$$\Rightarrow \frac{\text{atomic mass of sulphur}}{\text{valency}}$$

$$\overset{x\,(-1)}{SCl_2} = x + 2(-1) = 0$$

$$x = 2$$

$$\Rightarrow \frac{32}{2} = 16$$

71. 3.011 × 10^{22} atoms of an element weighs 1.15 g. The atomic mass of the element is :

(a) 23 (b) 10
(c) 16 (d) 35.5

AP-EAMCET (Engg.)-2015

Ans. (a) : From Avogadro's law :

∵ 3.011 × 10^{22} atoms contain an element weight 1.15 gm.

Atomic mass → 1 mole of atoms → 6.022 × 10^{23} atoms

$$1\,\text{atom} = \frac{1.15}{3.011\times10^{22}}$$

$$6.022\times10^{23}\,\text{atoms} = \frac{1.15\times6.022\times10^{23}}{3.011\times10^{22}} = 23$$

Thus, the atomic mass of the element is = 23.

72. $KMnO_4$ reacts with ferrous sulphate according to the following equation.

$$MnO_4^- + 5Fe^{2+} + 8H^- \rightarrow Mn^{2+} + 2Fe^{3+} + 4H_2O$$

Here, 10 mL of 0.1 M $KMnO_4$ is equivalent to

(a) 50 mL of 0.1 M $FeSO_4$
(b) 20 mL of 0.1 M $FeSO_4$
(c) 40 mL of 0.1 M $FeSO_4$
(d) 30 mL of 0.1 M $FeSO_4$

JIPMER-2015

Ans. (a) : $KMnO_4$ reacts with ferrous sulphate according to the following equation,

$$2KMnO_4 + 10FeSO_4 + 8H_2SO_4 \rightarrow K_2SO_4 + 2MnSO_4 + 5Fe_2(SO_4)_3 + 8H_2O$$

2 moles of $KMnO_4$ reacts with 10 moles of $FeSO_4$

The number of moles of $KMnO_4$ in 10 ml of 0.1

M = 0.1 × 0.01 = 10^{-3} moles

No. of moles $FeSO_4$ = 5 × 10^{-3}

Volume having 5×10^{-3} mol in 0.1 M$FeSO_4$

@apna_pdf

$$0.1 = \frac{5\times10^{-3}\times1000}{V_{m\ell}}$$
$$V_{m\ell} = \frac{5\times10^{-3}\times1000}{0.1}$$
$$V_{m\ell} = 50\,\text{ml}$$

73. In acidic medium, dichromatic ion oxidizes ferrous ion to 'ferric ion'. If the gram molecular weight of potassium dichromate is 294g, its gram equivalent weight (in grams) is

(a) 24.5 (b) 49
(c) 125 (d) 250

JIPMER-2015

Ans. (b) : In acidic medium $K_2Cr_2O_7$ acts as a strong oxidising agent and itself gets reduced to Cr^{3+}.

$$Cr_2O_7^{-2} + 6e^- \rightarrow 2Cr^{3+}$$

The oxidation state of $K_2Cr_2O_7$

$$2(+1) + 2x + 2(-7) = 0$$
$$2x = +12$$
$$x = +6$$

Equivalent weight of

$$K_2Cr_2O_7 = \frac{\text{Molecular weight}}{\text{Valency}} = \frac{294}{6} = 49$$

74. Which of the following is correctly arranged in order of increasing weight?

(a) 0.0105 equivalent of $H_2C_2O_4$. $2H_2O$ < 0.625 g of Fe < 0.006 g atom of Ag < 6.0×10^{21}atoms of Zn
(b) 0.625 g of Fe < 0.0105 equivalent of $H_2C_2O_4$. $2H_2O$ < 6.0×10^{21} atoms of Zn < 0.006 g atom of Ag
(c) 0.625 g of Fe < 6.0×10^{21} atoms of Zn < 0.006 g atom of Ag < 0.0105 equivalent of $H_2C_2O_4$. .$2H_2O$
(d) 0.0105 equivalent of $H_2C_2O_4$. $2H_2O$ < 0.006 g atom of Ag < 6.0×10^{21} atoms of Zn < 0.625 g of Fe

JIPMER-2015

Ans. (c) : Here, the correct order of increasing weight, - 0.625 g of Fe < 6.0 × 10^{21} atoms of Zn < 0.006 g atom of Ag < 0.0105 equivalent of $H_2C_2O_4$. $2H_2O$.

6.0 × 10^{21} atoms of Zn (atomic weight 65.4 g/mol)

Corresponds to $\frac{6.0\times10^{21}}{6.0\times10^{23}}\times65.4 = 0.654$ g

0.006 g atom of Ag (atomic mass 108 g/mol)

Corresponds to 0.006 × 108 = 0.648 g

0.0105 equivalent of $H_2C_2O_4.2H_2O$ (equivalent mass 63 g/eq)

Corresponds to 0.0105 × 63 = 0.662 g

75. What is the mass of the precipitate formed when 50 mL of 16.9% solution of $AgNO_3$ is mixed with 50mL of 5.8% NaCl Solution?
(Ag = 107.8, N = 14, O = 16 Na = 23, Cl = 35.5)

(a) 3.5 g (b) 7 g
(c) 14 g (d) 28 g

NEET-2015

Ans. (b) : 16.9 g $AgNO_3$ is present in 100 mL solution.
∴ 8.45 g $AgNO_3$ is present in 50 mL solution.
5.8 g NaCl is present in 100 mL solution.
2.9 g NaCl is present in 50 mL solution.
Initial mole

$$\begin{array}{lcccc} & AgNO_3 + & NaCl \rightarrow & AgCl + & NaNO_3 \\ & \frac{8.45}{169.5} & \frac{2.9}{58.5} & 0 & 0 \\ & =0.049 & =0.049 & & \\ \text{After reaction} & 0 & 0 & 0.049 & 0.049 \end{array}$$

Therefore, mass of AgCl precipitated
= 0.049 × 143.5 = 7 g

76. Suppose the elements X and Y combine to form two compounds XY_2 and X_3Y_2. When 0.1 mole of XY_2 weight 10 g and 0.05 mole of X_3Y_2 weights 9 g, the atomic weights of X and Y are

(a) 40, 30 (b) 60, 40
(c) 20, 30 (d) 30, 20

NEET-2015

Ans. (a) : $M_1 \rightarrow$ Molecular mass of xy_2

$M_2 \rightarrow$ Molecular mass of x_3y_2

$a_1 \rightarrow$ Atomic weight of x

$a_2 \rightarrow$ Atomic weight of y

$$\frac{10}{M_1} = 0.1$$
$$m_1 = 100$$
$$a_1 + 2a_2 = 100 \qquad \dots \text{(i)}$$

Similarly

$$\frac{9}{m_2} = 0.05$$
$$n_2 = \frac{900}{5}$$
$$3a_1 + 2a_2 = \frac{900}{5} = 180 \qquad \dots \text{(ii)}$$

Solving (i) & (ii) simultaneously

$$\begin{array}{rl} 3a_1 + 2a_2 &= 180 \\ \underline{-\,a_1 + 2a_2} &\underline{= 100} \\ 2a_1 &= 80 \\ a_1 &= 40 \\ a_2 &= 30 \end{array}$$

Atomic weight of x & y are
40 & 30 respectivily

77. The equivalent weight of $Na_2S_2O_3$ in the following reaction is
$2Na_2S_2O_3 + I_2 \rightarrow Na_2S_4O_6 + 2NaI$

(a) M (b) M/8
(c) M/0.5 (d) M/2

JCECE - 2014

Ans. (a) : $2S_2O_3^{2-} \longrightarrow S_4O_6^{2-} + 2e^-$

$$E_{Na_2S_2O_3} = \frac{2M}{2} = M$$

@apna_pdf

78. The oxide of a metal contains 40% of oxygen. The valency of metal is 2. What is the atomic weight of metal?

(a) 24 (b) 13
(c) 40 (d) 36

AP-EAMCET (Engg.) - 2014

Ans. (a) : 100 gm of metal oxide contain 40 gm oxygen and 60 gm of metal.

∴ 8 gm of oxygen will be combined with =

$$\frac{60\times8}{40} = 12 \text{ gm of metal}$$

∴ Equivalent weight of metal = 12

Thus, atomic weight = Eq. weight × valency

= 12×2

= 24

79. Which has the maximum number of molecules among the following?

(a) 44g CO_2 (b) 48 g O_3
(c) 8 g H_2 (d) 64 g SO_2

AIIMS-2014

Ans. (c): 8g H_2 has the maximum number of molecules.

$$\text{No. of moles} = \frac{\text{weight of the substance}}{\text{Molecular weight of the substance}}$$

$$\text{Moles of } CO_2 = \frac{44}{44} = 1 \text{mol.}$$

$$\text{Moles of } O_3 = \frac{48}{48} = 1 \text{mol.}$$

$$\text{Moles of } H_2 = \frac{8}{2} = 4 \text{mol}$$

$$\text{Moles of } SO_2 = \frac{64}{64} = 1 \text{mol.}$$

Maximum no. of moles will corresponds to maximum number of molecules.

4 moles of H_2 i.e. $4 \times 6.023 \times 10^{23}$ molecules.

80. The ratio of masses of oxygen and nitrogen in a particular gaseous mixture is 1 : 4 The ratio of number of their molecule is

(a) 1:4 (b) 7:32
(c) 1:8 (d) 3:16

[JEE Main-2014]

Ans. (b) : Given ratio of masses of oxygen and Nitrogen = 1 : 4

Let mass of O_2 = x

Mass of N_2 = 4x

Molecular mass of oxygen = 32

Molecular mass of Nitrogen = 28

$$\text{Molecules of } O_2 = \frac{x}{32} N_A$$

$$\text{Molecules of } N_2 = \frac{4x}{28} N_A$$

Ratio of number of molecules = 7:32

81. What is the mass of one molecule of yellow phosphorus? (Atomic mass, P = 30)

(a) 1.993×10^{-22} kg (b) 1.993×10^{-19} mg
(c) 4.983×10^{-20} mg (d) 4.983×10^{-23} g

MHT CET-2014

Ans. (b) : Molecular mass of yellow phosphorus (P_4) = 4 × 30 = 120

According to Avogadro's hypothesis,

Mass of 6.022×10^{23} molecules = 120 g

$$\text{Mass of 1 Molecule} = \frac{120\times1}{6.022\times10^{23}}$$

$$= 19.926\times10^{-23} \text{g}$$

$$= 1.993 \times10^{-22} \text{ g}$$

$$= 1.993 \times 10^{-19} \text{ mg}$$

82. A certain metal sulphide, MS_2, is used extensively as a high temperature lubricant, If MS_2 has 40.96% sulphur by weight, atomic mass of M will be–

(a) 100 amu (b) 96 amu
(c) 60 amu (d) 30 amu

BCECE-2013

Ans. (b) :

Weight percentage of sulphur

$$= \frac{\text{Mass of sulphur}}{\text{Mass of Compound}} \times 100$$

$$\Rightarrow 40.96 = \frac{64}{M+64} \times 100$$

40.96 (M + 64) = 64 × 100

40. 96 M + 64 × 40.96 = 64 × 100

M = 96 amu

Where, M = Atomic mass of metal

83. Equivalent weight of $(NH_4)_2Cr_2O_7$ in the change is

$(NH_4)_2Cr_2O_7 \rightarrow N_2 + Cr_2O_3 + 4H_2O$

(a) Mol. wt./6 (b) Mol. wt./3
(c) Mol. wt./4 (d) Mol. wt./2

UP CPMT-2013

Ans. (a) : 1 mole $(NH_4)_2Cr_2O_7 \equiv$ 1 mole of Cr_2O_3

$\equiv$ 1 × 6 eq. of Cr_2O_3

∴ Reduction of $Cr_2O_7^{2-}$ to Cr^{3+} is a $6e^-$ change.

$$\left[(Cr^{6+})_2 + 6e^- \rightarrow (Cr^{3+})_2\right]$$

Therefore, equivalent weight of $(NH_4)_2Cr_2O_7 = M/6$

84. The equivalent mass of a certain bivalent metal is 20. The molecular mass of its anhydrous chloride is

(a) 111 (b) 55.5
(c) 75.5 (d) 91

Karnataka-CET-2012

Ans. (a) : The equivalent mass of bivalent metal

$$= \frac{\text{molecular mass}}{2}$$

Molecular mass = equivalent mass × 2

= 20 × 2 = 40

The metal is bivalent. So, 1 mole of metal atoms will combine with 2 moles of chlorine atoms.

$M + Cl_2 \rightarrow MCl_2$

The atomic mass of chlorine is 35.5 g

The molecular mass of its anhydrous chloride will be 40 + 2(35.5) = 111 g/mol.

@apna_pdf

85. A 100% pure sample of a divalent metal carbonate weighing 2g on complete thermal decomposition releases 448 cc of carbon dioxide at STP. The equivalent mass of the metal is

(a) 40 (b) 20
(c) 28 (d) 12
(e) 56

Kerala-CEE-2012

Ans. (b) : Formula of Metal carbonate is MCO_3

Molar mass of $MCO_3 = x + 12 + 3 \times 16$

$= (x + 60)$ g /mol

(Let atomic mass of M is x)

448 cc (448mL) CO_2 is produced from

Carbonate = 2 g

22400 cc CO_2 will be obtained from carbonate

$$= \frac{2 \times 22400}{448} = 100\,g$$

$\therefore \quad 100 = x + 60$

$x = 100 - 60 = 40$ g/mol

$$\text{Equivalent mass of metal} = \frac{\text{Atomic mass}}{\text{Valency}}$$

$$= \frac{40}{2} = 20\,g\,equiv^{-1}$$

86. 50 mL of each gas A and of gas B takes 150 and 200 seconds respectively for effusing through a pin hole under the similar conditions. If molecular mass of gas B is 36, the molecular mass of gas A will be

(a) 96 (b) 128
(c) 32 (d) 20.2

NEET-2012

Ans. (d) : Graham's law of effusion states that the rate of effusion of a gas is inversely proportional to the square root the molar mass of its particles.

$V_A = V_B = 50mL$

$T_A = 150s$

$T_B = 200s$

$M_B = 36$

$M_A = ?$

From Graham's law of effusion.

$$\frac{r_B}{r_A} = \sqrt{\frac{M_A}{M_B}} = \frac{V_B T_A}{T_B . V_A}$$

$$\sqrt{\frac{M_A}{36}} = \frac{V_A \times 150}{200 \times V_A}$$

$$\text{or} \sqrt{\frac{M_A}{36}} = \frac{15}{20} = 3/4$$

$$\frac{M_A}{36} = \frac{9}{16}$$

$$M_A = \frac{9 \times 36}{16} = \frac{81}{4} = 20.25 \approx 20.2$$

87. A certain gas takes three times as long to effuse out as helium. Its molecular mass will be

(a) 27 u (b) 36 u
(c) 64 u (d) 9 u

NEET-2012

Ans. (b) : The rate of effusion is inversely proportional to the molecular mass

$$\frac{r_1}{r_2} = \sqrt{\frac{Mw_2}{Mw_1}}$$

The rate of effusion is the ratio of the volume effused to the time taken

$$\frac{v_1}{t_1} \times \frac{t_2}{v_2} = \sqrt{\frac{Mw_2}{Mw_1}}$$

Here, volume is same.

$$\text{So, } \frac{3}{1} = \sqrt{\frac{Mw_2}{4}}$$

$$9 = \frac{Mw_2}{4}$$

$$Mw_2 = 36$$

88. Two gases A and B having the same volume diffuse through a porous partition in 20 and 10 seconds respectively. The molecular mass of A is 49 u. Molecular mass of B will be

(a) 50.00 u (b) 12.25 u
(c) 6.50 u (d) 25.00 u

UP CPMAT-2012
NEET-2011

Ans. (b) : Graham's law of diffusion states that the rate of diffusion of a gas is inversely proportional to the square root of its molecular weight.

According to the Graham's law

$$\text{Rate of diffusion (r)} \propto \frac{1}{\sqrt{M}}$$

$$\text{Rate of diffusion} = \frac{v}{t}$$

Where v is volume and t is time

$$\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$$

$$\frac{\frac{v_1}{t_1}}{\frac{v_2}{t_2}} = \sqrt{\frac{M_2}{M_1}} = \frac{t_2}{t_1} = \sqrt{\frac{M_2}{49}}$$

$$\frac{1}{2} = \sqrt{\frac{M_2}{49}}$$

$$M_2 = \frac{49}{4}$$

$M_2 = 12.254$

89. Excess of silver nitrate solution is added to 100 mL of 0.01 M pentaaqua chloro chromium (III) chloride solution. The mass of silver chloride obtained in grams is [Atomic mass of silver is 108].

(a) 287×10^{-3} (b) 143.5×10^{-3}
(c) 143.5×10^{-2} (d) 287×10^{-2}

Karnataka-CET-2011

@apna_pdf

Ans. (a) : The reagent is $[Cr(H_2O)_5Cl]Cl_2$

$$[Cr(H_2O_5)_5Cl]Cl_2 \xrightarrow[AgNO_3]{Excess} [Cr(H_2O_5)_5Cl]^+ NO_3^- + 2AgCl \downarrow$$

$$\text{No. of moles of } Cl^- \text{ ion present} = \frac{2\times100\times0.01}{1000}$$
$$= 0.002$$
$$\therefore \text{ Mass of AgCl} = 0.002 \times 143.5$$
$$= 0.287$$
$$= 287 \times 10^{-3} \text{ g}$$

90. Equivalent and molecular masses are same in
(a) Mohr's salt
(b) potassium permanganate
(c) potassium dichromate
(d) oxalic acid.

COMEDK-2011

Ans. (a) : Mohr's salt is $FeSO_4.(NH_4)_2SO_4.6H_2O$.

$$Fe^{2+} \rightarrow Fe^{3+} + e^-$$

The oxidation state of Fe change from +2 to +3.

$$\therefore \text{ Equivalent wt. of Mohr's salt} = \frac{\text{Mol.wt.}}{1} = \frac{392}{1} = 392$$

91. Two different electrolytic cells filled with molten $Al(NO_3)_3$ respectively are connected in series. When electricity is passed 2.7 gram Al is deposited on electrode. Calculate the weight of Cu deposited on cathode. [Cu = 63.5 ; Al = 27.0 gram. mol^{-1}]
(a) 190.5 gram (b) 9.525 gram
(c) 63.5 gram (d) 31.75 gram

GUJCET-2011

Ans. (b): $Cu^{2+} + 2e^- \rightarrow Cu(s)$
$Al^{3+} + 3e^- \rightarrow Al(s)$

When same current is passed through two electrolytic solution containing copper nitrate $[Cu(NO_2)_2]$ and aluminium nitrate $[Al(NO_3)_3]$ are connected in series.

$$\therefore \frac{\text{Weight of Cu deposited}}{\text{Weight of Al deposited}} = \frac{\text{Equivalent weight of Cu}}{\text{Equivalent weight of Al}}$$

$$\frac{\text{Wt.of Cu}}{2.7} = \frac{31.7}{9}$$

$$\text{Wt.of Cu} = \frac{31.7\times2.7}{9} = 9.5\,\text{gram}$$

So, weight of Cu deposited = 9.525 gm

92. Equivalent weight of crystalline oxalic acid is
(a) 90 (b) 63
(c) 53 (d) 45

BCECE-2011

Ans. (b) : Formula of crystalline oxalic acid $C_2H_2O_4$

$$\text{Equivalent weight} = \frac{\text{Molecular weight}}{\text{valency}}$$

$$\Rightarrow \frac{126}{2} = 63$$

93. The equivalent weight of $MnSO_4$ is half of its molecular weight when it is converted to
(a) Mn_2O_3 (b) MnO_2
(c) MnO_4^- (d) MnO_4^{2-}

CG PET- 2011

Ans. (b) :

$$\text{Equivalent weight in redox system} = \frac{\text{Molar mass}}{\text{n} - \text{factor}}$$

(where, n-factor is net change in oxidation number per formula unit of oxidising or reducing agent.)

In $MnSO_4$. n – Factor is 2 because equivalent weight is equal to its molecular weight.

Here, n-factor –

$MnSO_4 \rightarrow Mn_2O_3$ $1(+2 \rightarrow +3)$
$MnSO_4 \rightarrow MnO_2$ $2(+2 \rightarrow +4)$
$MnSO_4 \rightarrow MnO_4^-$ $5(+2 \rightarrow +7)$
$MnSO_4 \rightarrow MnO_4^{2-}$ $4(+2 \rightarrow +6)$

Therefore, $MnSO_4$ convert to MnO_2. Then the n-factor is to and the equivalent weight of $MnSO_4$ will be half of its molecular weight.

94. If the equivalent weight of a trivalent metal is 32.7, the molecular weight of its chloride is
(a) 68.2 (b) 103.2
(c) 204.6 (d) 32.7

JCECE - 2011

Ans. (c) : Atomic wt. of metal = valency × equivalent weight
= 3 × 32.7

Molecular wt. of metal chloride
$(MCl_3) = (3 \times 32.7) + (3 \times 35.5)$
= 204.6

95. In the disproportionation reaction $3HClO_3 \longrightarrow HClO_4 + Cl_2 + 2O_2 + H_2O$, the equivalent mass of the oxidizing agent is (molar mass of $HClO_3$ = 84.45)
(a) 16.89 (b) 32.22
(c) 84.45 (d) 28.15
(e) 29.7

Kerala-CEE-2011

Ans. (a): $$2H\overset{+5}{Cl}O_3 \longrightarrow H\overset{+7}{Cl}O + \overset{0}{Cl_2} + 2O_2 + H_2O$$

Since oxidation number of Cl decreases from +5 in $HClO_3$ to zero in Cl_2. Therefore, $HClO_3$ acts as an oxidising agent.

Eq. mass of $HClO_3$

$$= \frac{\text{Mol. mass of } HClO_3}{\text{oxidation number change}} = \frac{84.45}{5} = 16.89$$

96. One atomic mass is equal to
(a) 1.66×10^{-27} g (b) 1.66×10^{-24} g
(c) 1.66×10^{-23} g (d) 1.66×10^{-25} kg

MHT CET-2011

Ans. (b) : An atomic unit of mass is defined as accurately $^1/_{12}$ th mass of a C-12 atom.

One, AMU is the average of the proton rest mass and the neutron rest mass. This is approximately 1.67377×10^{-27} kilogram (kg) or 1.67377×10^{-24} gram (g). The mass of an atom in AMU is roughly equal to the sum of the number of protons and neutrons in the nucleus.

@apna_pdf

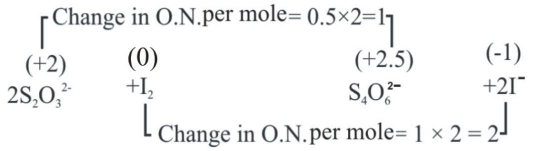
97. If The molecular wt. of $Na_2S_2O_3$ and I_2 are M_1 and M_2 respectively, then what will be the equivalent wt. of $Na_2S_2O_3$ and I_2 in the following reaction?

$$2S_2O_3^{2-} + I_2 \rightarrow S_4O_6^{2-} + 2I^-$$

(a) M_1, M_2 (b) $M_1, M_2/2$
(c) $2M_1, M_2$ (d) $M_1, 2M_2$

WB-JEE-2011

Ans. (b) :



Change in O.N.per mole= 0.5×2=1
(+2)
2S2O3 2-
(0)
+I2
(+2.5)
S4O6 2-
(-1)
+2I-
Change in O.N.per mole= 1 × 2 = 2

Equivalent mass of $S_2O_3^{2-} = \frac{M_1}{1} = M_1$

And equivalent mass of $I_2 = \frac{M_2}{2}$

98. 2g of metal carbonate is neutralized completely by 100 mL of 0.1 N HCl. The equivalent weight of metal carbonate is

(a) 50 (b) 100
(c) 150 (d) 200

WB-JEE-2011

Ans. (d) : As 2 g of metal carbonate is neutralized by 100 mL of 0.1 N HCl

$$\text{Normality} = \frac{\text{Number of gram equivalents of HCl}}{\text{Volume of solution (L)}}$$

$$0.1 = \text{Number of gram equivalents of HCl} \times \frac{100}{1000}$$

$\therefore$ Number of gram – equivalents of HCl

$$\frac{100 \times 0.1}{1000} = 0.01$$

Mass of 0.01 gram equivalent metal carbonate

$= 2g$

Mass of 1 gram equivalents metal carbonate

$$= \frac{2}{0.01} = 200\,g$$

$\therefore$ Equivalent mass of metal carbonate = 200

99. In the reaction of sodium thiosulphate with I_2 in aqueous medium the equivalent weight of sodium thiosulphate is equal to

(a) molar mass of sodium thiosulphate
(b) The average of molar masses of $Na_2S_2O_3$ and I_2
(c) half the molar mass of sodium thiosulphate
(d) molar mass of sodium thiosulphate×2

WB-JEE-2010

Ans. (a) : For two molecules of sodium thiosulphate, 2 electrons are lost by sodium thiosulphate. So, one molecule of sodium thiosulphate will lose one electron eventually.

Therefore, the number of electrons lost is 1.

$$\text{Equivalent weight} = \frac{\text{Molecular weight}}{1}$$

$$I_2 + 2Na_2S_2O_3 \rightarrow 2NaI + Na_2S_4O_6$$

Half reaction occur as :

$$I_2 + 2e^- \rightarrow 2I^-$$

$$2S_2O_3^{2-} \rightarrow S_4O_6^{2-} + 2e^-$$

for 2 electron lost by 2 molecules of $S_2O_3^{2-}$ (Sodium thiosulphate).

So one molecule will lost 1 electron so equivalent weight is equal to molecular weight divided by 1.

Equivalent weight = Molecular weight

100. The number of water molecules differing in molecular mass formed by hydrogen isotopes and oxygen isotopes

(a) 6 (b) 9
(c) 12 (d) 18

SCRA-2010

Ans. (a) : Water molecule mass formed by O^{16} and $_1H^1$, $_1H^2$, $_1H^3$ isotope is–

18, 20, 22, 19, 20, 19, 21, 20, 21

Water molecule mass formed by O^{17} and $_1H^1$, $_1H^2$, $_1H^3$ isotope is–

19, 21, 23, 20, 21, 20, 22, 21, 22

Water molecule mass formed by O^{18} and $_1H^1$, $_1H^2$, $_1H^3$ isotope is–

20, 22, 24, 21, 22, 21, 23, 22, 23

So, total 6 different water molecules can be formed which have mass–

18, 19, 20, 21, 22, 23

101. 0.32 g of metal gave on treatment with an acid 112 mL of hydrogen at NTP. Calculate the equivalent weight of the metal.

(a) 58 (b) 32
(c) 11.2 (d) 24

AMU-2010

Ans. (b) : Given, mass of metal = 0.32 g

volume of hydrogen = 112 ml

Equivalent weight

$$= \frac{\text{Mass of metal} \times 11200}{\text{Volume in mL of hydrogen}}$$

Given, Mass of metal = 0.32 g

Volume of hydrogen at NTP = 112 mL

$$\text{Equivalent weight} = \frac{0.32 \times 11200}{112} = 32g$$

102. The vapour density of ozone is

(a) 16 (b) 32
(c) 24 (d) 48

BITSAT-2010

Ans. (c) : We know that,

$$\text{Vapour density} = \frac{\text{molecular weight}}{2}$$

Molecular weight of O_3 = 16 × 3 = 48

$$\text{Then, Vapour density of ozone} = \frac{48}{2} = 24$$

103. The density of a gas is found to be 1.56g/L at 745 mm pressure and 65ºC. What is the molecular mass of the gas?

(a) 44.2 u (b) 4.42 u
(c) 2.24 u (d) 22.4 u

JIPMER-2010

@apna_pdf

Ans. (a): Pressure is P = 745 mm = 0.98 atm (1 atm = 760 mm Hg)

Temperature is T = 65°C = 65 + 273 = 338K

Density is d = 1.56 g/L

From ideal gas equation,

$$PV = nRT$$

$$P = \frac{m}{M \times V} \times R \times T \quad \left\{ \begin{matrix} \text{Where, } m = \text{given mass.} \\ M = \text{molecular mass} \end{matrix} \right\}$$

$$M = \frac{d \times R \times T}{P} \qquad (d = \text{density} = \frac{m}{v})$$

$$M = \frac{1.56 \times 338 \times 0.0821}{0.98} = 44.2u$$

Hence, the molecular mass of the gas is 44.2u

104. A 0.5 g/L solution of glucose is found to be isotonic with a 2.5 g/L solution of an organic compound. What will be the molecular weight of that organic compound?

(a) 300 (b) 600

(c) 900 (d) 200

JIPMER-2009

Ans. (c) : We know, two solutions are said to be isotonic when pressure are equal.

Osmotic pressure is given by (For glucose)

$$\frac{nRT}{V} = \frac{mRT}{MV} = \frac{0.5RT}{M} = \frac{RT}{360}$$

For other organic compound.

$$\frac{nRT}{V} = \frac{mRT}{MV} = \frac{2.5RT}{M_1}$$

n = Moles of solute.

m = mass of solute.

M = Molecular weight of solute.

V = volume of solution.

T = Temperature

When both the pressures are equal.

$$\frac{RT}{360} = \frac{2.5RT}{M_1}$$

$$M_1 = 900$$

105. The equivalent weight of Potassium permanganate ($KMnO_4$) in neutral medium will be

(a) Atomic weight (b) $\frac{\text{Atomic weight}}{2}$

(c) $\frac{\text{Atomic weight}}{3}$ (d) $\frac{\text{Atomic weight}}{5}$

MPPET- 2009

Ans. (c) : In neutral medium–

$$MnO_4^- + 4H^+ + 3e^- \longrightarrow MnO_2 + 2H_2O$$

Here, n = 3

$\because$ Molecular weight = 158.04

$\because$ Equivalent weight $= \frac{\text{Atomic Weight}}{\text{n - factor}}$

$\therefore$ Equivalent weight $= \frac{\text{Atomic Weight}}{3}$

106. 1.5 g of $CdCl_2$ was found to contain 0.9 g of Cd. Calculate the atomic weight of Cd.

(a) 118 (b) 112

(c) 106.5 (d) 53.25

AP EAMCET (Engg.)-2009

Ans. (c): Given that,

$CdCl_2 \rightarrow 1.5g$

$Cd \rightarrow 0.9g$

$Cl_2 \rightarrow$ 0.6 g(1.5–0.9)

$\because$ 0.6 g chlorine combine with 0.9 g Cd

$\therefore$ 71 g chlorine will combine with $\frac{0.9}{0.6} \times 71$ g Cd = 106.5 g Cd

$\therefore$ Atomic weight of Cd = 106.5

107. The standard for atomic mass is

(a) ${}^1_1H$ (b) ${}_6C^{12}$

(c) ${}_6C^{14}$ (d) ${}_8O^{16}$

BCECE-2009

Ans. (b) : Carbon-12 is the standard while measuring the atomic mass. because no other nuclides other than carbon – 12 have exactly whole number masses.

An atomic mass unit is defined as precisely $\frac{1}{12}^{th}$ mass of an atom of carbon-12 The Carbon -12 (C – 12) atom has six protons and six neutrons in its nucleus.

The C – 12 isotope of the carbon is the stable isotope which is not much affected as compared to others elements. Thus it is chosen as the standard for expressing the atomic mass and the molecular mass of the substance.

108. The equivalent mass of potassium permanganate in alkaline medium is its

(a) $\frac{\text{Molar Mass}}{5}$ (b) $\frac{\text{Molar Mass}}{3}$

(c) $\frac{\text{Molar Mass}}{2}$ (d) Molar mass itself

J & K CET-(2009)

Ans. (d) : The reaction in alkaline medium is:

$$K\overset{+7}{Mn}O_4 + 1e^- \rightarrow K_2\overset{+6}{Mn}O_4$$

Thus, n factor = change in oxidation state = 1

The equivalent mass of potassium permanganate in alkaline medium is its molar mass itself

Equivalent weight $= \frac{\text{molar mass}}{\text{n} - \text{factor}} \Rightarrow \frac{\text{molar mass}}{1}$

109. The formula mass of Mohr's salt is 392. The iron present in it is oxidised by $KMnO_4$ in acid medium. The equivalent mass of Mohr's salt is

(a) 392 (b) 31.6

(c) 278 (d) 156

JCECE - 2009

Ans. (a) : We know, Formula of Mohr's salt : $(NH_4)_2SO_4 \cdot FeSO_4 \cdot 6H_2O$

oxidation of Fe^{2+} ions take place as:

$$5Fe^{2+} + MnO_4^- + 8H^+ \rightarrow 5Fe^{3+} + Mn^{2+} + 4H_2O$$

Total change in oxidation number of iron (Fe)

= +3 – (+2) = +1

@apna_pdf

Equivalent mass of Mohr's salt

$$= \frac{\text{Molecular mass}}{\text{Change in oxidation number}}$$

$$= \frac{392}{1} = 392$$

110. A bivalent metal has an equivalent mass of 32. The molecular mass of the metal nitrate is

(a) 182 (b) 168

(c) 192 (d) 188

Karnataka-CET, 2009

Ans. (d) : Equivalent mass $= \frac{\text{Atomic mass}}{2}$

$$32 = \frac{\text{Atomic mass}}{2}$$

Atomic mass of the metal = 32 × 2 = 64

Formula of metal nitrate = $M(NO_3)_2$

∴ Molecular mass = 64 + 28 + 96 = 188

111. Copper is a divalent metal. The value of its electrochemical equivalent is 3.29×10^{-4} g. Its atomic mass is

(a) 31.74 g (b) 63.5 g

(c) 126.9 g (d) 15.87 g

MHT CET-2009

Ans. (b) : Electrochemical equivalent is the weight of a substance deposited or evolved during electrolysis by the passage of a specified quantity of electricity and usually expressed in grams per coulomb.

Electrochemical equivalent, $Z = \frac{E}{96500}$

Or, $3.29\times10^{-4} = \frac{E}{96500} = 31.74$

Atomic mass = 2 ×E [∴Cu is divalent]

= 2 × 31.74 = 63.49 gm

112. 0.126 g of an acid is titrated with 0.1 N 20 mL of an base. The equivalent weight of the acid is

(a) 63 (b) 50

(c) 53 (d) 23

UP CPMT-2009

Ans. (a): We know that,

$$w = \frac{E\times NV}{1000}$$

$$\therefore \text{Eq. wt. of acid} = \frac{w\times1000}{NV}$$

$$= \frac{0.126\times1000}{0.1\times20}$$

$$= 63$$

113. Mass of 0.1 mole of methane is

(a) 1g (b) 16g

(c) 1.6 g (d) 0.1 g

Karnataka-CET, 2008

Ans. (c) : Mass of one mole of methane (CH_4) = 16g

Mass of 0.1 mole of methane = 16 × 0.1g = 1.6 g

114. In acidic medium dichromate ion oxidises ferrous ion to ferric ion. If gram molecular weight of potassium dichromate is 294 g, its gram equivalent weight is

(a) 294 g (b) 127 g

(c) 49 g (d) 24.5 g

JCECE - 2008

Ans. (c) : In acidic medium $K_2Cr_2O_7$ acts as a strong oxidizing agent and itself gets reduced to Cr^{3+}

$$\overset{+6}{Cr_2}O_7^{2-} + 6e^- \rightarrow 2Cr^{3+}$$

During the reaction, the oxidation number of Cr decreases from +6 to +3.

Net decrease in the oxidation number of one Cr atom is 6 – 3 = 3 for 2 Cr atoms (in dichromate ion), the total decrease in the oxidation number is 2 × 3 = 6

Equivalent weight of $K_2Cr_2O_7 = \frac{\text{molecular weight}}{6}$

$$= \frac{294}{6} = 49$$

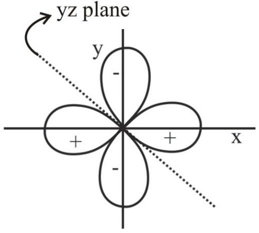
115. Electron density in the yz plane of $3d_{x^2-y^2}$ orbital is

(a) zero (b) 0.50

(c) 0.75 (d) 0.90

J & K CET-(2008)

Ans. (a) : No electron density



Electron density in the yz plane of $3d_{x^2-y^2}$ orbital is zero.

116. Assertion : Equivalent weight of a base

$$= \frac{\textbf{Molecular weight}}{\textbf{Acidity}}$$

Reason : Acidity is the number of replaceable hydrogen atoms in one molecule of the base.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS-2008

Ans. (c):

Equivalent weight of base $= \frac{\text{Molecular weight}}{\text{Acidity}}$

Acidity of base is defined as the number of ionizable hydroxyl group present in base.

So, reason is incorrect.

@apna_pdf

117. The number of formula units calcium flouride CaF_2 present in 146.4 g of CaF_2 are (molar mass of CaF_2 is 78.08 g/mol)

(a) 1.129×10^{24} CaF_2 (b) 1.146×10^{24} CaF_2
(c) 7.808×10^{24} CaF_2 (d) 1.877×10^{24} CaF_2

VITEEE- 2008

Ans. (a) : $CaF_2 = 146.4g$
Molecular weight CaF_2 = 78.08 g/mol
Formula unit = no. of molecules of CaF_2.

$$\text{Moles} = \frac{\text{mass in gm}}{\text{molar mass}} = \frac{146.4\,\text{gm}}{78.08\,\text{gm}} = 1.875$$

$$\text{Molecules} = \text{Mole} \times 6.022 \times 10^{23}$$
$$= 1.875 \times 6.022 \times 10^{23}$$
$$= 1.129 \times 10^{24}\ \text{units of } CaF_2$$

118. The mass of $KClO_3$ required to produce 2.4 mol of oxygen by catalytic decomposition will be

(a) 19.6 g (b) 196.0 g
(c) 122.5 g (d) 245.0 g

[Given that : $2KClO_{3(g)} \rightarrow 2KCl_{(g)} + 3O_{2(g)}$; molar mass of $KClO_3$=122.5 g]

AMU – 2007

Ans. (b) : $2KClO_{3(g)} \rightarrow 2KCl_{(g)} + 3O_{2(g)}$
Molar mass of $KClO_3$= 122.5
Now, 3 mol of O_2 is produced by 2 mol of $KClO_3$.

1 mole of O_2 is producd by $\frac{2}{3}$ mole of $KClO_3$

24 mole of O_2 is produced by $\frac{2}{3} \times 2.4$ mole of $KClO_3$

= 1.6 mol of $KClO_3$
Therefore, the mass of $KClO_3$ required to produce 2.4 mol of oxygen is given as
=1.6×122.5 g =196 g

119. The milliequivalent in 60 ml 4M H_2SO_4 is:

(a) 240 (b) 480
(c) 24 (d) 48

[BITSAT – 2007]

Ans. (b) : Relation between normality and molarity is given by the equation
Normality = n × Molarity
Where,
n = number of replaceable hydrogen = 2 (for sulfuric acid)
Given
Molarity of the solution = 4.0M
Then
$N_{H_2SO_4} = 2 \times 4 = 8\,N$
Milliequivalents = Normality × volume (in mL)
= 8 × 60
= 480 m. eq.

120. An oxide of the element contains 20% O_2 by weight. Calculate the equivalent weight of the element.

(a) 8 (b) 16
(c) 32 (d) 12

Karnataka-CET-2007

Ans. (c) : Gram equivalent of element
= Gram equivalent of O_2

$$\frac{80}{E} = \frac{20}{8}$$
E = 32

121. What is the equivalent weight of $SnCl_2$ in the following reaction

$SnCl_2 + Cl_2 \longrightarrow SnCl_4$?

(a) 95 (b) 45
(c) 60 (d) 30

Karnataka-CET-2007

Ans. (a) : $\underset{190}{SnCl_2} + \underset{71}{Cl_2} \longrightarrow SnCl_4$

$$\frac{190}{E_1} = \frac{71}{35.5}$$
$\Rightarrow$ $E_1 = 95$

122. An element, X has the following isotopic composition :

$^{200}X : 90\%$ $^{199}X : 8.0\%$ $^{202}X : 2.0\%$

The weighted average atomic mass of the naturally occurring element X is closed to

(a) 201 amu (b) 202 amu
(c) 199 amu (d) 200 amu

NEET-2007

Ans. (d) : weight of ^{200}X = 0.90 × 200 = 180.00 u
Weight of ^{199}X = 0.08 × 199 = 15.92 u
Weight of ^{202}X = 0.02 × 202 = 4.04 u
Total weight = 199.96 ≈ 200 amu.

123. A 0.5 g/L solution of glucose is found to be isotonic with a 2.5 g/L solution of an organic compound. What will be the molecular weight of that organic compound?

(a) 300 (b) 600
(c) 900 (d) 200

AP-EAMCET (Medical), 2006

Ans. (c) : 0.5 g/L 2.5 g/L
(Glucose) (Organic compound)
Isotone,
$\pi_1 = \pi_2$
$C_1RT = C_2RT$ $\{C_1, C_2 = \text{Molarity}\}$
$C_1 = C_2$

$$\frac{0.5/180}{1} = \frac{2.5/M}{1}$$
$$\frac{0.5}{180} = \frac{2.5}{M}$$
$$\boxed{M = 900\,g/mole}$$

124. The equivalent weight of potassium permanganate when it acts as oxidizing agent in ferrous ion estimation is

(a) 158 (b) 31.6
(c) 79 (d) 39.5

VITEEE- 2006

Ans. (b) : The oxidation of ferrous ion by $KMnO_4$ takes place in acidic medium as per following reaction

@apna_pdf

$2KMnO_4 + 8H_2SO_4 + 10FeSO_4$

$\rightarrow K_2SO_4 + 2MnSO_4 + 8H_2O + 5Fe_2(SO_4)_3$

∴ Eq. mass of $KMnO_4$

$$\frac{\text{Molecular mass}}{\text{change in oxidation number}}$$

$$= \frac{158}{5} = 31.6$$

125. $KMnO_4$ (mol. wt. = 158) oxidizes oxalic acid in acidic medium to CO_2 and water as follows.

$5C_2O_4^{2-} + 2MnO_4^{-} + 16H^{+} \rightarrow 10CO_2 + 2Mn^{2+} + 8H_2O$

What is the equivalent weight of $KMnO_4$?

(a) 158 (b) 31.6
(c) 39.5 (d) 79

J & K CET-(2006)

Ans. (b) : Given that,

Molecular wt. of $KMnO_4$ = 158

$$MnO^{-4} \longrightarrow Mn^{2}_{+}$$

(Oxidation number of M_n = +7) (Oxidation number of M_n = +2)

Equivalent mass of $KMnO_4$ =

$$\frac{\text{molecular mass}}{\text{change in oxidation number}}$$

$$= \frac{158}{5} = 31.6$$

126. 1.520 g of hydroxide a metal on ignition gave 0.995 g of oxide. The equivalent weight of metal is

(a) 1.52 (b) 0.995
(c) 190 (d) 9

UP CPMT-2006

Ans. (d) : Since hydroxide and oxide both are involving in same reaction, the ratio of their molecular weight is equal to the ratio of their equivalent weight.

$$\frac{E_{\text{Hydroxide}}}{E_{\text{metal}} + E_{OH^-}} = \frac{E_{\text{oxide}}}{E_{\text{metal}} + E_O}$$

$$\frac{1.520}{E+17} = \frac{0.995}{E+8}$$

$$E = 9$$

127. The mass of a photon with wave length 3.6 Å is

(a) 6.135×10^{-29} kg (b) 3.60×10^{-29} kg
(c) 6.135×10^{-33} kg (d) 3.60×10^{-27} kg

AMU-2005

Ans. (a) : $\lambda = 3.6 \times 10^{-10}$m

We know, de-Broglie wavelength

$$\lambda = \frac{h}{p} \Rightarrow \lambda = \frac{h}{mv} \Rightarrow m = \frac{h}{\lambda v}$$

λ = 3.6 A° = 3.6×10^{-10}m

Velocity of Photon = velocity of light

$$m = \frac{h}{\lambda v} = \frac{6.626 \times 10^{-34}\, Js^{-1}}{(3.6 \times 10^{-10}\, m)(3 \times 10^{8}\, ms^{-1})}$$

$= 6.135 \times 10^{-29}$kg.

128. The standard adopted for the determination of atomic weight of elements is based on:

(a) H^1 (b) C^{12}
(c) O^{16} (d) S^{32}

JCECE - 2005

Ans. (b) : The standard adopted for the determination of atomic weight of elements is based on C^{12}.

Mass of one atom of an element = atomic mass × $\left(\frac{1}{12}\right)^{th}$ of the mass of one atom of carbon.

129. The mass of carbon anode consumed (giving only carbon dioxide) in the production of 270 kg of aluminium metal from bauxite by the Hall process is

(a) 270 kg (b) 540 kg
(c) 90 kg (d) 180 kg

NEET-2005

Ans. (c): $$\underset{3\times12=36}{2Al_2O_3 + 3C} \longrightarrow \underset{4\times27=108}{4Al + 3CO_2}$$

∴ For 108 g of Al, 36 g of C is required in above reaction

∴ For 270 kg of Al require amount of C

$$= \frac{36}{108} \times 270 = 90 \text{ kg}$$

130. What is the ratio of mass of an electron to the mass of a proton?

(a) 1 : 2 (b) 1 : 1
(c) 1 : 1837 (d) 1 : 3

UPTU/UPSEE-2004

Ans. (c) : It is clear that an electron is 1/1837 times lighter than a proton,

So, ratio between them will be = 1 : 1837

Or

$$\frac{\text{Mass of proton}}{\text{Mass of electron}} = \frac{1.6 \times 10^{-27}}{9.1 \times 10^{-31}} = 1.8 \times 10^{3}$$

131. Equivalent weight of an acid:

(a) Depends on the reaction involved
(b) Depends upon the number of oxygen atoms present
(c) Is always constant
(d) None of the above

UPTU/UPSEE-2004

Ans. (a) : Equivalent Weight – The equivalent of a compound can be calculated by dividing the molecular weight by the number of positive or negative electrical charge that result from the dissolution of the compound (i.e. acidity or basicity).

Example- NaOH

$$\frac{23+16+2}{1} = \frac{\text{Molecular weight}}{\text{Basicity}} = 41$$

Equivalent weight of an acid depends on the reaction involved with the base.

The equivalent weight of an acid does not depend on the number of oxygen atoms presents.

@apna_pdf

132. In acidic medium, dichromate ion oxidizes ferrous ion to ferric ion. If the gram molecular weight of potassium dichromate is 294 g, its gram equivalent weight is…. g.

(a) 294 (b) 147
(c) 49 (d) 24.5

AP-EAMCET (Medical), 2003

Ans. (c) : From reaction-

$$Cr_2O_7^{2-} + 14H^+ + 6Fe^{2+} \rightarrow 2Cr^{3+} + 6Fe^{3+} + 7H_2O$$

Potassium dichromate ($K_2Cr_2O_7$) acts as a strong oxidizing agent and itself gets reduced to Cr^{3+}.

$$Cr_2O_7{}^{2-} + 6e^- \longrightarrow 2Cr^{3+}$$

change in oxidation number = 6

Equivalent weight of

$$K_2Cr_2O_7 = \frac{\text{Molecular Weight}}{\text{Total change in oxidation number}}$$

$$= \frac{294}{6} = 49g$$

133. The number of gram equivalent of H_2SO_4 in 1000 mL 3M solution is:

(a) 3 (b) 6
(c) 4 (d) 1.5

JCECE - 2003

$$H_2SO_4 \longrightarrow 2H^+ + SO_4^{2-}$$

Ans. (b):

$\therefore$ 1 mole H_2SO_4 = 2 g - equivalent of H_2SO_4

$\therefore$ 3 mole H_2SO_4 = 2 × 3 g - equivalent of H_2SO_4

= 6 g equivalent of H_2SO_4

134. Assertion: Atoms can neither be created nor destroyed.

Reason: Under similar condition of temperature and pressure, equal volume of gases does not contain equal number of atoms.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2002

Ans. (c): Dalton hypothesized the law of conservation of mass. According to this law atoms can neither be created nor destroyed.

Avogadro's law states that under similar condition of temperature and pressure, equal volume of gases contain equal number of atoms.

Therefore Assertion is correct but Reason is incorrect.

135. The equivalent weight of $KMnO_4$ in acidic medium is

(a) 158 (b) 52.67
(c) 31.6 (d) 49

UP CPMT-2002

Ans. (c) : Equivalent weight of $KMnO_4$ = 158

$KMnO_4$ as an oxidizer in acidic media

$$MnO_4^- + 8H^+ + 5e^- \rightarrow Mn^{+2} + 4H_2O$$

In Acidic medium

$$= \frac{\text{Molecular weight}}{\text{No. of electron lost or gained}} = \frac{158}{5} = 31.6$$

$$\text{In Basic Medium} = \frac{\text{Molecular weight}}{3} = \frac{158}{3} = 52.67$$

$$\text{In Neutral Medium} = \frac{\text{Molecular weight}}{1} = 158$$

136. The oxygen obtained from 72 kg water is

(a) 72 kg (b) 46 kg
(c) 50 kg (d) 64 kg

UP CPMT-2002

Ans. (d) : Molecular weight of H_2O = 18

Atomic weight of oxygen = 16

$\because$ 18 gm H_2O contain = 16 gm Oxygen

$$\therefore \text{ 72 kg } H_2O \text{ contain} = \frac{72 \times 16}{18}$$

= 64000 gm or 64 kg.

137. Specific volume of cylindrical virus particle is 6.02×10^{-2} cc/g whose radius and length are 7 Å and 10 Å respectively. If $N_A = 6.02 \times 10^{23}$, find molecular weight of virus.

(a) 15.4 kg/mol (b) 1.54×10^4 kg/mol
(c) 3.08×10^4 kg/mol (d) 3.08×10^4 kg/mol

NEET-2001

Ans. (a) : Given,

$$\text{Radius}(r) = 7\text{Å} = 7 \times 10^{-8}$$

$$\text{Length}(L) = 10\text{Å} = 10 \times 10^{-8}\text{cm}$$

Specific volume (volume of 1g of cylindrical virus)= 6.02×10^{-2} cc/gm

$$\text{Volume of virus } \pi r^2 L = \frac{22}{7} \times (7 \times 10^{-8})^2 \times 10 \times 10^{-8}$$

$$= 154 \times 10^{-23} \text{ cc}$$

$$\text{Wt. of one virus particle } = \frac{\text{Volume}}{\text{Specific volume}}$$

$\therefore$ Molecular wt. of virus = wt. of N_A particle

$$= \frac{154 \times 10^{-23}}{6.02 \times 10^{-2}} \times 6.02 \times 10^{23}$$

= 15400g/mol = 15.4 kg/mol

138. The oxide of an element contains 67.67% oxygen and the vapour density of its volatile chloride is 79. Equivalent weight of the element is

(a) 2.46 (b) 3.82
(c) 4.36 (d) 4.96

AIIMS-1998

Ans. (b): Equivalent weight of an element is its weight which reacts with 8 gm of oxygen to form oxide.

67.67 g of oxygen combines with 32.33 g of the element to form oxide.

@apna_pdf

1 g of oxygen will combine with $\frac{32.33}{67.67}$ g of element to form oxide.

8 g of oxygen will combine with $8\times\frac{32.33}{67.67}$ = 3.82 g of element to form oxide.

Hence, the equivalent weight of the element is 3.82 g.

139. The weight of a single atom of oxygen is:

(a) 1.057×10^{23} g (b) 3.556×10^{23} g

(c) 2.656×10^{-23} g (d) 4.538×10^{-23} g

AIIMS-1998

Ans. (c): Molar mass of oxygen atoms = 16 g mol^{-1}

Number of atom in 1 mole = 6.022×10^{23}

Therefore, 1 atom of oxygen weight $=\frac{16}{6.022\times10^{23}}$

$=2.657\times10^{-23}$ g

140. Haemoglobin contains 0.334% of iron by weight. The molecular weight of haemoglobin is approximately 67200. The number of iron atoms (Atomic weight of Fe is 56) present in one molecules of haemoglobin is

(a) 4 (b) 6

(c) 3 (d) 2

NEET-1998

Ans. (a) : Given that,

Molecular weight of haemoglobin = 67200

It contains 0.334% of iron by weight.

Weight of iron = $\frac{0.334}{100}\times67200 = 224.448$

No. of atoms = $\frac{\text{weight of iron in haemoglobin}}{\text{Atomic weight}}$

$=\frac{224.448}{56}$

= 4.008

141. If active mass of a 6% solution of a compound is 2, its molecular weight will be

(a) 30 (b) 15

(c) 60 (d) 22

AIIMS-1996

Ans. (a): Given, 6% of solution contains 6g of Compound in 100 ml of solution.

Then, mass of Compound present in 1 liter of Solution = 60 g

⇒ No. of moles = $\frac{\text{given mass}}{\text{molar mass}}=\frac{60\text{g}}{\text{M}}$

⇒ Active mass is defined as number of moles per litre.

So, Active mass = $\frac{60\text{g}}{\text{M}}$/litre

$2 = \frac{60}{\text{M}}\times\frac{1}{1\text{L}}$

Then, M (molar mass) = 30

142. A bivalent metal has the equivalent weight of 12. The molecular weight of its oxide will be

(a) 36 (b) 24

(c) 40 (d) 32

AIIMS-1994

Ans. (c): Molecular weight = equivalent weight × n-factor

(Where , n-factor of the metal ion = 2.)

So molecular weight = 12 × 2 = 24

Since it is bivalent ion it requires only one oxygen combine to form oxide.

Therefore, the molecular wt. of the oxide is molecular wt. = molecular wt. of metal + molecular wt. of oxygen

i.e. molecular wt. = 24 + 16 = 40

143. The weight to a metal of equivalent weight 12, which will give 0.475 g of its chloride, is

(a) 0.18 g (b) 0. 12 g

(c) 0. 24 g (d) 0. 16 g

AIIMS-1994

Ans. (b) : Equivalent weight of metal chloride = Equivalent weight of Metal + Equivalent wt. of Cl = 12 +35.5 = 47.5

47.5 g of metal chloride will give 12g of metal

Then, 0.475g of metal chloride will give -

$\equiv\frac{12\times0.475}{47.5}$

= 0.12g

144. The molecular mass of a volatile substance may be measured by

(a) Liebig's method

(b) Hofmann's method

(c) Victor Meyer's method

(d) none of these

AIIMS-1994

Ans. (c): The molecular mass of volatile substances can be determined by Victor Meyar. In this method primary, secondary and tertiary alcohols are subjected to a series of chemical analysis and the colour of resulting solution observed. A known mass of the compound is vaporized in an instrument called Victor Meyar tube.

145. What is the weight of oxygen required for the complete combustion of 2.8 kg of ethylene?

(a) 2.8 kg (b) 6.4 kg

(c) 9.6 kg (d) 96 kg

NEET-1989

Ans. (c) : $C_2H_4(\text{ethylene})+3O_2\longrightarrow2CO_2+2H_2O$

To oxidise 1mol of ethylene we required 3 moles of oxygen.

Then,

For oxidising 28g of C_2H_4,

We need 3×32 = 96g of oxygen.

For 2.8kg of C_2H_4,

We need $=\frac{96}{28}\times2.8$ =9.6kg of oxygen.

146. 2.76 g of silver carbonate on being strongly heated yields a residue weighing

(a) 3.54 g (b) 3.0 g

(c) 1.36 g (d) 2.16 g

IIT JEE 1997

Ans. (d) :

$$Ag_2CO_3(s)\longrightarrow2Ag(s)+CO_2(g)+\frac{1}{2}O_2(g)$$

@apna_pdf

Molecular weight of $Ag_2\ CO_3$ = 276 gm
and molecular weight of Ag = 2×108 = 216 gm
$\because$276 gm of Ag_2CO_3 give = 216 gm of Ag

$\therefore$ 1 gm of Ag_2CO_2 give $= \dfrac{216}{276}$ gm of Ag

Then, 2.76 gm Ag_2CO_2 give $= \dfrac{216}{276} \times 2.76$ gm of Ag

= 2.16 gm of Ag

147. The molecular weight of O_2 and SO_2 are 32 and 64 respectively At 15^0C and 150 mmHg pressure, one litre of O_2 contains 'N' molecules. The number of molecules in two litres of SO_2 under the same conditions of temperature and pressure will be

(a) N/2 (b) N
(c) 2N (d) 4N

AIPMT 1990

Ans. (c) : Avogadro's law states, equal volumes of all gases contain equal number of molecules under similar, condition of temperature and pressure.

Given, T = 15°C
P = 759 mm
Volume of $O_2 = v_1$ = 1 lit
No. of O_2 molecules = n_1 = N
Volume of $SO_2 = V_2$ = 2 lit
No. of molecule of $SO_2 = n_2$ =?

From Avogadro's law, $\dfrac{v_1}{n_1} = \dfrac{v_2}{n_2}$ Avogadro's law

$$\frac{1}{N} = \frac{2}{n_2}$$

$n_2 = 2N$

3. Mole Concept and Molar Mass

148. 2.0 g of H_2 gas is adsorbed on 2.5 g of platinum powder at 300 K and 1 bar pressure. The volume of the gas adsorbed per gram of the adsorbent is _____mL.
(Given: R = 0.083 L bar K^{-1} mol^{-1})

JEE Main-26.06.2022, Shift-I

Ans. (9960) : Given,
Mass of H_2 = 2.0g
Mass of platinum (Pt) = 2.5g
Temperature = 300K
Pressure = 1 bar
R = 0.083 L bar K^{-1} mol^{-1}

$$V_{H_2(g)} = \frac{n \times R \times T}{1}$$

$$= \frac{2}{2} \times \frac{0.083 \times 300}{1} = 24.9L$$

$\therefore$ 24.9L H_2(g) adsorbed on 2.5 Pt
$\therefore$ Volume of H_2(g) adsorbed on 1g Pt

$$= \frac{24.9}{2.5} = 9.96L = 9960\ mL$$

149. A commercially cold conc. HCl is 35% HCl by mass. If the density of this commercial acid is 1.46 g/mL, the molarity of this solution is:
(Atomic mass:Cl=35.5 amu, H=1 amu)

(a) 10.2 M (b) 12.5 M
(c) 14.0 M (d) 18.2 M

JEE Main-26.06.2022, Shift-I

Ans. (c) : Given, Concentration of HCl = 35% by mass
Density = 1.46 g/mL
We know that–

$$\text{Molarity} = \frac{(W/W\%) \times d \times 10}{(\text{Molar mass})_{\text{solute}}}$$

$$= \frac{35 \times 1.46 \times 10}{36.5}$$

= 14.0M

150. Which one of the following contains the highest number of oxygen atoms?

(a) One mole of aluminum sulphate
(b) Three moles of ferrous sulphate
(c) Three moles of hydrogen peroxide
(d) Two moles of potassium permanganate
(e) One mole of potassium dichromate

Kerala CEE -03.07.2022

Ans. (a) : One mole of aluminum sulphate =$Al_2\ (SO_4)_3$
It contain 12 mole of oxygen
1 mole of oxygen = N_A atoms
$\therefore$ 12 mole of oxygen = 12 N_A atoms
(b) Three moles of ferrous sulphate = 3 $FeSO_4$
It contain 12 mole of oxygen
$\therefore$ 12 mole of oxygen = 12 N_A atoms.
(c) Three moles of hydrogen peroxide = $3H_2O_2$
It contain 6 mole of oxygen
$\therefore$ 6 mole of oxygen = 6 N_A atoms
(d) Two moles of potassium permanganate =$2KMnO_4$
It contain 8 mole of oxygen
$\therefore$ 8 mole of oxygen =$8N_A$ atoms
(e) One mole of potassium dichromate = $K_2Cr_2O_7$
It contain 7 mole of oxygen
$\therefore$ 7 mole of oxygen =7 N_A atoms
Here, N_A =Avogadro number
So, option (a) one mole of aluminum sulphate contains the highest number of oxygen atoms.

151. Two elements A and B which form 0.15 moles of A_2B and AB_3 type compounds. If both A_2B and AB_3 weigh equally, then the atomic weight of a is _______ times of atomic weight of B.

JEE Main-27.06.2022, Shift-I

Ans. (2) : Given,
Moles of A_2B = 0.15 mole
Moles of AB_3 = 0.15 mole
Weight of A_2B = Weight of AB_3
Let molar mass of element A = x g
and molar mass of element B = y g
We know that –

$$\text{No. of moles} = \frac{\text{given mass}}{\text{molar mass}}$$

@apna_pdf

For compound A_2B –

Molar mass $(2x + y) = \frac{\text{given mass}}{\text{no. of moles}} = \frac{w}{0.15}$

For compound AB_3 –

Molar mass $(x + 3y) = \frac{w}{0.15}$

So,

$$x + 3y = 2x + y$$
$$2x - x = 3y - y$$
$$x = 2y$$

So, atomic weight of A is 2 times of atomic weight of B.

152. Choose the correct answer:
Given below are two statements: one is labelled as
Assertion (A) and the other is labelled as Reason (R).
Assertion (A): At 10°C, the density of a 5 M solution of KCl [atomic masses of K and Cl are 39 and 35.5 g mol^{-1} respectively], is 'X' g mL^{-1}. The solution is cooled to –21°C. The molality of the solution will remain unchanged.
Reason (R): The molality of a solution does not change with temperature as mass remains unaffected with temperature.
In the light of the above statement choose the correct answer from the options given below.

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

JEE Main-27.06.2022, Shift-I

Ans. (a) : We know that molality and mass both are temperature independent so, on changing temperature. Molality and mass remain unchanged.

153. If a rocket runs on a fuel ($C_{15}H_{30}$) and liquid oxygen, the weight of oxygen required and CO_2 released for every litre of fuel respectively are: (Given: density of the fuel is 0.756 g/mL)

(a) 1188 g and 1296 g (b) 2376 g and 2592 g
(c) 2592 g and 2376 g (d) 3429 g and 3142 g

JEE Main-24.06.2022, Shift-I

Ans. (c) : Given,
Density of fuel = 0.756 g/mL
Molecular formula of fuel = $C_{15}H_{30}$
Then, molar mass of fuel = 15 × 12 + 30 × 1
= 210 g

$$\text{Density} = \frac{\text{mass}}{\text{volume}}$$

Mass = density × volume
= 0.756 × 1000 = 756 gm.

The reaction is —

$$C_{15}H_{30}\,(l) + \frac{45}{2}O_2\,(g) \longrightarrow 15CO_2\,(g) + 15H_2O$$

Weight of oxygen $= \frac{45}{2}\left[\frac{756}{210}\right] \times 32 = 2592$ g

Weight of $CO_2 = 15\left[\frac{756}{210}\right] \times 44 = 2376$ g.

154. Geraniol, a volatile organic compound, is a component of rose oil. The density of the vapour is 0.46 gL^{-1} at 257°C and 100 mm Hg. The molar mass of geraniol is —— g mol^{-1} (Nearest Integer)
[Given: R = 0.082 L atm K^{-1} mol^{-1}]

JEE Main-29.06.2022, Shift-I

Ans. (152) : $P = \frac{dRT}{M}$

$$P = \frac{100}{760}\text{atm}$$
$$T = 256 + 273 = 530\text{K}$$
$$d = 0.46\frac{g}{L}$$
$$M = \frac{0.46 \times 0.082 \times 530}{100} \times 760$$
$$= 151.92 = 152$$

155. Production of iron in blast furnace follows the following equation:

$$Fe_3O_4(s) + 4CO(g) \rightarrow 3Fe(l) + 4CO_2(g)$$

When 4.640 kg of Fe_3O_4 and 2.520 kg of CO are allowed to react then the amount of iron (in g) produced is:
[Given: Molar Atomic mass (g mol^{-1}): Fe = 56
Molar Atomic mass (g mol^{-1}): O = 16
Molar Atomic mass (g mol^{-1}): C =12]

(a) 1400 (b) 2200
(c) 3360 (d) 4200

JEE Main-29.06.2022, Shift-I

Ans. (c) : Given,
The reaction is ———

$$Fe_3O_4\,(s) + 4CO\,(g) \longrightarrow 3Fe\,(l) + 4CO_2\,(g)$$

Fe_3O_4 = 4.640 kg.
CO = 2.520 kg.

Molar mass of Fe_3O_4 = 3 × 56 + 4 × 16
= 232 g

1 mole of Fe_3O_4 is produced 3 mole of Fe
= 3 × 56 = 168g Fe

∵ 232 g FeO_4 produce 168 g Fe.

∵ 4.640 kg Fe_3O_4 will produce $= \frac{168}{232} \times 4.640$ kg
= 3.36 kg
= 3360 g

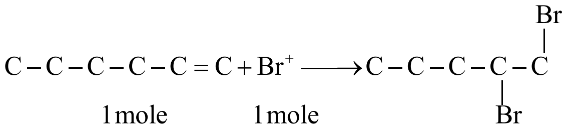
So, the correct option is (c)

156. Number of grams of bromine that will completely react with 5.0 g of pent-1-ene is_____×10^{-2} g.
(Atomic mass of Br= 80 g/mol) [Nearest Integer]

JEE Main-25.06.2022, Shift-I

@apna_pdf

Ans. (1142) :



$$C-C-C-C-C=C+Br^+ \longrightarrow C-C-C-C-\underset{Br}{C}-\overset{Br}{C}$$

$$\underset{1\,mole}{} \qquad \underset{1\,mole}{}$$

Molecular mass of pent -1-ene = 70

Mole of pent -1-ene = $\frac{5}{70}\times\frac{1}{14}$ mole

Required mole of bromine = $\frac{1}{14}\times160$

= 11.42 or 1142 $\times10^{-2}$

157. The number of N atoms in 681 g of $C_7H_5N_3O_6$ is X × 10^{21}. The value of X is____. (N_A= 6.02 × 10^{23} mol^{-1}) (Nearest Integer)

JEE Main-25.06.2022, Shift-I

Ans. (5418) : Molar mass of $C_7H_5N_3O_6$ is 84 + 5 + 42 + 96 = 227

$^nC_6H_5N_3O_6 = \frac{681}{227}$ = 3 moles

$^nN = \frac{681}{227}$ × 3 = 9 moles of N

No. of N atoms = 9 × 6.02 × 10^{23}

= 5418 × 10^{21}

158. CNG is an important transportation fuel. When 100 g CNG is mixed with 208 g oxygen in vehicles, it leads to the formation of CO_2 and H_2O and produced large quantity of heat during this combustion, then the amount of carbon dioxide, produced in grams is———. [nearest integer]

JEE Main-26.06.2022, Shift-II

Ans. (143) : $CH_4 + 2O_2(g) \longrightarrow CO_2(g) + H_2O$

Mass 100 208 moles = 3.25

Moles $\frac{100}{16}$ $\frac{208}{32}$ mass = 143 gram

$\Rightarrow$ 6.25 $\frac{6.5}{2}$3.25 (L.R.)

$$\frac{^nO_2}{2} = \frac{^nCO_2}{1}$$

$$\frac{6.5}{2} = {^nCO_2}$$

Mass of $CO_2 = \frac{6.5}{2}\times44$ = 143 gm.

159. The maximum number of molecules is present in

(a) 15 L of H_2 gas at STP

(b) 5 L of N_2 gas at STP

(c) 0.5 g of H_2 gas

(d) 10 g of H_2 gas

JCECE - 2008
UPTU/UPSEE-2007
NEET-2004

Ans. (a)
1 mole of gas at STP occupies a volume of 22.4 L

Option (a)- 15 L of gas corresponds to

$$\frac{15L}{22.4L} = 0.67\,moles$$

Option (b)- 5L of N_2 gas at STP:

5L of gas corresponds to $\frac{5L}{22.4L}$ =0.22 moles

Option (c)- 0.5g of H_2 gas (molecular weight 2g/mole) corresponds to $\frac{0.5g}{2g/mol}$ = 0.25moles

Option (d)- 10g of O_2 gas (molecular weight 3g/ mol) corresponds to $\frac{10g}{32g/mol}$ =0.3125moles

Higher is the number of moles of a gas, higher will be its number of molecules.

160. 10 gm of hydrogen and 64 g of oxygen were kept in a steel vessel and exploded. Amount of water produced in this reaction will be

(a) 2 mol
(b) 4 mol
(c) 8 mol
(d) 10 mol

UP CPMT-2012
NEET-2009

Ans. (b) : $2H_2 + O_2 \rightarrow 2H_2O$

10g of hydrogen (molar mass 2g /mol) = $\frac{10g}{2g/mol}$

= 5 mol

64g of oxygen (molar mass 32g/mol) = $\frac{64}{32g/mol}$

= 2 mol

2 moles of oxygen will react with 2 × 2 = 4 moles of hydrogen to form 4 moles of water.

161. The mass of one mole of electron is

(a) 9.1 × 10^{-28}g
(b) 0.55 mg
(c) 9.1 × 10^{-24}g
(d) 6 10^{-12}g

UP CPMT-2010
UPTU/UPSEE-2006

Ans. (b): As we know that,
Mass of one electron = 9.1× 10^{-31} kg
= 9.1× 10^{-28} g
1 mole = 6.023×10^{23} electron
So, 1 mole of electron has mass of
= 9.1 × 10^{-28} × 6.023 × 10^{23}
= 5.48×10^{-4}
= 0.55mg

162. The number of moles of oxygen obtained by the electrolytic decomposition of 108 g water is

(a) 2.5
(b) 3
(c) 5
(d) 7.5

JIPMER-2008, JCECE-2007

Ans. (b): $2H_2O \xrightarrow{Electrolysis} 2H_2 + O_2$

$\underset{2\,mole}{}$ $\qquad$ $\underset{1\,mole}{}$

2×18

$=36$

@apna_pdf

$\because$ 36 g of H_2O produce 1 mole of oxygen

$\therefore$ 108 g of water will produce oxygen

$$= \frac{108}{36} = 3\,\text{mole}$$

163. The number of moles of $KMnO_4$ reduced by one mole of KI in alkaline medium is

(a) one fifth (b) five

(c) one (d) two

JCECE-2012

JIPMER-2007

Ans. (d) : In alkaline solution, $KMnO_4$ is reduced to MnO_2 (colourless).

$$2KMnO_4 + 2H_2O \longrightarrow MnO_2 + 2KOH + 3[O]$$

$$KI + 3[O] \longrightarrow KIO_3$$

$$2KMnO_4 + 2H_2O + KI \longrightarrow 2MnO_2 + 2KOH + KIO_3$$

Hence, two moles of $KMnO_4$ are reduced by one mole of KI.

164. In Kjeldahl' s method, ammonia from 5g of food neutralizes 30 cm^3 of 0.1 N acid. The percentage of nitrogen in the food is

(a) 0.84 (b) 8.4

(c) 16.8 (d) 1.68

BCECE-2014

Karnataka-CET, 2010

Ans. (a) : Given, w = 5g, V = 30 cm^3

From Kjedahl's method,

$$\text{percentage of nitrogen} = \frac{1.4 \times N \times V}{w} = \frac{1.4 \times 0.1 \times 30}{5}$$

$$= 0.84\%$$

165. 50 cm^3 of 0.2 N HCl is titrated against 0.1 N NaOH solution. The titration is discontinued after adding 50 cm^3 of NaOH. The remaining titration is completed by adding 0.5 N KOH. The volume of KOH required for completing the titration is

(a) 12 cm^3 (b) 10 cm^3

(c) 25 cm^3 (d) 10.5 cm^3

Karnataka-CET, 2010, 2011

Ans. (b) : (i) Calculation of volume of HCl left often incomplete titration.

When 0.1 N NaOH is used,

$$\underset{\text{(For HCl)}}{N_1V_1} = \underset{\text{(For NaOH)}}{N_2V_2}$$

$0.2\text{ N} \times V_1 = 50 \times 0.1\text{N}$

$$V_1 = \frac{50 \times 0.1}{0.2} = 25\text{cm}^3$$

(ii) Calculation of volume of KOH for completing the titration.

When 0.5 N KOH is used,

$$\underset{\text{(For remaining HCl)}}{N_1V_1} = \underset{\text{(For KOH)}}{N_3V_3}$$

$$0.2\text{ N} \times 25 = 0.5\text{ N} \times V_3$$

$$V_3 = \frac{0.2 \times 25}{0.5}$$

$= 10\ cm^3$

166. A gas is found to have a formula $[CO]_x$. Its vapour density is 70, the x is

(a) 3.0 (b) 3.5

(c) 5.0 (d) 6.5

BCECE-2007

BITSAT-2006

Ans. (c) : $\text{Vapour density} = \dfrac{(\text{molecular weight})}{2}$

Formula mass CO is = 28

Vapour density of the gas = 70

Molecular weight of gas = 2 × vapour density = 2 × 70 = 140

$$x = \frac{\text{molecular weight}}{\text{weight of CO}}$$

$$x = \frac{140}{28} = 5$$

167. Number of atoms of He is 100 amu of He (atomic wt. of He is 4) are :

(a) 25 (b) 100

(c) 50 (d) $100 \times 6 \times 10^{-23}$

BITSAT-2012

BCECE-2008

Ans. (a) : We know formula,

$$\text{No. of atoms} = \frac{\text{Mass of substance}}{\text{Atomic mass}}$$

$$100\text{ amu of He} = \frac{100}{4}\text{ atoms of He}$$

$= 25$ atoms.

[1 AMU = mass of one proton (approx.)]

168. Calculate the mole fraction of aqueous solution of 1 molal urea (NH_2CONH_2)

(a) 0.01878 (b) 0.01768

(c) 0.01800 (d) 0.01698

GUJCET-2022

Ans. (b) : $\text{Molarity} = 1\text{M}$

$$\text{Molarity} = \frac{\text{n solute}}{\text{mass of solvent in kg}}$$

$$\frac{1}{1} = \frac{\text{n solute}}{\text{mass of solvent in kg}}$$

Hence solute in urea and solvent aqueous solution is given

$$X_{\text{urea}} = \frac{n_{\text{urea}}}{n_{\text{urea}} + n_{H_2O}}$$

$n_{\text{urea}} = 1$ and mass of H_2O = 1 kg = 1000 gm

$$\therefore X_{\text{urea}} = \frac{1}{1 + \frac{1000}{18}}$$

@apna_pdf

$$X_{urea} = \frac{1}{1+55.55} \quad \left\{ \begin{array}{l} X_{urea} = \dfrac{w\left(\text{given mass}\right)}{\text{molecular wt.}} \\ \text{and} \\ n_{H_2O} = \dfrac{w}{\text{molecular wt.}} \\ \quad = \dfrac{1000}{18} \end{array} \right.$$

$$X_{urea} = \frac{1}{56.55}$$

$$\simeq 0.0177$$

169. How many numbers of mole ions produced from aqueous solution of 1 mole Iron (III) hexacyano Ferrate (II) complex ?

(a) 4 (b) 7

(c) 5 (d) 6

GUJCET-2022

Ans. (b): Co-ordination compounds donot completely dissociate in water into all its cationic and anionic components.

Chemical formula of, Ferric hexacynoferrate (II)

$Fe_4[Fe(CN)_6]_3$

Its co-ordination sphere does not get dissociated in aqueous solution,

by adding Ferric hexacynoferrate (II) to water, it will produce 4 Fe^{+3} ion and $3[Fe(CN)_6]^{-4}$ ion

So, it will produce total 7 ions in aqueous solution.

170. The number of electron present in 2.3g of NO_2 is

(a) 6.92×10^{23} (b) 6.92×10^{22}

(c) 138×10^{23} (d) 6.023×10^{23}

Assam CEE-2021

Ans. (a) : Number of molecule = mole × N_A

$$= \frac{\text{mass}}{\text{molar mass}} \times N_A$$

$$= \frac{2.3g}{46} \times N_A$$

$$= 0.05 \times N_A$$

Molecular of weight of NO_2 = 7 + 16 = 23

1 molecule = 23 e^- of NO_2

Total number of e^- = $23 \times 0.05 \times N_A = 6.92 \times 10^{23}$

171. Number of atom in 5.586 g Fe ($M = 55.86\ g\ mol^{-1}$) is

(a) Twice of 60.0 g of C (b) Twice of 0.6 g of C

(c) Twice of 6.0 g of C (d) Twice of 600g of C

Assam CEE-2021

Ans. (b) : Number of atom = mole × N_A

$$= \frac{\text{Mass}}{\text{atomic mass}} \times N_A$$

$$= \frac{5.586}{55.86} \times N_A$$

$$= 0.1\ N_A$$

0.6g C Number of atom $= \dfrac{0.6}{12} \times N_A$

$$= 0.05\ N_A$$

172. A reaction of 0.1 mole of benzylamine with bromomethane gave 23 g of benzyle trimethyl ammonium bromide. The number of moles of bromomethane consumed in this reaction are $n \times 10^{-1}$, when n = ... (Round off to the nearest integer)

(Given : Atomic masses : C = 12.0 u, H = 1.0 u. N = 14.0 u, Br = 80.0 u)

[JEE Main 2021, 18 March Shift-I]

Ans. Number of moles of benzyl trimethyl

Ammonium bromide formed = $\dfrac{23}{230} = 0.1$

No. of moles of bromomethane consumed

$= 3 \times 0.1$

$= 3 \times 10^{-1}$

173. The number of moles of CuO, that will be utilised in Dumas method for estimation nitrogen in a sample of 57.5 g of N, N-dimethylaminopentane is...... $x10^{-2}$ (Nearest integer)

[JEE Main 2021, 27 Aug Shift-II]

Ans. Moles of N in N, N– dimethylaminopentane = $\left(\dfrac{57.5}{115}\right) = 0.5\text{mol}$

$$\frac{n_{CuO}\text{reacted}}{\left(\dfrac{45}{2}\right)} = \frac{n_{C_7H_{17}N}\text{ reacted}}{1}$$

$$\Rightarrow\ n_{CuO}\text{reacted} = \left(\frac{45}{2}\right) \times 0.5 = 11.25$$

174. The ratio of the mass percentages of 'C' and H' and 'C and O' of a saturated acyclic organic compound 'X' are 4:1 and 3:4 respectively. Then, the moles of oxygen gas required for complete combustion of two moles of organic compound 'X' is............

[JEE Main 2021, 2 Sep Shift-II]

Ans. Mass ratio of C : H is 4 : 1 ⇒ 12 : 3 &

C : O is 3 : 4 ⇒ 12 : 16

So,

	Mass	Mole	Mole ratio
C	12	1	1
H	3	3	3
O	16	1	1

Empirical formula ⇒ CH_3O

As compound is saturated acyclic so molecular Formula is $C_2H_6O_2$

$$C_2H_6O_2 + \frac{5}{2}O_2(g) \rightarrow 2CO_2(g) + 3H_2O(g)$$

So, required moles of O_2 is 5.

175. The minimum number of moles of O_2 required for complete combustion of 1 mole of propane and 2 moles of butane is.......

[JEE Main 2021, 5 Sep Shift-I]

@apna_pdf

Ans. $C_3H_8 + SO_2 \rightarrow CO_2 + 4H_2O$

1 mole 5 mole

For 1 mole propane Combustion 5 mole O_2 required

$C_4H_{10} + \frac{13}{2}O_2 \rightarrow 4CO_2 + 5H_2O$

1 mole $\rightarrow$ 6.5 mole

2 mole $\rightarrow$ 13 mole

For 2 moles of butane 13 mole of O_2 is required

total moles = 13 + 5 = 18

176. The ammonia (NH_3) released on quantitative reaction of 0.6 g urea (NH_2CONH_2) with sodium hydroxide (NaOH) can be neutralised by

[JEE Main 2021, 7 Jan Shift-II]

Ans. $NH_2CONH_2 + 2NaOH \rightarrow 2NH_3 + Na_2CO_3$

1 mole urea gives 2 moles ammonia as per the balance reaction.

$n_{urea} = \frac{0.6}{60} = 0.01$ mole

$\therefore$ $n_{ammonia} = 2 \times 0.01 = 0.02$ mole

Now,

0.02 moles of NH_3 reacts with 0.02 moles of HCl.

Mole of HCl $= \frac{100 \times 0.2}{1000} = 0.02$ mole

177. A chloro compound A,

(i) Forms aldehydes on ozonolysis followed by the hydrolysis,

(ii) When vaporised completely, 1.53 g of A gives 448 mL of vapour at STP.

The number of carbon atoms in a molecule of compound A is……. .

[JEE Main 2021, 26 Aug Shift-II]

Ans. 448 ml of A $\Rightarrow$ 1.53 gm A

1ml of A = 1.53/448gm of A

22400 ml of A $\Rightarrow \frac{1.53}{448} \times 22400$ gm A = 76.5 A gm

$$\underset{\text{It has 3 Carbon atoms}}{H_3CHC-CH-Cl} \xrightarrow[Zn/H_2O]{O_3} \underset{\text{Aldehyde}}{CH_3-CH=0}$$

& mm is 36 + 5 + 35.5 = 76.5

178. 4g equimolar mixture of NaOH and Na_2CO_3 contains x g of NaOH and y g of Na_2CO_3. The value of x is…….g. (Nearest integer)

[JEE Main 2021, 20 July Shift-II]

Ans. Mass of NaOH = x

Moles of NaOH = $\frac{x}{40}$

Mass of Na_2CO_3 = y

Moles of Na_2CO_3 = $\frac{y}{106}$

$\frac{x}{40} = \frac{y}{106} = K$

x + y = 4

40K + 106K = 4

K = 4/146

Now, x = 40K

$x = 40 \times \frac{4}{146}$ g

So,

x = 1.1, y = 2.9

x = 1.1 ≈ 1 (nearest integer)

179. The hardness of a water sample (in terms of equivalents of $CaCO_3$) containing 10^{-3} M $CaSO_4$ is

(Molar mass of $CaSO_4$ = 136 g mol^{-1})

(a) 100 ppm (b) 10 ppm

(c) 50 ppm (d) 90 ppm

[JEE Main 2021, 12 Jan Shift-I]

Ans. (a) : The hardness of water sample (in terms of equivalents of $CaCO_3$) containing 10^{-3}M $CaSO_4$

Mole of $CaSO_4$ = 10^{-3} moles

Mass of water = 1000g

DOH (in terms of $CaCO_3$) = $10^{-3} \times 100/1000$ g

Hardness = $(10^{-3} \times 100/1000) \times 10^6$

Hardness of water = 100 ppm

180. The $NaNO_3$ weighed out to make 50 mL of an aqueous solution containing 70.0 mg Na^+ per mL is…..g. (Rounded off to the nearest integer) [Given : Atomic weight in g mol^{-1}, Na : 23 ; N : 14 ; O : 16].

[JEE Main 2021, 26 Feb Shift-II]

Ans. Given that,

Na^+ present in 50ml

Na^+ = 70 mg/mL

W_{Na^+} in 50 mL solution

= 70 × 50 mg

= 3500 mg

= 3.5 mg

Moles of Na^+ in 50 mL solution = $\frac{3.5}{23}$

Moles of $NaNO_3$ = moles of Na^+

$= \frac{3.5}{23}$ mol

Mass of $NaNO_3 = \frac{3.5}{23} \times 85 = 12.934 \simeq 13$ gm

181. The number of atoms in 8 g of sodium is X $\times 10^{23}$. The value of X is…….

(nearest integer)

[Given : $N_A = 6.02 \times 10^{23}$ mol^{-1} Atomic mass of Na = 23.0 u]

[JEE Main 2021, 1 Sep Shift-II]

Ans. We know that,

$$\frac{\text{Weight of sodium atom}}{\text{Molecular mass of sodium atom}} = \frac{\text{Number of atoms}}{\text{Avogadro's number}}$$

$$\frac{8\,g}{23\,g} = \frac{\text{Number of atoms}}{6.02 \times 10^{23}}$$

Number of atoms = $\frac{8 \times 6.02 \times 10^{23}}{23}$

Number of atoms = 2.09×10^{23}

x ≈ 2

@apna_pdf

182. 10.0 mL of 0.05 M $KMnO_4$ solution was consumed in a titration with 10.0 mL of given oxalic acid dihydrate solution. The strength of given oxalic acid solution is……x10^{-2} g/L. (Round off to the nearest integer)

[JEE Main 2021, 27 July Shift-II]

Ans.(1575). $n_{eq}\ KMnO_4 = n_{eq} H_2C_2O_4 . 2H_2O$

then $\frac{10\times0.05}{1000}\times5=\frac{10\times m}{1000}\times2$

∴ Conc. of oxalic acid solution = 0.125 M

0.125 × 126 g/L = 15.75 g/L

1575×10^{-2} g/L

183. When 10 mL of an aqueous solution of Fe^{2+} ions was titrated in the presence of dil. H_2SO_4 using diphenylamine indicator, 15 mL of 0.02 M solution of $K_2Cr_2O_7$ was required to get the end point. The morality of the solution containing Fe^{2+} ions is x $\times10^{-2}$ M. The value of x is….. . (Nearest integer)

[JEE Main 2021, 25 July Shift-I]

Ans.(18)

$Cr_2O_7^{2-} + 6Fe^{2+} + 14H^+ \rightarrow 2Cr^{3+} + 6Fe^{3+} + 7H_2O$

$Cr_2O_7^{2-}$: 15 mL 0.02 M and 1 mole used in reaction

Fe^{2+} : 10 mL M_2 ? and 6 mole used in reaction

$(Cr_2O_7^{2-})$ (Fe^{2+})

Now, $\frac{M_1V_1}{n_1} = \frac{M_2V_2}{n_2}$

$$\frac{0.02M\times15\,mL}{1\text{ mole}}=\frac{M_2\times10\,mL}{6\text{ mole}}$$

$$M_2=\frac{0.02\times15\times6}{10}=0.18\text{ M}=18\times10^{-2}M$$

184. Calculate the amount of lime, Ca $(OH)_2$ required to remove hardness of 50,000 litres of well water which contains 1.62 g of calcium bicarbonate per 10 liters. [Given, atomic masses : Ca→40, H →1, C → 12, O → 16]

(a) 1.5 kg (b) 3.7 kg

(c) 2.8 kg (d) 4.2 kg

AP- EAPCET- 07-09-2021, Shift-I

Ans. (b) : Ca (HCO_3) + $Ca(OH)_2 \rightarrow$ 2 $CaCO_3$ + $2H_2O$

well water contain 1.62 gm of calcium bicarbonate per 10 litres of water so, 50,000 litres of well water contain

$=\frac{1.62\times50,000}{10}=162\times50$ gm of calcium carbonate

∴ No. of moles of calcium bicarbonate $=\frac{162\times50}{162}$

= 50 mole

The mass of calcium hydroxide required is $\frac{74\times50}{1000}$

= 3.7 kg

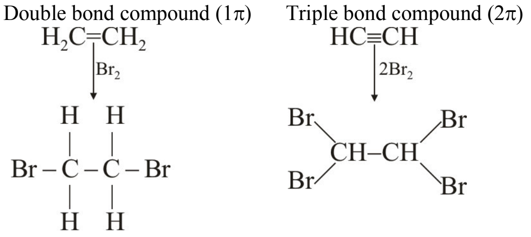
185. One mole of an organic compound with a double bond and a triple bond is reacted with Br_2/CCl_4. The amount of Br_2 required to completely brominates all π-bonds in the compounds is (Given Br mass is 80 amu)

(a) 480 g (b) 160 g

(c) 320 g (d) 240 g

TS-EAMCET 09.08.2021, Shift-I

Ans. (a) :



Since, weight of Br of 1mole = 80gm

Then, weight of 6 mole of Br atom is = 80 × 6

= 480 gm.

186. Number of moles of dichromate needed to oxidizes one mole of Sn^{2+} is

(a) 3 (b) 2

(c) $\frac{1}{3}$ (d) $\frac{1}{2}$

TS-EAMCET 09.08.2021, Shift-I

Ans. (c) : The overall oxidation reaction is given below–

$$\overset{+6}{Cr_2}O_7^{2-}+14H^++3Sn^{+2}\rightarrow2Cr^{3+}+3Sn^{4+}+7H_2O$$

Thus, 3 mole of Sn^{+2} will reduce 1 mole of $K_2Cr_2O_7$.

Therefore, 1 moles of Sn^{2+} will reduce 1/3 moles of $K_2Cr_2O_7$.

187. 20 g of $CaCO_3$ on heating produces x amount of CO_2. If the final weight of $CaCO_3$ after the reaction is 5 g. the amount of CO_2 liberated in L at STP is

(a) 44 (b) 3.36

(c) 22 (d) 6.66

TS-EAMCET 09.08.2021, Shift-I

Ans. (b) : The balanced equation is–

$$CaCO_3\rightarrow \underset{\downarrow}{CO_2}+CaO$$

1mole 1mole = 22.4 litre at STP

∵ 100 gm of $CaCO_3$ evolve CO_2 = 22.4 litre

1gm of $CaCO_3$ evolve $CO_2=\frac{22.4}{100}$

∴ 15 gm of $CaCO_3$ evolve $CO_2=\frac{22.4}{100}\times15$

= 3.36 litre

188. $KMnO_4$ oxidises oxalic acid in acidic medium. The number of CO_2 molecules produced per mole of $KMnO_4$ is

(a) 5 (b) 4

(c) 3 (d) 1.5

TS EAMCET 05.08.2021, Shift-I

Ans. (a) : for 2 mole →

$2KMnO_4 + 5H_2C_2O_4 + 3H_2SO_4 \rightarrow 2\ MnSO_4 + 10\ CO_2 + K_2SO_4 + 8\ H_2O$

For one mole 10/2 = 5 CO_2 molecule are formed.

@apna_pdf

189. Salts of A (atomic weight 8), B (atomic weight 18) and C (atomic weight 50) were electrolysed under identical conditions using the same quantity of electricity. It was found that 2.4g of A was deposited, the weight of B and C deposited are 1.8 g and 7.5 g respectively. The valences of A, B and C are, respectively,

(a) 3, 1 and 2 (b) 1, 2 and 3
(c) 1, 3 and 2 (d) 3, 2 and 1

TS EAMCET 04.08.2021, Shift-I

Ans. (c) : According to Faraday law–

$$W = Z.Q = \frac{E.Q}{96500}$$

For A,

$$2.4 = \frac{(8/x)Q}{96500}$$

$$x = \frac{8Q}{96500 \times 2.4}$$

For B,

$$1.8 = \frac{(18/y)Q}{96500}$$

$$y = \frac{18Q}{96500 \times 1.8}$$

For C,

$$7.5 = \frac{(50/z)Q}{96500}$$

$$z = \frac{50Q}{96500 \times 7.5}$$

Hence, $x : y : z = \left(\frac{8}{2.4}\right) : \left(\frac{18}{1.8}\right) : \left(\frac{50}{7.5}\right)$

$= 3.33 : 10 : 6.66$

$= 1 : 3 : 2$

By solving equation,

A = 1, B = 3 and C = 2

So, valence of A, B and C are 1, 3 and 2.

190. The number of grams of oxygen in 32.2g of $Na_2SO_4 . 10H_2O$ is approximately

(a) 32.2 g (b) 22.4 g
(c) 11.2 g (d) 64.4 g

TS EAMCET 04.08.2021, Shift-I

Ans. (b) : No. of oxygen atoms in one molecule of $Na_2SO_4.10\ H_2O = 4 + 10 = 14$

Thus, moles of oxygen in n moles of compound = 14n

Molar mass of $Na_2SO_4.\ 10\ H_2O = 46 + 32 + 64 + 180$
$= 322$ g/mol

Since, $32.2g = \frac{32.2}{322} = 0.1$ moles

Thus, moles of oxygen = 0.1 × 14 = 1.4

So, weight is 16 × 1.4 = 22.4 g

191. KBr is doped with 10^{-5} mole percent of $SrBr_2$. The number of cationic vacancies in 1 g of KBr crystal is _______ 10^{14}. (Round off to the Nearest Integer).
[Atomic Mass: K: 39.1 u, Br: 79.9u
$N_A = 6.023 \times 10^{23}$]

JEE Main 17.03.2021, Shift-II

Ans. (5).

100 mole of KBr is doped with 10^{-5} mole of $SrBr_2$.

1 mole KBr contain $= \frac{10^{-5}}{100} = 10^{-7}$ mol of $SrBr_2$

Hence, 10^{-7} moles cation vacancy (as $1Sr^{2+}$ will result 1 cation vacancy)

119g KBr contains 10^{-7} mol of $SrBr_2$

1g KBr contains $\frac{10^{-7}}{119}$ mol of $SrBr_2$

∴ Required number of cation vacancy

$$= \frac{10^{-7} \times 6.023 \times 10^{23}}{119}$$

$= 5.06 \times 10^{14}$

$\approx 5 \times 10^{14}$

192. A gas X is dissolved in water at 2 bar pressure. Its mole fraction in the solution is 0.02. Find the mole fraction of water in the solution when the pressure of the gas is doubled at the same temperature.

(a) 0.04 (b) 0.98
(c) 0.96 (d) 0.02

AP EAPCET 24.08.2021, Shift-I

Ans. (c) : According to the Raoult's law –

$P_1 = X_1 P_0$

Where –

P_1 = Vapour pressure of the solvent.
P_0 = Vapour pressure in pure state.
X_1 = mole fraction

Given – $P_1 = 2$ Bar

$X_1 = 0.02$

and

$P_2 = 2P_1 = 2 \times 2 = 4$ Bar

$X_2 = ?$

∴ $P_1 = X_1 P_0$

$2 = 0.02 \times P_0$ ... (I)

and

$P_2 = X_1 P_0$

$4 = X_2\ P_0$ ... (II)

From (I) and (II) we get

$$\frac{0.02}{X_2} = \frac{1}{2}$$

or $X_2 = 0.04$

So, Mole fraction of water = $1 - X_2 = 1 - 0.04 = 0.96$

193. How many moles of electrons weighs one kg?

(a) 3×10^4 (b) 6×10^{23}
(c) 1×10^8 (d) 1.8×10^6

TS EAMCET 10.08.2021, Shift-II

@apna_pdf

Ans.(d) :

$$1\,\text{mole}\,e^- = 6.023\times10^{23}\,e^-$$

$$\text{Mass 1 mole of electron} = 6.023\times10^{23}\times9.108\times10^{-31}\,\text{kg}$$

$$= 6.023\times9.108\times10^{-8}\,\text{kg}$$

$$\text{No. of mole in one kg} = \frac{1}{9.108\times6.023\times10^{-8}}$$

$$= \frac{10^8}{9.108\times6.023}$$

$$= \frac{100}{9.108\times6.023}\times10^6$$

$$= 1.82\times10^6$$

194. 3.011×10^{22} atoms of an element weighs 1.5gm. The atomic mass of the element is ———

(a) 10 amu (b) 2.3 amu

(c) 35.5 amu (d) 23 amu

AP EAPCET 25.08.2021, Shift-II

Ans. (d) : Given that –

Weigh = 1.15gm

Atoms = 3.011×10^{22}

$$\text{Atomic mass} = \frac{\text{Mass}}{\text{No. of atoms}}$$

$$= \frac{1.15\,\text{gm}}{3.011\times10^{22}}$$

$= 0.38\times10^{-22}$ gm

We know,

1amu = 1.66×10^{-24} gm

Then,

$$= \frac{0.38\times10^{-22}}{1.66\times10^{-24}}$$

= 23 amu.

195. If $Fe_{0.96}O$, Fe is present in +2 and +3 oxidation state, what is the mole-fraction of Fe^{2+} in the compound?

(a) 12/25 (b) 25/12

(c) 1/12 (d) 11/12

AP EAPCET 25.08.2021, Shift-II

Ans. (d) : Given $Fe_{0.96}O$, Fe is present +2 and +3 oxidation state

Let 'x' molecule fraction of Fe^{+2} and (0.96 – x) molecular fraction of Fe^{+3}

Now,

$$x(+2) + (0.96 - x)(+3) - 2 = 0$$

$$2x - 3x + 2.88 - 2 = 0$$

$$x = 0.88$$

Fraction of Fe^{+2} = 0.88 and fraction of Fe^{+3} = 0.12

$$\text{Mole fraction of } Fe^{+2} = \frac{0.88}{0.88+0.12}$$

$$= \frac{11}{12}$$

196. When oxalic acid is oxidised with acidified $KMnO_4$, the number of moles of CO_2 liberated is (consider balancing the reaction)

(a) 2 (b) 4

(c) 6 **(d) 10**

TS EAMCET 10.08.2021, Shift-I

Ans. (d) : Balance chemical reaction

$2KMnO_4 + 5H_2C_2O_4 + 3H_2SO_4 \rightarrow 2MnO_4 + K_2SO_4 + 8H_2O$ + 10 mole of CO_2 liberate.

197. The strength of 50 volume of H_2O_2 solution is approximately.

(a) 50% (b) 25%

(c) 10% (d) 15%

TS EAMCET 10.08.2021, Shift-I

Ans. (d) : $2H_2O_2 \rightarrow 2H_2O + O_2$

$2(34) = 68g$ $\qquad$ $22.4\,L\,at\,NTP$

50 volume H_2O_2 means 1L of 50 volume of H_2O_2 give 50L O_2 at STP

∴ 22.4 liter of O_2 produced from = 68 gm H_2O_2

∴ 50 liter of

$$O_2 \text{ produced from} = \frac{68}{22.4}\times50 = 151.7\,g\ of\ H_2O_2$$

$$\text{Percentage strength of } H_2O_2 \text{ Solution} = \frac{151.7}{1000}\times100$$

$$= 15.17\%\ or \approx 15\%$$

198. 100 ml of 0.2 M acetic acid is completely neutralized using a standard solution of NaOH. The volume of ethane obtained at STP after complete electrolysis of the resulting solution is ———

(a) 11.2 L (b) 2.24 L

(c) 0.224 L (d) 22.4 L

AP EAPCET 23-08-2021 Shift-I

Ans. (c) : $CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$

Number of moles of sodium acetate

$$= \frac{100\,\text{ml}}{1000\,\text{ml/lit}}\times0.2\,\text{mol/lit} = 0.02 \text{ moles}$$

$$2CH_3COONa \xrightarrow[\text{electrolysis}]{\text{hydrolysis}} CH_3-H_3+2CO_2+2NaOH+H_2\uparrow$$

Number of moles of ethane are one half the number of moles of sodium acetate(CH_3COONa).

$$\text{No. of moles of ethane} = \frac{0.02}{2} = 0.01 \text{ moles.}$$

At STP, 1 mole of ethane occupies = 22.4 liter.

0.01 mole of ethane =?

0.01×22.4= 0.224 liter.

199. The number of sodium ions present in 0.5 mole of sodium ferrocyanide is

(a) 2×10^{23} (b) 0.5×10^{23}

(c) 12×10^{23} (d) 4×10^{23}

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (c) : Formula of sodium ferrocyanide $Na_4[Fe(CN)_6]$ contains 4 Na atoms.

Number of Na atoms = Number of moles × Number of atom per molecule × Avogadro number

$= 0.5\times4\times6.023\times10^{23}$

$= 12.046\times10^{23}$

$\approx 12\times10^{23}$

@apna_pdf

200. 56 g of CaO has been mixed with 63 g of HNO_3, the amount of $Ca(NO_3)_2$ formed is
$Ca(NO_3)_2$ 63g$HNO_3$56gCaO

(a) 4g (b) 8.28g
(c) 164 g (d) 82 g

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (d) : $\underset{\text{Calcium oxide}}{CaO} + \underset{\text{Nitric acid}}{2HNO_3} \rightarrow \underset{\text{Calcium nitrate}}{Ca(NO_3)_2} + H_2O$

Molar mass of CaO = 56 gm/mol
Molar mass of HNO_3 = 63 gm/mol
Molar mass of $Ca(NO_3)_2$ = 164 gm/mol
Molar mass of H_2O = 18 gm/mol
∵ 126 gm Nitric acid forms = 164 gm $Ca(NO_3)_2$

$$\therefore 1 \text{ gm Nitric acid forms} = \frac{164}{126} \text{gm} Ca(NO_3)_2$$

$$\therefore 63\text{gm Nitric acid forms} = 63 \times \frac{164}{126} \text{gm} Ca(NO_3)_2$$

$= 82$ gm $Ca(NO_3)_2$

201. When 35 mL of 0.15 M lead nitrate solution is mised with 20 mL of 0.12 M chromic sulphate solution,-------$\times 10^{-5}$ moles of lead sulphate precipitate out. (Round off to the Nearest Integer).

JEE Main 16.03.2021, Shift-II

Ans. The following reaction take place -

$3Pb(NO_3)_2 + Cr_2(SO_4)_3 \longrightarrow 3PbSO_4 + 2Cr(NO_3)_3$
lead nitrate chromic sulphate lead sulphate chromic nitrate.

Volume of lead nitrate solution = 35mL
concentration of lead nitrate = 0.15M
∴Number of moles of $Pb(NO_3)_2 = 0.15 \times 35 \times 10^{-3}$mol
$= 5.25 \times 10^{-3}$mol
Similarly, number of moles of $Cr_2(SO_4)_3$
$= 0.12 \times 20 \times 10^{-3}$mol
$= 2.4 \times 10^{-3}$mol
therefore moles of $PbSO_4$ formed $= 5.25 \times 10^{-3}$
$= 525 \times 10^{-5}$

202. The volume strength (in L) of 3N H_2O_2 is approximately ____

(a) 3 (b) 8
(c) 17 (d) 9

AP EAPCET 24.08.2021 Shift-II

Ans. (c): Given, normality = 3N
Volume strength = ?
∴ We known,
Volume strength = 5.6 × Normality
= 5.6 × 3
= 16.8
Volume strength ≈ 17

203. A cylinder contains a mixture of 5 g of N_2 and 6 g of Ar gases. If the total pressure of the mixture of the gases in the cylinder is 30 bar, then the partial pressure of N_2 gas is ___ (Molecular mass of N_2 = 28 g mol^{-1}. Atomic mass of Ar = 40u)

(a) 16.36 bar (b) 0.545 bar
(c) 30 bar (d) 0.180 bar

AP EAPCET 24.08.2021 Shift-II

Ans. (a) : Given that,
$W_{N_2} = 5$ gm
$W_{A_r} = 6$ gm

$$n_{N_2} = \frac{\text{weight}}{\text{m. weight}} = \frac{5}{28} = 0.18$$

$$n_{A_r} = \frac{\text{weight}}{\text{m. weight}} = \frac{6}{40} = 0.15$$

$$\text{Mole fraction of } N_2 = \frac{0.18}{0.18+0.15} = 0.5454$$

$\therefore$ Partial pressure of $(P_{N_2}) = X_{N_2} \times P_{total}$
$= 0.5454 \times 30$
$= 16.36$ bar

204. The molal elevation constant is the ratio of Elevation in boiling point to ——

(a) Molarity
(b) Molality
(c) Mole fraction of solute
(d) Mole fraction of solvent

AP EAPCET 19-08-2021 Shift-I

Ans. (b): Due to solute presence in the solution the solution's boiling point is greater than the pure solvents boiling point. This is called as deviation in boiling point and it can be represented as-

$\Delta T_b = K_b \times$ molality

or $K_b = \dfrac{\Delta T_b}{\text{molality}}$

205. When 10 g of copper and 10 g of iodine are mixed, calculate the theorctical yield of CuI according to the equation,

$2Cu + I_2 \rightarrow 2CuI$

(a) 30 g (b) 10 g
(c) 15 g (d) 20 g

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (c) : I_2 is limiting reagent,
mole of I_2 = mole of CuI

$$\text{Mole of CuI} = \frac{10}{127}$$

$$\text{Mass of CuI} = \frac{10}{127} \times 190.5 = 15\text{g}$$

Hence, the correct option is (c).

206. One mole of oxygen gas at STP is equal to

(a) 6.022×10^{23} molecules of oxygen
(b) 6.022×10^{23} atoms of oxygen
(c) 16 g of oxygen
(d) 32 g of oxygen

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (a) : 1 mole of $O_2(g)$ at STP contains Avogadro number ($N_a = 6.022 \times 10^{23}$ mol^{-1}) of O_2 molecules, which will occupy its molar volume, i.e, 22.4 L.

207. Which of the following units is useful in relating concentration of solution with its vapour pressure ?

(a) Mole fraction (b) Parts per million
(c) Mass percentage (d) Molality

AP EAMCET (Engg.) 21.09.2020, Shift-I

@apna_pdf

Ans. (a) : According to Raoult's law, relative lowering of vapour pressure is directly proportional to mole fraction of solute. So, mole fraction is used in relating concentration of solution with its vapour pressure.

Raoult's law Can be expressed as;

$$\frac{P^0 - P_s}{P^0} = \frac{n_2}{n_1 + n_2} = x_2$$

Where, x_2= Mole fraction of solute

n_1= Moles of solvent

n_2= Moles of solute

p_s= Vapour pressure of the solution

p^0= Vapour pressure of pure solvent

208. Calculate the energy required to convert all atoms 4.8 g of Mg to Mg^{2+} in the vapour state. IE_1 and IE_2 of Mg are 740 kJ/mol and 1450 kJ/mol respectively.

(a) + 740 kJ/mol (b) –740 kJ/mol

(c) –1450 kJ/mol (d) +438 kJ/mol

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (d) : For 1 mole of $(Mg \rightarrow Mg^{2+})$ $1E = 1E_1 + 1E_2$ = (740 + 1450) = 2190 kJ/mol. Number of mole in 4.8g of Mg = 4.8/24 = 0.2 mol.

For 1 mole energy required = 2190 kJ/mol.

For 0.2 mole energy required = 2190 0 × 0.2 = 438 kJ.

Thus, for 4.8 g of Mg to Mg^{2+} conversion, energy required is 438 kJ. Hence, the correct option is (d).

209. An excess of $AgNO_3$ is added to 100 mL of 0.01 M solution of dichlorotetraaquachromium (III) chloride. The number of moles of AgCl precipitated would be

(a) 0.001 (b) 0.002

(c) 0.003 (d) 0.01

Assam CEE-2020

Ans. (a): Molecular formula of dichlorotetraaqua chromium (III)

chloride is $[Cr(H_2O)_4 Cl_2] Cl$.

On ionisation it generate only one Cl^- ion

$$[Cr(H_2O)_4Cl_2]Cl \xrightarrow{\text{exces } AgNO_3} [Cr(H_2O)_4Cl_2]^+ + AgCl\downarrow$$

$$\text{Using formula, molarity} = \frac{\text{No. of moles}}{\text{Volume}} \times 1000$$

$$0.01 = \frac{\text{No. of moles}}{100} \times 1000$$

No. of moles of AgCl = 0.001 mol AgCl

210. The volume (in mL) of 0.1 NaOH required to neutralise 10mL of 0.1 N phophonic acid is …

[JEE Main 2020, 3 Sep Shift-II]

Ans. $H_3PO_2 + NaOH \rightarrow NaH_2PO_2 + H_2O$

$$\frac{\text{Moles of } H_3PO_2 \text{ reacted}}{1} = \frac{\text{Moles of NaOH reacted}}{1}$$

$$\frac{0.1 \times 10}{1} = 0.1 \times V_{NaOH}$$

$$V_{NaOH} = 10 \text{ ml}$$

211. The mass of ammonia in grams produced when 2.8 kg of dinitrogen quantitatively reacts with 1 kg of dihydrogen is…..

[JEE Main 2020, 4 Sep Shift-I]

Ans. $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$

$$\text{Number of moles of } N_2 = \frac{2.8 \times 10^3}{28} = 100$$

$$\text{Number of moles of } H_2 = \frac{1000}{2} = 500$$

∴ Number of moles of NH_3 produced = 2 × 100

= 200

Mass of NH_3 Produced = 200 × 17 = 3400 gm

212. The volume, in mL, of 0.02 M $K_2Cr_2O_7$ solution required to react with 0.288 g of ferrous oxalate in acidic medium is…….

(Molar mass of Fe = 56 g mol^{-1})

[JEE Main 2020, 5 Sep Shift-II]

Ans. $K_2Cr_2O_7 + FeC_2O_4 \rightarrow Cr^{+3} + Fe^{+3} + CO_2$

n_{factor} of $K_2Cr_2O_7 = 3 \times 2 = 6$

n_{factor} of $FeC_2O_4 = 1 + 2 = 3$

$$\frac{0.02 \times 6 \times V(mL)}{1000} = \frac{0.288}{144} \times 3$$

$$V = 50 \text{ mL}$$

213. The volume (in mL) of 0.125 M $AgNO_3$ required to quantitatively precipitate chloride ions in 0.3 g of $[Co(NH_3)_6]Cl_3$ is…….

$$M_{[co(NH_3)_6]Cl_3} = 267.46 g/mol$$

$$M_{AgNO_3} = 169.87 g/mol$$

[JEE Main 2020, 8 Jan Shift-I]

Ans. $[CO(NH_3)_6]Cl_3 + 3AgNO_3 \rightarrow 3AgCl_3$

0.3 gm v ml, 0.125m

$$\frac{\text{wt.}}{\text{mol.wt.}} \times (\text{n} - \text{factor}) = \text{Molarity} \times \text{volume}$$

$$\frac{0.3}{267.46} \times 3 = 0.125 \times v \times 10^{-3}$$

$$v = \frac{0.3 \times 3 \times 1000}{267.46 \times 0.125} = 26.92 \text{ mL}$$

214. $NaClO_3$ is used, even in spacecrafts, to produce O_2. The daily consumption of pure O_2 by a person is 492 L at 1 atm 300 K. How much amount of $NaClO_3$ in grams, is required to produce O_2 for the daily consumption of a person at 1 atm, 300 K……?

$NaClO_3(s) + Fe(s) \rightarrow O_2(g) + NaCl(s) + FeO(s)$

R = 0.082 L atm mol^{-1} K^{-1}

[JEE Main 2020, 8 Jan Shift-II]

Ans.

$$NaClO_{3(S)} + Fe_{(s)} \rightarrow O_{2(g)} + NaCl_{(s)} + FeO(s)$$

Moles of $NaClO_3$ = moles of O_2

$$\text{Moles of } O_2 = \frac{PV}{RT} = \frac{1 \times 492}{0.082 \times 300}$$

= 20 mol

Molar mass of $NaClO_3$ = 23 + 35.5 + 3 × 16

= 106.5 g

Mass of $NaClO_3$ = 20 × 106.5 = 2130 g

@apna_pdf

215. Ferrous sulfate heptahydrate is used to fortify foods with iron. The amount (in grams) of the salt required to achieve 10 ppm of iron in 100 kg of wheat is….. .
Atomic weight : Fe = 55.85; S=32.00, O=16.00
[JEE Main 2020, 8 Jan Shift-I]

Ans. $FeSO_4.\ 7H_2O$ (m = 277.85)

$$PPM = \frac{\text{Mass of iron}}{\text{Mass of wheat}}\times10^6$$

$$\Rightarrow 10 = \frac{\text{Mass of iron}}{100\times10^3}\times10^6$$

⇒ Mass of iron = 1 gm

Molecular mass of $FeSO_4\ 7H_2O$ is 277.85

55.85 gm iron is present in 277.85 gm of salt

$$1 \text{ gm iron is present in} = \frac{277.85}{55.85} = 4.97 \text{ gm of salt}$$

216. Which one of the following will have the largest number of atoms?

(a) 1g Au(s)
(b) 1g Na(s)
(c) 1g Li(s)
(d) 1g of Cl_2(g)
(e) 1g of O_2(g)

Kerala-CEE-2020

Ans. (c) : $\text{No. of moles} = \dfrac{\text{weight in gram}}{\text{molecular weight}}$

(i) 1 g Au (s) $= \dfrac{1}{197}$ mol atom of Au

$= \dfrac{1}{197}\times6.022\times10^{23}$
$= 0.005076 \times 6.022 \times 10^{23}$
$= 0.005076 \times 6.0 \times 10^{23}$
$\approx 0.0305 \times 10^{23} = 3.05\times10^{21}$

(ii) 1 g Na (s) $= \dfrac{1}{23}$ mol atom of Na

$= \dfrac{1}{23}\times6.022\times10^{23}$
$= 0.0434 \times 6.022 \times 10^{23}$
$= 0.26 \times 10^{23} = 2.6\times10^{22}$

(iii) 1 g Li (s) $= \dfrac{1}{7}$ mol atom of Li

$= \dfrac{1}{7}\times6.022\times10^{23}$
$= 0.1428 \times 6.022 \times 10^{23}$
$= 0.860 \times 10^{23} = 8.61\times10^{22}$

(iv) 1 g Cl_2 (g) $= \dfrac{1}{71}$ mol atom of Cl_2

$= \dfrac{1}{71}\times6.022\times10^{23} = 8.48\times10^{21}$

(v) 1 g O_2 (g) $= \dfrac{1}{32}$ mol atom of O_2

$= \dfrac{1}{32}\times6.022\times10^{23} = 1.188\times10^{22}$

So, 1 g Li(s) has the largest no, of atoms.

217. Which one of the following has maximum number of atoms?

(a) 1 g of $Ag_{(s)}$ [Atomic mass of Ag = 108]
(b) 1 g of $Mg_{(s)}$ [Atomic mass of Mg = 24]
(c) 1 g of $O_{2(s)}$ [Atomic mass of O = 16]
(d) 1 g of $Li_{(s)}$ [Atomic mass of Li = 7]

NEET-2020

Ans. (d):

Number of atoms in 1g of Li $= \dfrac{1}{7}\times N_A$

$= \dfrac{1}{7}\times6.023\times10^{23}$
$= 0.86\times10^{23}$

Number of atoms in 1g of Ag $= \dfrac{1}{108}\times N_A$
$= 0.056\times10^{23}$

Number of atoms in 1g of Mg $= \dfrac{1}{24}\times N_A$
$= 0.25\times10^{23}$

Number of atoms in 1g of O_2 $= \dfrac{1}{32}\times N_A\times2$
$= \dfrac{N_A}{16} = 0.37\times10^{23}$

Max. number of atoms are present in 1g of Li.

218. $2KHCO_3 \rightarrow$ …+ CO_2 + H_2O find amount of gases formed (in lit).
When amount of $KHCO_3$ is 33 gm.

(a) 5.6
(b) 11.2
(c) 7.39
(d) 22.4

JIPMER-2019

Ans. (c) :

$$\underset{n=\frac{33}{100}}{2KHCO_3(s)} \longrightarrow \underset{0.165}{K_2CO_3(s)} + \underset{0.166}{CO_2(g)} + H_2O$$

Total moles of gas (0.165 + 0.165) mol
Total volume of gas = 0.33 × 22.4 L
= 7.39 L

219. The mass of AgCl precipitated when a solution containing 11.70g of NaCl is added to a solution containing 3.4 g of $AgNO_3$ is
[Atomic mass of Ag = 108, Atomic mass of Na = 23]

(a) 5.74g
(b) 1.17g
(c) 2.87g
(d) 6.8 g

Karnataka-CET-2019

Ans. (c):

$$\begin{array}{lccccc} & NaCl + & AgNO_3 & \longrightarrow & NaNO_3 + & AgCl \\ \text{m.wt.}\Rightarrow & 58.5g & 170g & & 85g & 143.5g \\ \text{G.wf.}\Rightarrow & 11.72g & 3.4g & & & \end{array}$$

170g $AgNO_3$ will give 143.5g AgCl
Then, 3.4 g $AgNO_3$ will give x g AgCl

$$x = \frac{3.4\times143.5}{170}$$

$$x = 2.87\,g$$

@apna_pdf

220. 0.1 mole of XeF_6 is treated with 1.8 g of water. The product obtained is

(a) XeO_3 (b) XeO_2F_2

(c) $XeOF_4$ (d) $Xe + XeO_3$

Karnataka-CET-2019

Ans. (c) : When 0.1 mole of XeF_6 is treated with 1.8 g of water. The product obtained is XeF_4

∴ moles of water = $\frac{\text{Given mass of water}}{\text{molecular mass}} = \frac{1.8}{18} = 0.1\text{mole}$

When 0.1 mole of XeF_6 react with 0.1 mole of H_2O then $XeOF_4$ and HF are formed

reaction involved as follows:

$$XeF_6 + H_2O \rightarrow XeOF_4 + 2HF$$

221. The number of moles of electron required to reduce 0.2 mole of $Cr_2O_7^{-2}$ to Cr^{+3} is

(a) 1.2 (b) 6

(c) 12 (d) 0.6

Karnataka-CET-2019

Ans. (a) : From given reaction:-

$$\overset{+6}{Cr_2}O_7^{2-} \rightarrow 2Cr^{+3}$$

1 mole required 6 mole of electrons 0.2 mole requires

$\frac{0.2 \times 6}{1}$ =1.2 mole of electrons.

222. In a lead-acid battery, if 1 A current is passed to charge the battery for 1 h, what is the amount of $PbSO_4$ converted to PbO_2? (Given data: 1F = 96500 C mol^{-1})

(a) 0.0373 moles (b) 0.0186 moles

(c) 0.0093 moles (d) 0.0268 moles

(e) 0.0400 moles

Kerala-CEE-2019

Ans. (b) : Given,

i = 1A, T = 1h = 60 × 60 = 3600sec

Charge = 1 × 3600 = 3600 C

$PbSO_4 + 2e^- \times PbO_2$

$$\text{Moles} = \frac{\text{Charge}}{2 \times 96500}$$

$$= \frac{3600}{193000}$$

= 0.0186 moles.

223. On passing silent electric discharge through oxygen in an ozonizer, 5.5 mol% of oxygen is converted to ozone. How many moles of O_2 and O_3 result when 35 moles of O_2 is originally present?

(a) 33.0 (b) 34.4

(c) 35.0 (d) 31.8

(e) 31.0

Kerala-CEE-2019

Ans. (b) : Given, 5.5 mol% of O_2 is converted into O_3.

$$\therefore 35 - \frac{35 \times 5.5}{100} \text{ moles of } O_2$$

$$= \frac{35 \times 5.5}{100} \times \frac{2}{3} \text{ mole of } O_3$$

33.05 moles of O_2 = 1.28 moles of O_3

Thus the total no. of moles present originally was

= 33.05 of O_2 + 1.28 of O_3

= 34.4 moles.

224. In a mixture of 1 g H_2 and 8 g O_2 the mole fraction of hydrogen is :

(a) 0.667 (b) 0.5

(c) 0.33 (d) None of the above

Manipal-2019

Ans. (a) :

- No. of moles of $H_2 = \frac{1}{2} = 0.5$
- No. of moles of $O_2 = \frac{8}{32} = 0.25$
- Total moles of H_2 and O_2 = 0.5 + 0.25 = 0.75
- Mole fraction of $H_2 = \frac{\text{No.of mass of } H_2}{\text{Total moles}}$
- $= \frac{0.50}{0.75} = 0.667$

225. Two electrolytic cells are connected in series containing $CuSO_4$ solution and molten $AlCl_3$. If in electrolysis 0.4 moles of 'Cu' are deposited on cathode of first cell. The number of moles of 'Al' deposited on cathode of the second cell is

(a) 0.6 moles (b) 0.27 moles

(c) 0.18 moles (d) 0.4 moles

MHT CET-02.05.2019, Shift-III

Ans. (b) : Given,

Number of moles of Cu deposited = 0.4 moles

According to Faraday's second law.

$$\frac{\text{Weight of Cu deposited}}{\text{Weigth of Al deposited}} = \frac{E_4 \text{ wt.of Cu}}{E_4 \text{ wt.of Al}} --- (i)$$

$$\because \quad \text{No. of moles} = \frac{\text{weight}}{\text{molecular weight}}$$

$$\therefore \quad \text{weight of Cu} = 0.4 \times 63.5$$

Now, from E_q (i), $\frac{0.4 \times 63.5}{\text{weight fo Al deposited}} = \frac{\frac{63.5}{2}}{\frac{27}{3}}$

$$\therefore \text{ weight of Al deposited} = \frac{0.4 \times 63.5 \times 9}{31.75} = 7.2\text{g}$$

Number of moles of Al deposited = $\frac{7.2}{27} = 0.27\text{moles}$

226. A cold drink bottle contains 200 mL liquid, in which CO_2 is 0.1 molar. Considering CO_2 as an ideal gas the volume of the dissolved CO_2 at S.T.P is

(a) 22.4 L (b) 0.224 L

(c) 2.24 L (d) 0.448 L

MHT CET-02.05.2019, Shift-III

@apna_pdf

Ans. (d) : Number of moles of CO_2 in 200 ml solution

$= \text{molarity} \times \text{volume (in L)}$

$$= 0.1 \times \frac{200}{1000} = 0.02$$

volume of 0.02 mole of CO_2 at STP $= 22.4 \times 0.02$

$= 0.448$ L

227. How many gram of sodium (atomic mass 23 u) is required to prepare one mole of ethane from methyl chloride by Wurtz reaction?

(a) 2 (b) 23

(c) 11.5 (d) 46

MHT CET-02.05.2019, Shift-II

Ans. (d): Wurtz reaction–

$$2CH_3Cl + 2Na \xrightarrow{\text{Dry ether}} \underset{\text{Ethane}}{CH_3 - CH_3} + 2NaCl$$

⇒2 moles of sodium metal reacts to give 1 mole of ethane.

weight of 2 moles of Na = 23 × 2 = 46 g

228. The volume of 1 mole of any pure gas at standard temperature and pressure is always equal to

(a) 0.022414 m^3 (b) 22.414 m^3

(c) 2.2414 m^3 (d) 0.22414 m^3

MHT CET-02.05.2019, Shift-II

Ans. (a) : The volume of 1 mole of any pure gas at standard temp. and pressure (STP) is equal to 22.414 L

$1\text{L} = 0.001\text{m}^3$

$\therefore$ 22.414 L $= 0.022414 \text{ m}^3$

229. Which of the following gases has the density 1.8 gm/lit at 27 °C temperature and 760 Torr pressure?

(a) O_2 (b) CO_2

(c) NH_3 (d) SO_2

Tripura JEE-2019

Ans. (b) : Given,

$$P = 760 \text{ Torr} = \frac{760}{760} = 1\text{atm}$$

$T = 27^\circ\text{C} = 27 + 273 = 300$ K

d = 1.8 g/L

$$PV = \frac{m}{M}RT$$

$$M = \frac{mRT}{VP} \Rightarrow M = \frac{dRT}{P}$$

$$M = \frac{1.8 \times 0.0821 \times 300}{1}$$

$$M = 44\text{g/mole}$$

Molar mass of gas = 44g/mole

So, gas is CO_2 molar mass 44 g/mole.

230. 20 gm of a metal produces 0.504 gm H_2(g) on reaction with dilute H_2SO_4. Calculate the receivable amount of metal oxide from 2 gm of same metal.

(a) 2.4gm (b) 2.2gm

(c) 2.8gm (d) 2.6gm

Tripura JEE-2019

Ans. (a) : Given,

0.504g of H_2 is liberated by 20g of the metal

So, 1.008g H_2 is liberated by $\dfrac{20 \times 1.008}{0.504}$

= 40g of the metal.

40g metal combines with 8g of oxygen

So, 2.0g of metal combines with $= \dfrac{8 \times 2}{40}$g

= 0.4g of oxygen

Amount of metal oxide = Mass of metal + Mass of oxygen = (2.0 + 0.4) = 2.4 g

231. At S.T.P. the volume of 7.5 g of a gas is 5.6L. The gas is

(a) NO (b) N_2O

(c) CO (d) CO_2

WB-JEE-2019

Ans. (a) : We know,

22.4 L volume of S.T.P. contain 1 mole

Then, 5.6 L volume at S.T.P contain

$$= \frac{1}{22.4} \times 5.6 = 0.25\text{mole}$$

And,

$$\text{No. of mole} = \frac{\text{Mass}}{\text{Molecular weight}}$$

$$\text{Molecular weight} = \frac{7.5}{0.25} = 30$$

From the given option NO has molecular weight 30. Hence, correct option is 'a'

232. 1.2 g of Mg is treated with 100mL of 1M H_2SO_4. Molar concentration of the H_2SO_4 solution after complete reaction will be

(a) 0.20 M (b) 0.005 M

(c) 0.10 M (d) 0.5 M

CG PET -2019

Ans. (d) : $Mg + H_2SO_4 \rightarrow MgSO_4 + H_2$

24g (98g = 1 mol)

1.2g Mg reacts with = 0.5 mol H_2SO_4

H_2SO_4 taken = 100 mL of 1 M H_2SO_4

= 0.1 mol

H_2SO_4 left = 0.1 – 0.05

= 0.05 mol in 100 mL solution

$[H_2SO_4] = 0.05 \times 10 = 0.5$ M

233. The volume of ' 10 vol' of H_2O_2 required to liberate 500mL O_2 at NTP is

(a) 125mL (b) 500mL

(c) 50mL (d) 100mL

CG PET -2019

Ans. (c) : 10 vol of H_2O_2 means that

10 L O_2 can be liberated from 1 L H_2O_2

1 L O_2 liberated from $\dfrac{1}{10}$L H_2O_2

500 mL O_2 liberated from $= \dfrac{500}{10}$mL H_2O_2

@apna_pdf

$= 50$ mL H_2O_2

10 vol. H_2O_2 means that 1 mL H_2O_2 gives 10 mL O_2.

Thus, 50 mL H_2O_2 will give 500 mL O_2.

234. The volume strength of 1 M H_2O_2 is (Molar mass of H_2O_2 = 34 g mol^{-1})

(a) 16.8 (b) 22.4

(c) 11.35 (d) 5.6

[JEE Main-2019, 12 Jan Shift-II]

Ans. (c) : The balanced reaction

$$2H_2O_2 \rightarrow 2H_2O + O_2$$

$$-1 \qquad -2 \qquad 0\,(\text{Oxidation state of O})$$

2 moles of H_2O_2 give 1 mole of O_2

1 mole of H_2O_2 will give 11.2L of O_2 gas

Volume strength of H_2O_2 = 11.2 × molarity

For 1 M H_2O_2 volume strength is 11. 2 L.

235. A solution of $Ni(NO_3)_2$ is electrolysed between platinum electrodes using 0.1 Faraday electricity. How many moles of Ni will be deposited at the cathode?

(a) 0.20 (b) 0.10

(c) 0.15 (d) 0.05

[JEE Main 2019, 9 April Shift-II]

Ans. (d) : $Ni(NO_3)_2 \rightarrow Ni^{2+} + 2NO_3^-$

$$Ni^{2+} + 2e^- \rightarrow Ni$$

2. eq. of Ni^{2+} will be discharged from 2F

0.1 eq. of Ni^{2+} will be discharged from 0.1 F

No. of eq. = No of moles × (n – factor)

0.1 = No. of moles × 2

No. of moles of Ni = $\frac{0.1}{2} = 0.05\,\text{mol.}$

236. In order to oxidise a mixture of one mole of each of FeC_2O_4, $Fe_2(C_2O_4)_3$, $FeSO_4$ and $Fe_2(SO_4)_3$ in acidic medium, the number of moles of $KMnO_4$ required is

(a) 2 (b) 1

(c) 3 (d) 1.5

[JEE Main 2019, 8 April Shift-I]

Ans. (a) :

$FeC_2O_4 + KMnO_4 \rightarrow Fe^{3+} + CO_2 + Mn^{2+}$

v.f. = 3 v.f = 5

1× 3 = mole × 5

Mole = $\frac{3}{5}$

$Fe_2(C_2O_4)_3 + KMnO_4 \rightarrow Fe^{3+} + CO_2 + Mn^{2+}$

v.f. = 6 v.f = 5

1× 6 = mole × 5

Mole = $\frac{6}{5}$

$FeSO_4 + KMnO_4 \rightarrow Fe^{3+} + SO_4^{2-} + Mn^{2+}$

v.f. = 1 v.f = 5

1× 1 = mole × 5

Mole = $\frac{1}{5}$

$Fe(SO_4)_3$ doesn't oxidize

Total moles of $KMnO_4$ = $\frac{3}{5} + \frac{6}{5} + \frac{1}{5} = 2$

237. In the reaction of oxalate with permanganate in acidic medium, the number of electrons involved in producing one molecule of CO_2 is

(a) 2 (b) 5

(c) 1 (d) 10

[JEE Main 2019, 10 Jan Shift-II]

Ans. (c) : As given in question, Reaction of oxalate with permanganate in acidic medium

$5C_2O_4^{2-} + 2MnO_4^- \rightarrow 10CO_2 + 2Mn^{2+} + 8H$

N factor (4 – 3) × 2 = 2 – (7–2) = 5

$5C_2O_4^{2-}$ ions transfer $10e^-$ to produce to molecules of CO_2

So, number of electron involved in producing 10 molecule of CO_2 is 10.

Thus, number of electron involed in producing 1 molecules of CO_2 is 1.

238. For the following reaction , the mass of water produced from 445 g of $C_{57}H_{110}O_6$ is :

$2C_{57}H_{110}O_6(s) + 163O_2(g) \rightarrow 114CO_2(g) + 110H_2O(l)$

(a) 490 g (b) 495 g

(c) 445 g (d) 890 g

[JEE Main 2019, 10 Jan Shift-II]

Ans. (b) : Given equation

$2C_{57}H_{110}O_6(s) + 163O_2(g) \rightarrow 114CO_2(g) + 110H_2O(l)$

Moles of $C_{57}H_{110}O_6(s) = \frac{445}{890} = 0.5$ moles

$$2C_{57}H_{110}O_6(s) + 163O_2 \rightarrow 114CO_2(g) + 110H_2O(I)$$

$$nH_2O = \frac{110}{4} = \frac{55}{2}$$

No. of moles of H_2O = $\frac{\text{given mass}}{\text{molar mass}}$

Given mass = No. of moles × molar mass

$= \frac{55}{2} \times 18$

= 495 g

239. 5 moles of AB_2 weight 125×10^{-3} kg and 10 moles of A_2B_2 weight 300×10^{-3} kg. The molar mass of $A(M_A)$ and molar mass of $B(M_B)$ in kg mol^{-1} are

(a) $M_A = 10 \times 10^{-3}$ and $M_B = 5 \times 10^{-3}$

(b) $M_A = 50 \times 10^{-3}$ and $M_B = 25 \times 10^{-3}$

(c) $M_A = 25 \times 10^{-3}$ and $M_B = 50 \times 10^{-3}$

(d) $M_A = 5 \times 10^{-3}$ and $M_B = 10 \times 10^{-3}$

[JEE Main 2019,12 April Shift-I]

Ans. (d) : 5 moles of AB_2 weight 125 g

$$= \frac{\text{weight in g}}{\text{number of moles}} = \frac{125}{5} = 25$$

∴ AB_2 = 25 g/mol

$$5 = \frac{125}{M_A + 2M_B}$$

$M_A + 2M_B = 25$

10 mole of A_2B_2 weight 300 g

@apna_pdf

$$= \frac{\text{weight in g}}{\text{number of moles}} = \frac{300}{10} = 30$$

$\therefore A_2B_2 = 30 \text{ g / mole}$

$$10 = \frac{300}{2M_A + 2M_B}$$

$2M_A + 2M_B = 30$

$\therefore$ Molar mass of A, $(M_A) = 5$ g or 5×10^{-3}kg

$\therefore$ Molar mass of B, $(M_B) = 10$ g or 10×10^{-3}kg

240. Total number of atoms in 44 g of CO_2 is

(a) 6.02×10^{23} (b) 6.02×10^{24}

(c) 1.806×10^{24} (d) 18.06×10^{22}

J & K CET-(2019)

Ans. (c) : 44 gram CO_2 mean 44/44 = 1 mole of the CO_2.

1 mole CO_2 implies total of 6.022×10^{23} molecules of CO_2. 1 molecules of CO_2 has 3 atoms.

Therefore total atoms in 44 grams of CO_2 has $(6.022\times10^{23}) \times 3 = 18.066 \times 10^{23}$ atoms $= 1.806 \times 10^{24}$ atoms

241. The amount of water (g) produced by the combustion of 32 g of methane is

(a) 18 g (b) 36 g

(c) 54 g (d) 72 g

Assam CEE-2019

Ans. (d) : $CH_4(g) + 2O_2 \rightarrow CO_2 + 2H_2O$

As per stoichiometric equation, 16 g of methane produces 36 g of H_2O

$$\therefore 32 \text{ g of methane will produce} = \frac{36}{16} \times 32 = 72 \text{ g } H_2O.$$

242. Which one of the following is the lightest?

(a) 0.2 mole of hydrogen gas

(b) 6.023×10^{22} molecules of nitrogen

(c) 0.1 g of silver

(d) 0.1 mole of oxygen gas

AIIMS 25 May 2019 (Evening)

Ans. (c):

$$\text{(a) Moles} = \frac{\text{Weight}}{\text{Molecular weight}}$$

Weight of H_2 = mole × molecular wt.

$= 0.2 \times 2 = 0.4$ g

(b) 6.023×10^{23} represents 1 mole

Thus 6.023×10^{22} will represent 0.1 mole

Weight of $N_2 = 0.1 \times 28 = 2.8$ g

(c) Weight of Silver = 0.1 g

(d) Weight of oxygen = $32 \times 0.1 = 3.2$ g

Thus from the above, silver is lightest.

243. Calculate molarity of a 63% w/w HNO_3 solution if density is 1.4g/mL:

(a) 14 M (b) 12 M

(c) 10 M (d) 8 M

AIIMS 26 May 2019 (Evening)

Ans. (a):

HNO_3 solution = 63 % w/w

Density = 1.4 g / mL

$$\text{Molarity} = \frac{\% \text{ w/w} \times d \times 10}{M_{\text{Solute}}}$$

$$M = \frac{63 \times 1.4 \times 10}{63} = 14 \text{M}$$

244. Haemoglobin contains 0.33% of iron by weight. The molecular weight of haemoglobin is approximately 67200. The number of iron atoms (at. Wt. of Fe= 56) present in one molecule of haemoglobin is

(a) 6 (b) 1

(c) 2 (d) 4

AIIMS-27 May, 2018 (E)

Ans. (d) : Given,

% of Iron = 0.334 %

Molecular weight of the haemoglobin = 67200 g / mol

Weight of the Iron = 56 g

The number of iron atoms =

$$\frac{\text{Molecular Weight of haemoglobin} \times \% \text{ of iron}}{100 \times \text{Atomic weight of Iron}}$$

$$= \frac{67200 \times 0.334}{100 \times 56} = 4$$

245. 100 mL brandy contains 40 mL ethanol. The mole fraction of water is

(a) 0.6 (b) 0.667

(c) 0.26 (d) 0.425

CG PET -2018

Ans. (a) : Volume of water = 100 – 40 = 60 mL and

Volume fraction $\propto$ mole fraction

$$\text{Volume fraction of water} = \frac{\text{Volume of water}}{\text{Total volume}}$$

$$= \frac{60}{100} = 0.6$$

246. If 0.05g of urea is dissolved in 5 g of water, then

(a) Its molarity will be greater than molality

(b) Its molality will be greater than molarity

(c) Molarity and molality will be same

(d) Its normality will be 50/60

CG PET -2018

$$\textbf{Ans. (b) :} \text{ Molarity} = \frac{\text{Number of moles of solute}}{\text{Volume of solution (in L)}}$$

$$\text{And Molality} = \frac{\text{Number of moles of solute}}{\text{Mass of solution (in kg)}}$$

$\therefore$Mass of solute (urea) and solvent (water) remain in changed, during the calculations of molarity and molality.

Then volume of solution and contain water molecules.

($\therefore$ In case of volume of solution, it has both solute and solvent)

Thus, molality will be greater than that of molarity.

@apna_pdf

247. How many grams of Cl_2 gas will be obtained by the complete reaction of 31.6 gm of potassium permanganate with hydrochloric acid?
[Mole mass of $KMnO_4$ = 316 gm/mol]

(a) 71 (b) 17.75
(c) 35.5 (d) 142

GUJCET-2018

Ans. (b) :
$$2KMnO_4 + 16HCL \rightarrow 2KCl + 2MnCl_2 + 8H_2O + 5Cl_2$$
Moles of 31.6 gm of potassium permanganate
$$= \frac{31.6\,gm}{316\,gm/mol} = 0.1 \text{ mole}$$
0.1 moles of potassium permanganate will give
$$\frac{5}{2} \times 0.1 = 0.250 \text{ moles of chlorine.}$$
The molar mass of Cl_2 = 71 g/mole
The mass of Cl_2 = 71 g/mole × 0.250 mol = 17.75 g

248. Two solutions NaCl and CH_3COOH are prepared separately. The molarity of both is 0.1 m and osmotic pressure p_1 and p_2 respectively. The correct relationship between osmotic pressure is

(a) $p_1 = p_2$ (b) $p_1 > p_2$
(c) $p_2 > p_1$ (d) $p_1 \neq p_2$

JCECE - 2018

Ans. (b) : NaCl is a salt made up of strong acid and strong base that completely dissociates to give 2 ions. As we know osmotic pressure is directly proportional to i (Van't Hoff factor) i.e. $\pi \propto i$. So, $P_1 > P_2$.

249. 1.0 g of Mg is burnt with 0.28 g of O_2 in a closed vessel. Which reactant is left in excess and how much?

(a) Mg, 5.8 g (b) Mg, 0.58 g
(c) O_2, 0.24 g (d) O_2, 2.4 g

Karnataka-CET-2018

Ans. (b) : The burning of Mg occurs as follows:
$2Mg + O_2 \rightarrow 2MgO$
Moles 212
Molar mass of Mg = 48g and O_2 = 32g
32 g of oxygen, needs 48 g of Mg
$$0.28 \text{ g of oxygen, needs} = \frac{48 \times 0.28}{32}$$
$$= 0.42\,g \text{ of Mg}$$
Mg left (in excess) = 1– 0.42 = 0.58g

250. Mass % of carbon in ethanol is

(a) 52 (b) 13
(c) 34 (d) 90
(e) 80

Kerala-CEE-2018

Ans. (a) : Molecular mass of C_2H_5OH = 46.00
[Atomic mass of C = 12, H = 1, O = 16]
46.00 of C_2H_5OH is contain, C = 24g
$$\text{Mass \% of Carbon} = \frac{\text{Molar mass of carbon}}{\text{Molar mass of ethanol}} \times 100$$
$$= \frac{24 \times 100}{46}$$
$$= 52.17\% \approx 52\%$$

251. 1.2 g of Mg (at. mass 24) will produce MgO equal to :

(a) 0.05 mol (b) 40 g
(c) 40 mg (d) 4 g

Manipal-2018

Ans. (a) : $Mg + \frac{1}{2}O_2 \rightarrow MgO$
From the above equation
1 mol of Mg reacts to give 1 mol of MgO.
Number of moles of Mg in
$$1.2 \text{ g} = \frac{1 \times 1.2}{24} = 0.05 \text{ mol of Mg}$$
The number of moles of MgO = 0.05 mol

252. The Avogadro number or a mole represents :

(a) 6.02×10^{23} ions
(b) 6.02×10^{23} atoms
(c) 6.02×10^{23} molecules
(d) 6.02×10^{23} entities

HP CET-2018

Ans. (b): Avogadro's number is the number of particles/atom in one mole of any substance.
$N_a = 6.023 \times 10^{23}$ atom.

253. To a 4 L of 0.2 M solution of NaOH 2 L of 0.5 M NaOH are added. The molarity of resulting solution is :

(a) 0.9 M (b) 0.3 M
(c) 1.8 M (d) 0.18 M

Manipal-2018

Ans. (b) : Given,
$M_1 = 0.2$ M ; $V_s = 4$ L
$M_2 = 0.5$ M ; $V_s' = 2$ L
$$M_{total} = \frac{M_1V_s + M_2V_s'}{V_s + V_s'} = \frac{0.2 \times 4 + 0.5 \times 2}{4 + 2}$$
$$= \frac{0.8 + 1.0}{6} = \frac{1.8}{6} = 0.3M$$

254. If 20 g of $CaCO_3$ is treated with 100 mL of 20% HCl solution, the amount of CO_2 produced is :

(a) 22.4 L (b) 8.80 g
(c) 4.40 g (d) 2.24 L

Manipal-2018

Ans. (b) :
$CaCO_3 + 2HCl \rightarrow CaCl + CO_2 + H_2O$
100g 73g 44g
100 mL of 20% HCl solution = 20g HCl
$CaCO_3$ is the limiting reactant 100g of $CaCO_3$ gives 44g CO_2
$$20g\ CaCO_3 \text{ gives } \frac{44}{100} \times 20 = 8.80\,g \text{ of } CO_2.$$

255. A mixture of 2.3 g formic acid and 4.5 g oxalic acid is treated with conc. H_2SO_4. The evolved gaseous mixture is passed through KOH pellets. Weight (in) g of the remaining product at STP will be

(a) 1.4 (b) 3.0
(c) 2.8 (d) 4.4

NEET-2018

@apna_pdf

Ans. (c)

$$HCOOH \xrightarrow{H_2SO_4} CO + H_2O \qquad ....(i)$$

$$(COOH)_2 \xrightarrow{H_2SO_4} CO + CO_2 + H_2O \qquad ....(ii)$$

Conc. H_2SO_4 is a strong dehydrating agent

Moles of HCOOH = $\frac{2.3}{46} = 0.05$ mole

Moles of $(COOH)_2$ = $\frac{2.3}{46} = 0.05$ mole

From reaction (i),
Number of CO formed = 0.05 mole
From reaction (ii),
Number of CO formed = 0.05 mole
Number of CO_2 formed = 0.05 mole
Hence, Total CO formed = 0.05 + 0.05 = 0.1 mole
KOH pellets absorbs all CO_2, H_2O absorbed by H_2SO_4 thus CO is remaining product.
Thus the weight of the remaining product = 0.1 × 28 = 2.8g

256. In which case is number of molecules of water maximum?

(a) 18 mL of water
(b) 0.18 g of water
(c) 0.00224 L of water vapours at 1 atm and 273 K
(d) 10^{-3} mol of water

NEET-2018

Ans. (a) : 1 moles of water contain = 6.023×10^{23} atom

(i) Mass of water = 18×1 = 18g (H_2O = 18)
Molecules of water

$$= \text{mole} \times N_A = \frac{18}{18} \times 6.023 \times 10^{23} = 6.023 \times 10^{23}$$

(ii) Molecules of water = mole × N_A

$$= \frac{18}{18} \times 6.023 \times 10^{23}$$
$$= 6.023 \times 10^{21}$$

(iii) Molecules of water = mole × 6.023×10^{23}
$$= 10^{-4} \times 6.023 \times 10^{23}$$
$$= 6.023 \times 10^{-19}$$

(iv) Molecules of water = mole × N_A = $6.023 \times 10^{23} \times 10^{-3}$
$$= 6.023 \times 10^{20}$$

From above, It is clear that 18 mL of water has maximum molecules.

257. One litre of an acidified solution of $KMnO_4$ containing 15.8 g $KMnO_4$ is decolourised by passing sufficient amount of SO_2. If SO_2 is produced by roasting of iron pyrite (FeS_2). The amount of pyrite required to produce the necessary amount of SO_2 will be

(a) 15.8 g FeS_2
(b) 15.0 g FeS_2
(c) 7.5 g FeS_2
(d) 7.9 g FeS_2

UPTU/UPSEE-2018

Ans. (b) $2\,KMnO_4 + 5SO_2 + 2H_2O \rightarrow K_2SO_4 + 2MnSO_4 + 2H_2SO_4$

Molar mass of $KMnO_4$ is 158.034 g/mol

Moles of $KMnO_4$ = $\frac{15.8g}{158.034\,g/mol} = 0.10$ moles

According to given equation, 2 moles of $KMnO_4$ reacts with 5 moles of SO_2

∴ 0.10 moles of $KMnO_4$ will react with $\frac{5}{2} \times 0.10$ moles of SO_2 i.e. 0.25 moles of SO_2

Given, SO_2 is produced by roasting of iron pyrite (FeS_2) as:

$4FeS_2 + 11O_2 \rightarrow 2Fe_2O_3 + 8SO_2$

So, 8 moles of SO_2 will be formed by 4 moles of FeS_2

∴ 0.25 moles of SO_2 will be formed by $\frac{4}{8} \times 0.25$ moles of FeS_2 = 0.125 moles of FeS_2

molecular mass of FeS_2 = 119.98 g mol^{-1}

∴ Amount of FeS_2 required to give necessary SO_2
= 119.98g mol^{-1} × 0.125 mol.
= 14.99g ≈ 15g of FeS_2

258. What will be the correct number of total electrons in 1.6 g methane ?

(a) 6.02×10^{24}
(b) 6.02×10^{23}
(c) 6.02×10^{22}
(d) 9.632×10^{23}

UPTU/UPSEE-2018

Ans. (b): Given mass of methane = 1.6g
Molecular weight of methane = 12 + 4 = 16 g mol^{-1}

Moles of methane $= \frac{\text{Given mass}}{\text{Molecular mass}}$

Moles of Methane = $\frac{1.6}{16} = 0.1$

In one mole there are 6.02×10^{23} atoms
In 0.1 mol there are $0.1 \times 6.02 \times 10^{23}$ atoms
= 6.02×10^{22} atoms
[No. of electron in CH_4 = 6+4=10]
Hence, Total number of electrons = Number of electrons present in CH_4 × atoms present in 0.1 mole
= 10× 6.02×10^{22} = 6.02×10^{23}

259. The heat of neutralisation of a strong base and a strong acid is 13.7 kcal. The heat released when 0.6 mole HCl solution is added to 0.25 mole of NaOH is

(a) 3.425 kcal
(b) 8.22 kcal
(c) 11.645 kcal
(d) 13.7 kcal

WB-JEE-2018

Ans. (a) :

$$\underset{1\,mol}{HCl} + \underset{1\,mol}{NaOH} \longrightarrow NaCl + H_2O$$

$$\Delta H = -13.7\ Kcal$$

According to question,

$$\underset{0.25\,mol}{HCl} + \underset{0.6\,mol}{NaOH} \longrightarrow NaCl + H_2O \qquad ....(i)$$

In equation (i), NaOH acts as a limiting reagent. for 1 mole of NaOH and 1 mole of HCl heat of neutralization = 13.7 kcal.

∴ For 0.25 mole of NaOH and 0.6 mole of HCl, heat of neutralization = 13.7 × 0.25 = 3.425 kcal.

260. How many moles of electrons will weigh one kilogram?

@apna_pdf

(a) 6.023×10^{23} (b) $\frac{1}{9.108}\times10^{31}$

(c) $\frac{6.023}{9.108}\times10^{54}$ (d) $\frac{1}{9.108\times6.023}\times10^{8}$

WB-JEE-2018

Ans. (d) : 1 mole of electrons = 6.023×10^{23} electrons
Mass of 1 mole of electrons
$= 6.023\times10^{23}\times9.108\times10^{-31}$ kg

No. of moles of electron in 1 kg $= \frac{10^8}{9.108\times6.023}$ moles of electrons.

Thus, $\frac{1}{9.108\times6.023}\times10^{8}$ moles of electrons will weight one kilogram.

261. The number of molecules of 8 g of oxygen gas at NTP is

(a) 6.022×10^{23} (b) $8\times6.022\times10^{23}$

(c) $\frac{1}{4}\times6.022\times10^{23}$ (d) $\frac{1}{2}\times6.022\times10^{23}$

Assam CEE-2018

Ans. (c) : Mass of Oxygen molecule O_2 = 8g
Molar mass of O_2 = 16 + 16 = 32g

The number of Moles O_2 in 8g of O_2 = $\frac{8}{32}=\frac{1}{4}$
= 0.25 moles

1 mole contains = 6.022×10^{23} number of O_2
Then 0.25 mole will contain

$6.022\times10^{23}\times\frac{1}{4}$

The number of molecules of 8 g of oxygen gas at NTP is $6.022\times10^{23}\times\frac{1}{4}$.

262. The 25 mL of a 0.15 M solution of lead nitrate, $Pb(NO_3)_2$ reacts with all of the aluminium sulphate, $Al_2(SO_4)_3$, present in 20 mL of a solution. What is the molar concentration of the $Al_2(SO_4)_3$?

$$\mathbf{3Pb(NO_3)_2(aq)+Al_2(SO_4)_3(aq)\rightarrow}$$
$$\mathbf{3PbSO_4(s)+2Al(NO_3)_3(aq)}$$

(a) 6.25×10^{-2} M (b) 2.421×10^{-2} M

(c) 0.1875 M (d) None of these

BITSAT-2018

Ans. (a) : Given,
$Al_2(SO_4)_3 + Pb(NO_3)_2 \rightarrow 3PbSO_4 + 2Al(NO_3)_3$
As we know,
Molar mass of $Pb(NO_3)_2$ = Volume × Concentration
= 25 × 0.15
= 3.75 mL M

And Molar mass of $Al_2(SO_4)_3$ $=\frac{1}{3}\times3.75$

Then, $M\times20=\frac{1}{3}\times3.75$

M = 0.0625M
$M = 6.25\times10^{-2}$M

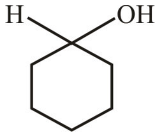
263. How many grams of cyclohexanol is required to produce 20 g cyclohexane, if % yield is 54%?

(a) 88 (b) 66

(c) 22 (d) 44

CG PET -2018

Ans. (d) : Formula of cyclohexanol is C_6H_{11} OH.



Molecular mass of C_6H_{11} OH = 100
Molecular mass of cyclohexane
$(C_6H_{12})=84$

∵ For 84 g of cyclohexane, we need = 100 g of material $C_6H_{11}(OH)$

∴ For 20 g of cyclohexane,

We need = $\frac{100\times20}{84}$
= 23.80 g of $C_6H_{11}(OH)$

∴ 54 g of $C_6H_{11}(OH)$ we get from = 100 g of $C_6H_{11}(OH)$

∴ 23.8 g of $C_6H_{11}(OH)$ get from = $\frac{100\times23.8}{54}$ = 44%

264. Excess of acidic solution of KI to mixed with 25 mL H_2O_2. Liberated I_2 requires 20 mL of 0.3 N $Na_2S_2O_3$ solution. The volume strength of H_2O_2 is

(a) 1.344 volume (b) 2.688 volume

(c) 1.5 volume (d) 2.5 volume

CG PET -2018

Ans. (a) : The reaction involved in this liberation is
$2KI+H_2O_2\rightarrow I_2+2KOH$
Normality of 25 ml H_2O_2 be x N
From above titration
N_1 = Normality of H_2O_2
V_1 = Volume of H_2O_2
N_2 = Normality of $Na_2S_2O_3$ or I_2
V_2 = Volume of $Na_2S_2O_3$ or I_2
$N_1V_1=N_2V_2$
a × 25 = 0.3 × 20
$a=\frac{0.3\times20}{25}$
a = 0.24
Normality of H_2O_2 solution = 0.24 N
Volume strength = Normality × Equivalent weight
Equivalent weight of H_2O_2 in terms of oxygen
= 5.6 L
Volume strength= 0.24 × 5.6
= 1.344 g L^{-1}

265. Number of electrons present in 3.6 mg of NH_4^+ are

@apna_pdf

(a) 1.20×10^{21} (b) 1.20×10^{20}
(c) 1.20×10^{22} (d) 2×10^{-3}

AMU-2017

Ans. (b) : Given, mass of NH_4^+ = 3.6 mg = 3.6×10^{-3} g

Molar mass of $NH_4^+ = (1 \times 14) + (4 \times 1) = 18$ g

[N = 14, H = 1]

$$\text{No. of moles} = \frac{\text{Given mass}}{\text{Molar mass}}$$

$$= \frac{3.6\times10^{-3}}{18} = 0.2\times10^{-3} \text{ moles}$$

No. of electrons in 3.6 mg of NH_4^+

= Moles × Avogadro Number

= $0.\ 2 \times 10^{-3} \times 6.023 \times 10^{23}$

= 1.2×10^{20} electron of NH_4^+

266. If 3.01×10^{20} molecules are removed from 98 mg of H_2SO_4, then number of moles of H_2SO_4 left are

(a) 0.1×10^{-3} mol (b) 9.95×10^{-2} mol
(c) 0.5×10^{-3} mol (d) 1.66×10^{-3} mol

Karnataka-CET-2017

Ans. (c) :

Molecular weight of H_2SO_4 = 98 mg = 98×10^{-3} g

$$\text{No. of moles} = \frac{\text{weight}}{\text{mole. wt.}}$$

$$= \frac{98 \times 10^{-3}}{98} = 10^{-3} \text{ moles} = 0.001 \text{ mol}$$

1 mole $H_2SO_4 = 6.022 \times 10^{23}$ molecules

0.001 moles = $6.022 \times 10^{23} \times 0.001$

= 6.022×10^{20} molecules

If 3.01×10^{20} molecules are removed then,

Remaining molecules = $6.022\times10^{20} - 3.01\times10^{20}$

= 3.01×10^{20}

$$\text{No. of moles} = \frac{3.01\times10^{20}}{6.022\times10^{23}}$$

$$= \frac{1}{2}\times10^{-3} = 0.5\times10^{-3} \text{ moles}$$

267. One mole of an unknown compound was treated with excess water and resulted in the evolution of two moles of a readily combustible gas. The resulting solution was treated with CO_2 and resulted in the formation of white turbidity. The unknown compound is

(a) Ca (b) CaH_2
(c) $Ca(OH)_2$ (d) $Ca(NO_3)_2$
(e) $CaSO_4$

Kerala-CEE-2017

Ans. (b) : The unknown compound is CaH_2 or calcium hydride

$CaH_2 + 2H_2O \rightarrow Ca(OH)_2 + 2H_2$

(2 mole)

readily combustible H_2 gas

$Ca(OH)_2 + CO_2 \rightarrow CaCO_3 + H_2O$

White turbidity.

268. The mass of $CaCO_3$ required to react with 25 mL of 0.75 M HCl is :

(a) 0.94 g (b) 9.4 g
(c) 0.094 g (d) 0.49 g

Manipal-2017

Ans. (a) :

1 moles $CaCO_3$ = 2 moles of HCl

$$\text{No. of moles of HCl} = \frac{MV}{1000} = \frac{0.75\times25}{1000} = 0.01875 \text{ moles}$$

$$\text{NO. of moles of } CaCO_3 = \frac{1}{2}\times\text{number of moles of HCl}$$

$$= \frac{1}{2}\times0.01875 = 9.375\times10^{-3}$$

Mass of $CaCO_3$ = No of moles × Molar Mass

[Molar mass of $CaCO_3$ = 40+12+16×3 = 100]

= $9.375 \times 10^{-3} \times 100 = 0.9375$g

269. What is the quantity of hydrogen gas liberated when 46 g sodium reacts with excess ethanol? (Given atomic mass of Na = 23)

(a) 2.4×10^{-3} kg (b) 2.0×10^{-3} kg
(c) 4.0×10^{-3} kg (d) 2.4×10^{-2} kg

MHT CET-2017

Ans. (b) : The reaction of ethanol with water is as follows-

$2C_2H_5OH(l) + 2Na(s) \rightarrow 2C_2H_5O^-Na^+ + H_2(g)\uparrow$

$$\text{Moles of Na (46g)} = \frac{\text{Mass}}{\text{Molecular weight}} = \frac{46}{23} = 2 \text{ mol}$$

Here, 2 moles of Na will give 1 mole of H.

The molecular weight of Hydrogen

$$= \frac{\text{Mass of hydrogen}}{\text{Moles of hydrogen}} = \frac{2}{1} = \text{g mol}^{-1}$$

Thus, quantity of hydrogen gas librated = 2 g

= 2×10^{-3} kg

270. The number of grams/weight of NH_4Cl required to be added to 3 liters of 0.01 M $NH_3$to prepare the buffer of pH=9.45 at temperature 298 K ($K_b$for NH_3 is 1.85×10^{-5})

(a) 0.354 gm (b) 4.55 gm
(c) 0.455 gm (d) 3.55 gm

UPTU/UPSEE-2017

Ans. (a) : Given pH = 9.45

K_b for NH_3 is 1.85×10^{-5}

$$pOH = pK_b + \log\frac{[NH_4Cl]}{[NH_3]}$$

$$\Rightarrow \ pOH = -\log K_b + \log\frac{[NH_4Cl]}{[NH_3]}$$

$(\because pK_b = -\log K_b)$

Also, pOH = 14 – pH = 14 – 9.45 = 4.55

$$\text{and } \log\frac{[NH_4Cl]}{[NH_3].K_b} = \log 3 \approx 0.470$$

$$\text{Thus, } \log 10^{14} - \left(\log10^9 + \log 3\right) \approx \log\frac{[NH_4Cl]}{[NH_3].K_b}$$

@apna_pdf

$$\frac{10^{14}}{10^9\times 3}\approx\frac{[NH_4Cl]}{[NH_3].K_b}$$

Or $\dfrac{10^4\times[NH_3].K_b}{10^9\times 3}$

$= [NH_4Cl]\approx\dfrac{10^{14}}{10^9\times 3}\times 0.01\times 1.85\times 10^{-5}$

$=$ 0.354 gm.

271. The yield of acetanilide in the reaction (100% conversion) of 2 moles of aniline with 1 mole of acetic anhydride is

(a) 270 g (b) 135 g

(c) 67.5 g (d) 177 g

WB-JEE-2017

Ans. (b) :

$$\underset{\text{Aniline}}{C_6H_5NH_2} + \underset{\substack{\text{Acetic}\\\text{anhydride}}}{(CH_3CO)_2O} \longrightarrow \underset{\text{Acetanilide}}{C_6H_5NHCOCH_3} + \underset{\text{Acetic acid}}{CH_3COOH}$$

Int.	2	1	0	0
Final	1	0	1	1

Thus acetic anhydride is the limiting reagent.

Molar mass of $C_6H_5NHCOCH_3$ or C_8H_9NO

$= 12 \times 8 + 9 \times 1 + 14 \times 1 + 16 \times 1$

$= 96 + 9 + 14 + 16 = 135$ g mol^{-1}

Amount of acetanilide formed = 1 mol

= 1 mol × 135 g mol^{-1} = 135g

272. 0.50 mol of $BaCl_2$ is mixed with 0.20 mol of Na_3PO_4 to get $Ba_3(PO_4)_2$. Number of moles $Ba_3(PO_4)_2$ of obtained are

(a) 0.6 mol (b) 0.2 mol

(c) 0.1 mol (d) 0.05 mol

BCECE-2017

Assam CEE-2014

Ans. (c) : Balanced equation for reaction between $BaCl_2$ and Na_3PO_4 is as follows:

$$3BaCl_2 + 2Na_3PO_4 \longrightarrow Ba_3(PO_4)_2$$

+ 6NaCl

3 moles of $BaCl_2$ react with 2 moles of Na_3PO_4 to give 1 mole of $Ba_3(PO_4)_2$

0.5 moles of $BaCl_2$ will react with (2/3) × 0.5 = 0.33 moles of Na_3PO_4

Available moles of Na_3PO_4 = 0.2

So, Na_3PO_4 is the limiting reagent

Now, 2 moles of Na_3PO_4 give 1 mole of $Ba_3(PO_4)_2$

So, 0.2 moles of $Na_3(PO_4)2$

Hence maximum number of moles of $Ba_3(PO_4)_2$ formed = 0.1

273. 4.9 g of H_2SO_4 is present in 100 mL solution. the molarity and normality of the solution will be

	Molarity	**Normality**
(a)	1M	0.5 N
(b)	1M	0.25 N
(c)	0.5M	1N
(d)	2M	3N

CG PET -2017

Ans. (c) : Given Mass of $H_2SO_4(w) = 4.9g$

Volume of solution (V)= 100mL

Molar mass (M)=98

Molarity (C) $= \dfrac{w\times 1000}{M\times V}, \therefore C = \dfrac{4.9}{98}\times\dfrac{1000}{100}$

Molarity = 0.5M

Normality (N)=Z× molarity (C)

where, Z= equivalent factor

For $H_2SO_4(Z=2) \Rightarrow 0.5M$

∴ Normality =2×0.5=1N

274. 1 g of a carbonate (M_2CO_3) on treatment with excess HCl produces 0.01186 mole of CO_2. The molar mass of M_2CO_3 in g mol^{-1} is

(a) 1186 (b) 84.3

(c) 118.6 (d) 11.86

[JEE Main-2017]

Ans. (b) : Given chemical equation.

$$M_2CO_3 + 2HCl \rightarrow 2MCl + H_2O + CO_2$$

1 gm 0.01186 mol

From the above chemical eq^n.

$$nM_2CO_3 = nCO_2$$

$$\frac{1}{\text{Molar mass of } M_2CO_3} = 0.01186$$

$$\text{Molar mass of } M_2CO_3 = \frac{1}{0.01186}$$

$$M = 84.3 \text{ g mol}^{-1}$$

275. At 25^{o}C consider the density of water is 1 g/L and that of propanol to be 0.925g/L what volume of propanol will have same number of molecules as present in 210 mL of water?

(a) 757 mL (b) 825 mL

(c) 646 mL (d) 437 mL

J & K CET-(2017)

Ans. (a) : Given, density of water = 1g/L

and Density of propanol = 0.925 g/L

$$\text{Density} = \frac{\text{Mass}}{\text{Volume}}$$

For water :

$1 = \dfrac{18}{V_{H_2O}}$ (molar mass of water = 18 g mol^{-1})

$V_{H_2O} = 18$ L

For propanol :

$0.925 = \dfrac{60}{V_{propanol}}$

[Molar mass of $CH_3CH_2CH_2OH$ = 60g mol^{-1}]

$V_{propanol} = 64.86$ L

Ratio : $\dfrac{V_{propanol}}{V_{H_2O}} = \dfrac{64.86}{18}$

$V_{propanol} = 3.603\times V_{H_2O}$

$V_{propanol} = 3.603\times 210$

$= 756.63$

$= 757$ mL

@apna_pdf

276. Dissolving 120 g of urea in 1000 g of water gave a solution of density 1.15 g/mL. The molarity of the solution is

(a) 1.78 M (b) 2 M
(c) 2.05 M (d) 2.22 M

JCECE - 2017

Ans. (c) : Given, Mass of urea = 120g
Molar mass of urea = 120 + 1000 = 1120 g
Density of solution = 1.15 g/mL

$$\text{Volume of solution} = \frac{\text{mass}}{\text{density}} = \frac{1120}{1.15} = 973.15\text{mL}$$

$$\text{Molarity} = \frac{W \times 1000}{M \times \text{Volume(in mL)}}$$

$$= \frac{120 \times 1000}{60 \times 973.15} = 2.05 \text{ M}$$

The molarity of the solution is 2.05M

277. How much CO_2 is produced on heating of 1 kg of carbon?

(a) $\frac{11}{3}$kg (b) $\frac{3}{11}$kg
(c) $\frac{4}{3}$kg (d) $\frac{3}{4}$kg

NDA (II)-2017

Ans. (a) : We know that, $C+O_2 \rightarrow CO_2$
12 g of C produces = 44 g of CO_2

$$\text{So,} \quad \frac{12}{1000} \text{ kg of C produces} = \frac{44}{1000} \text{ kg of } CO_2$$

$$\therefore 1 \text{ kg of C produces} = \frac{44}{1000} \times \frac{1000}{12} \text{kg of } CO_2$$

$$= \frac{11}{3} \text{ kg}$$

Hence, $\frac{11}{3}$ kg of CO_2 produced on heating 1 kg of carbon.

278. The compound $C_6H_{12}O_4$ contains

(a) 22 atoms per mole
(b) twice the mass percent of H as compared to the mass percent of C
(c) six times the mass percent of C as compared to the mass percent of H
(d) thrice the mass percent of H as compared to the mass percent of O

NDA (II)-2017

Ans. (c) : Given, $C_6H_{12}O_4$
Molar mass of C in $C_6H_{12}O_4$= 6×12=72
Molar mass of H in $C_6H_{12}O_4$= 1×12=12
Therefore, mass percent of C is six times as compared to the mass percent of H.

279. A 5.2 molal aqueous solution methyl alcohol, CH_3OH is supplied. What is the mole fraction of methyl alcohol in the solution?

(a) 0.05 (b) 0.10
(c) 0.18 (d) 0.086

JCECE - 2017

Ans. (d) : Given,
n_1 (CH_3OH) = 5.2 mol

$$n_2 (H_2O) = \frac{1000\text{g}}{18\text{g/mol}} = 55.56 \text{ mol}$$

$$\therefore \quad n_1 + n_2 = 5.20 + 55.56$$
$$= 60.76 \text{ mol}$$

$$\therefore \quad X_{CH_3OH} = \text{mole fraction of } CH_3OH$$

$$= \frac{n_1}{n_1 + n_2} = \frac{5.2}{60.76} = 0.086$$

280. The molality of 90% H_2SO_4 solution is [density = 1.8 g/mL]

(a) 1.8 (b) 48.4
(c) 91.8 (d) 94.6

COMEDK-2017

Ans. (c) : Given,
[density = 1.8 g/mL]
Sstrength of H_2SO_4=90%
and mass of solvent =100 – 90=10 g
Now, Molality= Moles of solute dissolved in

$$1000 \text{ g of the solvent} = \frac{90 \times 1000}{98 \times 10} = 91.8$$

281. 6g of a non-volatile, non-electrolyte X dissolved in 100 g of water freezes at –0.93ºC. The molar mass of X in g mol^{-1} is (K_f of H_2O = 1.86 K kg mol^{-1})

(a) 60 (b) 140
(c) 180 (d) 120

AP-EAMCET – 2016

Ans. (d) : Given that–
K_f = 1.86 K kg mol^{-1}
W = 6 gm
$\Delta T_f = -0.93^\circ C$
W' = 100 gm

$$\therefore \quad \Delta T_f = \frac{K_f \times W \times 1000}{M \times W'}$$

$$0.93 = \frac{1.86 \times 6 \times 1000}{M \times 100}$$

$$M = \frac{1.86 \times 6 \times 10}{0.93}$$

M = 120

282. The number of moles of H_2O in one litre is

(a) 50.5 (b) 55
(c) 55.05 (d) 55.55

SRMJEEE – 2015, 2010

Ans. (d) : A appropriate unit of measurement for water's density is gram per milliliter or 1 gram per cubic centimeter ($1g/cm^3$) i.e.
Density of water = 1 g/cc
and

$$\text{Density of water} = \frac{\text{Mass of water}}{\text{Volume of water}}$$

Or mass of water = 1 × 1000 = 1000 gm

@apna_pdf

$$\text{No. of moles} = \frac{\text{Mass of water}}{\text{Molecular weight}}$$

$$\text{No. of moles} = \frac{1000\text{ gm}}{18} = 55.5\text{ mol}$$

283. What weight of HCl is present in 155 mL of a 0.54 M solution?

(a) 3.06 g (b) 6.12 g
(c) 1.53 g (d) 0.30 g

AMU-2016

Ans. (a) : Given,
$V_s(\text{HCl}) = 155\text{ mL} = 0.155\text{ L}$
$n(\text{HCl}) = V_s(\text{HCl}) \times C(\text{HCl}) = 0.155\text{L} \times 0.540\text{M}$
$= 0.0837$ mol.
Molecular weight = 36.4 g/mol
$m(\text{HCl}) = n(\text{HCl}) \times M(\text{HCl})$
$= 0.0837\text{ mol} \times 36.5\text{ g/mol}$
$= 3.05505\text{g} \approx 3.060\text{ g}$

284. If 27 g of water is formed during complete combustion of pure propene (C_3H_6), the mass of propene burnt is

(a) 42 g (b) 21 g
(c) 14 g (d) 56 g
(e) 40 g

Kerala-CEE-2016

Ans. (b) : Given,
H_2O (formed) = 27g
Reaction,

$$\underset{\text{Propene}\,(3\times12+6=42)}{C_3H_6} + \frac{9}{2}O_2 \longrightarrow 3CO_2 + \underset{(3\times18=54)}{3H_2O}$$

The mass ratio between C_3H_6 and H_2O
$= 42:54$
$\therefore$ 54g of H_2O require = 42g C_3H_6
$\therefore$ 27g of H_2O require $= \frac{42\times27}{54}$
$= 21\text{g. } C_3H_6$

285. A silicon chip used in an integrated circuit of computer has a mass of 5.68 mg. The number of Si atoms present in this chip are :

(a) 144×10^{20} atoms (b) 18×10^{20} atoms
(c) 21×10^{20} atoms (d) None of these

Manipal-2016

Ans. (d) : Given,
Molar mass of Si = 28g = 28000 mg
So, 28000 mg of Si contain 6.022×10^{23} atoms
Then, 5.68 mg of silicon contain $\frac{6.022\times10^{23}}{28000}\times5.68$
$= 0.00122 \times 10^{23} = 1.22 \times 10^{20}$ atoms
The number of Si atoms present in this chip is
$= 1.22 \times 10^{20}$ atoms

286. Cost of sugar ($C_{12}H_{22}O_{11}$) is ₹ 50 per kg. Calculate its cost per mol.

(a) ₹ 17.1 per mol (b) ₹ 27.1 per mol
(c) ₹ 14.1 per mol (d) none of the above

Manipal-2016

Ans. (a) : Given, cost of sugar = ₹ 50 kg
Molar mass of sugar $= 12 \times 12 + 1 \times 22 + 11 \times 16$
= 342g
[C = 12, H = 1, O = 16]
$\because$ Cost of 1000 g of sugar is Rs. 50
$\therefore$ Cost of 342g of sugar $= \frac{50}{1000}\times342$
= ₹. 17.1

287. A man writes his biodata with carbon pencil on the plane paper having mass 150 mg. After writing his biodata, he weighs the written paper and find its mass is 152 mg. What is the number of carbon atoms present in the paper?

(a) 1.0036×10^{20} (b) 5.02×10^{20}
(c) 1.0036×10^{23} (d) 0.502×10^{20}

Manipal-2016

Ans. (a) : We know,
Mass of C-atoms = 152–150 = 2mg
Molar mass of C-atoms = 12g = 12000mg
12000 mg of carbon contains $= \frac{6.022\times10^{23}}{12000}\times2$
$= 0.0010036\times10^{23}$
$= 1.0036\times10^{20}$ atoms.
Therefore, the number of carbon atoms present in 1.0036×10^{20} atoms.

288. The concentration of a solution can be expressed in molarity, normality, formality and molality. Among them, which mode of expression is the most accurate for the all conditions?

(a) Molarity (b) Formality
(c) Normality (d) Molality

Manipal-2016

Ans. (d) : Molality (m) $= \frac{\text{Moles of solute}}{\text{Mass of solvent in kg}}$

Molality is defined in terms of weight, hence independent of temperature. Remaining three concentration units are defined in terms of volume of solution, they depends on temperature.

289. When a liquid that is immiscible with water was steam distilled at. 95.2°C at a total pressure of 99.652 kPa. The distillate contained 1.27 g of the liquid per gram of water. What will be the molar mass of the liquid if the vapour pressure of water is 85.140 kPa at 95.2°C^2

(a) 99.65 g mol^{-1} (b) 18 g mol^{-1}
(c) 134.1 g mol^{-1} (d) 105.74 g mol^{-1}

UPTU/UPSEE-2016

Ans. (c): Given,
$P_{\text{total}} = 99.652\text{ kP}_a$
$P_{\text{water}} = P_B = 85.140\text{ kP}_a$
$P_{\text{liquid}} = P_A = (99.652–85.140)\text{ kP}_a$
$= 14.512\text{ kP}_a$

and $\frac{m_A}{m_B} = \frac{1.27}{1} \Rightarrow \frac{m_A}{m_B} = \frac{p_A m_A}{p_B m_B}$

@apna_pdf

$$M_A = \left(\frac{m_A}{m_B}\right)\left(\frac{p_B m_B}{p_A}\right)$$

$$M_A = 1.27 \times \left(\frac{85.140\,kP_a \times 18\,g\,mol^{-1}}{14.512\,kP_a}\right)$$

$$M_A \simeq 134.1\,g\,mol^{-1}$$

290. Number of atoms of sulphur in 9.8 grams of H_2SO_4 are–

(a) 0.6023×10^{23} (b) 6.023×10^{23}

(c) 6×10^{23} (d) 6.023×10^{21}

BCECE-2016

Ans. (a) : No. of atom in 9.8 g of H_2SO_4

$H_2SO_4 = 2 + 32 + 16 \times 4$

$= 98$

$$\text{No. of moles} = \frac{\text{Given mass}}{\text{Molecular mass}}$$

$$= \frac{9.8}{98}$$

$= 0.1$ moles

So, No. of atoms = No. of moles × N_A

$= 0.1 \times 6.023 \times 10^{23}$

$= 0.6023 \times 10^{23}$

291. For 1 molar solution of NaCl in water at 25^0C and 1-atm pressure show that–

(a) molarity = mole fraction

(b) molality = mole fraction

(c) Normality = mole fraction

(d) molarity = normality

BCECE-2016

Ans. (d) : 1 Molar solution of NaCl will have molarity and Normality.

292. If 50 mL of 0.1 M HCl and 200 mL of 0.01 M HCl are mixed together. The molarity of mixture will be –

(a) 0.28 M (b) 2.8 M

(c) 0.028 M (d) 28..57 M

BCECE-2016

Ans. (c) : Given,

$M_1 = 0.1$, $M_2 = 0.001$

$V_1 = 50$, $V_2 = 200$

$$M_{(mixture)} = \frac{M_1V_1 + M_2V_2}{V_1 + V_2}$$

$$\frac{(0.1\times 50)+(0.01\times 200)}{50+200}$$

$$\frac{5+2}{250} = \frac{7}{250}$$

Molarity of mixture = 0.028M.

293. Among the following gases of specified masses, which one has least number of molecules? (Atomic masses of H, C, O and S are respectively 1, 12, 16 and 32 g mol^{-1})

(a) 32 g of sulphur dioxide gas

(b) 8 g of oxygen gas

(c) 16 g of methane gas

(d) 4 g of hydrogen gas

J & K CET-(2016)

Ans. (b) : We know that,

32g of SO_2 gas:

Molar mass of SO_2 = 64 g

64 g $SO_2 \equiv 6.023 \times 10^{23}$ molecules

$\therefore$ 32 g of $SO_2 = 3.01 \times 10^{23}$ molecules

8 g of oxygen gas :

32 g of $O_2 \equiv 6.023 \times 10^{23}$ molecules

$$\therefore 8 \text{ g of } O_2 \equiv \frac{6.023\times10^{23}}{32}\times 8 = 1.5\times10^{23} \text{ molecules}$$

16 g of $CH_4 \equiv 6.023 \times 10^{23}$ molecules

4g of H_2 gas:

2g $H_2 \equiv 6.023 \times 10^{23}$ molecules

$$4 \text{ g of } H_2 \equiv \frac{6.023\times10^{23}}{2}\times 4$$

$= 12.046 \times 10^{23}$ molecules

294. 20 volume of H_2O_2 means

(a) 20% H_2O_2 solution

(b) 20 mL of solution contain 1 g of H_2O_2

(c) 1 mL of solution liberate 20 mL of O_2 at STP

(d) 20 mL of solution contain 1 mol of H_2O_2

JCECE - 2016

Ans. (c) : By definition volume strength of H_2O, the amount of O_2 liberated by 1 mL of H_2O_2 at STP is the volume strength of H_2O_2.

295. If 1.4 g of N_2(g) react with 1 g of H_2(g) to form ammonia (NH_3), then amount of NH_3(g) formed and number of atoms present in NH_3 respectively are (in moles)

(a) 0.5 and 0.1 (b) 0.1 and 0.1

(c) 0.1 and 0.5 (d) 0.5 and 0.5

JCECE - 2016

Ans. (b) : The relation used for formation of ammonia is

Given,

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$$

Relation by mass = 28 : 6 : 34

14 : 3 : 17

$N_2(g) = 1.4g \Rightarrow H_2(g) = 1g$

Thus, N_2(g) behave as a limiting reagent and NH_3(g) will formed as per amount of N_2 used.

Therefore,

14g of N_2 give NH_3 = 17 g

$$\therefore \quad 1.4 \text{ g of } N_2 \text{ give } NH_3 = \frac{17\times1.4}{14}$$

Amount of NH_3 (g) = 1.7 g

$$\text{No. of moles of } NH_3,\ n = \frac{w}{M}$$

$$n = \frac{1.7}{17} = 0.1 \text{ mol.}$$

Also

No. of moles of $NH_3 \equiv$ No. of atoms of N in NH_3

$\therefore$ If no. of moles of NH_3 = 0.1

Then, no. of moles of N-atoms in NH_3 = 0.1 mol

Hence,

No. of moles of NH_3 = 0.1 mol

No. of moles of N-atoms = 0.1 mol

@apna_pdf

296. Solid $NaHCO_3$ will be neutralized by 40.0mL of 0.1M H_2SO_4 solution. What would be the weight of solid $NaHCO_3$ in gram?

(a) 0.672g (b) 6.07g
(c) 17g (d) 20g

JIPMER-2016

Ans. (a) :

$$\underset{\substack{\text{Mole ratio}\ \ 2\text{mole}\\ =168\text{g}}}{2NaHCO_3} + H_2SO_4 \longrightarrow \underset{\substack{1\text{mole}\\ =98\text{g}}}{Na_2SO_4} + 2H_2O + 2CO_2$$

m- moles of $H_2SO_4 = M \times V_{mL} = 40.0\times0.01$
$= 4$ m – mole

Moles of $H_2SO_4 = M \times VmL = 40.0\times0.1 = 4m$ mol

Also, it can written as m-moles of $NaHCO_3$ when neutralised = 4×2 = 8m-moles.

$$\text{But m-mole} = \frac{w}{m}\times1000$$

$$8 = \frac{w}{84}\times1000 \Rightarrow w = \frac{84\times8}{1000} \Rightarrow w = 0.672\,g.$$

297. Which one of the following has different number of molecules? (All are kept at normal temperature and pressure)

(a) 3 gram of Hydrogen (b) 48 gram of Oxygen
(c) 42 gram of Nitrogen (d) 2 gram of Carbon

NDA (II)-2016

Ans. (d) : We know that,

1 mole= 6.022×10^{23} atom
1g of hydrogen= 6.022×10^{23} atoms
3g of hydrogen= $3\times6.022\times10^{23}$ atoms

$\frac{3}{2}\times6.022\times10^{23}$ molecule (∴hydrogen is diatomic)

Now , 16g of oxygen = 6.022×10^{23} atoms

48g of oxygen= $\frac{3}{2}\times6.022\times10^{23}$ atoms

(∴Oxygen is diatomic)

Again, 12g of carbon= 6.022×10^{23} atoms

2g of carbon= $\frac{1}{6}\times6.022\times10^{23}$ molecule

(∴carbon is monoatomic molecule)

Hence, 2g of C contain different number of molecules.

298. The number of oxygen atoms in 4.4g of CO_2 is

(a) 1.2×10^{23} (b) 6×10^{22}
(c) 6×10^{23} (d) 12×10^{23}

Karnataka-CET-2016

Ans. (a) : Given that,

$$\text{Moles of } CO_2 = \frac{4.4}{44} = 0.1\text{moles}$$

∴ Number of molecules of $CO_2 = 0.1 \times 6.022 \times 10^{23}$
$= 6.022 \times 10^{22}$ molecules

1 molecule of CO_2 contains 2 oxygen atoms.

∴Number of oxygen atoms $= 2 \times 6.022 \times 10^{22}$
$= 12.044 \times 10^{22}$ atoms
$= 1.2 \times 10^{23}$ atoms

299. One mole of $N_2O_{4(g)}$ at 300 K is kept in a closed vessel at 1 atm pressure. It is heated to 600 K when 20% by mass of $N_2O_{4(g)}$ decomposes to $NO_{2(g)}$. The resultant pressure is

(a) 1.2 atm (b) 2.4 atm
(c) 2.0 atm (d) 1.0 atm

AMU-2015

Ans. (b) : $N_2O_4 \rightarrow 2NO_2$

Moles of un reacted $N_2O_4 = 1(1 - 0.2) = 0.8$

Moles of $NO_2 = 2 \times 0.2 = 0.4$

Total moles $(n_2) = 0.8 + 0.4 = 1.2$

$$P_1/(T_1n_1) = P_2/T_2\times n_2$$

$$\frac{1}{300\times1} = \frac{P_2}{600\times1.2}.$$

$P_2 = 2.4$ atm

300. When 4A of current is passed through a 1.0 L, 0.10 M Fe^{3+} (aq) solution for 1 hour, it is partly reduced to Fe(s) and partly of Fe^{2+}(aq), Identify the incorrect statement.

(a) 0.10 mole of electrons are required to convert all Fe^{3+} to Fe^{2+}
(b) 0.025 mol of Fe(s) will be deposited
(c) 0.05 mol of iron remains as Fe^{2+}
(d) 0.050 mol of iron remains as Fe^{2+}

BCECE-2015

Ans. (d) : Given,

4 a, 1 hours, 1.0L, 0.l0mF_e^{+3}

$$\text{Number of } F = \frac{It}{96500} = \frac{4\times3600}{96500} = 0.15\,F$$

Initially mole Fe^{+3} =b 1 × 0.10 = 0.1 mole

$e^- + F3^{+3} \longrightarrow F^{+3}$

1F = 1 Mole $F3^{+3}$ deposited

0.15 F = 0.15 mole $F3^{+3}$ deposited > Initially mole

0.1 mole Fe^{+3} = 0.1 F electricity = 0.1 mole Fe^{+2}

Fe^{+2} 0.1 mole

$0.05\ F \Rightarrow Fe^{+2} + 2e^- \longrightarrow Fe$

2F = 1 mole Fe^{+2}

$$0.05 = \frac{1}{2}\times0.05 \text{ mole } Fe^{+2}\ 0.025 \text{ mole } Fe^{+2}$$

Fe mole = 0.025 mole

$Fe^{+2} \rightarrow 0.1 - 0.025 = 0.05$ mole

Hence the in correct option (d)

301. The number of Na atoms in 46g of Na (atomic weight of Na = 23) is

(a) 6.023×10^{23} (b) 2
(c) 1 (d) 12.046×10^{23}

J & K CET-(2015)

Ans. (d) : Given,

Molar mass of Na = 23 g, Given mass = 46 g

$$\text{No. of atoms} = \frac{\text{Given mass}\times N_A}{\text{Molar mass}}$$

$$= \frac{46\times6.022\times10^{23}}{23}$$

$$= 2\times6.022\times10^{23}$$

$= 12.044 \times 10^{23}$ atoms

∴ 46 g of Na contains 12.044×10^{23} atoms

302. In order to prepare one liter 1N solution of $KMnO_4$, how many grams of $KMnO_4$ are required, if the solution to be used in acid medium for oxidation?

@apna_pdf

(a) 128 g (b) 41.75 g
(c) 31.60 g (d) 62.34 g

JIPMER-2015

Ans. (c) : Given,
Normality = 1 N, volume = 1L

$$\text{Normality} = \frac{\text{No. of gram equivalence}}{\text{Volume of solution in (L)}}$$

No. of gram equivalence = N × V in (L)
= 1 × 1 = 1

$$\text{No. of gram equivalence} = \frac{\text{wt}}{\text{eq wt}}$$

$$\text{Where, eq. wt} = \frac{\text{molecular wt}}{\text{n} - \text{factor}} . \text{m.w} = 158\text{g}$$

$$\overset{+7}{\text{KMnO}_4} \xrightarrow{\quad 5 \quad} \overset{+2}{\text{Mn}} \quad \Rightarrow \text{ n factor} = 5$$

$$\text{equal} = \frac{158}{5} = 31.6$$

Let of $KMnO_4$ = eq. wt × No. of gram equivalence
= 31.6 × 1 == 31.6 g

303. What amount of dioxygen (in gram) contains 1.8×10^{22} molecules?
(a) 0.0960 (b) 0.960
(c) 9.60 (d) 96.0

Karnataka-CET-2015

Ans. (b): Dioxygen = O_2
Molar mass of O_2 = 2(16)
= 32g mol^{-1}
1 mole = 6.022×10^{23} molecule
32 g of O_2 = 6.022×10^{23} molecules of O_2
∴ 1.8×10^{22} molecules of O_2

$$= \frac{32 \times 1.8 \times 10^{22}}{6.022 \times 10^{23}} = 0.955 = 0.960$$

304. How many ions per molecular are produced in the solution, when Mohr salt is dissolved in excess of water?
(a) 4 (b) 5
(c) 6 (d) 10

Karnataka-CET-2015

Ans. (b) : Mohrs salt: $(NH_4)_2 Fe(SO_4)_2 . 6H_2O$

$$(NH_4)_2 Fe(SO_4)_2 \cdot 6H_2O \xrightarrow[\text{of water}]{\text{in excess}} 2NH_4^+ + 2SO_4^{2-} + Fe^{2+}$$

on dissolving in water two NH_4^+ ions, two SO_4^{2-} ions and one Fe^{2+} ion will be produced.
Total number of ions = 5

305. How many moles of platinum will be deposited on the cathode when 0.60 F of electricity is passed through a 1.0 M solution of Pt^{4+} ?
(a) 0.60 mol (b) 0.15 mol
(c) 0.30 mol (d) 0.45 mol
(e) 1.0 mol

Kerala-CEE-2015

Ans. (b) :
$$pt^{4+} + 4e^- \rightarrow pt$$
When 4F electricity is passed, it gives = 1mole pt
When 0.60 F electricity passed through solution then, the number of moles of pt = x
number of moles (x) = 0.6F/ 4F = 0.15 moles

306. A mixture of gases contains H_2 and O_2 gases in the ratio of 1 : 4 (w/w). What is the molar ratio of the two gases in the mixture?
(a) 16 : 1 (b) 2 : 1
(c) 1 : 4 (d) 4 : 1

NEET-2015, cancelled

Ans. (d) $$\text{Number of moles (n)} = \frac{\text{given mass (m)}}{\text{Molar mass (M)}}$$

As the ratio by weight of Hydrogen and Oxygen is 1: 4

$$\text{Molar ratio will be } \frac{n_{H_2}}{n_{o_2}} = \frac{32}{8} = 4:1$$

The molar ratio of hydrogen and Oxygen is 4 :1

307. Vapour pressure in mm Hg of 0.1 mole of urea in 180 g of water at 25°C is (The vapor pressure of water at 25°C is 24 mm Hg)
(a) 2.376 (b) 20.76
(c) 23.76 (d) 24.76

AP EAMCET (Engg.) -2014

Ans. (c) : Given,
$P^0 = 24, P_S = ?$

$$\frac{w}{m} = 0.1$$

From Raoults law –

$$\frac{P^\circ - P_S}{P^\circ} = \frac{w}{m} \times \frac{M}{W}$$

$$\frac{24 - P_S}{24} = 0.1 \times \frac{18}{180}$$

$24 - p_s = 0.24$
∴ $p_s = 23.76$ mm Hg

308. $KMnO_4$ reacts with KI, in basic medium to form I_2 and MnO_2. When 250 mL of 0.1 M KI solution is mixed with 250 mL of 0.02 M $KMnO_4$ in basic medium, what is the number of moles of I_2 formed?
(a) 0.015 (b) 0.005
(c) 0.005 (d) 0.01

AP EAMCET (Engg.) -2014

Ans. (b) : Given that,
Number of equivalents of $KMnO_4$ =
Number of equivalents of $I_2 = 0.02 \times 3 \times 250 \times 10^{-3}$
= 0.015

$$\text{Number of moles of } I_2 \text{ is } \frac{0.015}{2} = 0.005$$

309. Density of 3 M solution of NaCI is 1.25 g/mL. The mass of the solvent in the solution is
(a) 105.4 g (b) 10.745g
(c) 10.754 g (d) 1074.5g

COMEDK 2014

@apna_pdf

Ans. (d) : Density of solution = 1.25 g/mL
M = 3 mol/lit
Molar mass of NaCl = 58.5 g mol^{-1}

$$\text{No. of moles} = \frac{\text{Weight}}{\text{Molecular weight}}$$

∴ Mass of solution = d×V
= 1.25 g mL^{-1}×1000 mL= 1250 g
Mass of solute (NaCl) = n× molar mass
= 3×58.5=175.5 g
Mass of solvent = Mass of solution – mass of solute
= 1250–175.5= 1074.5 g

310. How many moles of magnesium phosphate $Mg_3(PO_4)_2$ will contain 0.25 mole of oxygen atoms?

(a) 0.02 (b) 3.125×10^{-2}
(c) 1.25×10^{-2} (d) 2.5×10^{-2}

SRMJEEE – 2014

Ans. (b) :
8 mole oxygen contained by → 1 mole of $Mg_3(PO_4)_2$

1 mole oxygen contained by → $\frac{1}{8}$ mole of $Mg_3(PO_4)_2$

∴ 0.25 mole oxygen contained by → $\left(\frac{1}{8}\times 0.25\right)$ mole of $Mg_3(PO_4)_2$

= 3.125×10^{-2} moles

311. 25 mL of 3.0 M HCl are mixed with 75 mL of 4.0 M HCl. If the volumes are additive, the molarity of the final mixture will be

(a) 4.0 M (b) 3.75 M
(c) 4.25 M (d) 3.50 M

AMU-2014

Ans. (b) : Given, M_1 = 25, V_1 = 3
M_2 = 75. V_2 = 4
On mixing two solutions of same substance Molarity of the final mixture, $M = \frac{M_1V_1 + M_2V_2}{V_1 + V_2}$

$$= \frac{25\times3+75\times4}{25+75} = \frac{375}{100} = 3.75 \text{ M}$$

312. The total number of protons in 10g of calcium carbonate is

(a) 1.5057×10^{24} (b) 2.0478×10^{24}
(c) 3.0115×10^{24} (d) 4.0956×10^{24}

Assam CEE-2014

Ans. (c) : 1 mole of $CaCO_3$ = 20 × 1 + 6 × 1 + 8 × 3
= 50
One mole of $CaCO_3$ contains 50 moles of protons.
10 g of CaCO3 contains:

$$\frac{50\times10}{100}$$

Moles of protons

$$\frac{500}{100} = 5$$

Number of protons = 5 × 6.02 × 10^{23}
= 3.01 × 10^{24} Protons.

313. In which one of the following, does the given amount of chlorine exert the least pressure in a vessel of capacity 1 dm^3 and 273K?

(a) 0.0355 g (b) 0.071 g
(c) 6.023×10^{21} molecules (d) 0.02 mol

BCECE-2014

Ans. (a) : Given that,
Ideal gas equation in

$$PV = nRT$$

When V and T are same

$$P \propto n$$

Thus when number of moles, i.e., n is least, it will exert the least pressure.

(a) $n = \frac{\text{Wt}}{\text{Mol. wt}} = \frac{0.0355}{35.5} = 1\times10^{-3}\text{ mol}$

(b) $n = \frac{0.071}{35.5} = 2\times10^{-3}\text{ mol}$

(c) $n = \frac{\text{Number of molecules}}{N_A}$

$$n = \frac{6.023\times10^{21}}{6.023\times10^{23}} = 0.01 \text{ mol}$$

(d) n = 0.02 mol
Thus, 0.0355 g chlorine will exert the least pressure.

314. 19 g of a mixture containing $NaHCO_3$ and Na_2CO_3 on complete heating liberated 1.12 L of CO_2 at STP. The weight of the remaining solid was 15.9 g. What is the weight (in g) of Na_2CO_3 in the mixture before heating?

(a) 8.4 (b) 15.9
(c) 4.0 (d) 10.6

BCECE-2014

Ans. (d) : The component $NaHCO_3$ can only produce CO_2 on heating of the given mixture as per following balanced equation.

$$2NaHCO_3 \rightarrow Na_2CO_3 + H_2O + CO_2$$

This equation reveals that 22.4 L CO_2 is produced from 2 moles or $NaHCO_3$
2(23 + 1 + 12 + 3 × 16) = 168 g $NaHCO_3$
1.12 L of CO_2 can be obtained from
168/22.4 × 1.12 = 8.4 g of $NaHCO_3$
Weight of Na_2CO_3 in the mixture of 19 g before heating was = 19 – 8.4 = 10.6 g

315. The volume strength of 1 molar solution of H_2O_2 is

(a) 11.2 (b) 22.4
(c) 5.6 (d) 56

JCECE - 2014

Ans. (a) : 1 molar H_2O_2 solution means 1 mole (or 34g H_2O_2) is present in 10^3 mL solution.
∴ 68 g H_2O_2 gives = 22400 mL of O_2

∴ 34 g H_2O_2 will gives = $\frac{22400\text{ mL}\times34}{68}$ = 11200 mL

Volume strength = $\frac{11200}{10^3} = 11.2$

@apna_pdf

316. 5.5 mg of nitrogen gas dissolves in 180 g of water at 273 K and 1 atm pressure due to nitrogen gas. The mole fraction of nitrogen in 180 g of water at 5 atm nitrogen pressure is approximately

(a) 1×10^{-6} (b) 1×10^{-5}

(c) 1×10^{-3} (d) 1×10^{-4}

Karnataka-CET-2014

Ans. (d) : Moles of $N_2 = \dfrac{5.5\times10^{-3}\text{g}}{28\text{g}}$

$P_{gas} = K_H.\ X_{gas}$

Moles fraction of :

$$\frac{P_1}{P_2}=\frac{X_1}{X_2}\Rightarrow\frac{1}{5}=\frac{\dfrac{5.5\times\dfrac{10^{-3}}{28}}{5.5\times\dfrac{10^{-3}}{28}+\dfrac{180}{18}}}{x_2}$$

$$X_2=5\left(\frac{0.0001964}{0.0001785+10}\right)$$

$$X_2=9.819\times10^{-5}$$

$$X_2=0.9819\times10^{-4}\approx1\times10^{-4}$$

317. 25 cm^3 of oxalic acid completely neutralized 0.064g of sodium hydroxide. Molarity of the oxalic acid solution is

(a) 0.064 (b) 0.045

(c) 0.015 (d) 0.032

Karnataka-CET-2014

Ans. (d) : Given,

V(oxalic acid) = $25cm^3$

W (NaOH) = 0.064 g

Moles of oxalic acid = Mole of NaOH

$$V(\text{oxalic acid})\times N(\text{oxalic acid})=\frac{W\ (\text{NaOH})}{M(\text{NaOH})}$$

$$N\ (\text{oxalic acid})=\frac{0.064\times1000}{25\times40}=0.064$$

Normality = Molarity × Basicity

$$\text{Molarity}=\frac{0.064}{2}=0.032$$

318. A sample of sea water contains 5×10^{-3} g of dissolved oxygen in 1 kg of the sample. The concentration of O_2 in that sea water sample in ppm is

(a) 5×10^{-4} (b) 5×10^{-3}

(c) 5×10^{-2} (d) 5×10^{-1}

(e) 5

Kerala-CEE-2014

Ans. (e) :

10^3g (1kg) sample contains oxygen= 5×10^{-3}g

$$\therefore\quad 10^6\text{g sample will contain oxygen}=\frac{5\times10^{-3}\text{g}}{10^3\text{g}}\times10^6\text{g}$$

= 5 ppm

Concentration of O_2 in that sea water sample in PPM is 5 ppm.

319. At 273 K, the density of a certain gaseous oxide at 2 atm is same as that of dioxygen at 5 atm. The molecular mass of the oxide (in g mol^{-1})

(a) 80 (b) 64

(c) 32 (d) 160

(e) 70

Kerala-CEE-2014

Ans. (a) : Given,

$P_1 = 2$, M_1 = ?

$P_2 = 5$, $M_2 = 32$

We know that-

$$pV=nRT=\frac{W}{M}RT$$

$$pM=\frac{W}{V}RT$$

$$pM=dRT\Rightarrow\text{or, }d=\frac{pM}{RT}$$

Since, R and T are constant and d_1=d_2

$\therefore\quad p_1 M_1 = p_2 M_2 \Rightarrow 2 \times M_1 = 5 \times 32$

$$M_1=\frac{5\times32}{2}=80\,\text{g mol}^{-1}$$

320. 20 mL solution of 0.1 M ferrous sulphate was completely oxidised using a suitable oxidising agent. What is the number of electrons exchanged?

(a) 1.204×10^{22} (b) 193

(c) 1930 (d) 1.204×10^{21}

MHT CET-2014

Ans. (d) : When oxidation of Fe_2SO_4, Fe^{2+}, ion is oxidises into $Fe^{3+} + e^-$

i.e. $1e^-$ is transferred from 1 molecule of $FeSO_4$, i.e. from $1Fe^{2++}$ ion.

molarity of $FeSO_4$ solution = 0.1 M

$$\text{Volume of solution} = 20\text{ mL}=\frac{20}{1000}\text{L}$$

$$\therefore\ \text{Number of moles}=0.1\times\frac{20}{1000}=0.002\ .$$

$\because$ In 1 mole $FeSO_4$, number of molecules

$= 6.022\times10^{23}$

$\therefore$ In 0.002 mol $FeSO_4$, number of molecules

$= 6.022 \times 10^{23} \times 0.002$

$= 1.204\times10^{21}$

$\therefore$Number of electrons transferred = 1.204×10^{21}

321. 1.0 g of magnesium is burnt with 0.56 g O_2 in a closed vessel, Which reactant is left in excess and how much? (At. wt. Mg = 24, O = 16)

(a) Mg, 0.16 g (b) O_2, 0.16 g

(c) Mg, 0.44 g (d) O_2, 0.28 g

NEET-2014

Ans. (a):

$2Mg + O_2 \rightarrow 2MgO$

2 moles of Mg require 1 mole of O_2 to produce 2 moles of MgO.

$$\text{Mole of Mg}=\frac{\text{given mass}}{\text{molar mass}}$$

@apna_pdf

$$= \frac{1}{24} = 0.041667$$

$$\text{moles of } O_2 = \frac{\text{gives mass}}{\text{molar mass}}$$

$$= \frac{0.56}{32} = 0.0175$$

⇒ 0.0175 moles O_2 require 0.0175 × 2 = 0.035 moles of Mg.

Mass of Magnesium (Mg) that reacts:-

Mass = moles × molar mass

= 0.035 × 24

= 0.84 g

That means only 0.84 g magnesium is used.

Therefore magnesium is in excess by 0.16 g

322. How many grams of $MgCO_3$ contain 24.00 g of oxygen? (The molar mass of $MgCO_3$ is 84.30 g mol^{-1})

(a) 42.15 g
(b) 84.30 g
(c) 126.00 g
(d) 154.00 g

NDA (II)-2014

Ans. (a) : Given data,

Molar mass of $MgCO_3$ = 84.30 g mol^{-1}

Gram of oxygen present in 1 mole $MgCO_3$

= 3 × atomic weight of oxygen

= 3 × 16

= 48 g

48g of oxygen present in 84.30 $MgCO_3$

$$1\text{ g } O_2 = \frac{84.30}{48} MgCO_3$$

$$24\text{ g } O_2 = \frac{84.30}{48} \times 24$$

= 42.15 g

323. The system that contains the maximum number of atoms is

(a) 4.25 g of NH_3
(b) 8 g of O_2
(c) 2 g of H_2
(d) 4 g of He

WB-JEE-2014

Ans. (c) : 17g of NH_3 = 4 × N_A atoms

$$\therefore 4.25\text{ g of } NH_3 = \left(\frac{4.25}{17}\right) \times 4 \times N_A = N_A \text{ atoms}$$

32g of O_2 = 2 × N_A atoms

$$8\text{g of } O_2 = \frac{2\times 8}{32} \times N_A = \frac{N_A}{2} \text{atoms}$$

2g of H_2 = 2 × N_A atoms

= 2 N_A atoms

4g of He = N_A atoms

Thus, the system that contains 2g of H_2 has maximum numbers of atoms.

324. The volume occupied by 16 g of oxygen gas at S.T.P. is

(a) 22.4 L
(b) 44.8 L
(c) 11.2 L
(d) 5.6 L

AMU-2013

Ans. (c) : Gram Molecular mass of oxygen = 32 g

Now 32 g oxygen at STP occupies volume = 22.4 lit

∴ 16 g oxygen at STP would occupy volume

$$= \frac{22.4}{32} \times 16 = 11.2 \text{ liters}$$

325. 100 mL of 0.1 M H_2SO_4 is mixed with 100 mL of 0.1 N NaOH. The normality of the solution obtained is

(a) 0.4 N
(b) 0.05 N
(c) 0.04 N
(d) 0.2 N

AMU-2013

Ans. (b) : We know,

N_1V_1 = 0.2 × 100 = 20

(0.1 MH_2SO_4 = 0.2 NH_2SO_4) acid

N_2V_2 = 0.1 × 100 = 10 base

N_1V_1 acid > N_2V_2 base therefore, resultant mixture is acidic.

$$\text{Resultant normality} = \frac{N_1V_1 - N_2V_2}{V_1 + V_2} = \frac{20-10}{200}$$

$$= \frac{10}{200} = 0.05 \text{ N}$$

326. What volume of oxygen at 18°C and 750 torr, can be obtained from 110 g of $KClO_3$?

(a) 32.6 L
(b) 42.7 L
(c) 3.26 L
(d) 4.27 L

AMU-2013

Ans. (a) : Since,

$$2KClO_3 \rightarrow 2KCl + 3O_2$$

245 g $KClO_3$ gives = 3 mole O_2

$$110 \text{ g } KClO_3 \text{ will give} = \frac{3\times 110}{245} = 1.346 \text{ mole}$$

PV = nRT

Given P = 750 torr, V = ?

R = 62.364 dm^3 Torr k^{-1} mol^{-1}

and T = 273 + 18 = 291 K

$$V = \frac{1.346 \times 62.34 \times 291}{750}$$

$$= 32.569 \approx 32.6 \text{L}$$

327. A drop water is about 0.05 mL. The density of water at room temperature is about 1.0 mL^{-1}. The number of water molecules present in a drop of water are

(a) 1.67 × 10^{21} H_2O molecules
(b) 1.67 × 10^{26} H_2O molecules
(c) 1.806 × 10^{23} H_2O molecules
(d) 1.806 × 10^{21} H_2O molecules

JCECE - 2013

Ans. (a) : Given,

$$d = \frac{m}{v} \text{ or mass of 0.05 mL water}$$

= 0.05 mL × 1.0 gmL^{-1} = 0.05g H_2O

$$\text{Therefore, Moles of } H_2O = \frac{0.05}{18} \text{mol } H_2O$$

$$= \frac{6.023\times 10^{23} \times 0.05}{18}$$

= 1.67 × 10^{21} H_2O molecules

@apna_pdf

328. The mass of 112 cm^3 of NH_3 gas at STP is

(a) 0.085 g (b) 0.850 g

(c) 8.500 g (d) 80.500 g

Karnataka-CET-2013

Ans. (a): The molar volume of a gas is volume of one mole of a gas at STP. At STP, one mole of any gas occupies a volume of 22.4 L=22400 cm^3.

Therefore, 1 mol of NH_3= 17g = 22400 cm^3 at STP

$\therefore$ 112 cm^3 of NH_3 at STP will have mass

$$=\frac{17}{22400}\times 112 = 0.085\,g$$

329. The number of water molecules present in a drop of water weighing 0.018 g is

(a) 6.022×10^{26} (b) 6.022×10^{23}

(c) 6.022×10^{19} (d) 6.022×10^{20}

Karnataka-CET-2013

Ans. (d) : We know,

Number of moles $=\frac{0.018}{18} = 0.001$ moles

Number of molecules = moles · N_A

$= 0.001\times 6.022 \times 10^{23}$

$= 1\times10^{-3}\times6.022\times10^{23}$

$= 6.022 \times 10^{20}$

330. An organic compound crystallises in an ortho rhombic system with two molecules per unit cell. The unit cell dimensions are 12.05, 15.05 and 2.69 $\overset{o}{A}$. If the density of the crystal is 1.419 g cm^{-3}, then molar mass of compound will be

(a) 207 g mol^{-1} (b) 209 g mol^{-1}

(c) 308 g mol^{-1} (d) 317 g mol^{-1}

UPTU/UPSEE-2013

Ans. (b): Orthorhombic system has different edge length, width and height

Given,

$\therefore$ a = 12.05 $\overset{o}{A}$ = 12.05×10^{-8} cm

b = 15.05 $\overset{o}{A}$ = 15.05×10^{-8} cm

c = 2.69 $\overset{o}{A}$ = 2.69×10^{-8} cm

$\therefore$ System has 2 molecules per unit cell.

Z = 2

and $N_A = 6.023 \times 10^{23}$

$$\text{Density. P} = \frac{Z\times M}{a^3\times N_A}$$

Now, molecular mass =

$$M=\frac{1.419\times12.05\times10^{-8}\times15.05\times10^{-8}\times2.69\times10^{-8}\times6.023\times10^{23}}{2}$$

$$M=2084.6\times10^{-1} = 209\,\text{gmole}^{-1}$$

331. If a LPG cylinder contains mixture of butane and isobutene, then the amount of oxygen that would be required for combustion of 1 kg of it will be

(a) 2.50×10^3 g (b) 4.50×10^3 g

(c) 1.80×10^3 g (d) 3.58×10^3 g

UPTU/UPSEE-2013

Ans. (d) :

$$C_4H_{10}+\frac{13}{2}O_2 \rightarrow 4CO_4 + 5H_2O$$

58g C_4H_{10} required $O_2 = \frac{13}{2}\times 32g$

1000g C_4H_{10} required $O_2 = \frac{13\times32\times1000}{58}$

$= 3.58 \times 10^3$ g

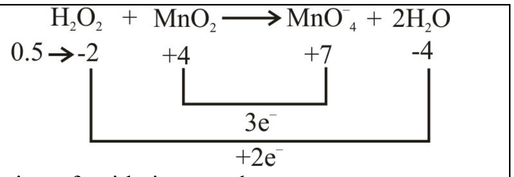
332. H_2O_2 oxidises MnO_2 is MnO_4^- in basic medium, H_2O and MnO_2 react in the molar ratio of–

(a) 1 : 1 (b) 2 : 1

(c) 2 : 3 (d) 3 : 2

BCECE-2013

Ans. (d):



On Balancing of oxidation number, we get-

$$3H_2O_2 + 2MnO_2 \rightarrow 2MnO_4^- + 6H_2O$$

Thus H_2O_2: MnO_2 = 3: 2

333. In HNC, which element has least value of formal charge?

(a) H (b) N

(c) C (d) All have same value

BCECE-2013

Ans. (c) : We know,

$$\text{Formal charge, F} = V-\frac{S}{2}-u$$

Where, V = valency electrons

S = shared electrons

u = unshared electron.

	H	N	C
V	1	5	4
S	2	8	6
U	0	0	2
F	0	1	–1

334. Haemoglobin contains 0.33% of iron by weight. The molecular weight of haemoglobin is approximately 67200. The number of iron atoms (At. Wt. of Fe = 56) persent in one molecule of haemoglobin is

(a) 4 (b) 1

(c) 5 (d) 2

BITSAT 2013

Ans. (a) : Given,

$\because$ 100 g Hb contain = 0.33 g Fe

$$\therefore 67200\,g\,Hb = \frac{67200\times0.33}{100}g\,Fe$$

$$\text{Gram atom of Fe} = \frac{672\times0.33}{56} = 4$$

335. How many grams of concentrated nitric acid solution should be used to prepare 250 mL of 2.0M HNO_3? The concentrated acid is 70% HNO_3.

@apna_pdf

(a) 90.0 g conc. HNO_3 (b) 70.0 g conc. HNO_3
(c) 54.0 g conc. HNO_3 (d) 45.0 g conc. HNO_3

BITSAT-2013

Ans. (d) : $\text{Molarity (M)} = \dfrac{\text{wt} \times 1000}{\text{mol.wt} \times \text{vol (mL)}}$

$$2 = \frac{\text{wt.}}{63} \times \frac{1000}{250}$$

$$\text{wt.} = \frac{63}{2}\text{g}$$

$$\text{wt. of 70\% acid} = \frac{100}{70} \times 31.5 = 45\,\text{g}$$

336. How many moles of O_2 can be obtained by electrolysis of 90 g H_2O?
(a) 5.0 mol (b) 0.50mol
(c) 2.5 mol (d) 0.25 mol

CG PET- 2013

Ans. (c) : Electrolytic decomposition of 18 g of water gives 0.5 mole of O_2.
90 g of water will give (0.5/18) × 90
= 2.5 moles of O_2.

337. Which of the following would contain the same number of atoms as 20 grams of calcium?
[At masses : Ca = 40, Mg = 24, C = 12]
(a) 24 grams of magnesium
(b) 12 grams of carbon
(c) 24 grams of carbon
(d) 12 grams of magnesium

J & K CET-(2013)

Ans. (d) : Number of atoms in 40 g of Ca = 6.022 × 10^{23} (Avogadro's number)
∴ Number of atoms in 20 g of Ca =

$$\frac{6.022 \times 10^{23} \times 20}{40} = 3.011 \times 10^{23}$$

Number of atoms in 24 g of Mg = 6.022×10^{23}
∴ Number of atoms in 12 g of Mg =

$$\frac{6.022 \times 10^{23} \times 12}{24} = 3.011 \times 10^{23}$$

Number of atoms in 12 g of Carbon = 6.022×10^{23}
Number of atoms in 24 g of Carbon = $2 \times 6.022 \times 10^{23}$
= 12.044 × 10^{23}

338. Which has minimum number of atoms ?
(a) 24 gms of $C_{(12)}$ (b) 56 gms of $Fe_{(56)}$
(c) 27 gms of $Al_{(27)}$ (d) 108 gms of $Ag_{(108)}$

MPPET-2013

Ans. (a) :

Species	**Mole**	**No. of atom**
24gms of C	$\frac{12}{24} = \frac{1}{2}$	$\frac{1}{2}N_A$
56 gms of Fe	$\frac{56}{56} = 1$	1 N_A
27 gms of Al	$\frac{27}{27} = 1$	1 N_A
108 gms of Ag	$\frac{108}{108} = 1$	1 N_A

Hence, the option (a) is correct.

339. In an experiment it showed that 10 mL of 0.05 M solution of chloride required 10 mL of 0.1 M solution of $AgNO_3$. Which of the following will be the formula of the chloride? (X stands for the symbol of the element other than chlorine.)
(a) X_2Cl_2 (b) XCl_2
(c) XCl_4 (d) X_2CI

COMEDK 2013

Ans. (b) : Millimoles of solution of chloride
= 0.05×10=0.5
Millimoles of $AgNO_3$ solution = 10×0.1 =1
So, the millimoles of $AgNO_3$ are double than the chloride solution.

$$\therefore XCl_2 + 2AgNO_3 \longrightarrow 2AgCl + X(NO_3)_2$$

340. Calculate the normality of 10 volume H_2O_2?
(a) 1.7 N (b) 12 N
(c) 30.3 N (d) 0.0303 N

(AIIMS-2013)

Ans. (a): $\text{Normality} = \dfrac{\text{Gram equivlent}}{\text{volume}}$

$$\text{Gram equivalent} = \frac{\text{Molar mass}}{\text{Normality factor}}$$

Molar mass of H_2O_2 is = 1 × 2 + 2 × 16 = 34 g
N. factor of H_2O_2 is 2.

$$\text{Gram equivalent} = \frac{34}{2} = 17$$

$$\text{Normality} = \frac{17}{10} = 1.7$$

341. Number of atoms in 560 cm^3 of oxygen at S.T.P. is
(a) $\frac{1}{20} \times 6.022 \times 10^{23}$ (b) $\frac{1}{40} \times 6.022 \times 10^{23}$
(c) $\frac{1}{16} \times 6.022 \times 10^{23}$ (d) $\frac{1}{32} \times 6.022 \times 10^{23}$

COMEDK-2012

Ans. (a) : 22400 cm^3 of oxygen (O_2) at S.T.P.
=2 ×6.022×10^{23} atoms
560 cm^3 of oxygen at S.T.P.

$$= \frac{2 \times 6.022 \times 10^{23}}{22400} \times 560 = \frac{1}{20} \times 6.022 \times 10^{23}\ \text{atoms}$$

342. How many molecules of CO_2 are formed when one milligram of 100% pure $CaCO_3$ is treated with excess hydrochloric acid?
(a) 6.023 × 10^{23} (b) 6.023 × 10^{21}
(c) 6.023 × 10^{20} (d) 6.023 × 10^{19}
(e) 6.023 × 10^{18}

Kerala-CEE-2013

Ans. (e) :

$$\underset{100g}{CaCO_3} + 2HCl \rightarrow CaCl_2 + H_2O + \underset{1mol}{CO_2}$$

∵ 100g $CaCO_3$ gives, molecules of CO_2 = 6.022×10^{23}
∴ 1×10^{-3}g $CaCO_3$ given molecules of CO_2 =

$$\frac{6.022 \times 10^{23} \times 1 \times 10^{-3}}{100} = 6.022 \times 10^{18}$$

@apna_pdf

343. The volume of CO_2 (in cm^3) liberated at S.T.P. when 1.06 g of anhydrous sodium carbonate is treated with excess of dilute HCl is [atomic mass of Na = 23J]

(a) 112 (b) 224

(c) 56 (d) 2240

COMEDK-2012

Ans. **(b)** :

$$\underset{\substack{106g \\ 1.06g}}{Na_2CO_3} + 2HCl \rightarrow 2NaCl + \underset{\substack{22400cm^3 \\ \frac{22400}{106}\times 1.06cm^3 \\ =224cm^3}}{CO_2} + H_2O$$

344. The number of moles of electrons required to deposit 36 g of Al from an aqueous solution of $Al(NO_3)_3$ is (At. wt. of Al = 27)

(a) 4 (b) 2

(c) 3 (d) 1

AP EAMCET (Engg.) 2012

Ans. (a) : $Al(NO_3)_3 \longrightarrow Al^{+3} + 3NO_3^-$

$$\underset{3\text{ mol}}{Al^{3+} + 3e^-} \longrightarrow \underset{1\text{ mole} = 27\text{ gm}}{Al}$$

$\therefore$ 27 gm of Al is deposited by 3 moles of electrons.

$\therefore$ 36 gm of Al will be deposited by electrons $= \frac{3}{27}\times 36 = 4$ mole

345. The vapour density of a mixture containing NO_2 and N_2O_4 is 27.6 Mole fraction of NO_2 in the mixture is

(a) 0.8 (b) 0.6

(c) 0.4 (d) 0.2

AIIMS-2012

Ans. (a): Let the moles of NO_2 be x.

Moles of N_2O_4 will be 1 – x

Molar mass = 2 × Vapour density

So, Molar mass = 2 × 27.6 = 55.2 g

Molar mass of NO_2 = 46 g and N_2O_4 = 92 g

$$\frac{x\times 46 + (1-x)\times 92}{1} = 55.2$$

$46x + 92 - 92x = 55.2$

$$x = \frac{36.8}{46} = 0.8$$

Here, mole fraction of NO_2 in the mixture is 0.8

346. For preparing 0.1 N solution of a compound from its impure sample of which the percentage purity is known, the weight of the substance required will be

(a) less than the theoretical weight

(b) more than the theoretical weight

(c) same as the theoretical weight

(d) none of these

AIIMS-2012

Ans. (b): The sample contains impurity. The impurity won't contribute to the normality of the solution. So, we need to take more amount of sample than the theoretical weight so that the theoretical weight of compound equals weight of compound in the sample.

347. Which has the maximum number of molecules among the following ?

(a) 44 g CO_2 (b) 48 g O_3

(c) 8 g H_2 (d) 64 g SO_2

VITEEE- 2012, NEET Mains-2011

Ans. (c) : $\text{No. of moles}(n) = \frac{\text{weight in gram}}{\text{molecualr weight}}$

$$(i)\ 44\text{ gram } CO_2 = \frac{44}{44} \quad \begin{cases} \text{Molecular weight of } CO_2 \\ = 12 + 2\times 16 \\ = 12 + 32 \\ = 44 \end{cases}$$

= 1 mol

= N_A i.e. 6.022×10^{23} atoms

$$(ii)\ 48\text{ gram } O_3 = \frac{48}{48} = 1\text{ mol}$$

$$(iii)\ 8\text{ gram } H_2 = \frac{8}{2} = 4\text{ mol}$$

$$(iv)\ 64\text{ gram } SO_2 = \frac{64}{(32+2\times 16)} = \frac{64}{64} = 1\text{ mol}$$

So, maximum no. of moles present in H_2.

348. Which one of the following will have largest number of atoms?

(a) 1 g Au (b) 1 g Na

(c) 1 g Li (d) 1 g Cl_2

BCECE-2012

Ans. (c) : (i) 197 g of Au Contains = 6.022×10^{23}

1 gm of Au Contains = $\frac{6.022\times 10^{23}}{197\times 1}$

= 3.06×10^{21} atoms

(ii) 23 g of Na Contains atoms = 6.022×10^{23}

1 gm of Na Contains atoms = $\frac{6.022\times 10^{23}}{23\times 1}$

= 26.2×10^{21} atoms

(iii) 7 g of Li Contains atoms = 6.022×10^{23}

1 g of Li Contains atoms = $\frac{6.022\times 10^{23}}{7\times 1}$

= 86.0×10^{21} atoms

(iv) 1 g of Cl Contains atoms = $\frac{6.022\times 10^{23}}{71\times 1}$

= 8.48×10^{21} atoms

Hence, 1 g of Li will have the largest number of atoms.

349. Morality of liquid HCl if density of solution is 1.17 g/cc

(a) 36.5 (b) 18.25

(c) 32.05 (d) 42.10

BCECE-2012

@apna_pdf

Ans. (c) : Molarity = (density /molar mass) × 1000 moles per liter.

Molar mass of HCl = [1 + 35.5] = 36.5 g/mol

Molarity = (1.17/36.5) × 1000 = 32.05 M

Molarity of liquid HCl with density equal to 1.17 g/cc is 32.05.

350. The volume of neon gas in cm^3 at STP having the same number of atoms as that present in 800 mg of Ca is (At. mass : Ca = 40 g mol^{-1} Ne = 20 g mol^{-1})

(a) 56 (b) 896
(c) 224 (d) 112
(e) 448

Kerala-CEE-2013

Ans. (e) : Given,

Mass of Ca = 800mg = $\frac{800}{1000} = 0.8g$

Moles of Ca in 0.8g = $\frac{0.8}{40} = 2\times10^{-2}$

∵ At S.T.P. Volume of 1 mole = 22400 cm^3

∴ At S.T.P, Volume of 2×10^{-2} moles

$= 22400 \times 2 \times 10^{-2} = 448\ cm^3$

351. Avogadro number (6.023×10^{23}) of carbon atoms are present in

(a) 12 grams of $^{12}CO_2$
(b) 22.4 liter $^{12}CO_2$ in room temperature
(c) 44 grams of $^{12}CO_2$
(d) 12 moles of $^{12}CO_2$

J & K CET-(2012)

Ans. (c) : 1 mole of CO_2

= Gram molecular mass of CO_2 (44g)

= 6.023×10^{23} molecules of CO_2

= 6.023×10^{23} atoms of Carbon

352. The volume of 0.1 M $Ca(CH)_2$ required to neutralize 10 mL of 0.1 N HCl

(a) 10 mL (b) 20 mL
(c) 5 mL (d) 15 mL

J & K CET-(2012)

Ans. (c) : The volume of 0.1 M $Ca(OH)_2$ required to neutralize 10 mL of 0.1 N HCl =

$$\underset{Ca(OH)_2}{2M_1V_1} = \underset{(HCl)}{M_2V_2}$$

(because 0.1 NHCl = 0.1 MHCl)

$2 \times 0.1 \times v_1 = 0.1 \times 10$

$v_1 = \frac{0.1\times10}{2\times0.1}$

$v_1 = 5$ mL

353. 6.02×10^{20} molecules of urea are present in 100 ml. of its solution. The concentration of solution is

(a) 0.001 M (b) 0.1 M
(c) 0.02 M (d) 0.01 M

NEET-2013

Ans. (d) : Number of molecules of Urea = 6.02×10^{20}

Number of moles = $\frac{6.02\times10^{20}}{N_A}$

$= \frac{6.02\times10^{20}}{6.02\times10^{23}} = 1\times10^{-3}$ mol

volume of the solution

= 100 mL = $\frac{100}{1000}L = 0.1L$

Concentration of Urea solution (in mol L^{-1}) =

$\frac{1\times10^{-3}}{0.1} mol\,L^{-1} = 10^{-2}\ molL^{-1} = 0.01M$

Hence the concentration of solution is 0.01M

354. 10 g of hydrogen and 64 g of oxygen were filled in a steel vessel and exploded. Amount to water produced in this reaction will be

(a) 3 mol (b) 4 mol
(c) 1 mol (d) 2 mol

JCECE - 2012

Ans. (b) : Moles of $H_2 = \frac{10}{2} = 5\,mol$

Moles of $O_2 = \frac{64}{32} = 2\,mol$

$$\underset{(5mol)}{2H_2} + \underset{(2mol)}{O_2} \longrightarrow \underset{(4mol)}{2H_2O}$$

Here O_2 is limiting reagent. So, amount of product, H_2O obtained depends on the amount of O_2. According to equation,

1 mole O_2 on reaction with H_2 gives = 2 mole of H_2O

2 mole O_2 on reaction with H_2 will give $= \frac{2\times2}{1} = 4$ mole of H_2O

Note 1 mole of H_2 is in excess.

355. The total number of electrons present in 18 mL of water (density = 1g mL^{-1}) is

(a) 6.02×10^{25} (b) 6.02×10^{24}
(c) $6.02 \times 18 \times 10^{23}$ (d) 6.02×10^{23}

Karnataka-CET-2012

Ans. (b):

18 ml H_2O = 18g H_2O = 1 mole of H_2O

1 mole H_2O = 6.022×10^{23} molecules

(Number of electrons present in one molecule of water = 2 + 8 = 10)

then, 1 mole H_2O = $10 \times 6.02 \times 10^{23}$

= 6.02×10^{24} electrons.

356. 0.02 mole of $[Co(NH_3)_5Br]Cl_2$ and 0.02 mole of $[Co(NH_3)_5Cl]SO_4$ are present in 200 cc of a solution X. The number of moles of the precipitates Y and Z that are formed when the solution X is treated with excess silver nitrate and excess barium chloride are respectively

(a) 0.02, 0.02 (b) 0.01, 0.02
(c) 0.02, 0.04 (d) 0.04, 0.02
(e) 0.02, 0.01

Kerala-CEE-2012

@apna_pdf

Ans. (d):

$$[Co(NH_3)_5Br]Cl_2 \longrightarrow [Co(NH_3)_5Br]^{2+} + 2Cl^-$$

Here, 1 mole of $[Co(NH_3)_5Br]Cl_2$ is giving 2 moles of Cl^- ion. Then 0.02 mole will dissociate to give $2\times0.02 = 0.04$ moles of Cl^- ions.

⇒ On reaction with silver nitrate, 0.04 moles of silver chloride precipitate will be obtained. $[Co(NH_3)_5Cl]SO_4 \longrightarrow [Co(NH_3)_5Cl]^{2+} + SO_4^{2-}$

Here, 1 mole of $[Co(NH_3)_5Cl]SO_4$ is giving 1 mole of SO_4^{2-} ion. Then 0.02 moles of $[Co(NH_3)_5Cl]SO_4$ will dissociate to give 0.02 moles of SO_4^{2-}ion.

⇒ On reaction with silver nitrate, 0.02 moles of silver sulphate precipitate will be obtained.

357. The mole fraction of methanol is in 4.5 molal aqueous solution is

(a) 0.250 (b) 0.125
(c) 0.100 (d) 0.05
(e) 0.055

Kerala-CEE-2012

Ans. (d):

$$\text{molality} = \frac{\text{moler of solute}}{\text{mass of solvent}(kg)}$$

$$4.5 = \frac{n_A}{18g}\times1000$$

$$n_A = \frac{4.5\times18}{1000} = 0.081 \text{ moles}$$

$$\text{mole fraction } = \frac{\text{moles of solute}}{\text{total moles of solution}}$$

$$= \frac{n_A}{n_A + n_B}$$

$$= \frac{0.081}{0.081+1} \quad (n_B = \text{moles of solvent} = \text{moles of water})$$

$$= 0.075$$

358. How many grams of sulphuric acid is to be dissolved to prepare 200 mL aqueous solution having concentration of $[H_3O^+]$ ions 1 M at 25^0 C temperatures? [H= 1, O= 16, S= 32g mol^{-1}]

(a) 4.9g (b) 19.6g
(c) 9.8g (d) 0.98g

UP CPMT-2012

Ans. (c) ∴ 2 M $[H_3O^+]$ ions are obtained from 1M H_2SO_4
∴ 1 M $[H_3O^+]$ ions are obtained from 0.5 M H_2SO_4
Molarity

$$M = \frac{m(H_2SO_4)\times1000}{M(\text{molar mass } H_2SO_4)}\times\text{Volume of solution(mL)}$$

$$0.5 = \frac{m\times1000}{98\times200}$$

$$m = \frac{0.5\times98\times200}{1000} = 9.8g$$

359. How much ethyl alcohol C_2H_5OH, must be added to 1.00 L of water so that the solution will not are freeze at – 4° F?

(a) 211 g (b) 495 g
(c) 85 g (d) 46 g

UPTU/UPSEE-2012

Ans. (b) :

$$4^oF = \frac{5}{9}(-4-32)^oC = -20^oC$$

$$\Delta T_f = 20^oC = K_f m = (1.86^o c/m)(m)$$

$$m = \frac{20^oC}{1.86^oc/m} = 10.70m = (10.7\,mol)(46.0g/mole)$$

$$= 495g$$

360. The number of sodium atoms in 2 moles of sodium ferroyanide is

(a) 12×10^{23} (b) 26×10^{23}
(c) 34×10^{23} (d) 48×10^{23}

UPTU/UPSEE-2012

Ans. (d) : formula of sodium ferrocyanide = $Na_4[Fe(CN)_6]$. It has four sodium atoms. Number of Na atoms = no of moles × no. of atoms per Molecule × Avogadro number
$= 2 \times 4 \times 6.023 \times 10^{23}$
$= 48 \times 10^{23}$

361. Sodium bicarbonate on heating decomposes to form sodium carbonate, CO_2 and water. If 0.2 moles of sodium bicarbonate is completely decomposed, how many moles of sodium carbonate is formed?

(a) 0.1 (b) 0.2
(c) 0.05 (d) 0.025

UPTU/UPSEE-2012

Ans. (a) : Sodium hydrogen carbonate (also known as sodium bicarbonate or bicarbonate of soda) has the chemical formula $NaHCO_3$.

$$\underset{2mol}{2NaHCO_3} \xrightarrow{\Delta} \underset{1mol}{Na_2CO_3} + H_2O + CO_2$$

∵ 2 mol $NaHCO_3$ on decomposition gives = 1 mol Na_2CO_3

∴ 0.2 mol $NaHCO_3$ on decomposition will give

$$= \frac{1}{2}\times0.2 = 0.1 \text{ mol } Na_2CO_3$$

362. The weight of oxalic acid that will be required to prepare a 1000 mL (N/20) solution is

(a) 126/100 g (b) 63/40 g
(c) 63/20 g (d) 126/20 g

WB-JEE-2012

Ans. (c) : Hydrated oxalic acid = $C_2H_2O_4.2H_2O$
Molecular mass of oxalic acid = 126
12.6g oxalic acid per liter of the solution should be dissolved to prepare M/10 oxalic acid solution.
M.wt of $H_2C_2O_4.2H_2O$ is 126 (n factor = 2),

$$E.wt = \frac{126}{2} = 63$$

@apna_pdf

$$N = \frac{\text{no.of gm-equivalent}}{\text{Volume of Solution in L}}$$

$$\therefore \quad \frac{1}{20} = \frac{W/63}{1}$$

$$\because \quad \frac{63}{20}\text{gm}.$$

363. If one mole of a substance is present in 1kg of solvent then its concentration is called

(a) molar conc. (b) molal conc.
(c) normality (d) strength wt/wt.

BCECE-2011

Ans. (b) : If one mole of a substance is present in 1 kg of solvent then it concentration is called molal concentration.

A 1-molar solution contains one mole of solute per 1kg solvent, molality is a hybrid concentration unit, retaining the convenience of mole measure for the solute, but expressing it in relation to a temperature-independent mass rather than a volume.

364. The mass of potassium dichromate crystals required to oxidise 750 cm^3 of 0.6 M Mohr's salt solution is (molar mass = 392)

(a) 0.49 g (b) 0.45 g
(c) 22.05 g (d) 2.2 g

[AIEEE 2011]

Ans. (c) : Given,

Concentration of Mohr's salt = 0.6M

Volume = $750cm^3$ = 0.75L

$$\text{Molarity} = \frac{\text{No.of Moles Solute}}{\text{Volume of Solution in L}}$$

$$0.6 = \frac{n}{0.75\,L}$$

n = 0.6×75L = 0.45 mol

$$K_2Cr_2O_7 + 6FeSO_4 + 7H_2SO_4 \rightarrow K_2SO_4 + Cr_2(SO_4)_3 + 3Fe(SO_4)_3 + 7H_2O$$

For 6 mol Mohr's salt 1 mole of Potassium dichromate is required.

For 0.45 mol of Mohr's salt, Potassium dichromate required is 1 × 0.45/6 = 0.05 mol

Mass of Potassium dichromate required is 0.05 × 294
= 22.05 g

365. When 6.3 g of sodium bicarbonate are added to 30.0 g of acetic acid solution, the residual solution is found to weigh 33.0 g. The mass of carbon dioxide released in the reaction is

(a) 3.0 g (b) 0.91 g
(c) 1.91 g (d) 3.3 g

J & K CET-(2011)

Ans. (d) : Given,

Amount of sodium bicarbonate = 6.3g

Amount of acetic acid = 30.0g

Amount of residual solution = 33.0g

$$CH_3COOH + NaHCO_3 \rightarrow CH_3COONa + H_2O + CO_2$$

Total amount of reactants = 6.3 + 30.0 = 36.3 g

∴ Mass of Carbon dioxide released
= 36.3 – 33.0
= 3.3 g

366. 0.1 mol HCl is equal to

(a) 3.65 g (b) 36.5 g
(c) 18 g (d) 1.8 g

JIPMER-2011

Ans. (a) : Given,

The number of moles of HCl = 0.1

The number of particles in one mole = 6.023×10^{23}

The molar mass of a substance is defined as the mass of 1 mole of that substance, expressed in gram per mole, and is equal to the mass of 6.022×10^{23} atoms, molecules, or formula units of that substance.

So the mass of one mole of HCl = 1 + 35.5 = 36.5 g

- So, the mass of 0.1 mole = $\frac{36.5}{10} = 3.65g$

367. A mixture of ethane and ethene occupies 41L at 1 atm and 500 K. The mixture reacts completely with $\frac{10}{3}$ mole of O_2 to produce CO_2 and H_2O. The mole fraction of ethane and ethene in the mixture are respectively (R = 0.082 L atm K^{-1} mol^{-1})

(a) 0.50, 0.50 (b) 0.75, 0.25
(c) 0.67, 0.33 (d) 0.25, 0.75
(e) 0.33, 0.67

Kerala-CEE-2011

Ans. (c) : For a gaseous mixture of C_2H_6 and C_2H_4

$$pV = nRT \text{ or } n = \frac{PV}{RT} = \frac{1\times 41}{0.082\times 500}$$

or n = 1

∴ Total mole of $C_2H_6 + C_2H_4$ = 1mole

Let the mole of

$C_2H_6 = x$

Then mole of $C_2H_4 = 1 – x$

$C_2H_6 + 7/2O_2 \rightarrow 2CO_3 + 3H_2O$

$C_2H_4 + 3O_2 \rightarrow 2CO_3 + 2H_2O$

∴ Mole of O_2

Needed for complete reaction of mixture

$$= \frac{7}{2}x + 3(1-x)$$

$$\therefore \quad \frac{7}{2}x + 3(1-x) = \frac{10}{3}$$

$$\text{or } x = \frac{2}{3}$$

Thus, mole fraction of

$$C_2H_6 = \frac{2}{3} = 0.67$$

and mole fraction of

$$C_2H_6 = \frac{2}{3} = 0.67$$

and mole fraction of

$$C_2H_4 = 1 - \frac{2}{3} = 0.33$$

368. How many moles of magnesium phosphate, $Mg_3(PO_4)_2$ will contain 0.25 mole of oxygen atoms.

(a) 0.02 (b) 3.125×10^{-2}
(c) 1.25×10^{-2} (d) 2.5×10^{-2}

UP CPMT-2011

@apna_pdf

Ans. (b): 8 mol O-atoms are contained by 1 mole $Mg_3(PO_4)_2$.

$\therefore$ 0.25 mole of O-atoms are present in

$$Mg_3(PO_4) = \frac{1}{8} \times 0.25 \text{ mol}$$

$$= 3.125 \times 10^{-2} \text{ mol}$$

369. The amount of energy released when 20 mL 0.5 M NaOH is mixed with 100 ML 0.1 M HCl is x kJ. The heat of neutralization (in kj mol^{-1}) is

(a) –100 x kJ/mol (b) –50 x kJ/mol

(c) +100x kJ/mol (d) +50 x kJ/mol

WB-JEE-2011

Ans. (a) :

$$\text{moles of NaOH} = \frac{20\text{mL}}{1000\text{mL/L}} \times 0.5\text{mol/L}$$

$$= 0.01 \text{ mol.}$$

$$\text{moles of HCl} = \frac{100\text{mL}}{1000\text{mL/L}} \times 0.1\text{mole} = 0.01\text{mol}$$

when 0.01 moles of NaOH neutralizes 0.01 moles of HCl, the heat released is x kJ.

when 1 mole of NaOH neutralizes 1 mole of HCl, heat released will be $\dfrac{x\,\text{kJ}}{0.01\text{mol}} = 100x\,\text{kJ/mol}$

Since heat is released, negative sign will be introduced. Hence, the answer is

= –100x kJ/mol.

370. 2 g of non-volatile water soluble compound is dissolved in 100 g of water. The elevation in boiling point is found to be 0.26. The molecular mass of the compound X is

(a) 20 (b) 60

(c) 80 (d) 40

COMEDK-2011

Ans. (d) : Given that,

$\Delta T_b = 0.26$

$K_b = 0.512$

$\therefore \Delta T_b = K_b m$

$$0.26 = \frac{1000 \times K_b \times \omega_2}{M_2 \times \omega_1}$$

$$M_2 = \frac{1000 \times 0.52 \times 2}{0.26 \times 100} = 40 \text{ gm.}$$

371. A container of 1.0 lit. capacity filled with 1.0 mole of ideal gas is connected to an evacuated vessel of 9.0 lit. calculate change in entropy. (R = 1.987 Cal.)

(a) 0.188 Cal. K^{-1} mol^{-1}

(b) 0.4576 Cal. K^{-1} mol^{-1}

(c) 4.576 Cal. K^{-1} mol^{-1}

(d) 4.366 Cal. K^{-1} mol^{-1}

GUJCET-2011

Ans. (d): Given that, V_1 = 1 liter, V_2 = 9 liter, n = 1

$$\therefore \text{Change in entropy} = nR\ln\frac{V_2}{V_1}$$

Putting the value of these, we get

$$\therefore \text{Change in entropy} = 2.303 \times 1 \times 1.987 \times \log\frac{9}{1}$$

$$= 2.303 \times 1.987 \times 0.9542$$

Change in entropy = 4.366 cal K^{-1} mol^{-1}

372. How many grams of sulphuric acid is to be dissolved to prepare 200 ml. aqueous solution having concentration of $[H_3O^+]$ ions 1 M at 25ºC temperature.

[H = 1, O = 16, S = 32 gram $mole^{-1}$]

(a) 4.9 gram (b) 19.6 gram

(c) 9.8 gram (d) 0.98 gram

GUJ CET-2011

Ans. (c): Given that, V = 200 ml

Concentration of $[H_3O^+]$ ions = 1 M

$$\therefore \quad M = \frac{W_2 \times 1000}{M_2 \times V(\text{ml})}$$

$$W_2 \text{ (Weight of } H_2SO_4) = \frac{M \times M_2 \times V}{1000}$$

$$= \frac{1 \times 98 \times 200}{1000} = 19.6$$

$\therefore$ $H_2SO_4 + 2H_2O \rightleftharpoons 2H_3O^+ + SO_4^{2-}$

1 mole of $H_2SO_4 \rightarrow$ 2 mole of H_3O^+

W_2 = 19.2/2 = 9.8 gm

373. A solution is prepared by dissolving 24.5 g of sodium hydroxide in distilled water to give 1 L solution. The molarity of NaOH in the solution is (Given that molar mass of NaOH = 40.0 g mol^{-1})

(a) 0.2450 M (b) 0.6125 M

(c) 0.9800 M (d) 1.6326 M

AIIMS-2010

Ans. (b): Given, W_{NaOH} = 24.5 g

Molar mass of NaOH = 23 + 16 + 1 = 40

$$\text{No. of moles of NaOH} = \frac{24.5}{40}\text{moles}$$

$$= 0.6125$$

$$\therefore \text{Molarity of solution} = \frac{0.6125\text{moles}}{1\text{L}}$$

$$= 0.6125 \text{ M}$$

374. The number of molecules of CO_2 liberated by the complete combustion of 0.1 g atom of graphite in air is

(a) 3.01×10^{22} (b) 6.02×10^{23}

(c) 6.02×10^{22} (d) 3.01×10^{23}

AP-EAMCET- (Engg.) - 2010

Ans. (c) : $\underset{1\text{ mole}}{C(s)} + O_2(g) \longrightarrow \underset{1\text{ mole}}{CO_2(g)}$

$\because$ 1 mole of graphite on complete combustion gives $CO_2 = 6.023 \times 10^{23}$ molecules.

$\therefore$ 0.1 mole of graphite will give CO_2

$$= \frac{6.023 \times 10^{23} \times 0.1}{1} = 6.023 \times 10^{22}$$

375. The number of water molecules is maximum in

(a) 1.8 gram of water

(b) 18 gram of water

@apna_pdf

(c) 18 moles of water
(d) 18 molecules of water

NEET-2013

Ans. (c) : No of moles of water in 1.8 g = 0.1 moles in 18 g = 1 moles.

$\because$ 1 mole water = 6.02×10^{23} molecules

$\therefore$ 18 mole water = $18 \times 6.02 \times 10^{23}$ molecules

Here, 18 mole water has maximum number of molecules.

376. Which of the following has smallest number of molecules ?

(a) 11.2 L of O_2 at NTP
(b) 8.0 g of O_2
(c) 0.1 mole of O_2
(d) 2.24×10^4 mL of O_2

AMU – 2010

Ans. (c) : (i) No. of molecules in 11.2 lit of O_2

$$= \frac{11.2}{22.4} \times 6.023 \times 10^{23}$$

$$= 0.5 \times 6.023 \times 10^{23}$$

(ii) No. of. molecules in 8.0 g of O_2

$$= \frac{8.0}{32} \times 6.023 \times 10^{23}$$

$$= 0.25 \times 6.023 \times 10^{23}$$

(iii) No. of. molecules in 0.1 mole of O_2

$$= 0.1 \times 6.023 \times 10^{23}$$

(iv) No. of molecules in 2.24×10^4 ml of O_2

$$= \frac{2.24 \times 10^4}{22400} \times 6.023 \times 10^{23}$$

$$= 6.023 \times 10^{23}$$

So, 0.1 mole of O_2 contains smallest no. of molecules.

377. The total number of atoms of all elements present in 1 mole of ammonium dichromate is

(a) 19
(b) 6.023×10^{23}
(c) 114.437×10^{23}
(d) 84.322×10^{23}

AMU – 2010

Ans. (c) : Ammonium dichromate is $(NH_4)_2Cr_2O_7$.

1 mole consists of 2 atoms of N,
8 atoms of H,
2 atoms of Cr,
and 7 atoms of O

So, total = $(2+8+2+7) \times 6.023 \times 10^{23}$
= 114.473×10^{23}

378. In redox reaction 1 g-eq of reducing agent requires P gm-eq. of oxidizing agent. The value of P is

(a) 1
(b) 2
(c) 3
(d) Depends on reaction

BITSAT 2010

Ans. (a) : In redox reaction,

g equivalent of reducing agent = g equivalent of oxidizing agent

Hence, 1g equ. of reducing agent = Pg equ. of oxidizing agent.

379. If 20 mL of 0.4 N NaOH solution completely neutralises 40 mL of a dibasic acid, the molarity of the acid solution is

(a) 0.1 M
(b) 0.2 M
(c) 0.3 M
(d) 0.4 M

CG PET- 2010

Ans. (a) : Volume b of NaOH = 20 ml.

Strength of NaOH = 0.4 N

Volume of dibasic acid = 40 ml

Strength of dibasic acid = $20 \times \frac{0.4}{40} = 0.2$ N

Molarity of the dibasic acid = $\frac{\text{Normality}}{2}$

Molarity = $\frac{0.2}{2} = 0.1\text{m}$

380. Molality of a solution is equal to

(a) $\frac{\text{number of Moles of solute}}{\text{number of litres of solution}}$

(b) $\frac{\text{number of equivalents of solute}}{\text{number of litres of solution}}$

(c) $\frac{\text{number of Moles of solute}}{\text{number of kilogram of solvent}}$

(d) $\frac{\text{number of Moles of a component}}{\text{total number of moles of all components}}$

CG PET- 2010

Ans. (c) : Molarity = $\frac{\text{number of Moles of solute}}{\text{number of litres of solution}}$

Molarity = $\frac{\text{number of equivalents of solute}}{\text{number of litres of solution}}$

Molarity = $\frac{\text{number of Moles of solute}}{\text{number of kilogram of solvent}}$

Molarity = $\frac{\text{number of Moles of a component}}{\text{total number of moles of all components}}$

381. If 300 mL of a gas weighs 0.368 g at STP. What is its molecular weight?

(a) 30.16 g
(b) 2.55 g
(c) 27.5 g
(d) 37.5 g

J & K CET-(2010)

Ans. (c) : Given,

Weight of 300mL gas = 0.368g

As we know that one mole of any gas occupies a volume of 22.4L = 22400mL at STP.

Weight of 22400 mL gas

$$= \frac{0.368 \times 2240}{300} \text{g/mol}$$

$$= 27.47 \text{ g/mol} \simeq 27.5 \text{g/mol}$$

$\because$ Molecular weight of the gas is 27.5 g

[$\therefore$ 22400 mL of a gas contains amount equal to molecular weight of the gas.]

@apna_pdf

382. The molecules present in 5.6 L of sulphur dioxide at STP is

(a) 1.5×10^{23} (b) 1.5×10^{-23}

(c) 4×10^{23} (d) 0.15×10^{23}

J & K CET-(2010)

Ans. (a) : The molar volume of a gas is the volume of one mole of a gas at STP. At STP, one mole (6.02×10^{23} particles) of any gas occupies a volume of 22.4 L.

22.4 L of gas at STP = 1 mole

$$5.6 \text{ L of gas at STP} = \frac{5.6}{22.4} \text{ moles}$$
$$= 0.25 \text{ moles}$$

$\therefore$ Number of molecules in 5.6 L SO_2

$$= 0.25 \times 6.023 \times 10^{23}$$
$$= 1.50 \times 10^{23}$$

383. The number of moles of H_2 in 0.224 L of hydrogen gas at STP (273 K, 1 atm), is

(a) 0.1 (b) 0.01

(c) 0.001 (d) 1

JCECE - 2010

Ans. (b) : As we know that one mole of any gas occupies a volume of 22.4L at STP.

22.4 L of H_2 = 1 mol H_2

$$0.224 \text{ L of } H_2 = \frac{1}{22.4} \times 0.224 \text{ mol}$$
$$= 0.01 \text{ mol of } H_2$$

384. 9.65 C of electric current is passed through fused anhydrous magnesium chloride. The magnesium metal thus, obtained is completely converted into a Grignard reagent. The number of moles of the Grignard reagent obtained is

(a) 5×10^{-4} (b) 1×10^{-4}

(c) 5×10^{-5} (d) 1×10^{-5}

KARNATAKA-CET, 2010

Ans. (c) : Given, volue of electric current = 9.65C

$$MgCl_2 \longrightarrow Mg^{2+} + 2Cl^-$$
$$Mg^{2+} + 2e^- \longrightarrow \underset{1\,mol}{Mg} \text{ (at cathode)}$$

$\because$ 2F (2 × 96500 C) deposits Mg = 1 mol

$$9.65 \text{ C charge will deposit Mg} = \frac{1 \times 9.65}{2 \times 96500}$$
$$= 5 \times 10^{-5} \text{mol}$$

In order to prepare Grignard reagent, one mole of Mg is used per mole of reagent obtained. Thus, by 5×10^{-5} mol Mg, 5×10^{-5} mole of Grignard reagent are obtained.

385. How much time (in hours) would it take to distribute one Avogadro number of wheat gains, if 10^{20} grains are distributed each second?

(a) 0.1673 (b) 1.673

(c) 16.73 (d) 167.3

(e) 1673

Kerala-CEE-2010

Ans. (b): Avogadro's number, number of units in one, mole of any substance (defined as its molecular weight is grams), equal to 6.022×10^{23}. The units may be electrons, atoms, ions, or molecules.

If 10^{20} grains are distributed in 1s, 6.023×10^{23} grains will be distributed

$$\frac{6.023 \times 10^{23} \times 1}{10^{20}} = 6023 \text{ sec} = 1.673 \text{hr.}$$

386. A 600 W mercury lamp emits monochromatic radiation of wavelength 331.3 nm. How many photons are emitted from the lamp per second? (h = 6.626×10^{-34} Js; velocity of light = 3×10^8 ms^{-1})

(a) 1×10^{19} (b) 1×10^{20}

(c) 1×10^{21} (d) 1×10^{23}

(e) 1×10^{22}

Kerala-CEE-2010

Ans. (c) : Given than, $\lambda = 331.3 \text{ nm} = 331.3 \times 10^{-9}$ m

$h = 6.626 \times 10^{-34}$ Js, $c = 3 \times 10^8$ ms^{-1}

Photons are emitted from the lamp per second

$$E = \frac{nhc}{\lambda}$$
$$\therefore \quad n = \frac{E\lambda}{hc}$$
$$\Rightarrow \quad n = \frac{600 \times 331.3 \times 10^{-9}}{6.626 \times 10^{-34} \times 3 \times 10^8}$$
$$n = 1 \times 10^{21}$$

387. How many gram-equivalents of NaOH are required to neutralise 25 cm^3 of a decinormal HCl solution?

(a) 0.00125 (b) 0.0025

(c) 0.0050 (d) 0.025

MHT CET-2010

Ans. (b) : For acid-base reactions,

gram equivalent of acid (HCl) = gram equivalent of base (NaOH)

$$\therefore \text{ gram equivalent of acid} = (25 \times 10^{-3}) dm^3 \times \frac{1}{10}$$
$$= 25 \times 10^{-4}$$
$$= 0.0025$$

388. 25.3 g of sodium carbonate, Na_2CO_3 is dissolved in enough water to make 250 ml. of solution. If sodium carbonate dissociates completely, molar concentration of sodium ion, Na^+ and carbonate ions, CO_3^{2-} are respectively (Molar mass of Na_2SO_3 = 106 g mol^{-1})

(a) 0.955 M and 1.910 M

(b) 1.910 M and 0.955 M

(c) 1.90 M and 1.910 M

(d) 0.477 M and 0.477 M

NEET-2010

Ans. (b) : Given that, weight of sodium carbonate = 25.3 gm

$$\text{Moles of } Na_2CO_3 = \frac{\text{Moles of solute}}{\text{litre of solution}}$$
$$= \frac{25.3}{106} = 0.239 \text{ moles}$$

@apna_pdf

Molarity of solution $= \dfrac{0.239}{0.25} = 0.956$ mol/litre

$Na_2CO_3 \rightarrow 2Na^+ + CO_3^{2-}$

∴ Concentration of $CO_3^{2-} = 0.956$ M

Concentration of $Na^+ = 2\times0.956$

$= 1.912$ M.

389. The number of atoms in 0.1 mol of triatomic gas is ($N_A = 6.02 \times 10^{23}$ mol^{-1})

(a) 6.026×10^{22}
(b) 1.806×10^{23}
(c) 3.600×10^{23}
(d) 1.800×10^{22}

NEET-2010

Ans. (b) : 1 mole of triatomic gas has $3 \times 6.02\times10^{23}$ atoms

Therefore, no. of atoms 0.1 mol $= 0.1 \times 3\times6.02 \times 10^{23}$

$= 1.806 \times 10^{23}$

390. Which is heaviest?

(a) 25g mercury
(b) 2 mole carbon dioxide
(c) 2 mole water
(d) 4 g-atom of oxygen

UPTU/UPSEE-2010

Ans. (d) : The atom which has maximum mass is known as heaviest.

(i) Mass of Hg = 25g
(ii) Mass of 2 moles of $CO_2 = 2 \times 44 = 88$g
(iii) Mass of 2 moles of $H_2O = 2 \times 18 = 36$g
(iv) Mass of 4g atoms of $O_2 = 4 \times 32 = 128$g

391. How many moles of helium gas occupy 22.4 L at 0^o C and at 1 atm pressure?

(a) 0.11
(b) 1.11
(c) 0.90
(d) 1.0

BCECE-2010

Ans. (d) : Given that, P = 1 atm, T = 0^oC = 273K

$$PV = nRT$$

$$n = \frac{PV}{RT}$$

$$n = \frac{1\,atom(22.4L)}{(0.082\ L\,atm/mol\,k)273k}$$

$$n = 1 \text{ mole}$$

1mole of the gas occupies 22.4 L at 0°C at 1 atm pressure.

392. If two moles of glucose are oxidized in the body through respiration, then number of moles of ATP produced are

(a) 19
(b) 38
(c) 57
(d) 76

AMU–2009

Ans. (d) : Cellular respiration can be an anaerobic or aerobic respiration, depending on whether or not oxygen is present. Anaerobic respiration makes a total 2ATP. Aerobic respiration is much more efficient and can produce upto 38 ATP with a single molecule of glucose.

It two moles of glucose is oxidized to give 38 × 2 = 76 moles of ATP.

393. 1 mole of CO_2 contains

(a) 6×10^{23} atoms of C
(b) 6×10^{23} atoms of O
(c) 18×10^{23} molecules of CO_2
(d) 3 g-atoms of CO_2

BCECE-2009

Ans. (a) : The molecular mass of carbon dioxide is 44 amu. The molar mass of any compound is the mass in grams of one mole of that compound. One mole of carbon dioxide molecules has a mass of 44.01 gm.

One mole of any substance contains Avogadro number of atoms. In this carbon one mole is present.

So, 1 mole of CO_2 contains $= 6.023 \times 10^{23}$ atoms of C

394. If $NO_2(N_2O_4)$ is dissolved in NaOH, we get solution of

(a) $NaNO_2$
(b) $NaNO_3$
(c) mixture of $NaNO_2$ and $NaNO_3$
(d) $NaNO_4$

CG PET-2009

Ans. (c) : Nitrogen dioxide (NO_2) exists as a dimer N_2O. When it is dissolved in sodium hydroxide or any other alkali, a mixture of nitrate and nitrite is obtained.

$$2NO_2 + 2NaOH \rightarrow \underset{\substack{\text{Sodium}\\\text{Nitrite}}}{NaNO_2} + \underset{\substack{\text{Sodium}\\\text{Nitrate}}}{NaNO_3} + H_2O$$

395. If 'F' is Faraday and 'N' is Avogadro number, then charge of electron can be expressed as

(a) $F \times N$
(b) $\dfrac{F}{N}$
(c) $\dfrac{N}{F}$
(d) F^2N

CG PET -2009

Ans. (b) : We know that,

$$F = N \cdot e$$

Where, F = Faraday Constant
N = Avogadro number
e = Charge of electron.

Or $\quad e = \dfrac{F}{N}$

396. By passing 9.65 A current for 16 min 40s, the volume of O_2 liberated at STP will be

(a) 280 mL
(b) 560 mL
(c) 1120 mL
(d) 2240 mL

CG PET -2009

Ans. (b): Given than, i = 9.65A, t = 16 min 40 sec = 1000 sec.

We known that, Charge (Q) = i × t

= 9.65 × 1000 coulomb

= 9650 C = 0.1 F

$$O^{2-} \rightarrow \frac{1}{2}O_2 + 2e^-$$

$2F = 0.5$ mol $O_2 = 0.5 \times 22400$ mol

$$0.1F \text{ of } O_2 = \frac{0.5\times22400}{2F}\times0.1F = 560\,\text{mole}$$

@apna_pdf

397. The number of molecules in 18 mg of water in terms of Avogadro number N is

(a) 10^{-3} N (b) 10^{-2} N

(c) 10^{-1} N (d) 10 N

J & K CET-(2009)

Ans. (a) : Weight of water = 18 mg = 18 × 10^{-3} g

$$\therefore \text{ Number of moles } = \frac{\text{weight}}{\text{molar mass}}$$

$$= \frac{18\times10^{-3}}{18} = 1\times10^{-3}$$

Number of molecules = no. of moles × Avogadro no.

$$= 1\times10^{-3}\text{N} = 10^{-3}\text{N}$$

398. How much volume of oxygen at STP in litres is required to burn 4 gm of methane gas completely?

(a) 11.2 (b) 5.6

(c) 2.8 (d) 8

J & K CET-(2009)

Ans. (a) : $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$

1 mole of CH_4 needs 2 moles of molecular O_2.

4 g of CH_4 = 0.25 mole of CH_4 mole ratio between CH_4 and O_2 = 1: 2 then 0.25

Mole of CH_4 reacts with $\cancel{2/1} \times 0.25 = 0.50$ mole of O_2

Volume of O_2 required to completely combust CH_4 at STP condition is

= 0.50 mole × 22.4 L/ mole

= 11.20 L

399. Excess of carbon dioxide is passed through 50 mL of 0.5 M calcium hydroxide solution. After evaporated to dryness. The solid calcium carbonate was completely neutralised with 0.1 N hydrochloric acid. The volume of hydrochloric acid required is (Atomic mass of calcium = 40)

(a) 300 cm^3 (b) 200 cm^3

(c) 500 cm^3 (d) 400 cm^3

Karnataka-CET, 2009

Ans. (c) : No. of millimoles of Ca $(OH)_2$ = 50 × 0.5 = 25

No. of millimoles of $CaCO_3$ = 25

No. of milliequivalents of $CaCO_3$ = 50

$$\therefore \text{ Volume of 0.1 N HCl} = \frac{50}{0.1} = 500\text{ cm}^3$$

400. 0.25 g of an organic compound on Kjeldahl's analysis gave enough ammonia to just neutralize 10 cm^3 of 0.5 M H_2SO_4. The percentage of nitrogen in the compound is

(a) 28 (b) 56

(c) 14 (d) 112

(e) 42

Kerala-CEE-2009

Ans. (b) : Given that,

Mass of given compound = 0.25g

Molarity = 0.5M

Volume = 10M (Let 1cm^3 = 1 mL)

$$\%\text{ of Nitrogen} = \frac{1.4\times\text{molarity}\times V\times B}{\text{mass of given compound}}$$

B = Basicity of acid = $(2H^+)$ (B = 2)

$$\%\text{ of Nitrogen } = \frac{1.4\times0.5\times2\times10}{0.25}$$

$$= 56\%$$

401. In the following reaction,

$$\mathbf{M^{x+} + MnO_4^- \longrightarrow MO_3^- + Mn^{2+} + \frac{1}{2}O_2,}$$

If one mole of MnO_4^- oxidizes 2.5 moles of M^{x+}, then the value of x is

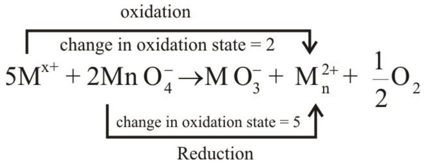
(a) 5 (b) 3

(c) 2 (d) 1

(e) 4

Kerala-CEE-2009

Ans. (b):



$$5M^{x+} + 2Mn\,O_4^- \rightarrow M\,O_3^- + M_n^{2+} + \frac{1}{2}O_2$$

$$MnO_4^- \rightarrow Mn^{2+} \qquad M^{x+} \rightarrow MO_3^-$$

n = 5 n = (5 – x)

$\therefore$ gm equation of MnO_4^- = gm equation of M

1 × 5 = 2.5 × (5 – x)

x = 3

402. In acid medium Zn reduces nitrate ion to NH_4^+ ion according to the reaction $Zn + NO_3^- \rightarrow Zn^{2+} + NH_4^+ + H_2O$ (unbalanced) How many moles of HCl are required to reduce half a moles of HCL are required to reduce half a mole of $NaNO_3$ completely? Assume the availability of sufficient Zn

(a) 5 (b) 4

(c) 3 (d) 2

(e) 1

Kerala-CEE-2009

Ans. (a): First the given unbalanced equation is balanced by using following steps

Step I. The equation is splitted into two half equations as

$$Zn \rightarrow Zn^{2+}$$

$$NO_3^- \rightarrow NH_4^+$$

Step II. Now water molecules are added to the side deficient in oxygen and H^+ and added to the side deficient in hydrogen as

$$Zn \rightarrow Zn^{2+};NO_3^- + 10H^+ \rightarrow NH_4^+ + 3H_2O$$

Step III. The number of electorns are balanced and the two half equations are added

$$[Zn \rightarrow Zn^{2+} + 2e^-]\times4;$$

@apna_pdf

$$NO_3^- + 10H^+ + 8e^- \rightarrow NH_4^+ + 3H_2O$$

$$4Zn \rightarrow 4Zn^{2+} + 8e^-$$

∴ $4Zn + NO_3^- + 10H^+ \rightarrow 4Zn^{2+} + NH_4^+ + 3H_2O$

(Net equation) or

$4Zn + NO_3^- + 10HCl \rightarrow 4Zn^{2+} + NH_4^+ + 5Cl_2 + 3H_2O$

∵ 1 mole of NO_3^- (or $NaNO_3$) is reduced by = 10 moles of HCl

∴ $\frac{1}{2}$ mole of NO_3^- will be reduced by = 10 × $\frac{1}{2}$ mole of HCl = 5 moles of HCl

403. The number of electrons required to reduce 4.5×10^{-5} g of Al is

(a) 1.03×10^{18} (b) 3.01×10^{18}

(c) 4.95×10^{26} (d) 7.31×10^{20}

MHT CET-2009

Ans. (b) : $\underset{27}{Al^{3+}} + 3e^- \rightarrow \underset{27g}{Al}$

27g of Al is reduced by = 3 × 6.023 × 10^{23} e^-s

1 gm of Al is reduced by = $\frac{3 \times 6.023 \times 10^{23}}{27}$

4.5 × 10^{-5}g of Al will be reduced by

$= \frac{3 \times 6.023 \times 10^{23} \times 4.5 \times 10^{-5}}{27}$

= 3.01 × 10^{18} electrons.

404. Which of the following contains greatest number of oxygen atoms?

(a) 1 g of O

(b) 1 g of O_2

(c) 1 g of O_3

(d) All have the same number of atoms

UPTU/UPSEE-2009

Ans. (d) :

Step-1 : Finding the number of moles

Number of moles = $\frac{\text{Given mass}}{\text{Molecular mass}}$

1 gram of O = $\frac{1}{16}$

1 gram of O_2 = $\frac{1}{32}$

1 gram of O_3 = $\frac{1}{48}$

Setp-2 : Finding the number of atoms

Number of atoms = Number of moles × N_A × Atomicity

In O = $\frac{1}{16} \times N_A \times 1$

In O_2 = $\frac{1}{32} \times N_A \times 2 = \frac{1}{16} N_A$

In = $\frac{1}{48} \times N_A \times 3 = \frac{1}{16} \times N_A$

Therefore, all three have the same number of O atoms.

405. What is the number of moles of oxygen gas evolved by electrolysis of 180 g of water ?

(a) 2.5 (b) 5.0

(c) 7.5 (d) 10.0

SCRA - 2009

Ans. (b) :

Reaction is given by, $\underset{2\times18=36g}{2H_2O(l)} \rightarrow 2H_{2(g)} + O_{2(g)}$

Using unitary method -

36g of water produces 1 mole of O_2 gas

180g water of will produce $\frac{180}{36} = 5$ moles of O_2 gas

Hence, 5 moles of oxygen gas can be produced during the electrolytic decomposition of 180 g of water.

406. Calculate the millimoles of SeO_3^{2-} in solution on the basis of following data: 70 mL of $\frac{M}{60}$ solution of $KBrO_3$ was added to SeO_3^{2-} solution. The bromine evolved was removed by boiling and excess of $KBrO_3$ was back titrated with 12.5 mL of $\frac{M}{25}$ solution of $NaAsO_2$.

The reactions are given below.

I. $SeO_3^{2-} + BrO_3^- + H^+ \rightarrow SeO_4^{2-} + Br_2^+ + H_2O$

II. $BrO_3^- + AsO_2^- + H_2O \rightarrow Br^- AsO_4^{3-} + H^+$

(a) 1.6 × 10^{-3} (b) 1.25

(c) 2.5 × 10^{-3} (d) None of these

AIIMS-2009

Ans. (c): Given that,

$$SeO_3^{2-} + BrO_3^- + H^+ \rightarrow SeO_4^{2-} + Br_2^+ + H_2O$$

$$BrO_3^- + AsO_2^- + H_2O \rightarrow Br^- AsO_4^{3-} + H^+$$

In reaction (i)

Moles of BrO_3^- Consumed = $\frac{70}{1000} \times \frac{1}{60} - \frac{10^{-3}}{6} = 10^{-3}$

gm. eq. of SeO_3^{2-} = gm. eq. of BrO_3^-

$n_{SeO_3^{2-}} \times 2 = 10^{-3} \times 5$

$n_{SeO_3^{2-}} = 2.5 \times 10^{-3}$

In reaction (ii)

Gm. Eq. of BrO_3^- = gm. Eq. of AsO_2^-

$n_{BrO_3^-} \times 6 = n_{AsO_2^-} \times 2 = \frac{12.5}{1000} \times \frac{1}{25} \times 2 = 10^{-3}$

$n_{BrO_3^-} = \frac{10^{-3}}{6}$

407. If 11.1 mg of $CaCl_2$ and 12 mg of $MgSO_4$ are present in 2 L of water, what is its hardness (in gram $CaCO_3$/ppm)?

(a) 5 (b) 10

(c) 15 (d) 20

AP-EAMCET (Medical), 2008

Ans. (b) : $MgSO_4 \equiv CaCO_3$

$24 + 32 + 64 \quad 40 + 12 + 48$

$= 120 \times 10^3 \text{mg} \quad = 100 \times 10^3 \text{mg}$

@apna_pdf

And $\quad CaCl_2 \equiv CaCO_3$

$$40+35.5\times2 \quad 40+12+48$$

$$=111\times10^3\text{mg} \quad =100\times10^3\text{mg}$$

111×10^3mg of $CaCl_2$ = 100 × 10^3mg of $CaCO_3$

$$11.1\text{mg of } CaCl_2 = \frac{100\times10^3\times11.1}{111\times10^3}\text{mg of } CaCO_3$$

$$= 10\text{mg of } CaCO_3$$

Similarly,

120 × 10^3mg of $MgSO_4$ = 100 × 10^3mg of $CaCO_3$

$$12\text{mg of } MgSO_4 = \frac{100\times10^3}{120\times10^3}\times12\text{mg of } CaCO_3$$

$$= 10\text{mg of } CaCO_3$$

∴ Total weight of $CaCO_3$ in 2L of water = 10 + 10 = 20mg.

∴ In 1L of water, total weight of $CaCO_3 = \frac{20}{2}$ mg=10mg.

∴ In 10^6 mg of water, total weight of $CaCO_3$ = 10mg.

So, in 10^6 part water, hardness of water in terms of $CaCO_3$ = 10mg.

408. 40 g of a sample of carbon on combustion left 10% of it unreacted. The volume of oxygen required at STP for this combustion reaction is

(a) 22.4 L (b) 67.2 L

(c) 11.2 L (d) 44.8 L

AP-EAMCET (Medical), 2008

Ans. (b) : The combustion of carbon can be expressed by following equation-

$$C(s)+O_2(g)\longrightarrow CO_2(g)$$

$$12g \quad 22.4L$$

$$\therefore \text{amount of carbon unreacted} = \frac{40\times10}{100} = 4g$$

So, the amount of carbon reacted = (40 – 4) g = 36g

∴ At STP, for the combustion of 12g of C, oxygen required is = 22.4L

∴ For the combustion of 36g of C, oxygen required will be $= \frac{22.4}{12}\times36L = 67.2L$

409. Assertion: One molal aqueous solution of glucose contains 180 g of glucose in 1 kg water.
Reason: The solution containing one mole of solute in 1000 g of solvent is called one molal solution.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS-2008

Ans. (a): Molality = No. of moles of solute /wt. of solvent in kg

If no. of moles of solute = 1

weight of solvent = 1 kg

then,

molality = 1

Glucose ($C_6H_{12}O_6$)

molecular weight = 180

$$\text{Here, No. of mole} = \frac{\text{Molecular mass}}{\text{wt.of solvent}}$$

$$= \frac{180}{180} = 1$$

$$\text{Molality} = \frac{1}{1}$$

Hence, assertion and reason, both are Correct and reason is the correct explanation of assertion.

410. The number of hydrogen atoms present in 25.6 g of sucrose ($C_{12}H_{22}O_{11}$) which has a molar mass of 342.3 g is

(a) 22 × 10^{23} (b) 9.91 × 10^{23}

(c) 11 × 10^{23} (d) 44 × 10^{23}

VITEEE- 2008

Ans. (b) : No. of moles of a sucrose

$$= \frac{\text{Given mass (gm)}}{\text{Molar mass (gm)}}$$

$$= \frac{25.6}{342.3} = 0.0748 \text{ moles.}$$

1 mole of sucrose ($C_{12}H_{22}O_{11}$) contains 6.022 × 10^{23} molecules of it.

Hence, 0.0748 moles contains

$$= 6.022\times10^{23}\times0.0748$$

$$= 0.4504\times10^{23} \text{ molecules.}$$

1 molecule of sucrose by formula is having 22 atoms of hydrogen.

$\therefore\ 0.4504\times10^{23}\times22 = 9.91\times10^{23}$ atoms of hydrogen.

411. One mole of magnesium nitride on the reaction with an excess of water gives

(a) One mole of NH_3 (b) two moles of NH_3

(c) One mole of HNO_3 (d) two moles of HNO_3

UPTU/UPSEE-2008

Ans. (b): Formula for magnesium MgN_2

Reaction of magnesium nitride with excess of water

$$Mg_3N_2 + 6H_2O \rightarrow 3Mg(OH)_2 + 2NH_3$$

Hence one mole of magnesium nitride on reaction with excess water gives two moles of ammonia.

Note- Nitride on reaction with water gives ammonia

412. 2 N HCI solution will have same molar concentration as a

(a) 4.0 N H_2SO_4 (b) 0.5 N H_2SO_4

(c) 1 N H_2SO_4 (d) 2 N H_2SO_4

WB-JEE-2008

Ans. (a) : From the relation -

$$\frac{\text{Normality}}{\text{Molarity}} = \frac{\text{Molecular mass}}{\text{Equivelent mass}} = n$$

For 2NHCl

$$\text{Molarity} = \frac{\text{Normality}\times\text{Equivalent weight}}{\text{Molecular weight}}$$

@apna_pdf

$$\text{Molarty} = \frac{2\times 36.5}{36.5} = 2$$

For $4NH_2SO_4$

$$\text{Molarity} = \frac{4\times 49}{98} = 2$$

Hence, $4NH_2SO_4$ and 2NHCl solution will have same molar concentration.

413. 1 mole of methyl amine on reaction with nitrous acid gives at NTP

(a) 1.0 Litre of nitrogen
(b) 22.4 Litre of nitrogen
(c) 11.2 Litre of nitrogen
(d) 5.6 Litre of nitrogen

WB-JEE-2008

Ans. (b) : $CH_3 — NH_2 + HNO_2 \rightarrow CH_3OH + N_2 + H_2O$
1 mole of methyl amine gives 1 mole N_2 i.e. 22.4 L of nitrogen at NTP.

414. Sodium nitrate on reduction with Zn in presence of NaOH solution produces NH_3. Mass of sodium nitrate absorbing 1 mole of electron will be

(a) 7.750 (b) 10.625
(c) 8.000 (d) 9.875

WB-JEE-2008

Ans. (b) : Required equation is given below,

$$Zn + 2OH^- \rightarrow Zn O_2^{2-} + 2H^+ + 2e^-$$

$$NO_3^- + 8H^+ 8e^- \rightarrow OH^- + 2H_2O + NH_3$$

∵ 8 moles of electron absorbed by 85g of $NaNO_3$

∴ 1 mole of electron absorbed by $\frac{85}{8}$ g of $NaNO_3$
=10.625g

415. Of two oxides of iron, the first contained 22% and the second contained 30% of oxygen by weight. The ratio of weights of iron in the two oxides that combine with the same weight of oxygen is

(a) 3 : 2 (b) 2 : 1
(c) 1 : 2 (d) 1 : 1

J & K CET-(2008)

Ans. (a) : For first oxide, moles of oxygen = $\frac{22}{16}$ = 1.375

$$\text{Mole of Fe} = \frac{78}{56} = 1.392$$

$$\text{Molar ratio, } \frac{1.375}{1.375} = 1, \frac{1.392}{1.375} = 1$$

∴ The formula of first oxide is

FeO for second oxide, Moles of oxygen = $\frac{30}{16}$ = 1.875

$$\text{Moles of Fe} = \frac{70}{56} = 1.25 .$$

$$\text{Molar ratio} = \frac{1.875}{1.25} = 1.5, \frac{1.25}{1.25} = 1$$

∴ The formula of second oxide is Fe_2O_3.

Suppose in both the oxides, iron reacts with xg oxygen.
∴ Equivalent weight of Fe in

$$\text{FeO or} = \frac{\text{weight of Fe}_{\text{II}}}{\text{weight of oxygen}} \times 8$$

$$\frac{56}{2} = \frac{\text{weight of Fe}_{\text{II}}}{x} \times 8 \qquad \text{.... (i)}$$

∴ Equivalent weight of Fe in

$$Fe_2O_2 = \frac{\text{weight of Fe}_{\text{III}}}{\text{weight of oxygen}} \times 8$$

$$\frac{56}{3} = \frac{\text{weight of Fe}_{\text{III}}}{x} \times 8 \qquad \text{.... (ii)}$$

From eq (i) & (ii)

$$\frac{\text{weight of Fe}_{\text{II}}}{\text{weight of Fe}_{\text{III}}} = \frac{3}{2}$$

416. 80 g of oxygen contains as many atoms as in

(a) 80 g of hydrogen (b) 1g of hydrogen
(c) 10g of hydrogen (d) 5 g of hydrogen

Karnataka-CET, 2008

Ans. (d) : No. of mole of oxygen = $\frac{80}{16}$ = 5mol

1 mol contains Avogadro no. of atom i.e., 60.2×10^{23} atoms.

∴ 5 mol contains $6.02\times10^{23}\times5$ atoms = 30.1×10^{23} atoms

No. of mole of hydrogen = $\frac{5}{1}$ = 5 mol

5 mol of hydrogen contains 30.1×10^{23} atoms.

417. 10 cm^3 of 0.1N monobasic acid requires 15 cm^3 of sodium hydroxide solution which normality is

(a) 1.5 N (b) 0.15 N
(c) 0.066 N (d) 0.66 N

Karnataka-CET, 2008

Ans. (c) : Given,

Volume of monobasic acid = 10 cm^3
Normality of monobasic acid = 0.1 N
Volume of NaOH solution = 15 cm
Normality of NaOH solution = ?
From normality equation,
$N_1V_1 = N_2V_2$
(for monobasic acid) (for NaOH)
$10 \times 0.1 = 15 \times N_2$

$$N_2 = \frac{10\times 0.1}{15} = 0.066N$$

418. For the reaction Fe_2O_3 + 3CO × 2Fe + $3CO_2$ the volume of carbon monoxide required to reduce on mole of ferric oxide is

(a) 22.4 dm^3 (b) 44.8 dm^3
(c) 67.2 dm^3 (d) 11.2 dm^3

Karnataka-CET, 2008

Ans. (c) : $\underset{1\,mol}{Fe_2O_3} + \underset{3\,mol}{3CO} \longrightarrow 2Fe + 3CO_2$

Volume of 1mole carbon monoxide
= 22.4 L (at STP)
1 mole of ferric oxide is reduced by = 3 moles of CO
= 3 × 22.4 L = 67.2 dm^3 [∵ 1 dm^3 = 1L]

@apna_pdf

419. Three moles of PCl_5, three moles of PCl_3 and two moles of Cl_2 are taken in a closed vessel. If at equilibrium the vessel has 1.5 moles of PCl_5, the number of moles of PCl_3 present in it is?

(a) 5 (b) 3
(c) 6 (d) 4.5

Karnataka-CET, 2008

Ans. (d) : $$\underset{\substack{3\,\text{mol}\\(3-x)\,\text{mol}}}{PCl_5} \rightleftharpoons \underset{\substack{3\,\text{mol}\\(3+x)\,\text{mol}}}{PCl_3} + \underset{\substack{2\,\text{mol intially}\\(2+x)\,\text{mol at equilibrium}}}{Cl_2}$$

So, $3 - x = 1.5$

$x = 1.5$

Number of moles of $PCl_3 = 3 + x$

$= 3 + 1.5 = 4.5$

420. One mole of which of the following has the highest entropy?

(a) Liquid nitrogen (b) Hydrogen gas
(c) Mercury (d) Diamond

Karnataka-CET, 2008

Ans. (b) : Entropy is the measure of degree of disorder (or randomness) of a system. The greater the disorder in a system, the higher is the entropy. Hence, entropy is highest for hydrogen gas.

421. The number of moles of lead nitrate needed to coagulate 2 moles of colloidal $[AgI]I^-$ is

(a) 2 (b) 1
(c) 1/2 (d) 2/3
(a) 5/2

Kerala-CEE-2008

Ans. (b):

$$2[AgI]\,I^- + Pb^{2+} \rightarrow PbI_2 + 2AgI$$

Since for this reaction we required 1 mole of Pb^{2+} is 1 mole of $Pb(NO_3)_2$.

422. Two liquids X and Y form an ideal solution. The mixture has a vapour pressure of 400 mm at 300 K when mixed in the molar ratio of 1: 1 and a vapour pressure of 350 mm when mixed in the molar ratio of 1: 2 at the same temperature. The vapour pressures of the two pure liquids X and Y respectively are

(a) 250 mm, 550 mm (b) 350 mm, 450 mm
(c) 350 mm, 700mm (d) 500 mm, 500 mm
(e) 550 mm, 250 mm

Kerala-CEE-2008

Ans. (e): Molar ration of 1 : 1 means $X_x = X_y = 0.5$

$P_{total} = X_x p_x^o + X_y p_y^o \Rightarrow 400 = 0.5\,p_x^o + 0.5\,p_y^o$

$p_x^o + p_y^o = 800$ ….(i)

Molar ratio of 1 : 2, $X_x = 1/3$, $X_y = 2/3$

Similarly, $350 = 1/3\,p_x^o + 2/3\,p_y^o$

$p_x^o + 2\,p_y^o = 1050$ ….(ii)

From equation (i) and (ii),

$p_y^o = 250$ mm and $p_x^o = 550$mm

423. 1.6 moles of PCl_5 (g) is placed in 4 dm^3 closed vessel. When the temperature is raised to 500 K, it decomposes and at equilibrium 1.2 moles of PCl_5 (g) remains. What is the K_c value for the decomposition of $PCl_5(g)$ to PCl_3 (g) and Cl_2 (g) at 500 K?

(a) 0.013 (b) 0.050
(c) 0.033 (d) 0.067
(a) 0.045

Kerala-CEE-2008

Ans. (c) 1.6 mol of PCl_5 is placed in $4dm^3$ closed vessel.

$$\begin{array}{llll} & PCl_5(g) \rightleftharpoons & PCl_3(g) + & Cl_2(g) \\ \text{Intial} & 1.6\,\text{mol} & 0 & 0 \\ \text{At eqm.} & 1.2\,\text{mol} & 0.4\,\text{mol} & 0.4\,\text{mol} \end{array}$$

Therefore, $PCl_5 = \frac{1/2}{4} = 0.3, PCl_3 = \frac{0.4}{4} = 0.1$

$$Cl_2 = \frac{0.4}{4} = 0.1$$

$$K_c = \frac{PCl_3 \times Cl_2}{PCl_5} = \frac{0.1 \times 0.1}{0.3} = 0.033$$

424. How many moles of lead (II) chloride will be formed from a reaction between 6.5 g of PbO and 3.2 g HCI? (atomic weight of Pb = 207)

(a) 0.011 (b) 0.029
(c) 0.044 (d) 0.333

NEET-2008

Ans. (b) :

$$\underset{223g/mol}{PbO} + \underset{2(35.59+1)g/mole}{2HCl} \longrightarrow \underset{277\,g/mol}{PbCl_2} + \underset{18g/mol}{H_2O}$$

223g/mol of PbO need → 70g of HCl

$$6.5 \rightarrow x \quad \Rightarrow x = \frac{6.5 \times 70}{223}$$

$\Rightarrow$ x = 2.04 g of HCl is needed.

223g of PbO→277g of $PbCl_2$

$$6.5 \rightarrow y \quad \Rightarrow y = \frac{6.5 \times 277}{223} \Rightarrow y = 8.07g$$

1 mol → 277g

x mol → 8.07

$$\Rightarrow \quad x = \frac{8.07}{277} = 0.029\,\text{moles}$$

425. 1 mole of H_2 and 2 moles of I_2 are taken initially in a two liter vessel. The number of moles of H_2 at equilibrium is 0.2. Then, the number of moles of I_2 and HI at equilibrium are–

(a) 1.2, 1.6 (b) 1.8, 1.0
(c) 0.4, 2.4 (d) 0.8, 2.0

BCECE-2008, UP CPMT-2006

Ans. (a) :

$$\begin{array}{llll} & H_2 \; + & I_2 \rightleftharpoons & 2HI \\ \text{Intial} & 1\text{mol} & 2\text{mol} & \\ \text{At, equlibrium} & 0.2 & 2-0.8 & 2\times 0.8 \\ & & 1.2\,\text{mol} & 1.6\,\text{mol} \end{array}$$

The numbers of moles of I_2 and HI at equilibrium are 1.2 moles and 1.6 moles respectively.

426. The number of electrons in a mole of hydrogen molecule is :

(a) 6.023×10^{23} (b) 12.046×10^{23}
(c) 3.0115×10^{23} (d) indefinite

BITSAT 2008

@apna_pdf

Ans. (b) : 1 mole of H_2 contains 6.023×10^{23} moleculer no of electron in $H_2 = 6.023\times10^{23}\times 2 = 12.046\times10^{23}$

427. Amount of oxalic acid present in a solution can be determined by its titration with $KMnO_4$ solution in the presence of H_2SO_4. The titration gives unsatisfactory result when carried cut in the presence of HCl because HCl

(a) Gets oxidized by oxalic acid to chlorine
(b) Furnishes H^+ ions in addition to those from oxalic acid
(c) Reduces permanganate to Mn^{2+}
(d) Oxidises oxalic to carbon dioxide and water

[AIEEE 2008]

Ans. (c) : Titration of oxalic acid by $KMnO_4$ in the presence of HCl gives unsatisfactory result because HCl is a better reducing agent than oxalic acid and HCl reduces preferably MnO_4^- to Mn^{2+}.

428. 200 g of hydrogen reacts with nitrogen according to equation $3H_{2(g)}+N_{2(g)}\rightarrow 2NH_{3(g)}$, to produce

(a) 11.322 g of ammonia
(b) 113.22 g of ammonia
(c) 1132.2 g of ammonia
(d) 11322 g of ammonia

AMU–2007

Ans. (c) : Given, in equation

$$3H_{2(g)} + N_{2(g)} \rightarrow 2NH_{3(g)}$$

3(2) 2(17)

6 g H_2 34 g NH_3

6 g of H_2 reacts with nitrogen to produce34g of NH_3

$$1g\ H_2 \rightarrow \frac{34}{6}\ \text{g of } H_3$$

$$200\ g\ H_2 \rightarrow \frac{34}{6}\times 200\ \text{g of } NH_3$$

= 1133.33 g of ammonia ≃ 1132.2 g of ammonia

429. In the reaction,
$2Al(s)+6HCl(aq)\rightarrow 2Al^{3+}(aq)+6Cl^-(aq)+3H_2(g)$

(a) 6L HCl (aq) is consumed for every 3L H_2 (g) produced
(b) 33.6 L H_2(g) is produced regardless of temperature and pressure for every mole Al that reacts
(c) 67.2 L H_2 (g) at STP is produced for every mole Al that reacts
(d) 11.2 L H_2 (g) at STP is produced for every mole HCl (aq) consumed

[AIEEE 2007]

Ans. (d) : In the case of option D, from the balanced chemical equation, it Can be seen that 6 moles of HCl reacts with 3 moles of hydrogen.

Hence, 1 mole of HCl will react with $\frac{3}{6}$ = 0.5 mole of hydrogen.

At STP 1 mole of hydrogen Corresponds to 22.4 L

Hence, 0.5 moles of hydrogen will corresponds to $\frac{22.4}{2}$ = 11.2 L

Thus, 11.2 L of hydrogen gas at STP is produced for every mole of HCl Consumed.

430. What volume of hydrogen gas, at 273 K and 1 atm pressure will be consumed in obtaining 21.6 g of elemental boron (atomic mass = 10.8) form the reduction of boron trichloride by hydrogen?

(a) 89.6 L (b) 67.2 L
(c) 44.8 L (d) 22.4 L

[AIEEE 2007]

Ans. (b) : If $BCl_3 + 1.5H_2 \rightarrow B + 3HCl$

From the equation it is clear that 1 mole of boron formation requires 1.5 moles of hydrogen gas.

$$\text{No. of moles} = \frac{\text{Mass}}{\text{Molar mass}}$$

$$= \frac{21.6\,g}{10.8\,g\,mol^{-1}} = 2.00\ mol$$

To obtain 2.00 mol of boron, 3.00 mol of hydrogen gas is required.

One mole of hydrogen gas at 273 k and 1 atm occupies a volume of 22.4 L.

Therefore volume of hydrogen gas = 3.00 mol × 22.4L mol^{-1}

= 67.2 L

431. Maximum number of molecules of CH_3I that can react with a molecule of CH_3NH_2 are

(a) 3 (b) 4
(c) 2 (d) 1

Karnataka-CET-2007

Ans. (a) : $\underset{\text{Methly amine}}{CH_3NH_2} \xrightarrow[-HI]{CH_3I} \underset{\text{Dimethyl amine}}{(CH_3)_2NH} \xrightarrow[-HI]{CH_3I} \underset{\text{Trimethyl amine}}{(CH_3)_3N} \xrightarrow{CH_3I} \underset{\text{Tetramethyl ammonium iodide}}{(CH_3)_4N^+I^-}$

Hence, three molecules of CH_3I is used.

432. The number of gram molecules of chlorine in 6.02×10^{25} hydrogen chloride molecules is

(a) 10 (b) 100
(c) 50 (d) 5

Karnataka-CET-2007

Ans. (c) : Let the Number of gram molecules

$$\frac{6.02\times10^{25}}{6.02\times10^{23}} = 100$$

∴ Gram molecular mass of chlorine in 6.023 × 10^{25} molecules of HCl = $\frac{100}{2} = 50$

433. Molarity of a given orthophosphoric acid solution is 3M. It' s normality is

(a) 9N (b) 0.3N
(c) 3N (d) 1N

Karnataka-CET-2007

Ans. (a) : Orthophosphoric acid (H_3PO_4) is a tribasic acid.

∵ Normality = Molarity × basicity

∴ Normality = 3M × 3

= 9N

@apna_pdf

434. One mole of oxygen at 273 K and one mole of sulphur dioxide at 546 K are taken in two separate containers, then,

(a) kinetic energy of O_2> kinetic energy of SO_2
(b) kinetic energy of O_2 < kinetic energy of SO_2
(c) kinetic energy of both are equal
(d) None of the above

Karnataka-CET-2007

Ans. (b) : $KE = \frac{3}{2}RT$

$KE \propto T$

$$\frac{KE_{o_2}}{KE_{so_2}} = \frac{T_{o_2}}{T_{so_2}} = \frac{273}{546} = \frac{1}{2}$$

$KE_{SO_2} = 2KE_{O_2}$

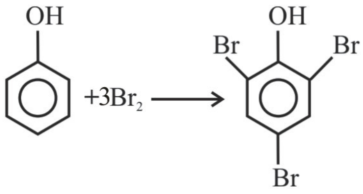
$\therefore\ KE_{SO_2} > 2KE_{O_2}$

435. What amount of bromine will be required to convert 2 g of phenol into 2, 4, 6-bribromo phenol

(a) 20.44 g
(b) 6.00 g
(c) 4.00 g
(d) 10.22 g

UPTU/UPSEE-2007

Ans. (d) :



molecular weight of Phenol = 12 × 6 + 1 × 6 + 16 = 94

molecular wt. of Br_2 = 3 × 160 = 480

$\because$ 94 of phenol requires = 480 of Br_2

$\therefore$ 2 g of phenol requires $= \frac{480}{94} \times 2 = 10.22g$

436. 138 g of ethyl alcohol is mixed with 72 g of water. The ratio of mole fraction of alcohol to water is

(a) 3 : 4
(b) 1 : 2
(c) 1 : 4
(d) 1 : 1

AP EAMCET (Engg.) -2007

Ans. (a) : Mass of ethyl alcohol $(C_2H_5OH) = 46$ g

Number of moles of ethyl alcohol

$$= \frac{138}{46} = 3$$

Number of moles of water $= \frac{72}{18} = 4$

$$X_{C_2H_5OH} = \frac{3}{3+4} = \frac{3}{7}$$

$$X_{H_2O} = \frac{4}{3+4} = \frac{4}{7}$$

$$\frac{X_{C_2H_5OH}}{X_{H_2O}} = \frac{3/7}{4/7} = \frac{3}{4} = 3 : 4$$

437. Assertion: Equal moles of different substances contain same number of constituent particles.

Reason: Equal weights of different substances contain the same number of constituent particles.

The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A).
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A).
(c) (A) is true, but (R) is false.
(d) (A) is false but (R) is true.

AP EAMCET (Engg.) -2007

Ans. (c) : Here, assertion is right, but reason is false Because –

Equal moles of different substances contain same number of constituent particles but equal weights of different substances do not contain the same number of constituent particles.

438. 250 mL of a 0.50 M NaCl solution contains [Given that molar mass of NaCl = 58.5 g mol^{-1}]

(a) 7.32 g of NaCl
(b) 14.64 g of NaCl
(c) 21.96 g of NaCl
(d) 5.85 g of NaCl

AMU–2006

Ans. (a) : Molarity, $M = \frac{\text{No.of moles of solute}(n)}{\text{Volume of solution in lit.}(v)}$

$$\text{or, } M = \frac{\frac{\text{weight.of solute}(w)}{\text{Molecular weight of solute}(M_s)}}{(V)}$$

$$\text{or, } M = \frac{w}{M_s \times V} \quad \text{or, } w = M \times M_s \times V$$

$= 0.50 \times 58.5 \times 0.25$ g = 7.3125 g

439. The volume of Cl_2 at STP obtained on reacting 4.35 g MnO_2 with conc. HCl (At. Wt. of Mn = 55)

(a) 4.48 litre
(b) 2.24 litre
(c) 1.12 litre
(d) 0.56 litre

BITSAT 2006

Ans. (c) : $\underset{87g}{MnO_2} + 4HCl \rightarrow MnCl_2 + 2H_2O + \underset{\substack{22.4\,litre \\ s\,at\,STP}}{Cl_2}$

1 gm MnO_2 gives $= \frac{22.4}{87}$ litres of Cl_2

4.35 g MnO_2 gives $= \frac{22.4 \times 4.35}{87}$

= 1.12 lit. of Cl_2.

440. CO_2 gas obtained by the combustion of 12 mL butane gas is

(a) 3 mL
(b) 12 mL
(c) 24 mL
(d) 48 mL

CG PET -2006

Ans. (d) :

$$C_4H_{10} + \frac{13}{2}O_2 \rightarrow 4CO_2 + 5H_2O$$

1 mole — 4 mole

12 mL — 12 × 4 = 48 mL

@apna_pdf

441. How many moles of magnesium phosphate, $Mg_3(PO_4)_2$ will contain 0.25 mole of oxygen atoms?

(a) 0.02 (b) 3.125×10^{-2}
(c) 1.25×10^{-2} (d) 2.5×10^{-2}

[AIEEE 2006]

Ans. (b) : $Mg_3(PO_4)_2$; mole

8 moles of O atom are contained by 1 mole $Mg_3(PO_4)_2$

Hence, 0.25 moles of O atom = $\frac{1}{8}\times0.25$

$= 3.125\times10^{-2}$

442. 1.25 g NH_3 contains how many atoms?

(a) 10^{23} (b) 1.77×10^{23}
(c) 6×10^{13} (d) 4×10^{23}

JCECE - 2006

Ans. (b) : Given that,
Mass of NH_3(W) = 1.25 g
Molar mass of NH_3(M) = 17 g/mol

$$\therefore \text{Number of moles } (n) = \frac{W}{M} = \frac{1.25}{17} = \frac{5}{68}\text{mol}$$

Each molecule contain 4 atom

$\therefore$ Number of atom (N) = 4 × n × N_A

$$= 4\times\frac{5}{68}\times6.022\times10^{23} = 1.77\times10^{23}\text{atoms}$$

443. One mole of acidified $K_2Cr_2O_7$ on reaction with excess KI will liberate.....mole (s) of I_2:

(a) 6 (b) 1
(c) 7 (d) 2
(e) 3

Kerala-CEE-2006

Ans. (e) : When one mole of acidified potassium dichromate ($K_2Cr_2O_7$) react with excess of KI solution the balanced chemical reaction is as

$$Cr_2O_7^{2-} + 14H^+ + 6I^- \to 2Cr^{3+} + 3I_2 + 7H_2O$$

3 moles of I_2 is evolved when excess of KI react with one mole of acidified potassium dichromate ($K_2Cr_2O_7$).

444. On a humid day in summer, the mole fraction of gaseous H_2O (water vapour) in the air at 25°C can be high as 0.0287. Assuming a total pressure of 0.977 atm. What is the partial pressure of dry air?

(a) 94.9 atm (b) 0.949 atm
(c) 949 atm (d) 0.648 atm
(e) 1.248 atm

Kerala-CEE-2006

Ans. (b) :

$$P_{H_2O} = X_{H_2O}P_{total} = 0.0287\times0.977 = 0.028\,\text{atm}$$

$$P_{total} = P_{dryair} + P_{H_2O}$$

$$P_{dryair} = P_{total} - P_{H_2O} = 0.977 - 0.028 = 0.949\,\text{atm}$$

445. Number of atoms of He in 100 amu of He (atomic wt. of He is 4) are

(a) 25 (b) 100
(c) 50 (d) 100

UP CPMT-2006

Ans. (a) : Number of atom of a substance = Number of gram molecular weight × 6.05 × 10^{23} × atomicity

$$= \frac{\text{wt. of substance}}{\text{Number of g.molecules}}\times6.02\times10^{23}\times\text{atomicity}$$

$$= 1\,\text{amu} = 1.6\times10^{-24}\text{g}$$

$$= 100\,\text{amu} = 1.6\times100\times10^{-24}\text{ g}$$

$$= \frac{100\times1.6\times10^{-24}}{4}\times6.023\times10^{23}\times1$$

$$= 25\times1.6\times10^{-24}\times6.023\times10^{23} = 25$$

446. One mole of CO_2 contains:

(a) 3g atoms of CO_2
(b) 18.1×10^{23} molecules of CO_2
(c) 6.02×10^{23} atoms of O
(d) 6.02×10^{23} atoms of C

UPTU/UPSEE-2006

Ans. (d) : One mole of CO_2 contains 6.02×10^{23} atoms of C and 6.023×10^{23} molecules of oxygen.

447. In the equation $H_2S + 2HNO_3 \longrightarrow 2H_2O + 2NO_2 + S$. The equivalent weight of hydrogen sulphide is :

(a) 18 (b) 68
(c) 34 (d) 17

BCECE-2006

Ans. (d): (Increase in oxidation state = 2)

$$\overset{-2}{H_2S} + 2HNO_3 \to 2H_2O + 2NO_2 + \overset{0}{S}$$

Hence, the equivalent weight of

$$H_2S = \frac{\text{molecular weight}}{\text{change in oxidation number}}$$

$$H_2S = \frac{34}{2} = 17$$

448. What is the weight of oxygen that is required for the complete combustion of 2.8 kg of ethylene?

(a) 9.6 kg (b) 96.0 kg
(c) 6.4 kg (d) 2.8 kg

BCECE-2006

Ans. (a) : $\underset{(12\times2+4=28)}{C_2H_4} + \underset{(3\times16\times2=96)}{3O_2} \to 2CO_2 + 2H_2O$

$\therefore$ The weight of oxygen required for complete Combustion of 28 kg ethylene = 96 kg

$\therefore$ Weight of oxygen required for combustion of 2.8 kg ethylene

$$= \frac{96\times2.8}{28}\text{kg} = 9.6\text{kg}$$

449. 100 g $CaCO_3$ is treated with 1 L of 1N HCl. What would be the weight of CO_2 liberated after the completion of the reaction?

@apna_pdf

(a) 55g (b) 11g
(c) 22g (d) 33g
(e) 44g

Kerala-CEE-2005

Ans. (c):

$$CaCO_3 + 2HCl \longrightarrow CO_2 + CaCl_2 + H_2O$$

No. of mole ⇒ 1 2 1 1 1

Molecular mass of $CaCO_3$ = 100g = 1 mole of $CaCO_3$

1 N HCl = 1 M HCl (n factor for HCl = 1)

No. of moles = molarity × volume (L)

= 1

Hence, 1 mole of HCl would react with 0.5 moles of $CaCO_3$ to give 0.5 mole of CO_2.

$$\text{Now, 0.5 moles of } CO_2 = \frac{\text{weight}}{\text{molar mass}}$$

$$0.5 = \frac{\text{weight}}{44\text{g}}$$

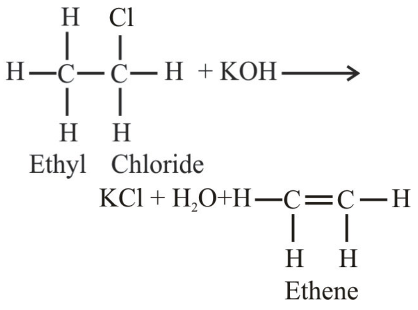
weight = 22g

450. When 32.25 g of ethyl chloride is subjected to dehydrohalogenation reaction the yield of the alkene formed is 50%. The mass of the product formed is : (atomic mass of chlorine is 35.5)

(a) 14g (b) 28g
(c) 64.5g (d) 56g
(e) 7g

Kerala-CEE-2005

Ans. (e) :



$$H-\underset{H}{\overset{H}{C}}-\underset{H}{\overset{Cl}{C}}-H + KOH \longrightarrow KCl + H_2O + H-\underset{H}{C}=\underset{H}{C}-H$$

Ethyl Chloride

Ethene

Molar mass of ethyl chloride

= 2 × 12 + 5 × 1 + 1 × 35.5

= 24 + 5 +350.5 = 64.5g mol^{-1}

Molar mass of ethene = 2 × 12 + 4 × 1

= 28 g mol^{-1}

Actual yield = 50% of 28g = 14g

64.5g of ethyl chloride on dehydrohalogenation gives 14g ethene

∴ 32.25 g of ethyl chloride on dehydoholoenation will give ethene = 7g.

451. How much of sulphur is present in an organic compound, if 0.53 g of the compound gave 1.158 g of $BaSO_4$ on analysis?

(a) 10% (b) 15%
(c) 20% (d) 25%
(e) 30%

Kerala-CEE-2005

Ans. (e) : Organic compond mass=0.53 g

$Baso_4$ produce =1.158 g

$$\% \text{ of sulphur in } BaSO_4 = \frac{32}{233} \times 100 = 13.7\%$$

$$\text{weight of sulphur in 1.158g of } BaSO_4 = \frac{13.7}{100} \times 1.158$$

$$= 0.158\text{g}$$

0.53g of compound gives 0.158g of sulphur

$$\% \text{ sulphur in given compound } = \frac{0.158}{0.53} \times 100 = 30\%$$

452. In alkaline medium, ClO_2 oxidises H_2O_2 to O_2 and itself gets reduced to Cl^-. How many moles of H_2O_2 are oxidized by 1 mole of ClO_2?

(a) 1.0 (b) 1.5
(c) 2.5 (d) 3.5
(e) 5.0

Kerala-CEE-2005

Ans. (c) : The balanced chemical equation is

$$2ClO_2 + 5H_2O_2 + 2OH^- \rightarrow 2Cl^- + 5O_2 + 6H_2O$$

$$\frac{1}{2} \text{ mol } ClO_2 = \frac{1}{5} \text{ mol } H_2O_2$$

$$1 \text{ mol } ClO_2 = \frac{5}{2} \text{ mol } H_2O_2$$

$$= 2.5 \text{ mol } H_2O_2$$

453. Number of moles of $K_2Cr_2O_7$ reduced by one mole of Sn^{2+}?

(a) $\frac{1}{3}$ (b) 3
(c) $\frac{1}{6}$ (d) 6

UP CPMT-2005

Ans. (a) One mole of Sn^{2+} can reduce 1/3 moles $K_2Cr_2O_7$.

454. How many moles of $Al_2(SO_4)_3$ would be in 50 g of the substance?

(a) 0.083mol (b) 0.952mol
(c) 0.481mol (d) 0.140 mol

UPTU/UPSEE-2005

Ans. (d) : $\text{Moles} = \frac{\text{Mass}}{\text{Molecular weight}}$

mass of $Al_2(SO_4)_3$ = 50g.

Molecular mass of $Al_2(SO_4)$ = 342g

$$\therefore \quad \text{Moles of } Al_2(SO_4) = \frac{50}{342} = 0.14 \text{ mol.}$$

455. The number of moles of proton which can be easily given by butyne-1 (1mole) is

(a) 1 (b) 2
(c) 3 (d) 6

CG PET -2005

Ans. (a) : The structure of butyne -1 is given below

$$H-C\equiv C-CH_2-CH_3$$

If triple bond bearing carbon attached with hydrogen, such hydrogen is acidic in nature.

Number of this type of hydrogen present in butyne –1 is one.

@apna_pdf

456. 50 mL of benzene is mixed with 50mL of chloroform. What is the volume of solution?

(a) Less than 100mL (b) More than 100mL
(c) Equal to 100mL (d) None of the above

CG PET -2005

Ans. (a) : 50 mL benzene is mixed with 50 mL of chloroform to form less than 100 mL volume of solution.

457. A mixture has 18g water and 414 ethanol. The mole fraction of water in mixture is (assume ideal behaviour of the mixture)

(a) 0.1 (b) 0.4
(c) 0.7 (d) 0.9

CG PET -2005

Ans. (a) :

$$\text{Mole fraction} = \frac{\text{moles of water}}{\text{moles of water} + \text{moles of ethanol}}$$

mol. wt. of H_2O = 18 mol

atomic weight of $C_2H_5OH = 46 \rightarrow 2 \times 12 + 5 \times 1 \times 16 + 1 = 26$ molecular weight.

$$\text{Mole fraction of water} = \frac{\frac{18}{18}}{\frac{18}{18}+\frac{414}{46}}$$

$$= \frac{1}{10} = 0.1$$

458. 1 moles of crystalline NaCl will have how many unit cells?

(a) 1.506×10^{23} (b) 3.012×10^{23}
(c) 4.518×10^{23} (d) 6.023×10^{23}

CG PET -2005

Ans. (a) : The molar mass of NaCl is ⇒ 23 + 35.5 = 58.5 g

58.5 g of NaCl corresponds to 1 mole of NaCl and Contains 6.023×10^{23} molecules.

One unit cell of NaCl (fcc structure) has 4 NaCl molecules.

1 mole of NaCl will contain

$$\frac{6.023 \times 10^{23}}{4} = 1.506 \times 10^{23} \text{ unit cells.}$$

459. The volume of 0.1 M H_2SO_4 that is needed to completely neutralise 30mL of 0.2 M NaOH solution, is

(a) 15 mL (b) 30 mL
(c) 40 mL (d) 60 mL

CG PET -2005

Ans. (b) : Let V be the volume of H_2SO_4 required.

Given:-

$M_{H_2SO_4} = 0.1$ M

$M_{NaOH} = 0.2$ M

$V_{NaOH} = 30$ ML

Now, as we know that

$N_1V_1 = N_2V_2$

The relation between the molarity and the normality is

$N = n \times m$

Where as n is the valence factor

$n_1m_1v_1 = n_2m_2v_2$

For H_2SO_4; n = 2

For NaOH ; n = 1

Therefore

$2 \times 0.1 \times v = 1 \times 0.2 \times 30$

$\Rightarrow v = \frac{6}{0.2}$

v = 30 mL

460. In 1 mole of NaCl the protons are

(a) 6 moles (b) 11 moles
(c) 17 moles (d) 28 moles

CG PET -2005

Ans. (d) : Constituent of NaCl are Na and Cl.

Number of proton is Na = 11

[Atomic number of Na = 11]

Number of proton in Cl = 17

[Atom number of Cl = 17]

So, 1 mole Na contains 11 moles of protons and 1 mole of Cl contains 17 moles of protons. Hence, 1 mole NaCl contains 28 moles of protons.

461. The morality of a solution made by mixing 50 mL of conc. H_2SO_4 (36N) with 50mL of water, is

(a) 36 M (b) 18 M
(c) 9 M (d) 6 M

CG PET -2005

Ans. (c) : Concentrated H_2SO_4 36 N is 18 M with 50 ml of water

Sulphuric acid

$m_1v_1 = m_2v_2$

Where

M_1 = intial molarity

V_1 = intial volume

M_2 = final molarity

V_2 = final volume

$m_1v_1 = m_2v_2$

$18 \times 50 = m_2 \times (50 + 50)$

$900 = 100\, m_2$

$m_2 = 9$

The molarity of the solution is 9M.

462. 171g of sugar cane ($C_{12}H_{22}O_{11}$) is dissolved in 1 L of water. The molarity of the solution is

(a) 2.0 M (b) 1.0M
(c) 0.5 M (d) 0.25 M

CG PET -2005

Ans. (c) : Number of mole of sugar cane ($C_{12}H_{22}O_{11}$)

$$\Rightarrow \frac{\text{Given weight}}{\text{Molecular weight}} = \frac{171}{342} = 0.5$$

@apna_pdf

$$\text{Molarity} = \frac{\text{No. of mole of solute}}{\text{volume of solution (L)}}$$

$$\text{Molarity} = \frac{171/342}{1}$$

$$= 0.5$$

463. The vapour pressure of a pure liquid 'A' is 0.80 atm. When a non-volatile solute 'B' is dissolved in 'A' its vapour pressure becomes 0.60 atm. The mole fraction of 'B' in the solution is

(a) 0.125 (b) 0.25
(c) 0.50 (d) 0.75

CG PET -2005

Ans. (b) : The vapour pressure of a solvent A = P_0 = 0.80 atm.

And after adding non- volatile substance B, vapour pressure P = 0.6 atm

According to Raoult's law for relative lowering of vapour pressure

$$\frac{P_0 - P}{P_0} = X_B$$

$$\Rightarrow \frac{0.80 - 0.60}{0.80} = \frac{0.20}{0.800} = X_B = \frac{1}{4}$$

i.e. $X_B = 0.25$

mole fraction of B in the solution is 0.25

464. If we consider that 1/6, in place of 1/12, mass of carbon atom is taken to be the relative atomic mass unit, the mass of one mole of a substance will

(a) Be a function of the molecular mass of the substance
(b) Remain unchanged
(c) Increase two fold
(d) Decrease twice

[AIEEE 2005]

Ans. (b) : If $\frac{1}{6}$ is used in place of $\frac{1}{12}$ mass of carbon then the mass of 1 mole of substance will remain unchange.

Since 1 mole = N_A × mass of 1 atom.

When we use $\frac{1}{6}$th in place of $\frac{1}{12}$th

Then,

1 AMU = 2 AMU

Now, the new Avogardo number (N_A) becomes $\frac{N_A}{2}$ since the atomic mass corresponding to it becomes 6 g.

So, 1 mole $= \frac{N_A}{2} \times 2\,\text{a.m.u.}$

Hence, the mass remains unchange.

465. The number of sodium atoms in 2 moles of sodium ferrocyanide is :

(a) 12×10^{23} (b) 26×10^{23}
(c) 34×10^{23} (d) 48×10^{23}

BITSAT 2005

Ans. (d) : $Na_4[Fe(CN)_6]$

No. of Na-atoms in molecules of $Na_4[Fe(CN)_6]$ is =4

No. of Na–atom in 1 mole of $Na_4[Fe(CN)_6]$=4 times of Na

$=4\times6.023\times10^{23}$

No. of Na-atom in 2 moles of $Na_4[Fe(CN)_6]$

$=2\times4\times6.023\times10^{23}$

$=48.134\times10^{23}$

466. Assertion (A) : 8 g of methane occupies 11.207 L of volume at 273K and 1 atm. pressure.

Reason (R) : One mole of any gas at STP occupies 22.414 litres of volume :

The correct answer is

(a) both A and R are true and R is the correct explanation of A
(b) both A and R are true but R is not the correct explantation of A
(c) A is true but R is false
(d) A is false but R is true

AP-EAMCET (Engg.)-2004

Ans. (a) : One mole of CH_4 gas is equal to 16 g of CH_4. So, at STP

∵ 1 mole or 16 g of CH_4 occupies volumes = 22.414 L

$$\therefore \text{ 8 g of } CH_4 \text{ occupies volume} = \frac{22.414\times8}{16} = 11.207\,\text{L}$$

Reason – At STP one mole of gas occupies 22.414 L of volume. Thus, both A and R are true and R is the correct explanation of A.

467. 10 g of $CaCO_3$ is completely decomposed to X and CaO. X is passed into an aqueous solution containing one mole of sodium carbonate. What is the number of moles of sodium bicarbonate formed ?

(a) 0.2 (b) 0.1
(c) 0.01 (d) 10

AP-EAMCET (Engg.)-2004

Ans. (a) :

$$\underset{\text{molecular weight}=100\text{g}}{CaCO_3} \longrightarrow CaO + \underset{\substack{(x)\\ \text{molecular}\\ \text{weight}=44\text{g}}}{CO_2}$$

Now (x) is passed into an aqueous solution containing one mole of Na_2CO_3 as given below–

$$CO_2 + \underset{\substack{\text{Sodium}\\ \text{carbonate}}}{Na_2CO_3} + H_2O \rightarrow \underset{\text{Sodiumbicarbonate}}{2NaHCO_3}$$

∵ No. of moles of Na_2CO_3 when 100 gm $CaCO_3$ is decomposed = 2

∴ No. of moles of $NaCO_3$ when 10g $CaCO_3$ is decomposed $= \frac{2\times10}{100} = 0.2$ mole

468. The normality of mixture obtained by mixing 100 mL of 0.2 M H_2SO_4 + 100 mL of 0.2 M NaOH is :

(a) 0.2 (b) 0.01
(c) 0.1 (d) 0.3

BCECE-2004

Ans. (c) : From the relation between molarity and normality is N = n × M

$N_1 = 2 \times 0.2 = 0.4$ N, $N_2 = 1 \times 0.2 = 0.2$N

@apna_pdf

When V_1 mL acid having normality N_1 is mixed with V_2 mL of base having normality N_2, the normality of the resultant solution is

$$\frac{V_1N_1 - V_2N_2}{V_1 + V_2} = N_R \qquad V_1N_1 > V_2N_2$$

$$N_R = \frac{0.4\times100 - 0.2\times100}{100+100} = \frac{40-20}{200}$$

$$N_R = \frac{1}{10} = 0.1\text{ N}$$

Normality = 0.1 N

469. Mole fraction of a solute in benzene is 0.2 then find molality of solute :

(a) 3.2 (b) 2
(c) 4 (d) 3.6

BCECE-2004

Ans. (a) : Let the solution be x molal then moles of benzene present in 1000 g of benzene

$$= \frac{1000}{78} = 12.82\text{ mol}$$

$$\therefore \text{ Mole fraction of solute} = \frac{x}{x+12.82}$$

$$0.2 = \frac{x}{x+12.82}$$

x = 0.2x + 2.564
0.8x = 2.564

$$x = \frac{2.564}{0.8} = 3.2$$

470. The number of moles of a solute in its solution is 20 and total numbers of moles are 80. The mole fraction of solute is

(a) 2.5 (b) 0.25
(c) 1 (d) 0.75

CG PET -2004

Ans. (b) : Given,
Number of moles = 20
Total number of moles = 80

$$\text{Mole fraction} = \frac{\text{Number of solute moles}}{\text{total number of moles}}$$

$$= \frac{20}{80} = 0.25$$

471. Vapour pressure of dilute aqueous solution of glucose is 750 mm of mercury at 373 K. The mole fraction of solute is

(a) 1/76 (b) 1/7.6
(c) 1/38 (d) 1/10

J & K CET-(2004)

Ans. (a) : 373 K is the boiling point of H_2O So, p° = 760

mm Hg, p_s = 750 mm Hg

$$\text{We know that-}\quad \frac{p^\circ - p_s}{p^\circ} = \text{mole fraction}\,(x_B)$$

$$\frac{760-750}{760} = x_B$$

$$x_B = \frac{1}{76}$$

472. One of the mole of a gas at NTP occupies 22.4 litres. This fact was derived from

(a) Law of gaseous volumes
(b) Avogadro's hypothesis
(c) Berzelius hypothesis
(d) Dalton's atomic theory

J & K CET-(2004)

Ans. (b) : One gram mole of a gas at NTP required 22.4 as volume. This fact was derived from Avogadro's hypothesis.

Taking STP to be 101.325 kPa and 273.15 K. From ideal gas equation PV = nRT

$$V = \frac{1\times RT}{p}$$

we can find the volume of one mole of a gas.

$$\text{Volume} = \frac{RT}{P} = \frac{8.314\times273.15}{101.325} = 22.4\text{L}$$

473. Number of atoms of oxygen present in 10.6 g of Na_2CO_3 will be

(a) 6.02×10^{22} (b) 12.04×10^{22}
(c) 1.806×10^{23} (d) 31.80×10^{28}

J & K CET-(2004)

Ans. (c) : 1 mole of Na_2CO_3 = 106 g

$$\text{Moles in 10.6 g of } Na_2CO_3 = \frac{10.6}{106} = 0.1\text{ mole}$$

106 g Contain atoms of oxygen = 3 × 6.022 ×10^{23}
10.6 g Contain atoms = 0.1 × 3 × 6.022 ×10^{23}
= 1.8 × 10^{23} atoms

474. 2 g of aluminium is treated separately with excess of dil. H_2SO_4 and excess of NaOH, the ratio of volume of hydrogen evolved in:

(a) 1:1 (b) 2:3
(c) 1:2 (d) 2:1
(e) 3:1

Kerala-CEE-2004

Ans. (a): $2Al + 3H_2SO_4 \longrightarrow Al_2(SO_4)_3 + 3H_2$

$2Al + 2NaOH + 6H_2O \longrightarrow 2Na[Al(OH)_4] + 3H_2$

In both reaction, 2 mole Al gives 3 mole. H_2 1 mole of H_2 = 22.4L

So, equal moles of H_2 corresponds to equals volume of H_2 in both reaction.

$$\text{Ratio} = \frac{3(H_2)}{3(H_2)} = \frac{1}{1}$$

475. The numerical value of $\frac{N}{n}$ (where, N is the number of molecules in a given sample of gas and n is the number of moles of the gas) is:

(a) 8.314 (b) 6.02×10^{23}
(c) 0.0821 (d) 1.66×10^{-19}
(e) 1.62×10^{-24}

Kerala-CEE-2004

Ans. (b) The numerical value of N/n, where:
N = The number of molecules in a given sample
n = number moles
suppose, we are having × mol of gas.

@apna_pdf

n = x mol
According to mole concept, 1 mole = $N_A = 6.023 \times 10^{23}$ molecules or atoms
Number of molecules in x moles of gas,
$N = x \times 6.023 \times 10^{23}$
The value of N/n is :

$$\frac{x \times 6.023 \times 10^{23}}{x} = 6.023 \times 10^{23}$$

476. The mass of 11.2 L of ammonia gas at STP is:

(a) 8.5 g (b) 85 g
(c) 17 g (d) 1.7 g
(e) 4.25 g

Kerala-CEE-2004

Ans. (a)
1 mole of NH_3 at STP occupies volume of 22.4 lit.
1 mole of NH_3 weights = molar mass = 17 g
So, 17 g of NH_3 = 22.4 lit
Let 17g of NH_3 = 22.4 lit
Let × g of NH_3 = 11.2 lit

Therefore, $x = \frac{(11.2 \times 17)}{(22.4)} = 8.5g$

477. Which of the following contains maximum number of molecules?

(a) 100 cc of CO_2 at STP
(b) 150 cc of N_2 at STP
(c) 50 cc of SO_2 at STP
(d) 150 cc of O_2 at STP
(e) 200 cc of NH_3 at STP

Kerala-CEE-2004

Ans. (e) 1 litre = 1000 cm^3 = 1000cc
We know that, volume of 1 mol of gas at S.T.P. = 22.4 L = 22400 cm^3 = 24000cc
200cc of NH_3 at S.T.P contains

$$\frac{(6.022 \times 10^{23} \times 200)}{22400} = 0.0537 \times 10^{23} \text{molecules}$$

150cc of N_2 at S.T.P. and 150cc of O_2 at S.T.P

$$\frac{(6.022 \times 10^{23} \times 150)}{22400} = 0.0403 \times 10^{23} \text{molecules}$$

50cc of SO_2 at S.T.P

$$= \frac{(6.022 \times 10^{23} \times 50)}{22400} = 0.013 \times 10^{23} \text{molecules}$$

From the above expression, it is clear that 200 cc of NH_3 at S.T.P. contains maximum number of molecule.

478. A litre of solution is saturated with Ag*Cl*. To this solution if 1.0 × 10^{-4} mole of solid Na*Cl* is added, what will be the $[Ag^+]$, assuming no volume change?

(a) More (b) Less
(c) Equal (d) Zero

UPTU/UPSEE-2004

Ans. (b) : A litre of solution is saturated with AgCl
1.0 × 10^{-4} mole of solid NaCl is added,
$[Ag^+]$ will be loss.

$$AgCl \rightleftharpoons Ag^+ + Cl^-$$

$$NaCl \rightarrow Na^+ + Cl^{-+}$$

Thus, the dissociation of NaCl provides chloride ions that are common to AgCl. Due to common ion effect, the dissociation of AgCl is suppressed and $[Ag^+]$ decreases.

479. The mass of $BaCO_3$ produced when excess CO_2 is bubbled through a solution of 0.205 mole $Ba(OH)_2$.

(a) 81 g (b) 40.5 g
(c) 20.25 g (d) 162 g

UPTU/UPSEE-2004

Ans. (b) : Given that,
Mole of $Ba(OH)_2$ =0.205 mole
Now,

$$Ba(OH)_2 + CO_2 \rightarrow BaCO_3 + H_2O$$

1 mole 1 mole
0.205 mol 0.205 mol
mole of $BaCO_3$ produced (n)=0.205 mol
molor man of $BaCO_3$ (m) =197 g/ mol
mass of $BaCO_3$ produced = 0.205 × 197g
= 40.385 g

480. Which of the following contains least number of molecules?

(a) 16 g of CO_2 (b) 8 g of O_2
(c) 4 g of N_2 (d) 2 g of H_2

AMU–2003

Ans. (c) : No. of molecules in 16 g of

$CO_2 = \frac{6.023 \times 10^{23}}{44} \times 16$

No. of molecules in 8 g of $O_2 = \frac{6.023 \times 10^{23}}{32} \times 8$

No. of molecules in 4 g of $N_2 = \frac{6.023 \times 10^{23}}{28} \times 4$

No. of molecules in 2 g of $H_2 = \frac{6.023 \times 10^{23}}{2} \times 2$

∴ 4 g of N_2 contains least number of molecules.

481. $KMnO_4$ reacts with oxalic acid according to the equation

$$\mathbf{2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 2Mn^{2+} + 10CO_2 + 8H_2O}$$

Here 20 mL of 0.1 $MKMnO_4$ is equivalent to

(a) 20 mL of 0.5 (b) 50 mL of 0.1
(c) 50 mL of 0.01 (d) 20 mL of 0.1

J & K CET-(2003)

Ans. (b) :

$$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$$

At NTP, 2 × 22.4 L react with 5 × 22.4 L oxalic acid

$$\frac{5 \times 22.4 \times 20}{2 \times 22.4} \text{ ml} = 50 \text{ ml}$$

20 mL of 0.1 m $KMnO_4$ is equivalent to 50 mL of 0.1 oxalic acid.

482. 720 g water contain the number o moles:

(a) 2 (b) 190
(c) 40 (d) 55

JCECE - 2003

@apna_pdf

Ans. (c): Given that –

Mass of H_2O is = 720 g

Molar mass of water = 18 g/mol

We know that, no. of mole = $\frac{\text{weight}}{\text{molecular weight}}$

Moles of water = $\frac{720}{18}$

= 40 moles.

483. The total number of protons in 10g of calcium carbonate is (N_0=6.023×10^{23})

(a) 3.01×10^{24} (b) 4.06×10^{24}

(c) 2.01×10^{24} (d) 3.01×10^{24}

UP CPMT-2003

Ans. (a) : Number of protons = Atomic number

∴ Protons in 1 mole $CaCO_3$

= Atomic No. of Ca + atomic. No. of C + 3 × atomic No. of O

= 20 + 6 + 3 × 8

= 50

Atomic mass of $CaCO_3$

= 40 + 12 + 3 × 16

=100

∵ 100 g of $CaCO_3$ has protons= 50

∴ 10 g of $CaCO_3$ has protons

$$= \frac{50}{100}\times10\times6.02\times10^{23}$$

$$= \frac{50}{100}\times10\times6.02\times10^{23}$$

$$= 3.01\times10^{24}$$

484. 3.65 g of HCl is dissolved in 16.2 g of water. The mole fraction of HCl in the resulting solution is:

(a) 0.4 (b) 0.3

(c) 0.2 (d) 0.1

AP-EAMCET (Medical), 2003

Ans. (d) : Given data:

$W_{HCl} = 3.65g$

$W_{H_2O} = 16.2g$

$X_{HCl} = ?$

Number of moles of HCl $\left(n_{HCl}\right) = \frac{3.65}{36.5} = 0.1$

Number of moles of H_2O $\left(n_{H_2O}\right) = \frac{16.2}{18} = 0.9$

Now, $X_{HCl} = \frac{n_{HCl}}{n_{HCl} + n_{H_2O}}$

$X_{HCl} = \frac{0.1}{0.1+0.9}$

or $X_{HCl} = 0.1$

485. One mole of fluorine reacted with two moles of hot concentrated KOH. The products formed are KF, H_2O and O_2. The molar ratio of KF, H_2O and O_2 respectively, is?

(a) 1 :1 : 2 (b) 2 :1 : 0.5

(c) 1 :2 : 1 (d) 2 :1 :2

AP EAMCET- 2002

Ans. (b) : $F_2 + 2KOH \rightarrow 2KF + H_2O + 1/2O_2$

The molar ratios of KF, H_2O and O_2 is 2: 1: 0.5 respectively.

486. The concentration of a 100 mL solution containing X g of Na_2CO_3 (molecular wt. = 106) is Y M. The values of X and Y are respectively :

(a) 2.12, 0.05 (b) 1.06, 0.2

(c) 1.06, 0.1 (d) 2.12, 0.1

AP-EAMCET-2002

Ans. (c) : Given, v = 100mL, w = X g, Molarity = Y M

We know that :

$$M = \frac{w\times1000}{m\times v} \quad (m = 106 \text{ gm, } v = 100 \text{ ml})$$

∴ $Y = \frac{X\times1000}{106\times100}$

or 106Y = 10X

Dividing both sides by 100 we get–

$\boxed{1.06X = 0.1Y}$

∵ Only option (c) satisfies the relation.

487. The number of moles of $KMnO_4$ that will be needed to react with one mole of sulphite ion in acidic solution is

(a) 1 (b) 4/5

(c) 3/5 (d) 2/5

AMU-2002

Ans. (d) :

$$2MnO_4^- + 5SO_3^{2-} + 6H^+ \longrightarrow 2Mn^{2+} + 5SO_4^{2-} + 3H_2O$$

So, according to the reaction, number of moles of $KMnO_4$ that will be needed to react with one mole of sulphite ion in acidic solution is $\frac{2}{5}$.

488. The volume strength of 1.5 NH_2O_2 solution is

(a) 5.2 (b) 8.4

(c) 8.8 (d) 4.8

AMU-2002

Ans. (b) : 1N of H_2O_2 → 5.6 volume

1.5N of H_2O_2 → 5.6 × 1.5

→ 8.4 volume strength.

489. One mole of SO_2 corresponds to

(a) 6.4g of SO_2

(b) 6.02×10^{23} molecules of SO_2

(c) 2.24 L at 25°C and 1 atm

(d) all of these

AMU-2002

Ans. (b) : One mole of SO_2 corresponds to 6.023×10^{23} molecules of SO_2.

490. The number of atoms in 0.004 g of magnesium is close to

(a) 2×10^{20} (b) 6.02×10^{23}

(c) 24 (d) 10^{20}

AMU-2002

@apna_pdf

Ans. (d) : Amount of magnesium = 0.004g
molecular weight of magnesium = 24

$$\therefore \text{ Number of moles(n)} = \frac{\text{Weight of magnesium}}{\text{molecular weight}}$$

or

$$n = \frac{0.004}{24} = \frac{1}{6} \times 10^{-3} \text{moles}$$

∴ Number of atoms in 0.004g of magnesium

$$= \frac{1}{6} \times 10^{-3} \times 6.023 \times 10^{23}$$

$$= 10^{20} \text{ atoms}$$

491. Number of atoms in 560 g of Fe (atomic mass = 56 g mol^{-1}) is

(a) Twice that of 70 g N_2 (b) half that of 20 g H
(c) Both (a) and (b) (d) None of the above

[AIEEE 2002]

Ans. (c) : Suppose that N be Avogadro's number
The atomic/molar masses of Fe, N_2 and H_2 are 56g/mol, 28 g/mol and 2 g/mol respectively.

$$560 \text{ g Fe} = \frac{560\text{g}}{56\text{g/mol}} = 10 \text{ mol Fe} = 10 \text{ N atoms}$$

$$70 \text{ g}N_2 = \frac{70\text{g}}{28\text{g/mol}} = 2.5 \text{ moles } N_2 = 2 \times 2.5 \text{ N} = 5\text{N}$$

atom
Twice of this Corresponds to 2 × 5N = 10 N

$$20 \text{ g of } H_2 = \frac{20\text{g}}{2\text{g/mol}} = 10 \text{ mole } H_2 = 2 \times 10 \text{ N} = 20 \text{ N}$$

atoms.
Half of this = 0.5 × 20 N = 10 N atoms.

492. Weight of 4 L of N_2 gas as N.T.P. is

(a) 56 g (b) 2.5 g
(c) 5 g (d) 28 g

J & K CET-(2002)

Ans. (c) : We know that weight of 22.4 L of Nitrogen at NTP
= 28 g
∴ weight of 4 L of N_2 gas at

$$\text{NTP} = \frac{28}{22.4} \times 4 = 5 \text{ g}$$

493. Which has maximum molecules?

(a) 7 g N_2 (b) 2 g H_2
(c) 16 g NO_2 (d) 16 g O_2

NEET-2002

Ans. (b): 1 mole of any element contain 6.022 × 10^{23} number of molecules so
(a) 28 g N_2 = 1 mole of N_2

$$7\text{g } N_2 = \frac{7}{28} = 0.25 \text{ mole}$$

(d) 32 g O_2 = 1 mole of O_2

$$16 \text{ g } O_2 = \frac{16}{32} = 0.5 \text{ mole}$$

(b) 2g H_2 = 1 mole of H_2
(c) 46 g NO_2 = 1 mole of NO_2

$$16 \text{ g } NO_2 = \frac{16}{46} = 0.35 \text{ mole}$$

Maximum number of moles will corresponds to maximum number of molecules.
So, 2g H_2 contain maximum molecules

494. One mole of CH_4 contains

(a) 4 g atoms of hydrogen
(b) 3.0 g atoms of carbon
(c) 6.02×10^{23} atoms of hydrogen
(d) 1.81×10^{23} molecules of CH_4

UP CPMT-2002

Ans. (a): 1 mole of CH_4 contains 1 gm of carbon and 4gm of mole of hydrogen. Methane (CH_4) is a colorless, odorless, flammable gas that is the simplest hydrocarbon and is the major constituent of natural gas.

495. The incorrect statement for 14g of CO is

(a) It occupies 2.24L at NTP
(b) It corresponds to 1/2 mole of CO
(c) It corresponds to same mole of CO and N_2
(d) It corresponds to 3.01×10^{23} molecules of CO

UP CPMT-2002

Ans. (a) : For 14 gm of CO –

$$\text{No. of mole CO} = \frac{14}{28} = \frac{1}{2} \text{mole.}$$

for 14 gm of N_2 –

$$\text{No. of mole } N_2 = \frac{14}{28} = \frac{1}{2} \text{mole}$$

∵ One mole of any gas occupies 2.24 litre.

$$\therefore \frac{1}{2} \text{ mole of CO gas occupies only 11.2 litre volume.}$$

One mole of molecule contain = N_A molecule
= 6.02 × 10^{23} molecule

$$\therefore \frac{1}{2} \text{ mole of CO contain} = 3.01 \times 10^{23} \text{ molecule of CO.}$$

496. 1.2 g of Mg (At mass 24) will produce MgO equal to

(a) 40 g (b) 4 g
(c) 0.05 mol (d) 2 g

AMU–2001

Ans. (c) :

$$\underset{24}{Mg} + \frac{1}{2}O_2 \rightarrow \underset{40}{MgO}$$

24g of Mg produce MgO = 1 mol

$$\therefore 1.2 \text{ g mol Mg produce MgO } \frac{1 \times 1.2}{24}$$

= 0.05 mol

497. An aqueous solution contains 25% ethanol and 50% acetic acid by mass. Calculate the mole fraction of acetic acid in this solution.

(a) 0.196 (b) 0.301
(c) 0.392 (d) 0.503

J & K CET-(2001)

@apna_pdf

Ans. (b) : Mole of $C_2H_5OH = \frac{25}{46} = 0.54$

Mole of $CH_3COOH = \frac{50}{60} = 0.83$

% of $H_2O = 100 - (50 + 25) = 25$

$\therefore$ Mole of $H_2O = \frac{25}{18} = 1.38$

Total number of moles = 0.54 + 0.83 + 1.39 = 2.76

$\therefore$ Mole fraction of acetic acid

$= \frac{0.83}{2.76} = 0.301$

498. 250 mL of a Na_2CO_3 solution contains 2.65 g of $Na_2CO_3 \cdot 10$ mL of this solution is added to x mL of water to obtain 0.001 M Na_2CO_3 solution. The value of x is (molecular weight of $Na_2CO_3 = 106$)

(a) 1000 mL (b) 990 mL

(c) 9990 mL (d) 90 mL

UPTU/UPSEE-2012

Ans. (b) :

Molarity of the solution of 250 ml of a sodium carbonate solution contains 2.65 gm of sodium carbonate.

$$M_1 = \frac{2.65g}{105.98g/mol \times 0.250L} = 0.1000\, mol/L$$

When 10 ml of above solution is added to x ml of water the molarity of the solution becomes 0.001 M volume of 0.1000 M solution = v_1

Molarity of the solution on dilution = m_2

Volume of the new solution = v_2 = 10 ml + x ml

$m_1 \times v_1 = m_2 \times v_2$

0.1000 M × 10ml = 0.01 M × (10+x) ml

on solving we get :

x = 990 ml

499. How many atoms of sulphur are present in 0.2 mole of sulphur (S_8) molecule?

(a) 9.64×10^{23} (b) 96.4×10^{23}

(c) 1.205×10^{23} (d) 12.05×10^{23}

J & K CET-(2001)

Ans. (a) : 1 mole of S_8 molecule = 6.022×10^{23} moles

0.2 mole of S_8 molecules = $0.2 \times 6.022 \times 10^{23}$

$= 1.2044 \times 10^{23}$ molecule

One molecule of S_8 Contains 8 atoms of sulphur

Hence, the total number of atom in S_8

$= 8 \times (1.2044 \times 10^{23})$

$= 9.6352 \times 10^{23}$

500. 120 g of urea is present in 5 L of solution. The active mass of urea is

(a) 0.06 (b) 0.2

(c) 0.4 (d) 0.8

UP CPMT-2001

Ans. (c) : Given, mass of urea = 120 g, and

Volume of solution = 5 L

Molecular mass of urea (NH_2CONH_2)

$= 14 + 2 \times 1 + 12 + 16 + 14 + 2 \times 1 = 60$

Active mass = $\frac{\text{moles}}{\text{volume}}$

$= \frac{\text{mass / molecular weight}}{\text{volume}}$

$\therefore$ Active mass of urea = $\frac{120/60}{5} = \frac{2}{5} = 0.40$

501. 7.5 g of a gas occupies 5.6 L of volume at S.T.P. The gas is:

(a) NO (b) N_2O

(c) CO (d) CO_2

AP-EAMCET (Medical), 2001

Ans. (a) : Given that, w = 7.5gm

One mole of gas of S.T.P. = 22.4 litres.

So, 5.6 litres of gas at STP contains 0.25 moles

Number of moles = $\frac{\text{Weight (grams)}}{\text{Molecular weight}}$

or $0.25 = \frac{7.5}{M}$

or $M = \frac{7.5}{0.25}$

or M=30

Then, NO has 30 number of moles.

502. How many moles of acidified $FeSO_4$ can be completely oxidised by one mole of $KMnO_4$?

(a) 10 (b) 5

(c) 6 (d) 2

AP-EAMCET (Medical), 2001

Ans. (b) : When 1 mole of $KMnO_4$ reacts with $FeSO_4$ then

$2KMnO_4 + 10FeSO_4 + 8H_2SO_4 \rightarrow K_2SO_4 + 2MnSO_4 + 5Fe_2(SO_4)_3 + 8H_2O$

$\because$ 2 moles of $KMnO_4$ react = 10 moles of $FeSO_4$

Hence, 1 mole of $KMnO_4$ = 5 moles of $FeSO_4$

503. 50g of calcium carbonate was completely burnt in air. What is the weight (in grams) of the residue? (Atomic weights of Ca, C and O are 40, 12 and 16 respectively)

(a) 2.8 (b) 28

(c) 4.4 (d) 44

AP-EAMCET (Medical), 2001

Ans. (b) : $CaCO_3(s) \xrightarrow{\Delta} CaO(s) + CO_2(g)$

Molecular weight of $CaCO_3$ = 100, CaO = 56 and CO_2 = 44

$\because$ 100 gm of $CaCO_3$ on burning provides residue = 56 gm of CaO

$\therefore$ 50 gm of $CaCO_3$ provides residue $= \frac{56}{100} \times 50$

= 28 gm

504. 10^{21} molecules are removed from 200 mg of CO_2. The moles of CO_2 left are:

(a) 2.84×10^{-3} (b) 28.4×10^{-3}

(c) 284×10^{-3} (d) 28.4×10^{3}

AIIMS-2001

@apna_pdf

Ans. (a): Given mass = 200 mg = 0.2 g

Molar mass of CO_2 = 44 g

$$\text{Number of moles} = \frac{\text{Weight}}{\text{Mole weight}} = \frac{0.2}{44} = \frac{1}{220}$$

No. of molecules = $6.022 \times 10^{23} \times 1/220$

$= 2.73 \times 10^{21}$

As 10^{21} molecules are removed,

Hence, No. of Molecules left = $2.73 \times 10^{21} - 10^{21}$

$= 1.73 \times 10^{21}$

No. of moles = No. of molecules /Avogadro's number

$$= \frac{1.73\times10^{21}}{6.23\times10^{23}}$$

$$= 2.88\times10^{-3}$$

505. The weight of NaCl decomposed by 4.9 g of H_2SO_4, if 6g of sodium hydrogen sulphate and 1.825 g of HCl, were produced in the reaction is:

(a) 6.921g (b) 4.65g
(c) 2.925g (d) 1.4 g

AIIMS-2001

Ans. (c): NaCl(xg) + H_2SO_4(4.9g) → $NaHSO_4$(6g) + HCl (1.825g)

The law of conservation of mass states that in a chemical reaction mass is neither created nor destroyed.

∴ Mass of the reactants = Mass of Products

x + 4.9 = 6 + 1.825 g

x = 2.925 g

506. Temperature does not affect:

(a) Molality (b) Formality
(c) Molarity (d) Normality

AIIMS-1997-2001

Ans. (a): Since molality is defined in terms of the solvent's mass not its volume, the temperature does not change the molality of a solution.

Where as in case of formality molarity and normality the concentration of solution is expressed in terms of volume which change with the change of temperature.

507. The molarity of 98% by weight H_2SO_4 solution, which has a density 1.84 g/cc at 35º C is:

(a) 1.84 M (b) 18.4 M
(c) 20.6 M (d) 24.5 M

AIIMS-2001

Ans. (b): The solution contains 98% H_2SO_4 by weight/mass that means 100 gram of solutions 98 grams of H_2SO_4.

Density is 1.84 gm/ml (cc = ml)

$$\text{So, volume of the solution} = \frac{\text{mass of the solution}}{\text{density of solution}}$$

$$= \frac{100\,\text{gram}}{1.84} = 54.34\ \text{ml}$$

$$\text{No. of moles of } H_2SO_4 = \frac{\text{weight of } H_2SO_4}{\text{molar mass of } H_2SO_4}$$

$$= \frac{98}{98} = 1\ \text{moles}$$

$$\text{Molarity} = \frac{1\,\text{mole}}{54.3\,\text{ml}\times1000} = 18.41\ \text{M}$$

508. The normality of orthophosphoric acid having purity of 70% by weight and specific gravity 1.54 is:

(a) 11 N (b) 22 N
(c) 33 N (d) 44 N

AIIMS-2001

Ans. (c): Density of orthophosphoric acid (H_3PO_4) = specific gravity × density of water.

Density of orthophosphoric acid = 1.54 × 0.998

= 1.54 g/ml

Mass in 1000 ml = 1.54 × 1000 = 1540 g

Gram equivalent weight of orthophosphoric acid =

$$\frac{\text{Molar mass}}{\text{N}-\text{factor}} = \frac{98}{3} = 32.66\ \text{g eq.}$$

orthophosphoric acid is only 70% pure so the weight of orthophosphoric acid = $1540 \times \frac{70}{100} = 1078\,\text{g}$

Number of gram equivalents of orthophosphoric acid

$$= \frac{1078}{32.66} = 33$$

$$\text{Normality} = \frac{(\text{number of gram equivalents})}{(\text{volume of solution in L})}$$

Normality = 33 N.

509. 0.4 moles of HCl and 0.2 moles of $CaCl_2$ were dissolved in water to have 500ml of solution, the morality of Cl^- ion is:

(a) 0.8 M (b) 1.6 M
(c) 1.2 M (d) 10.0 M

AIIMS-2000

Ans. (b): $HCl \rightleftharpoons H^+ + Cl^-$

$CaCl_2 \rightleftharpoons Ca^{2+} + \underset{2\times0.2=0.4\,\text{moles}}{2Cl^-}$

Total moles of Cl^- = 0.4 + 0.4 = 0.8 moles

Volume of solution of 500ml = 0.5 L

Molarity of Cl^- = moles Cl^- /volume of solution

$$\text{Molarity of } Cl^- = \frac{0.8}{0.5} = 1.6\,\text{M}$$

510. Number of molecules in one litre of water is close to

(a) $55.5 \times 6.023 \times 10^{23}$
(b) $18 \times 6.023 \times 10^{23}$
(c) $18 \div 22.4\times10^{23}$
(d) 1.8×10^{23}

J & K CET-(2000)

Ans. (a) : 1 L H_2O = 1000 g

∴ 18 g of H_2O = 6.023×10^{23} molecules

$$\therefore\ 1000\ \text{g of } H_2O = \frac{6.023\times10^{23}\times1000}{18}$$

$$= 55.5\times6.023\times10^{23}\ \text{molecules}$$

@apna_pdf

511. 2.0 g of oxygen contains number of atoms equal to that in

(a) 4.0 g of sulphur (b) 7.0 g of nitrogen
(c) 0.5 g of hydrogen (d) 2.3 g of sodium

J & K CET-(2000)

Ans. (a) : No. of moles in 2 g of oxygen = $\frac{2}{16} = \frac{1}{8}$ mole

No. of atoms of oxygen = $\frac{1}{8}$ ×Ma atoms

No. of moles in 4g of sulphur $\frac{4}{32} = \frac{1}{8}$ mole

No. of atom of sulphur = $\frac{1}{8}$ ×Ma atoms.

Therefor, 4g of Sulphur Contain equal atoms 2g of oxygen atoms.

512. Volume of CO_2 obtained by the complete decomposition of 9.85 g of $BaCO_3$ is

(a) 2.24 L (b) 1.12 L
(c) 0.84 L (d) 0.56 L

NEET-2000

Ans. (b) :

$$BaCO_3 \longrightarrow BaO + CO_2 \uparrow$$

1mole 1 mole mole

$$\text{Moles} = \frac{\text{Given weight}}{\text{molecular weight}} = \frac{9.85}{197 g/mol.}$$

=0.05 mole

At STP. 1 mole = 22.4 L

0.05 mole = 22.4 × 0.05 L = 1.12 L

513. The amount of zinc required to produce 224 ml. of H_2 at STP on treatment with dilute H_2SO_4 will be

(a) 65 g (b) 0.065 g
(c) 0.65 g (d) 6.5 g

NEET-1996

Ans. (c) : When Zinc react with H_2SO_4

$$Zn + H_2SO_4 \rightarrow ZnSO_4 + H_2$$

1 mole of Zinc will react to give 1 moles of hydrogen

Volume of 1 mole of hydrogen at STP = 22400 ml

1 mole of Zn = 65 grams = $\frac{65 \times 224}{22400} = 0.65g$

0.65 grams of Zinc can react to give 224 ml of hydrogen.

514. 0.2 mole of sodium chloride is dissolved in 0.6 mole of water. The mole fraction of water in the solution is

(a) 0.25 (b) 0.33
(c) 0.67 (d) 0.75

J & K CET-(1999)

Ans. (d) : Mole fraction of water

$$= \frac{\text{Mole of water}}{\text{mole of sodium chloride} + \text{mole of water}}$$

$$= \frac{0.6}{0.2 + 0.6}$$

= 0.75

515. What is the number of moles of hydrogen atoms in 3.2 g of methane?

(a) 0.2 (b) 0.4
(c) 0.8 (d) 2.0

J & K CET-(1999)

Ans. (c) : CH_4

(12 + 4) = 16 g

∵ 16 g of CH_4 Contains → 4 g of H

∴ 3.2 g CH_4 Contains → $\frac{4}{16} \times 3.2$

= 0.8 g H atoms.

516. The number of atoms in 4.25 g of NH_3 is approximately

(a) 4×10^{23} (b) 2×10^{23}
(c) 1×10^{23} (d) 6×10^{23}

NEET-1999

Ans. (d) : Given that,

Weight of NH_3 =4.25g

$$\text{Number of moles of } NH_3 = \frac{\text{Weight}}{\text{Molecular Weight}}$$

$$= \frac{4.25}{17} = 0.25\text{mole}$$

Number of molecules in 0.25 moles of NH_3

$= 0.25 \times 6.023 \times 10^{23}$

So, number of atoms = $4 \times 0.25 \times 6.023 \times 10^{23}$

$= 6.023 \times 10^{23}$

$\approx 6 \times 10^{23}$

517. The normality of a solution obtained by mixing 10 mL of N/5 HCI and 30mL of N/10HCI is:

(a) $\frac{N}{15}$ (b) $\frac{N}{5}$
(c) $\frac{N}{7.5}$ (d) $\frac{N}{8}$

AIIMS-1999

Ans. (d): N = M × n – factor

$$NV = N_1V_1 + N_2V_2 \quad \begin{cases} \text{where } N = \text{Normality of mixture} \\ V = \text{Volume of mixture} \end{cases}$$

$$NV = \frac{1}{5} \times 10 + \frac{1}{10} \times 30$$

N × 40 = 2 + 3

$$N = \frac{5}{40}$$

$$N = \frac{1}{8}$$

518. The molar concentration of 20g of NaOH present in 5 litre of solution is:

(a) 0.1 mols/litre (b) 0.2 mols/litre
(c) 1.0 mols/litre (d) 2.0 mols/litre

AIIMS-1998

Ans. (a) : Molar mass of NaOH : 39.997 g/mol

$$20g \text{ NaOH } \frac{1 \text{mol NaOH}}{39.997 \text{ g NaOH}} = 0.5 \text{ mol NaOH}$$

Convert liters of H_2O to kg

@apna_pdf

Density of H_2O – 1g/ml → 1 kg/L

$$\text{SL } H_2O — \frac{1\text{kg } H_2O}{1\text{L } H_2O} = 5\text{kg} H_2O$$

$$\text{Molarity of NaOH} = \frac{.5\,\text{mol}}{5\,\text{kg}}$$

m = 0.1 mols/liter

519. Volume of a gas at NTP is 1.12×10^{-7} cc. The number of molecule in it is:

(a) 3.01×10^{12} (b) 3.01×10^{18}
(c) 3.01×10^{24} (d) 3.01×10^{30}

AIIMS-1998

Ans. (a): Given that,

$\therefore$ 22400 cm^3 of the gas at STP has molecules

$= 6.02 \times 10^{23}$

$\therefore$ 1.12×10^{-7} cm^3 of the gas at STP will have molecules.

$$= \frac{6.02\times10^{23}}{22400}\times1.12\times10^{-7}$$

$= 3.01 \times 10^{12}$ molecules

520. Which one of the following quantities of ionic compounds contains greater number of ions?

(a) 100 g NaCl (formula mass 58)
(b) 100 g Na_2O (formula mass 62)
(c) 100 g K_2O (formula mass 94)
(d) 100 g CaI_2 (formula mass 111)

J & K CET-(1998)

Ans. (b) : In ionic compounds the formula of an ionic compound represents the ratio between Constituent ions.

The mass of 6.02×10^{23} formula unit reperesents one mole of an ionic Compound.

100 g NaCl (Formula mass 58) = 1.72 mol NaCl

$= 2 \times 1.72 \times 6.023 \times 10^{23}$ ions

$= 20.71 \times 10^{23}$ ions

100 g Na_2O (formula mass 62) = 1.06 mol Na_2O

$= 3 \times 1.61 \times 6.023 \times 10^{23}$ ions

$= 29.09 \times 10^{23}$ ions

100 g K_2O (formula mass 94) = 1.06 mol K_2O

$= 3 \times 1.06 \times 6.023 \times 10^{23}$ ions

$= 19.15 \times 10^{23}$ ions

100 g $CaCl_2$ (formula mass 111) = 0.90 mol $CaCl_2$

$= 3 \times 0.90\times 6.023 \times 10^{23}$ ions

$= 16.26 \times 10^{23}$ ions

521. At STP, the density of a gas (molecular weight 45) is

(a) 2 g/litres (b) 11.2 g/litres
(c) 22.4 g/litres (d) 26.6 g/litres

J & K CET-(1997)

Ans. (a) : As we know that,

At STP, P = 1 atm T = 273 K

Ideal gas equation –

PV = nRT

$$= \frac{m}{M}RT$$

$$PM = \frac{m}{v}RT \qquad \left[\frac{m}{v} = d(\text{density})\right]$$

$= dRT$

$$d = \frac{PM}{RT}$$

$$d = \frac{45}{0.0832\times273}$$

So, d = 2 gm/lit

522. When 6 volumes of oxygen undergoes complete reaction to ozone, the number of moles of ozone formed are

(a) 6 (b) 3
(c) 4 (d) 2

AP EAMCET- 1995

Ans. (c) : $3O_2 \rightarrow 2O_3$

No. of moles of O_3 produced by 3 moles of O_2 = 2

No. of moles of O_3 produced by 6 moles of

$$O_2 = \frac{2}{3}\times6 = 4\,\text{mol.}$$

523. The number of moles of AgCl precipitated when excess $AgNO_3$ is mixed with one mole of $[Cr(NH_3)_4Cl_2]Cl$, is

(a) 0 (b) 1.0
(c) 2.0 (d) 3.0

AMCET-1998, 1996

Ans. (b) : When excess $AgNO_3$ is mixed with one mole of $[Cr(NH_3)_4Cl_2]Cl$ than one mole of AgCl precipitated.

$$[Cr(NH_3)_4Cl_2]Cl + AgNO_3 \rightarrow$$

$$\left[Cr(NH_3)_4Cl_2\right]NO_3 + AgCl\text{-}$$

In this complex chloride ion form ionic isomerism and shows primary valency.

$AgNO_3$ is added in excess then result precipitation will occur.

524. The number of molecules in 4.25 g of ammonia is approximately

(a) 3.5×10^{23} (b) 0.5×10^{23}
(c) 2.5×10^{23} (d) 1.5×10^{23}

AIIMS-1996

Ans. (d): We know that 17 g of ammonia (NH_3) Contains 6.02×10^{23} molecules.

Therefore number of molecules in 4.25 of

$$NH_3 = \frac{6.02\times10^{23}\times4.25}{17}$$

$$NH_3 = 1.50\times10^{23}$$

$$NH_3 = 1.5\times10^{23}$$

525. Avogadro's number of oxygen atom weighs

(a) 32 g (b) 8 g
(c) 56 g (d) 16 g

AIIMS-1996

Ans. (d): Avogadro's number, number of units is one mole of any substance (defined as its molecular weight is grams), equal to 6.023×10^{23}.

Weight of 6.023×10^{23} molecular of oxygen (O_2) = 32g

@apna_pdf

Since the oxygen is diatomic, therefore weight of Avogadro's number of oxygen atom = $\frac{32}{2}$ = 16 g

526. The number of moles of water present in 180 gm of water is

(a) 18 (b) 5
(c) 100 (d) 10

AIIMS-1996

Ans. (d): Given that, Molecular weight of water = 18

$\therefore$ No of moles of water = $\frac{\text{Mass}}{\text{Molecular mass}}$

$= \frac{180}{18} = 10$ moles

527. Which one of the following gases contains the least number of molecules ?

(a) 4.0 g laughing gas (b) 3.0 g phosphorus
(c) 2.0 g marsh gas (d) 10.0 g phosgene

AP-EAMCET-1994

Ans. (a) : Mass of N_2O = 44
Mass of P = 31
Mass of CH_4 = 16
Mass of $COCl_2$ = 99

$\therefore$ Number of molecules in N_2O

$= 4\times\frac{N}{44} = \frac{N}{11}$ molecules

Number of molecules in 3 gm of

$P = 3\times\frac{N}{31}$ molecules

Number of molecules in 2 gm of CH_4

$= 2\times\frac{N}{16} = \frac{N}{8}$

Number of molecules in 10 gm $COCl_2$ $= 10\times\frac{N}{99}$

$\therefore$ 4 gm N_2O (Laughing gas) contains least number of molecules.

528. The mole fraction of solute in 20% aqueous H_2O_2 solution is

(a) 0.588 (b) 0.444
(c) 0.1168 (d) 4.44

AP EAMCET- 1992

Ans. (c) : Given that,
20% aqueous H_2O_2

No. of moles of H_2O_2 = $\frac{20}{34}$ =0.588

No. of moles of H_2O = $\frac{80}{18}$ = 4.44

$\therefore$ Mole fraction of H_2O_2= $\frac{0.588}{0.588+4.44}$ = 0.1168

529. The number of moles of barium carbonate which contains 1.5 moles of oxygen atoms is :

(a) 1.5 (b) 1
(c) 2 (d) 0.5

AP-EAMCET-1991

Ans. (d) : The number of moles of oxygen atom in $BaCO_3$ = 3

$\therefore$ 1.5 moles of oxygen atom in $BaCO_3$ $= \frac{1}{3}\times 1.5$

= 0.5 mole.

530. The number of moles of oxygen in one litre of air containing 21% oxygen by volume, under standard conditions, is

(a) 0.0093 mol (b) 2.10 mol
(c) 0.186 mol (d) 0.21 mol

NEET-1995

Ans. (a) : Volume of oxygen in 1L of air

$\frac{21}{100}\times 1000 = 210\text{mL}$

$\therefore$ 22400 mL volume at STP is occupied by oxygen = 1 mole

number of moles occupied by 210 mL

$\frac{210}{22400} = 0.0093\,\text{mol.}$

531. In the reaction,

$$4NH_{3(g)} + 5O_{2(g)} \longrightarrow 4NO_{(g)} + 6H_2O_{(i)}$$

when 1 mole of ammonia and 1 mole of O_2 are made to react to completion

(a) all the oxygen will be consumed
(b) 1.0 mole of NO will be produced
(c) 1.0 mole of H_2O is produced
(d) all the ammonia will be consumed

NEET-1998

Ans. (a) :
$4NH_3 + 5O_2 \rightarrow 4NO + 6H_2O$
$1\ NH_3 + 1.25O_2 \rightarrow 1NO + 1.5\ H_2O$
When 1 mole of NH_3 reacts with 1.25 moles of O_2 it produces 1 mole of NO and 1.5 moles of H_2O. When one mole of ammonia and one mole of oxygen are made to react to completion, then all the oxygen is consumed.

532. Which of the gases contains the same number of molecules as that of 16 g oxygen ?

(a) 16 g of O_3 (b) 32 g of SO_2
(c) 16 g of SO_2 (d) All of these

AP-EAMCET-1991

Ans. (b) : Number of moles of O_2 $= \frac{\text{weight of } O_2}{\text{M. weight of } O_2}$

$= \frac{16}{32} = 0.5$ mole

Number of moles of 32 gm SO_2 $= \frac{32}{64} = 0.5$ mole

Hence, the 32 gm of SO_2 moles equal to the 16 gm of O_2 moles.

533. The number of gram molecules of oxygen is 6.02×10^{24} CO molecules is

(a) 10 g molecules (b) 5 g molecules
(c) 1 g molecules (d) 0.5 g molecules

NEET-1990

@apna_pdf

Ans. (b) : No. of CO molecules = 6.022×10^{24}
Number of oxygen atoms = Number of CO molecules = 6.022×10^{24}

Number of Oxygen molecule = $\frac{1}{2} \times$ number of oxy
$= 3.011\times10^{24}$

Number of molecules of O_2 molecules

$$= \frac{\text{No.of molecules}}{\text{Avogadro's No.}} = \frac{3.011\times10^{24}}{6.022\times10^{23}} = 5\text{g molecule}$$

(Note: mole also called gram-molecule)

534. Boron has two stable isotopes, $^{10}B(19\%)$ and $^{11}B(81\%)$. Calculate average at. wt. of boron in the periodic table.

(a) 10.8	(b) 10.2
(c) 11.2	(d) 10.2

NEET-1990

Ans. (a) : Average atomic weight

$$= \frac{\sum \%\,\text{abundant} \times \text{atomic mass}}{100}$$

$$= \frac{19\times10+81\times11}{100} = 10.81$$

535. When 22.4 litres of $H_{2(g)}$ is mixed with, 11.2 litres of $Cl_{2(g)}$, each at STP, the moles of $HCl_{(g)}$ found is equal to

(a) 1 mol of HCl(g)	(b) 2 mol of HCl(g)
(c) 0.5 ml of HCl(g)	(d) 1.5 mol of HCl(g)

AIPMT-1990, AMU-2014

Ans. (a) : $H_2(g) + Cl_2(g) \rightarrow 2HCl(g)$
initial vol. 22.4 L   11.2L   2 mol
∴ 22.4 L volume of STP is occupied by Cl_2 = 1 mole
∴ 11.2 L volume will be occupied by Cl_2 = $\frac{1\times11.2}{22.4}$ mole = 0.5 mol
22.4 L volume of STP is occupied by H_2= 1mol
Thus, $H_2(g) + Cl_2(g) \rightarrow 2HCl(g)$
1 mol   0.5 mol
Since, Cl_2 possesses minimum number of moles,
thus it is the limiting reagent.
As per equation,
1 mole of Cl_2 = 2mol of HCl
∴ 0.5 mole of Cl_2 = 2 × 0.5 mole of HCl
= 1.0 mole of HCl

536. Ratio of C_P and C_v of a gas 'X' is 1.4. The number of atoms of the gas 'X' present in 11.2 litres of it at NTP will be

(a) 6.02×10^{23}	(b) 1.2×10^{23}
(c) 3.01×10^{23}	(d) 2.01×10^{23}

NEET-1989

Ans. (a) : Ratio of C_p/C_v = 1:4
The gas is diatomic
At NTP, volume of 1 mole of a gas = 22.4 L
At NTP 22.4 L contains = 6.023×10^{23} molecules

At NTP 11.2 L contains = $\frac{6.023\times10^{23}\times11.2}{2}$
$= 3.01 \times 10^{23}$ molecules

Hence, number of atoms of gas 'x' (diatomic)
$= 3.01 \times 10^{23} \times 2$ atoms
$= 6.02 \times 10^{23}$ atoms.

537. The number of oxygen atoms in 4.4 g of CO_2 is

(a) 1.2×10^{23}	(b) 6×10^{22}
(c) 6×10^{23}	(d) 0.12×10^{23}

NEET-1989

Ans. (a) : Moles of CO_2 = $\frac{4.4}{44} = 0.1$moles
∴ Number of molecules of CO_2 = $0.1\times6.022\times10^{23}$
$= 6.022 \times 10^{22}$ molucules
1 molecule of CO_2 contains 2 oxygen atoms.
∴ Number of oxygen atoms = $2 \times 6.022 \times 10^{22}$
$= 12.044 \times 10^{22}$
$= 1.2 \times 10^{23}$ atoms

538. 1 cc N_2O at NTP contains

(a) $\frac{1.8}{224}\times10^{22}$ atoms

(b) $\frac{6.02}{22400}\times10^{23}$ molecules

(c) $\frac{1.32}{224}\times10^{23}$ electrons

(d) All of the above

NEET-1988

Ans. (d) : At NTP 22400 cc of N_2O contains = 6.02×10^{23} molecules

∴ 1 cc N_2O will contain = $\frac{6.02\times10^{23}}{22400}$molecules

In N_2O molecule, number of atoms = 2 + 1 = 3

Thus, the number of atoms = $\frac{3\times6.02\times10^{23}}{22400}$ atoms

$= \frac{1.8\times10^{22}}{224}$atoms

In an N_2O molecule, the number of electrons = 7 + 7 + 8 = 22

Hence, the number of electrons, = $\frac{6.02\times10^{23}}{22400}\times22$

$= \frac{1.32\times10^{23}}{224}$ electrons.

539. At STP the density of CCl_4 vapour of g/L will be nearest to

(a) 6.87	(b) 3.42
(c) 10.26	(d) 4.57

NEET-1988

Ans. (a) : We know that, mass of C = 12g, Cl = 35.5 g
1 mole CCl_4 vapours = 12 + 4 × 35.5
= 154g
At STP, volume of 1 mole of gas = 22.4 L
Thus, 154g = 22.4 L

∴ Density of CCl_4 vapours = $\frac{154}{22.4}\text{gL}^{-1}$
$= 6.87\text{ g L}^{-1}$

@apna_pdf

540. **Sodium bicarbonate on heating decomposes to from sodium carbonate, CO_2 and water. If 0.2 moles of sodium bicarbonate is completely decomposed how many moles of sodium carbonate is formed?**

(a) 0.1 (b) 0.2

(c) 0.05 (d) 0.025

UPSEE/UPTU 2012

Ans. (a) : In this reaction –

$$2NaHCO_3(s) \xrightarrow{\Delta} Na_2CO_3(s) + CO_2(g) + H_2O(l)$$

2 mole of sodium bicarbonate $(NaHCO_3)$

Form 1 mole of sodium carbonate (Na_2CO_3)

Then, for 0.2 mole of $Na_2CO_3 = \frac{1}{2} \times 0.2$

$= 0.1$ mole of Na_2CO_3

Hence according to the given balanced reaction 0.1 moles of sodium Carbonate is formed.

4. Laws of Chemical Combinations

541. **Among the following pairs of compounds, the one that does not illustrate the law of multiple proportions, is**

(a) NO and NO_2 (b) CuO and Cu_2O

(c) FeO and Fe_2O_3 (d) H_2O and H_2S

(e) NO and N_2O

Kerala CEE -03.07.2022

Ans. (d) : Law of multiple proportion- it state that when two elements combine to form more than one compound, the weight of one element that combines with a fixed weight of the other is in the ratio of small whole numbers.

Here, in option (b), hydrogen is present in both compounds but oxygen is present in the first compound and sulphur is present in second compound. Hence, this pair cannot illustrate the law of multiple proportion.

542. **Calculate the amount of hydrogen gas required in order to produce 100g of ammonia by the reaction of $N_2(g)$ and $H_2(g)$ gases.**

(a) 35.29 g (b) 17.65 g

(c) 28.11g (d) 34 g

AP EAPCET 24.08.2021 Shift-II

Ans. (b) : Given, NH_3 Produce 100 gm.

$$N_2(g) + 3H_2(g) \longrightarrow 2NH_3$$

So, the number of moles of

$$NH_3 = \frac{\text{Weight}}{\text{Molecular weight}}$$

$$n_{NH_3} = \frac{100}{17}$$

$$n_{NH_3} = 5.88 \text{ mole.}$$

So, the amount of hydrogen gas

Required is = 3 × 5.88 = 17. 65 gm.

543. **When 20 g of $CaCO_3$ is treated with 20g of HC*l* the mass of CO_2 formed would be ——**

(a) 10 g (b) 8.8 g

(c) 22.2 g (d) 20 g

AP EAPCET 19-08-2021 Shift-I

Ans. (b) :

$$\underset{\substack{1\text{mol}\\100\text{g}}}{CaCO_3(s)} + \underset{\substack{2\text{mol}\\73\text{g}}}{2HCl(aq)} \rightarrow CaCl_2(aq) + H_2O(l) + \underset{\substack{1\text{mol}\\44\text{g}}}{CO_2(g)}$$

Let $CaCO_3(s)$ be completely consumed in the reaction.

∴ 100g $CaCO_3$ give 44g CO_2

∴ 20 g $CaCO_3$ will give $\frac{44}{100} \times 20\text{g}\, CO_2 = 8.8\text{g}\, CO_2$

544. **The complete combustion of one mole of benzene produces _______ grams of carbon dioxide.**

(a) 164 (b) 220

(c) 264 (d) 308

AP EAPCET 20.08.2021 Shift-II

Ans. (c): Combustion reaction of benzene to carbon dioxide is-

$$C_6H_6 + \frac{15}{2}O_2(g) \longrightarrow 6CO_2(g) + 3H_2O(g)$$

Find grams of carbon dioxide.

$$\therefore \text{mole} = \frac{\text{weight}}{\text{moleculor weight}}$$

$$6 = \frac{\text{weight}}{44}$$

Weight = 44 × 6 = 264 gm

So, 1 mole of benzene produces 264 gm of carbon dioxide.

545. **From the given reactions identify the disproportionation reaction**

(i) $Cl_2(g) + 2\,KI(aq) \longrightarrow 2KCl(aq) + I_2(s)$

(ii) $Cl_2(g) + 2OH^-(aq) \longrightarrow ClO^-(aq) + Cl^-(aq) + H_2O(l)$

(iii) $Mg(s) + 2HCl(aq) \longrightarrow MgCl_2(aq) + H_2(g)$

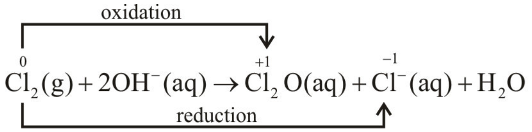
(iv) $2H_2O_2(aq) \longrightarrow 2H_2O(l) + O_2(g)$

(a) (i) and (iv) (b) (ii) and (iv)

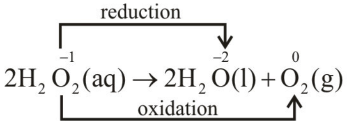
(c) (ii) and (iii) (d) (i) and (ii)

TS EAMCET 05.08.2021, Shift-I

Ans. (b) : A disproportionation reaction is a redox reaction in which one species is simultaneously oxidized and reduced.



$$\overset{0}{Cl_2}(g) + 2OH^-(aq) \rightarrow \overset{+1}{Cl_2}O(aq) + \overset{-1}{Cl^-}(aq) + H_2O$$



$$2H_2\overset{-1}{O_2}(aq) \rightarrow 2H_2\overset{-2}{O}(l) + \overset{0}{O_2}(g)$$

546. **In which one of the following sets all species show disproportionation reaction**

(a) ClO_2^-, F_2, MnO_4^{2-} and $Cr_2O_7^{2-}$

(b) $Cr_2O_7^{2-}, MnO_4^-, ClO_2^-$ and Cl_2

(c) MnO_4^-, ClO_2^-, Cl_2 and Mn^{3+}

(d) $ClO_4^-, MnO_4^{2-}, ClO_2^-$ and F_2

(JEE Main 2021, 31 Aug Shift-II)

@apna_pdf

Ans. (c) : No option contains all species that show disproportionation reaction.

$MnO_4^-, ClO_4^-, Cr_2O_7^{2-} - Cl, Mn, Cr$ in these anions are present in highest oxidation state. These will not undergo disproportionation. Mn is in +7 oxidation state (highest) hence cannot be simultaneously oxidized or reduced.

547. 250 mL of 0.5 M NaOH was added to 500 mL of 1M HCl. The number of unreached HCl molecules in the solution after complete reaction is……x 10^{21}. (Nearest integer)

$\left(N_A = 6.022 \times 10^{23}\right)$

[JEE Main 2021, 20 July Shift-I]

Ans. (226) : Number of moles = V_L × molarity and number of millimoles = V_{mL} ×molarity millimoles of NaOH = 250 × 0.5 = 125

Millimoles of HCl = 500 × 1 = 500

	NaOH	+ HCl	→ NaCl	+ H_2O
At t = 0,	125	500	0	0
At t = t,	0	375	125	125

So, millimoles of HCl left = 375

Moles of HCl = 375 × 10^{-3}

Number of HCl molecules = Avogadro's constant (N_A) × moles of HCl

$= 6.022 \times 10^{23} \times 375 \times 10^{-3}$

$= 225.8 \times 10^{21} = 226 \times 10^{21}$

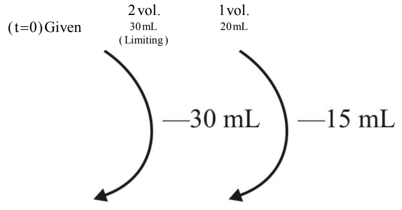
Therefore, answer is 226×10^{21} molecules

548. When 30 mL of H_2 reacts with 20 mL of O_2 to form water, what is leftover when the reaction ends ?

(a) 10 mL H_2
(b) 5 mL H_2
(c) 10 mL O_2
(d) 5 mL O_2

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (d) : Given, $2H_2(g) + O_2(g) \rightarrow 2H_2O(g)$



(t = ∝) after r × h: 30 – 30 = 0 (20 – 15) mL = 5 mL

Here, H_2 is the limiting reactant. So, 30 mL H_2 consumes 15 mL of O_2 as H_2 and O_2 react in 2 : 1 volume ratio (at constant pressure and temperature).

549. The minimum amount of O_2 (g) consumed per gram of reactant is for the reaction (Given atomic mass : Fe = 56, O = 16, Mg = 24, P = 31,) C =12, H = 1)

(a) $C_3H_8(g) + 5O_2(g) \rightarrow 3CO_2(g) + 4H_2O(l)$
(b) $P_4(s) + 5O_2(g) \rightarrow P_4O_{10}(s)$
(c) $4Fe(s) + 3O_2(g) \rightarrow 2Fe_2O_3(s)$
(d) $2Mg(s) + O_2(g) \rightarrow 2MgO(s)$

[JEE Main 2019, 10 April Shift-II]

Ans. (c) :

Option (a)- $C_3H_8(g) + 5O_2(g) \rightarrow 3XO_2(g) + 4H_2O(l)$

(1×36gm) + (1×8gm) = 5×32gm

36+8=160

$1gm = \frac{160}{44} = 3.63\,gm$

Each 1g of C_3H_8 requires 3.63 g of O_2

Option (b)- $P_4(S) + 5O_2(g) \rightarrow P_4O_{10}(s)$

4×31gm = 5×32 gm

$1gm = \frac{5 \times 32}{4 \times 31} = 1.29\,gm$

Each 1g of p requires 1.29 g of O_2.

Option (c)- $4Fe(s) + 3O_2(g) \rightarrow 2Fe_2O_3(s)$:

4×56gm = 3×32 gm

$1gm = \frac{3 \times 32}{4 \times 56} = 0.428\,gm$

Each 1g of Fe requires 0.428 g of O_2

Option (d)- $2Mg(s) + O_2(g) \rightarrow 2MgO(s)$

2×24gm = 1×32gm

$1gm = \frac{1 \times 32}{2 \times 24} = 0.67\,gm$

Each 1g of Mg requires 0.67 of O_2.

550. 25 g of an unknown hydrocarbon upon burning produces 88 g of CO_2 and 9 g of H_2O. This unknown hydrocarbon contains

(a) 20 g of carbon and 5 g of hydrogen
(b) 22 g of carbon and 3 g of hydrogen
(c) 24 g of carbon and 1 g of hydrogen
(d) 18 g of carbon and 7 g of hydrogen

[JEE Main 2019, 12 April Shift-II]

Ans. (c): Let the hydrocarbon is C_xH_y.

$$C_xH_y + O_2 \longrightarrow xCO_2 + \frac{y}{2}H_2O$$

The weight of Carbon $= \frac{88}{44} \times 12$

$= 24g$

The weight of hydrogen $= \frac{9}{18} \times 1$

$= 24g$

$$C_xH_y + \left(x + \frac{y}{4}\right)O_2 \rightarrow xCO_2 + \frac{y}{2}H_2O$$

$C = x \times \frac{25}{M} = 2$

$H = \frac{y}{2} \times \frac{25}{M} = 1$

⇒ 24:1 ratio by mass

551. An example of a disproportionation reaction is

(a) $2MnO_4^- + 10I^- + 16H^+ \rightarrow 2Mn^{2+} + 5I_2 + 8H_2O$
(b) $2NaBr + Cl_2 \rightarrow 2NaCl + Br_2$
(c) $2KMnO_4 \rightarrow K_2MnO_4 + MnO_2 + O_2$
(d) $2CuBr \rightarrow CuBr_2 + Cu$

[JEE Main 2019, 12 April Shift-I]

@apna_pdf

Ans. (d):

(a) $$2MnO_4^- + 10I^- + 16H^+ \longrightarrow 2Mn^{2+} + 5I_2 + 8H_2O$$

Oxidation= +7 +2
State

In this reaction manganese is getting reduced. So, this reaction is not a disproportionation reaction

(b) $2\ NaBr + Cl_2 \longrightarrow 2NaCl + Br_2$

Oxidation +1 +1
state

This is just an example of a displacement reaction not a disproportionation reaction.

(c) $2\ KMnO_4 \longrightarrow K_2MnO_4 + MnO_2 + O_2$

Oxidation +7 +6 +4
state

This indicate manganese is only getting reduced. So, this reaction is not a disproportionation reaction.

(d) $2\ CuBr \longrightarrow CuBr_2 + Cu$

Oxidation +1 +2 0
state

In this reaction copper is getting both oxidized as well as reduced Therefore, this reaction is an example of a dioproportionation reaction.

552. For a reaction,
$N_2(g)+3H_2(g) \rightarrow 2NH_3(g)$,
identify di-hydrogen (H_2) as a limiting reagent in the following reaction mixture.

(a) 56 g of N_2 + 10 g of H_2
(b) 35 g of N_2 + 8 g of H_2
(c) 14 g of N_2 + 4 g of H_2
(d) 28 g of N_2 + 6 g of H_2

[JEE Main 2019, 9 April Shift-I]

Ans. (a) :

$$\underset{\substack{2\times14g \\ 28g}}{N_2(g)} + \underset{\substack{3\times2g \\ 6g}}{3H_2(g)} \longrightarrow \underset{\substack{2(14+3) \\ 34g}}{2NH_3(g)} \quad ....(i)$$

28g N_2 requires 6g H_2 gas.

56g of N_2 requires $\frac{6g}{28g} \times 56g = 12g \text{ of } H_2$

12g of H_2 gas is required for 56g of N_2 gas but only 10g of H_2 gas is present in option (a).

Hence, H_2 gas is the limiting reagent

(b) 35g of N_2 + 8g of H_2.
28g N_2 required 6g of H_2

35g N_2 required $\frac{6g}{28g} \times 35g\,H_2$

$\Rightarrow$ 7.5g of H_2

Here, H_2 gas does not act as limiting reagent since 7.5g of H_2 is present in reaction mixture similarly, in option (c) and (d), H_2 doesnot act as limiting reagent.

For 14g of N_2 + 4g of H_2.
28g of N_2 reacts will 6g of H_2.

14g of N_2 reacts with $\frac{6}{28} \times 14g \text{ of } H_2 \Rightarrow 3g \text{ of } H_2$

For 28g of N_2 + 6g or H_2,
i.e. 28g of N_2 reacts with 6g of H_2.

553. Which of the following sets of components form homogeneous mixture?

(a) Phenol + Water
(b) Sugar + Benzene
(c) Silver chloride + Water
(d) Ethyl alcohol + water

MHT CET-02.05.2019, SHIFT-III

Ans. (d) : We know that these two are different compounds and phenol is only partially soluble in water. So the composition would not be uniform throughout the mixture making phenol water a heterogenous system.

554. Which one of the following statements about the law of conservation of mass is correct?

(a) A given compound always contains exactly same proportion of elements
(b) When gases combine in a reaction, they do so in a simple ratio by volume, provided all gases are all room temperature
(c) Matter can neither be created nor destroyed
(d) Equal volumes of all gases at same temperature and pressure contain equal number of molecules

NDA (II)-2018

Ans. (c) : According to law of conservation of mass, 'Matter can neither be created nor be destroyed' in chemical reactions.

555. Volume of water needed to mix with 10 mL 10N HNO_3 to get 0.1N HNO_3 is

(a) 1000mL (b) 990mL
(c) 1010mL (d) 10mL

AIIMS-2017

Ans. (b): Given, N_1 = 10 N, V_1 = mL, N_2 = 0.1 N and V_2 = ?

By law of conservation

$$N_1V_1 = N_2V_2$$

$$10 \times 10 = 0.1\ (10 + V)$$

$$V = \frac{10\times10}{0.1} - 10 = 1000 - 10 = 990\,mL$$

556. The proposition 'equal volumes of different gases contain equal numbers of molecules at the same temperature and pressure' is known as

(a) Avogadro's hypothesis
(b) Gay-Lussac's hypothesis
(c) Planck's hypothesis
(d) Kirchhoff's theory

NDA (II)-2017

Ans. (a) : Avogadro's hypothesis state that equal volume of different gases contain equal number of molecules at the same temperature and pressure.

557. On combustion of x-g of ethanol in bomb calorimeter, y-joules of heat energy is produced. The heat of combustion of ethanol (ΔH_{comb}) is–

@apna_pdf

(a) $\Delta H_{comb} = -x.J$

(b) $\Delta H_{comb} = -yJ$

(c) $\Delta H_{comb} = -\frac{x}{y} \times 44\,Jmol^{-1}$

(d) $\Delta H_{comb} = -\frac{y}{x} \times 44\,Jmol^{-1}$

BCECE-2017

Ans. (d) Mass of ethanol = y g

Heat product = yJ

$CH_3CHO + \frac{1}{2}O_2 \rightarrow 2CO_2 + 2H_2O$

Molar mass of $CH_3CHO = (12 + 3 + 12 + 1 + 16)$ g

$= 44g$

$\therefore$ 1 mole - 44g ethanol

yg produes yJ heat

$\therefore$ 44g produes $\frac{y}{x} \times 44J$

Also, this is exotherimic reaction as heat is produed

$\therefore$ $\Delta H_{(Combustion)} = \frac{-44y}{X} J/mole.$

558. When 'Z' grams of calcium carbonate completely burnt in air gives 28g of a solid compound. The mass of calcium carbonate used will be–

(a) 200 g
(b) 100 g
(c) 56 g
(d) 50 g

BCECE-2017

Ans. (d) : $CaCO_3 \xrightarrow{\Delta}$ heat $CaO + CO_2$

1 mole $CaCO_3$ produces 1 mole CaO molar mass CaO = 40g + 16 g = 56 g/mol

28g CaO = 28g/56g/mol = 0.5 mol CaO

Molar mass $CaCO_3 = 40 + 12 + 16 \times 3 = 100$ g/mol

Mass of 0.5 Mol $CaCO_3 = 100 \times 0.5$ mol = 50 g $CaCO_3$ was burnt.

559. Calculate the mass of oxygen obtained by complete decomposition of 10 kg of pure potassium chlorate. (Atomic mass : K = 39, O = 16 and C1 = 35.5)

(a) 39.2 kg
(b) 392 kg
(c) 3.92 kg
(d) 3 kg

SRMJEEE – 2016

Ans. (c) : The following reaction take place :

$2KClO_3 \longrightarrow 2KCl + 3O_2$

potassium chlorate– $KClO_3$

$\because$ 2 moles of $KClO_3$ form 3 moles of O_2.

$\therefore$ 2 × 122.5g of $KClO_3$ form 3 × 32g of O_2.

$\therefore$ 10×10^3g of $KClO_3$ form $\frac{3\times32}{2\times122\cdot5}\times10\times10^3$

$= 3.92$ kg

560. Combination of one volume of nitrogen with three volumes of hydrogen produces

(a) one volume of ammonia
(b) two volumes of ammonia
(c) three volumes of ammonia
(d) one and a half volumes of ammonia

NDA (II)-2016

Ans. (b) Two volume of Ammonia (NH_3) formed when combination of one volume of nitrogen with three volumes of hydrogen takes place.

$$\underset{(1\,volume)}{N_2} + \underset{(3\,Volume)}{3H_2} \xrightarrow[(200\,atm)]{Fe/Mo} \underset{\substack{Ammonia\\(2\,volume)}}{2NH_3} + Heat$$

561. Match List-I with List-II and select the correct answer using the code given below the Lists:

	List-I Process		List-II Type of change
A.	**Heating of Camphor**	**1.**	**Chemical**
B.	**Cooling of water vapour upto room temperature**	**2.**	**Evaporation**
C.	**Cooking an egg**	**3.**	**Condensation**
D.	**Formation of water vapour at room temperature**	**4.**	**Sublimation**

Code:

	A	B	C	D
(a)	4	3	1	2
(b)	4	1	3	2
(c)	2	1	3	4
(d)	2	3	1	4

NDA (II)-2016

Ans. (a) :

List I Process	List II Type of change
A. Heating of camphor	Sublimation
B. Cooling of water vapour upto room temperature	Condensation
C. Cooking an egg	Chemical
D. Formation of water vapour at room temperature	Evaporation

562. 25 mL of a solution of barium hydroxide on titration with a 0.1 molar solution of hydrochloric acid gave a titre value of 35 mL. The molarity of barium hydroxide solution was

(a) 0.07 M
(b) 0.14 M
(c) 0.28 M
(d) 0.35 M

SRMJEEE – 2014

Ans. (a) : The reaction is :

$Ba(OH)_2 + 2HCl\,(aq.) \longrightarrow BaCl_2 + 2H_2O\,(l)$

Given – $M_1 = ?$ $M_2 = 0.1M$

$V_1 = 25$ mL $V_2 = 35$ mL

From the molarity equation :-

$M_1V_1 = M_2V_2$

$$M_1 = \frac{M_2V_2}{V_1} = \frac{0.1\times35}{25} = 0.14M$$

$$\therefore \text{Molarity of } Ba(OH)_2 = \frac{M_1}{\text{Acidity of } Ba(OH)_2}$$

$$\therefore \text{Molarity of } Ba(OH)_2 = \frac{0.14}{2} = 0.07M$$

@apna_pdf

563. The formation of CO and CO_2 illustrates the law of

(a) reciprocal proportion
(b) conservation of mass
(c) multiple proportion
(d) constant composition

BITSAT 2014

Ans. (c) : Law of multiple proportions states that if two element can combine to form more than one compound with each other, the masses of one element that combine with a fixed mass of the other element are in ratios of small whole numbers.

Example -

$$\frac{\text{Ratio of O to C in corbon dioxide}}{\text{Ratio of O to C in corbon monoxide}} = \frac{2.66}{1.33} = 2:1$$

564. An aqueous solution of 6.3 g of oxalic acid dihydrate is made up to 250 mL. The volume of 0.1 N NaOH required to completely neutralise 10 mL of this solution is

(a) 20 mL (b) 40 mL
(c) 10 mL (d) 4 mL

AIIMS-2013

Ans. (b): As we know,

n- factor for $H_2C_2O_4.2H_2O = 2$

$$\text{Normality} = \frac{\text{weight} \times 2 \times 1000}{\text{molecular weight} \times 250} = \frac{6.3 \times 2000}{126 \times 250} = 0.4$$

$N_1V_2 = N_2V_2$

$0.4 \times 10 = V_2 \times 0.1 \Rightarrow$ Volume $(V_2) = 40$ mL.

565. Which one of the following is an example of disproportionation reaction?

(a) $3Cl_2(g) + 6OH^-(aq) \longrightarrow ClO_3^-(aq) + 5Cl^-(aq) + 3H_2O(l)$

(b) $Ag^{2+}(aq) + Ag(s) \longrightarrow 2Ag^+(aq)$

(c) $Zn(s) + CuSO_4(aq) \longrightarrow Cu(s) + ZnSO_4(aq)$

(d) $2KClO_3(s) \longrightarrow 2KCl(s) + 3O_2(g)$

AP-EAMCET (Engg.) 2013

Ans. (a) : Those reaction in which a compound undergoes oxidation as well as reduction is known as disproportionation reaction.

reduction

$$3\overset{0}{Cl}_2(g) + 6OH^-_{(aq)} \rightarrow ClO^-_{3(aq)} + 5\overset{+5}{Cl}^-_{(aq)} + 3H_2O(l)$$

oxidation

566. Which of the following species do not show disproportination on reaction?

ClO^-, ClO_2^-, ClO_3^-

(a) ClO_4^- (b) ClO_3^-
(c) ClO^- (d) None of these

JIPMER-2013

Ans. (a) :

$$3\overset{+1}{Cl}O \longrightarrow 2\overset{-1}{Cl} + \overset{+5}{Cl}O_3^-$$

ClO_2^- (chlorite ion):

$$3\overset{+3}{Cl}O_2^- \longrightarrow \overset{-1}{Cl^-} + 2\overset{+5}{Cl}O_4^{-1}$$

ClO_3^- (chlorate ion):

$$3\overset{+5}{Cl}O_2^- \longrightarrow \overset{-1}{Cl^-} + 4\overset{+7}{Cl}O_4^{-1}$$

ClO_4^- does not disproportionate because in this oxo anion chlorine is present in its highest oxidation state (+7).

567. $K_2Cr_2O_7 + xKCl + 6H_2SO_4$ × $yCrO_2Cl_2 + 6KHSO_4 + zH_2O$, x, y and z are respectively

(a) 4, 2, 3 (b) 6, 2, 6
(c) 8, 2, 4 (d) 4, 1, 6

SRMJEEE – 2012

Ans. (a) : The given equation is :

$$K_2Cr_2O_7 + xKCl + 6H_2SO_4 \longrightarrow y\,CrO_2Cl_2 + 6KHSO_4 + zH_2O$$

We find the moles i.e. x, y and z.

Firstly, count the specific atom both the side and balanced on the basis of the number of atom.

Hence, the balanced chemical reaction will be.

$$K_2Cr_2O_7 + 4KCl + 6H_2SO_4 \longrightarrow 2CrO_2Cl_2 + 6KHSO_4 + 3H_2O$$

568. Equal volumes of 1 M HCl and 1 M H_2SO_4 are neutralised by dil. NaOH solution separately. If X kcal and Y kcal of heat are liberated respectively, then which of the following relation is correct?

(a) X=Y (b) $X = \frac{1}{2}Y$
(c) X=2Y (d) $X = \frac{1}{3}Y$

CG PET -2019

Ans. (b) : Since H_2SO_4 give 2 moles H^+, HCl gives 1 mole H^+ from 1 mole after ionisation. Hence, H_2SO_4 will release double amount of heat as compared to HCl.

i.e. $y = 2X$ or $X = \frac{Y}{2}$

569. If Avogadro number N_A, is changed from 6.022×10^{23} mol^{-1} to 6.022×10^{20} mol^{-1}, this would change

(a) the mass of one mole of carbon
(b) the ratio of chemical species to each other in a balanced equation.
(c) the ratio of elements to each other in a compound
(d) the definition of mass in units of grams.

NEET-2012

Ans. (a) :

Mass of 1 mole (6.022×10^{23}) atoms of carbon = 12 g

If Avogadro Number (N_A) is changed than mass of 1 mol $(6.022 \times 10^{20}$ atom) of carbon

$$= \frac{12 \times 6.022 \times 10^{20}}{6.022 \times 10^{23}} = 12 \times 10^{-3}\,g$$

Therefore, Mass of 1 mol of carbon is changed.

@apna_pdf

570. KMnO$_4$ reacts with oxalic acid according to the equation:

$$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \rightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$$

Here 20 mL of 0.1 M KMnO$_4$ is equivalent to:

(a) 20mL of 0.5M $H_2C_2O_4$

(b) 50mL of 0.5M $H_2C_2O_4$

(c) 50mL of 0.1M $H_2C_2O_4$

(d) 20mL of 0.1M $H_2C_2O_4$

AIIMS-2013

Ans. (c):

$$2MnO_4^- + 5C_2O_4^{2-} + 16H^+ \longrightarrow 2Mn^{2+} + 10CO_2 + 8H_2O$$

At NTP

∵ 2 × 22.4 L reacts with 5×22.4 L of oxalic acid.

∴ 20 ml of 0.1 KMnO$_4$ reacts with oxalic acid,

$$= \frac{5 \times 22.4 \times 20}{2 \times 22.4} = 50\,ml$$

So, the correct option is 50 ml of 0.1 M oxalic acid.

571. The volume of 0.1 M oxalic acid that can be completely oxidized by 20 mL of 0.025 M KMnO$_4$ solution is

(a) 25 mL
(b) 12.5 mL
(c) 37.5 mL
(d) 125 mL

Karnataka-CET-2012

Ans. (b) :

$2KMnO_4 + 3H_2SO_4 + 5H_2C_2O_4 \rightarrow K_2SO_4 + 2MnSO_4 + 8H_2O + 10CO_2$

$$\because \quad \text{Molarity} = \frac{n_B}{V_{ml}} \times 1000$$

$$\therefore \quad 0.025 = \frac{n_B}{V_{ml}} \times 1000$$

$$\therefore \quad n_B = \frac{0.025}{50} = 5 \times 10^{-4} \text{ of } KMnO_4$$

2 moles of KMnO$_4$ completely oxidizes 5 moles of oxalic acid.

∴ 5×10^{-4} mol of KMnO$_4$ will completely

$$\text{oxidize} = \frac{5}{2} \times 5 \times 10^{-4} \text{ mol of oxalic acid}$$

$$= 1.25 \times 10^{-3} \text{ mol of oxalic acid}$$

$$\because \quad \text{Molarity} = \frac{n_B}{V_{ml}} \times 1000$$

$$\therefore \quad V_{ml} = \frac{n_B}{\text{molarity}} \times 1000 = \frac{1.25 \times 10^{-3}}{0.1} \times 1000$$

$$= 12.5\,mL$$

572. l(FeO·Cr$_2$O$_3$) + mNa$_2$CO$_3$ + nO$_2$ × xNa$_2$CrO$_4$ + yFe$_2$O$_3$ + zCO$_2$

l, m, n, x, y and z respectively are

(a) 4, 8, 7, 8, 2 and 8
(b) 4, 8, 7, 8, 8 and 2
(c) 8, 8, 8, 2, 4 and 7
(d) 2, 4, 7, 8, 8 and 8

SRMJEEE – 2011

Ans. (a) : The given reaction is :

$l(FeO{\cdot}Cr_2O_3) + mNa_2CO_3 + nO_2 \longrightarrow xNa_2CrO_4 + yFe_2O_3 + zCO_2$

after balancing the equation we get –

l = 4, m = 8, n = 7, x = 8, y = 2 and z = 8

$$\therefore\ 4(FeO.\ Cr_2O_3) + 8Na_2CO_3 + 7O_2 \longrightarrow 8Na_2CrO_4 + 2Fe_2O_3 + 8CO_2$$

573. The product of atomic weight and specific heat of any element is a constant, approximately 6.4. This is known as :

(a) Dalton's law
(b) Avogadro's law
(c) Newton's law
(d) Dulong Pettit law

BITSAT-2011

Ans. (d) : According to Dulong and Pettit's law Atomic weight × Specific heat = 6.4 (approx)

This law is applicable only to solid elements but it fails to explain very high specific heat of diamond.

574. 0.14 g of an element on combustion gives 0.28 gm of its oxide. What is that element?

(a) Nitrogen
(b) Carbon
(c) Fluorine
(d) Sulphur

AP- EAMCET(Medical) -2010

Ans. (d): The formula used to calculate the equivalent weight of an element in its oxide :

$$\text{The equivalent weight of element} = \frac{\text{wt. of element}}{\text{wt. of oxygen}} \times$$

equivalent wt. of O atom.

$$\text{The equivalent wt. of O atom} = \frac{16}{2} = 8g$$

$$\text{Equivalent weight of element} = \frac{\text{weight of element}}{\text{weight of oxygen}} \times 8$$

$$= \frac{0.14}{0.28 - 0.14} \times 8$$

$$= 1 \times 8$$

$$= 8 \text{ amu}$$

Also, by the balanced reaction:

$$S + O_2 \longrightarrow SO_2$$

Valency of sulphur = 4

$$\text{Equivalent weight of sulphur} = \frac{32}{4} \text{amu} = 8 \text{ amu}$$

So, the element is sulphur.

575. How many 'mL' of perhydrol is required to produce sufficient oxygen which can be used to completely convert 2 L of SO$_2$ Gas to SO$_3$ gas?

(a) 10 mL
(b) 5 mL
(c) 20 mL
(d) 30 mL

AP EAMCET (Engg.)-2009
VITEEE- 2009

Ans. (a): Perhydrol means 30% solution of H_2O_2.

H_2O_2 decomposes as

$2H_2O_2 \rightarrow 2H_2O + O_2$

Volume strength of 30% H_2O_2 solution is 100 that mean 1 mL of this solution on decomposition gives 100 mL oxygen.

@apna_pdf

$$SO_2+\frac{1}{2}O_2 \longrightarrow SO_3$$

$$1L \quad \frac{1}{2}L \qquad 1L$$

$$2L \quad 1L \qquad 2L$$

Since, 100 mL of oxygen is obtained by 1 mL of H_2O_2

$\therefore$ 1000 mL of oxygen will be obtained by

$$=\frac{1}{100}\times 1000\,\text{mL of } H_2O_2$$

$$=10\,\text{mL of } H_2O_2$$

576. Which of the following processes involves absorption of energy?

(a) $Cl+e^- \longrightarrow Cl^-$ (b) $O^- + e^- \longrightarrow O^{2-}$

(c) $O+e^- \longrightarrow O^-$ (d) $S+e^- \longrightarrow S^-$

BCECE-2009

Ans. (b) : Processes (a), (c) and (d) represent EA_1 of the atoms which is their natural tendency and hence energy is evolved. But (b) process is EA_2 of O atom and involves absorption of energy.

O^- to O^{-2} because of interelectronic repulsion, it will require energy to add an electron to its outermost shell.

577. Gram molecular volume of oxygen at STP is

(a) 3200 cm^3 (b) 5600 cm^3

(c) 22400 cm^3 (d) 11200 cm^3

Karnataka-CET-2007

Ans. (c) : Gram molecular volume of oxygen at STP is

GMV = 22.4 litre = 22.4

$\therefore$GMV = 22400 cm^3.

578. Dalton's law of partial pressure is applicable to which one of the following system?

(a) $NH_3 + HCl$ (b) $NO + O_2$

(c) $H_2 + Cl_2$ (d) $CO + H_2$

Karnataka-CET-2007

Ans. (d) : According to this law the total pressure exerted by mixture of non-reactive gases at a particular temperature & given volume of container in equal to summation of partial pressure of all gases. e.g. $CO + H_2$ are non-reacting gases. Hence, Dalton's law of partial pressure is applicable to this system.

579. x grams of calcium carbonate was completely burnt in air. The weight of the solid residue formed is 28 g. What is the value of x (in grams)?

(a) 44 (b) 200

(c) 150 (d) 50

AP-EAMCET-2005

Ans. (d) : $CaCO_3 \xrightarrow{\Delta} CaO(s)+CO_2(g)$

56 g o CaO is formed form 100 g of $CaCO_3$

28g will be formed

$$=\frac{28\times 100}{56}=50g$$

580. Law of multiple proportions is illustrated by one of the following pairs:

(a) H_2S and SO_2 (b) NH_3 and NO_2

(c) Na_2S and Na_2O (d) N_2O and NO

JCECE - 2005

Ans. (d) : According to the law of multiple proportions that if two element combine to form more than one compound, the fixed amount of one element combining with other element have simple whole number ratio.

(i) H_2S and SO_2 are not example of law of multiple proportion because elements are different

(ii) NH_3 and NO_2 are not examples of law of multiple proportion because elements are different

(iii) Na_2S and Na_2O are not NO here 16 parts of oxygen react with 14 and 28 parts of nitrogen. 14:28 is 1:2 which is simple whole number ratio.

$\therefore$ It follows law of multiple proportion.

581. What is the volume (in L) of oxygen required at STP to completely convert 1.5 moles of sulphur into sulphur dioxide ?

(a) 11.2 (b) 22.4

(c) 33.6 (d) 44.8

AP-EAMCET-2004

Ans. (c) : The reaction is $\underset{32gm}{S} + \underset{32gm}{O_2} \rightarrow SO_2$

$\because$ 1 mole of sulphur required = 22.4 L of O_2 at STP

$\therefore$ 1.5 moles of S required = 22.4 × 1.5

= 33.6 L of O_2.

582. What is the volume (in litres) of oxygen at STP required for complete combustion of 32 g of CH_4? (Molecular weight of CH_4 is 16.)

(a) 44.8 (b) 89.6

(c) 22.4 (d) 179.2

AP-EAMCET-2001

Ans. (b) : $\underset{16}{CH_4} + \underset{2\times 22.4L}{2O_2} \rightarrow CO_2+2H_2O$

$\therefore$ Volume of O_2 required for 32 g CH_4 is = 2 × 22.4 L and volume of O_2 required for 32 g CH_4 is $\frac{2\times 22.4}{16}\times 32$

= 89.6 L

583. How many moles of potassium chlorate should be decomposed completely to obtain 67.2 L of oxygen at NTP ?

(a) 3 (b) 4

(c) 1 (d) 2

AP-EAMCET-1999

Ans. (d) : $\underset{2\,mol}{2KClO_3} \rightarrow 2KCl+\underset{\substack{3\times 22.4\\67.2L}}{3O_2}$

$\because$ 3×22.4 L of O_2 required to 2 mole of $KClO_3$

$\therefore$ For obtaining 67.2 L of O_2, number of moles of $KClO_3$ required $=\frac{2}{3\times 22.4}\times 67.2$ = 2 mol.

584. How much litres of CO_2 at STP will be formed when 100 mL of 0.1M H_2SO_4 reacts with excess of Na_2CO_3?

(a) 22.4 (b) 2.24

(c) 0.224 (d) 5.6

AP-EAMCET-1998

@apna_pdf

Ans. (c) : $\underset{\substack{1mol\\100mL}}{H_2SO_4} + Na_2CO_3 \rightarrow \underset{\substack{22.4L\\?}}{CO_2} + Na_2SO_4 + H_2O$

1 mole of sulfuric acid will produce 1 mole (22.42 at STP) of carbon dioxide.

100 ml of 0.1 M H_2SO_4 = 10 million mole of H_2SO_4

$= 10 \times 10^{-3}$

$= 10^{-2}$ moles of H_2SO_4

$\because$ 1 mole of H_2SO_4 liberate CO_2 = 22.4 L

$\therefore$ 10^{-2} moles of H_2SO_4 liberates CO_2

$= 22.4 \times 10^{-2}$

$= 0.224$ L

Thus, 0.01 mole of sulfuric acid will produce 0.01 mole (0.224 L at STP) of CO_2.

585. $KMnO_4$ oxidizes oxalic acid in acid medium. The number of CO_2 molecules produced as per the balanced equation is:

(a) 10 (b) 8

(c) 6 (d) 3

AP EAMCET (Medical) -1998

Ans. (a): When potassium permanganate ($KMnO_4$) oxidize the oxalic acid then following reaction take place during the reaction–

$$2KMnO_4 + 3H_2SO_4 + 5H_2C_2O_4 \longrightarrow K_2SO_4 + 2MnSO_4 + 10CO_2 + 8H_2O.$$

In a balanced chemical equation of oxidation of oxalic acid by $KMnO_4$ in acidic medium evolve 10 molecules of CO_2.

586. The volume in litres of CO_2 liberated at STP when 10 g of 90% pure lime stone is heated completely is:

(a) 2.016 (b) 20.16

(c) 2.24 (d) 22.4

AP EAMCET (Medical) -1998

AP-EAMCET-1996

Ans. (a): $CaCO_3 \xrightarrow{\Delta} CaO + \underset{\substack{22.4L\,at\,STP\\(1mole)}}{CO_2}$

$\therefore$ Molecular weight of $CaCO_3$ = 100g/mole

Weight of 10gm of 90% pure limestone $= \dfrac{10 \times 90}{100}$

= 9 gm pure $CaCO_3$

$\therefore$ 9 gm pure $CaCO_3$

$CO_2 = \dfrac{22.4 \times 9}{100} = 2.016L$.

587. The total number of valence electrons in 4.2 g of N_3^- ion is (N_A is the Avogadro's number)

(a) 2.1 N_A (b) 4.2 N_A

(c) 1.6 N_A (d) 3.2 N_A

NEET-1994

Ans. (c) : Molecular wt of $N_3^- = 3 \times 14 = 42g$

Moles of N_3^- ion $= \dfrac{4.2}{42} = 0.1$

Each nitrogen atom has 5 valence electrons, total number of electrons in N_3^- ion $= 16$

Total number of electrons in 0.1 mole,

4.2g of N_3^- ion = 0.1 × 16 × N_A = 1.6 N_A

588. A compound X on heating gives a colourless gas. The residue is dissolved in water to obtain Y. Excess CO_2 is passed through aqueous solution of Y when Z is formed. Z on gentle heating gives back X. the compound X is

(a) $Ca(HCO_3)_2$ (b) $CaCO_3$

(c) $NaHCO_3$ (d) $Na_2\,CO_3$

VITEEE 2015

Ans. (b) :

$$\underset{(x)}{CaCO_3} \xrightarrow{\Delta} CaO + CO_2 \uparrow(\text{Colourless gas})$$

$$CaO + H_2O \longrightarrow \underset{(Y)}{Ca(OH)_2}$$

$$Ca(OH)_2 + 2\,CO_2 \longrightarrow \underset{(Z)}{Ca(HCO_3)_2}$$

$$\underset{(z)}{Ca(HCO_3)_2} \xrightarrow{\Delta} \underset{(x)}{CaCO_3} + CO_2 + H_2O$$

$CaCO_3$ on heating gives a colourless gas CO_2 and CaO as the residue. CaO with water will form $Ca(OH)_2$ and when treated with excess CO_2 will given $Ca(OH_3)_2$ which on heating gives back $CaCO_3$

5. Percentage Composition and Molecular Formula

589. 0.2 g of an organic compound was subjected to estimation of nitrogen by Duma's method in which volume of N_2 evolved (at STP) was found to be 22.400 mL. The percentage of nitrogen in the compound is_____. [nearest integer]

(Given : Molar mass of N_2 is 28 g mol^{-1}, Molar volume of N_2 at STP : 22.4L)

JEE Main-24.06.2022, Shift-II

Ans. (14) : Given,

Mass of organic compound = 0.2g

Molar volume of N_2 at STP = 22.4L = 22400mL

Given volume of N_2 = 22.400 mL

Then, Mole of $N_2(g) = \dfrac{22.4}{22400} = \dfrac{1}{1000}$

Weight of $N_2(g) = \dfrac{1}{1000} \times 28 = 0.028g$

% of N in organic compound $= \dfrac{0.028}{0.2} \times 100 = 14\%$

590. 120 g of an organic compound that contains only carbon and hydrogen gives 330 g of CO_2 and 270 g of water on complete combustion. The percentage of carbon and hydrogen, respectively are

(a) 25 and 75 (b) 40 and 60

(c) 60 and 40 (d) 75 and 25

JEE Main-24.06.2022, Shift-II

@apna_pdf

Ans. (d) : Given,

Mass of organic compound = 120g

Mass of CO_2 = 330g

Mass of H_2O = 270g

Mole of $CO_2 = \frac{330}{40}$

Weight of carbon = $\frac{330}{40} \times 12 = 90g$

% of C = $\frac{90}{120} \times 100 = 75\%$

Mole of $H_2O = \frac{270}{18}$

Weight of hydrogen = $\frac{270}{18} \times 1 = 15g$

% of hydrogen = $\frac{15}{120} \times 100 = 25\%$

591. The complete combustion of 0.492 g of an organic compound containing 'C', 'H' and 'O' gives 0.793 g of CO_2 and 0.442 g of H_2O. The percentage of oxygen composition in the organic compound is _____.[nearest integer]

JEE Main-28.06.2022, Shift-II

Ans. (46) : Given, organic compound = 0.492 g

CO_2 = 0.793 g

H_2O = 0.442 g

Reaction of complete combustion-

Organic compound + $O_2 \longrightarrow CO_2 + H_2O$

Weight of carbon in $CO_2 = \frac{0.793}{44} \times 12 = 0.216$ gm

Weight of hydrogen in $H_2O = \frac{0.442}{48} \times 2 = 0.0491$ gm

Weight of oxygen in organic compound

$\Rightarrow$ 0.492 – 0.2651

$\Rightarrow$ 0.2269

% of O = $\frac{0.442}{48} \times 100$

% of O = $45.71 \approx 46$

592. On complete combustion 0.30 g of an organic compound gave 0.20 g of carbon dioxide and 0.10 g of water. The percentage of carbon in the given organic compound is ______. (Nearest Integer)

JEE Main-26.06.2022, Shift-I

Ans. (18) : Reaction of complete combustion–

Organic compound + $O_2 \longrightarrow CO_2 + H_2O$

Given,

Mass of organic compound = 0.30g

Mass of CO_2 = 0.20g

Mass of H_2O = 0.10g

Moles of $CO_2 = \frac{0.20}{44}$

Weight of carbon = $\frac{0.20}{44} \times 12$

% of carbon in organic compound = $\frac{0.2}{44} \times 12 \times \frac{100}{0.3}$

= 18.11%

593. A 2.0 g sample containing MnO_2 is treated with HCl liberating Cl_2. The Cl_2 gas is passed into a solution of KI and 60.0 mL of 0.1 M $Na_2S_2O_3$ is required to titrate the liberated iodine. The percentage of MnO_2 in the sample is ——. (Nearest integer)

[Atomic masses (in u) Mn = 55; Cl = 35.5; O = 16, I = 127, Na = 23, K = 39, S = 32]

JEE Main-28.06.2022, Shift-I

Ans. (13) : Given,

Weight of sample = 2.0g

Volume of $Na_2S_2O_3$ = 60 mL

Molarity of $Na_2S_2O_3$ = 0.1 M

The complete reaction are-

$$MnO_2 + 4HCl \longrightarrow MnCl_2 + Cl_2(g) + H_2O$$

$$Cl_2 + 2KI \longrightarrow I_2 + 2KCl$$

$$I_2 + 2Na_2S_2O_3 \rightarrow 2NaI + Na_2S_4O_6$$

milli eq. of MnO_2 = milli eq. of Cl_2 = milli eq. of I_2 = milli eq. of Hypo

$$2 \times \left(\frac{w}{87}\right) = [0.1 \times 60]$$

w = 261 milligram

% of $MnO_2 = \frac{0.261}{2} \times 100 = 13.05\% = 13$

594. In the estimation of bromine, 0.5 g of an organic compound gave 0.40 g of silver bromide. The percentage of bromine in the given compound is ——— % (nearest integer) (Relative atomic masses of Ag and Br are 108 u and 80 u, respectively).

JEE Main-28.06.2022, Shift-I

Ans. (34) : Given,

Mass of organic compound = 0.5 g

mass of silver bromide (AgBr) = 0.40 g

moles of AgBr = $\frac{0.40}{188}$

Weight of Br = $\frac{0.40}{188} \times 80$

% of Br = $\frac{0.40}{188} \times \frac{80}{0.5} \times 100$

= 34%

595. Kjeldahl's method was used for the estimation of nitrogen in an organic compound. The ammonia evolved from 0.55 g of the compound neutralized 12.5 mL of 1 M H_2SO_4 solution. The percentage of nitrogen in the compound is ——. (nearest integer)

JEE Main-29.06.2022, Shift-I

@apna_pdf

Ans. (64) : Mili equivalent of H_2SO_4 used by NH_3 = 12.5 × 1 × 2

$$\%\text{ of N in the compound} = \frac{25\times10^{-3}\times14\times100}{0.55}$$

$$= 63.66$$

$$\approx 64\%$$

So, answer will be 64%

596. 0.25 g of an organic compound containing chlorine gave 0.40 g of silver chloride in Carius estimation. Te percentage of chlorine present in the compound is______ [in nearest integer] (Given: Molar mass of Ag is 108 g mol^{-1} and that of Cl is 35.5 g mol^{-1})

JEE Main-27.06.2022, Shift-II

Ans. (40) : Organic compound $\xrightarrow{AgNO_3}$ AgCl

(Containing chlorine)

0.25 gram 0.4 gram

$$\text{Mole of AgCl} = \left(\frac{0.4}{143.5}\right)$$

$$W_{Cl} = \left(\frac{0.4}{143.5}\right)\times 35.5$$

$$\%\text{ of Cl} = \left[\frac{0.4}{143.5}\times35.5\right]\times\frac{100}{0.25} = 39.58 \approx 40$$

597. The moles of methane required to produce 81 g of water after complete combustion is———— ×10^{-2} mol. [nearest integer]

JEE Main-26.06.2022, Shift-II

Ans. (225) : $CH_4 + 2O_2 \longrightarrow CO_3 + 2H_2O$

mole = 2.25 mass = 81

$$\text{mole} = \frac{81}{18}$$

$$= 4.5$$

So, 225 × 10^{-2} moles of CH_4 are required to produce 81g of water after complete combination.

598. A 0.166 g sample of an organic compound was digested with conc. H_2SO_4 and then distilled with NaOH. The ammonia gas evolved was passed through 50.0 mL of 0.5 N H_2SO_4. The used acid required 30.0 mL of 0.25 N NaOH for complete neutralization. The mass percentage of nitrogen in the organic compound is _____.

JEE Main-24.06.2022, Shift-I

Ans. (63) :

$$\begin{tikzcd}[column sep=small]
\underset{\substack{\text{(Containing nitrogen)}\\ 0.166\text{ gram}}}{\text{Organic compound}} + \text{Conc. } H_2SO_4 \arrow[r, "NaOH"] & NH_3 + CH_3 \arrow[d, "\substack{\text{Pass through}\\ H_2SO_4}"] \\
\text{Remaining acid} + NaOH \arrow[r] & \text{Complete neutralization}
\end{tikzcd}$$

Mili eq. of NH_3 = Mili eq. of used H_2SO_4 = Mili eq. of NaOH

$$= 0.25 \times 30 = 7.5$$

Milimole of nitrogen = 7.5

$$W_{nitrogen} = 7.5 \times 14 \times 10^{-3}$$

$$= 0.105 \text{ gram}$$

$$\%\text{ of nitrogen} = \frac{0.105}{0.166}\times100$$

$$= 63.25 \approx 63$$

599. The empirical formula of a non-electrolyte is CH_2O. A solution containing 6 g of the compound exerts the same osmotic pressure as that of 0.05 M glucose solution at the same temperature. The molecular formula of the compound is

(a) $C_2H_4O_2$ (b) $C_3H_6O_3$

(c) $C_5H_{10}O_5$ (d) $C_4H_8O_4$

BCECE-2014

Karnataka-CET, 2009

Ans. (d) : For isotonic : $\frac{w_1}{m_1V_1} = \frac{w_2}{m_2V_2}$

w_1 = mass of glucose = 0.05×180g = 9g

m_1 = molecular mass of glucose = 180 g

Assuming V_1= V_2 = 1L

$$\therefore \frac{\text{Molecularmass}}{\text{Empirical mas}} = n \Rightarrow n = \frac{120}{30} = 4$$

∴ Molecular formula = $C_4H_8O_4$

600. 1 g of silver gets distributed between 10 cm^3 of molten zinc and 100 cm^3 of molten lead at 800^{o}C. The percentage of silver in the zinc layer is approximately

(a) 89 (b) 91

(c) 97 (d) 94

BCECE-2014, Karnataka-CET, 2010

Ans. (c) : Let mass of Ag in Zn layer = x

∴Mass of Ag in lead layer = 1 – x

$$\text{Concentration of Ag is zinc} = \frac{x}{10}$$

$$\therefore \text{ Concentration of Ag in Pb} = \frac{1-x}{100}$$

$$\frac{\frac{x}{10}}{\frac{1-x}{100}} = 300$$

%v of Ag in Zinc layer = 97%

601. In Dumas' method of estimation of nitrogen 0.35 g of an organic compound gave 55 mL. of nitrogen collected at 300 K temperature and 715 mm pressure. The percentage composition of nitrogen in the compound would be (aqueous tension at 300 K = 15 mm)

(a) 15.44 (b) 16.45

(c) 17.45 (d) 14.45

JIPMER-2014

NEET-2011

@apna_pdf

Ans. (b): $\frac{P_1V_1}{T_1}=\frac{P_2V_2}{T_2}$

Given,

Where, p_2 = pressure of N_2 at STP = 760 mm

T_2 = Temperature of N_2 at STP = 273 K

Volume of N_2 at STP (by gas equation)

$$\left(\frac{P-P_1}{t+273}\right)V_1\times\frac{273}{160}=V_2$$

P = 715 mm (pressure at which N_2 collected)

P_1= aqueous tension of water = 15mm

T_1 = t + 273 = 300K

V_1 = 55 ml

$$\therefore\ V_2=\frac{(715-15)\times55}{300}\times\frac{273}{760}=46.098\,\text{mL}$$

% of nitrogen in given compound

$$=\frac{28}{22400}\times\frac{V_2}{W}\times100=\frac{28}{22400}\times\frac{46.09}{0.35}\times100$$

= 16.45%

602. 3.92 g of ferrous ammonium sulphate reacts completely with 50 ml $\frac{N}{10}$ KMnO$_4$ solution. The percentage purity of the sample is

(a) 50 (b) 78.4

(c) 80 (d) 39.2

[BITSAT-2014, 2006]

Ans. (a) : Given that,

V_1 = 1000

$N_2=\frac{1}{10}$

V_2 = 50

N_1 = ?

N_1V_1 (Ferrous ammonium sulphate) = N_2V_2 (KMnO$_4$)

$N_1\times1000=\frac{1}{10}\times50$

$N_1=\frac{50\times1}{1000\times10}=\frac{1}{200}$

Eq. wt of $Fe_2SO_4.(NH_4)_2SO_4.6H_2O$ = mol .wt = 392

$\therefore$ Strength of pure salt $=392\times\frac{1}{200}=1.96\,g\,L^{-1}$

$\therefore$ % purity $=\frac{1.96}{3.92}\times100=50\%$

603. The molecular formulae for phosgene and tear gas are …. and …. respectively,

(a) $COCl_2$ and CCl_2NO_2

(b) $SOCl_2$ and CCl_2NO_2

(c) $COCl_2$ and CCl_3NO_2

(d) $SOCl_2$ and CCl_3NO_2

GUJCET-2015, 2016

Ans. (c): Phosgene is the organic chemical compound with the formula $COCl_2$. It is a colourless gas.

Chloropicrin (CCl_3NO_2) is one of the tear gas which also called trichloronitromethane, toxic organic compound. Its vapours are irritating to the skin, eyes, and upper respiratory tract, and it has been used in chemical warfare and as tear gas.

604. A mixture of CaCl$_2$ and NaCl weighing 4.44 g is treated with sodium carbonate solution to precipitate all the calcium ions as calcium carbonate. The calcium carbonate so obtained is heated strongly to set 0.56 g of CaO. The percentage of NaCl in the mixture is (atomic mass of Ca = 40)

(a) 75 (b) 31.5

(c) 40.2 (d) 25

Karnataka-CET-2011, 2010

Ans. (a) : Concerned reaction is.

$$\underset{4.44g}{CaCl_2+NaCl}+Na_2CO_3\longrightarrow CaO_3+2NaCl+NaCl$$

$$\underset{1}{CaCO_3}\xrightarrow{\Delta}\underset{0.56g}{CaO}+CO_2$$

$(100\,CaCO_3=111\,g\,CaCl_2)$

$1\,g\,CaCO_3=1.11\,g\,CaCl_2$

weight of $CaCl_2$ = 1.11g, weight fo NaCl = 4.44 − 1.11 = 3.33g

$\%\,NaCl=\frac{3.33}{4.44}\times100=75\%$

605. An organic compound contains 60% C; 4.48% H and 35.5% O. Its empirical formula is

(a) $C_9H_8O_4$ (b) $C_5H_4O_2$

(c) $C_5H_4O_4$ (d) $C_9H_7O_6$

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (a) :

Element	**%**	**Atomic mass**	**Moles**
Carbon	60	12	$\frac{60}{12}\Rightarrow5$
Hydrogen	4.48	1	$\frac{4.48}{1}\Rightarrow4.48$
Oxygen	35.5	16	$\frac{35.5}{16}\Rightarrow2.2$

Empirical formula = C : H : O

$=\frac{5}{2.2}:\frac{4.48}{2.2}:\frac{2.2}{2.2}$

= 2.27 : 2.0 : 1.0

= 2.27 × 4 : 2 × 4 : 1 × 4

= 9 : 8 : 4

= $C_9H_8O_4$

606. If 0.765g of an acid gives 0.535g of CO$_2$ and 0.138g of H$_2$O then ratio percentage of C and H is ——

(a) 19 : 2 (b) 18 : 12

(c) 20 : 17 (d) 1 : 7

AP EAPCET 25.08.2021, Shift-II

Ans. (a) : Given –

Mass of acid = 0.765 gm

Mass of CO_2 = 0.535 gm

Mass of H_2O = 0.138 gm

$\therefore$ Acid × CO_2 + H_2O

$$\%\,C=\frac{12}{44}\times\frac{\text{mass of }CO_2}{\text{mass of acid (compound)}}\times100$$

$$\%\,C=\frac{12}{44}\times\frac{0.535}{0.765}\times100=19.07\%$$

@apna_pdf

$$\% H = \frac{2}{18} \times \frac{\text{mass of } H_2O}{\text{mass of compound}} \times 100$$

$$\% H = \frac{2}{18} \times \frac{0.13}{0.765} \times 100 = 2\%$$

So, the ratio of percentage of C and H is 19 : 2.

607. Using Duma's method for estimating nitrogen. 1 g of an organic compound 'X' gave 82 ml of nitrogen, collected at 27ºC and 750 mm Hg pressure. If the aqueous tension at 27ºC is 30 mm Hg pressure, then the percentage of nitrogen in the given compound X is ———

(a) 22.09% (b) 88.36%
(c) 44.18% (d) 70.69%

AP EAPCET 25.08.2021, Shift-II

Ans. (b) : Given, P = 750 mmHg,
T = 300K
Volume (v) = 82 ml.
∴ Actual pressure = 750 – 30 = 720 mmHg

$$\text{Volume of } N_2 \text{ at STP} = \frac{273 \times 720 \times 80}{300 \times 760\ (\text{mmHg})}$$

$$= 70.7 \text{ ml}$$

∴ 22400 ml of N_2 of at STP weight = 28 gm

$$70.7 \text{ ml of } N_2 \text{ weight} = \frac{28 \times 70.7}{22400}$$

$$\% \text{ of } N_2 = \frac{28 \times 70.7 \times 100}{22400 \times 0.1}$$

$$= 88.36\ \%$$

608. In Duma's method of estimation of nitrogen, 0.1840 g of an organic compound gave 30 mL of nitrogen collected at 287 K and 758 mm of Hg pressure. The percentage composition of nitrogen in the compound is ----------. (Round off to the Nearest Integer).

[Given: Aqueous tension at 287 K = 14 mm of Hg]

JEE Main 16.03.2021, Shift-II

Ans. (19%) : Given:-
Aqueous tension at 287K = 14mm of Hg
∴ Actual pressure = (758–14) = 744 mm of Hg

$$\text{volume of nitrogen at STP (V)} = \frac{273 \times 744 \times 30}{287 \times 760}$$

$$V = 27.935 \text{ mL}$$

∴ 22400 mL of N_2 at STP weights = 28g
∴27.94 mL of N_2 at STP weights

$$= \left(\frac{28}{22400} \times 27.94\right) g$$

$$= 0.034 g$$

$$\text{Hence\% of nitrogen} = \left(\frac{0.034}{0.1840} \times 100\right)$$

$$= 18.97\%$$

$$\approx 19\%$$

609. Using Kjeldahl's method over 1g of a soil sample, the ammonia evolved could neutralize 25 ml of 1 M H_2SO_4. Then, the percentage of nitrogen present in the sample is —

(a) 100% (b) 60%
(c) 70% (d) 25%

AP EAPCET 20.08.2021 Shift-I

Ans. (c) : Given that,
Mass of soil sample = 1 gm
Volume of 1M H_2SO_4 = 25 ml
∴ 25 ml of H_2SO_4 = 50 ml of NH_3
Since, 1 M NH_3 contain at 1000 ml is 14g Nitrogen.

$$\therefore \text{Parentage of } N = \frac{14 \times 50}{1000} \times \frac{100}{1} = 70\%$$

610. In each molecule of carbon tetrachloride. the mass percent of carbon and chlorine respectively are _____ and _____.

(a) 76.86 & 23.14 (b) 7.84 & 92.80
(c) 23.14 & 76.86 (d) 78.41 & 9.25

AP EAPCET 24.08.2021, Shift-I

Ans. (b) : Given,
Molar mass of CCl_4 = 153.82 g/mol
Formula –
Mass% of an element

$$= \frac{\text{mass of that element in compound}}{\text{molar mass of the compound}} \times 100$$

$$\text{Mass percent of carbon} = \frac{12}{153.82} \times 100 = 7.80$$

$$\text{Mass percent of Cl} = \frac{4 \times 35.45}{153.82} \times 100 = 92.18$$

611. 7.8 of a compound having molecular formula C_6H_6, on reacting with $CH_3COCl/AlCl_3$ gives 8.4 g of a product which has molecular formula C_8H_8O. Calculate the percentage yield of the product C_8H_8O. (Given atomic weights of H, C and O respectively are 1.12 and 16)

(a) 70% (b) 60%
(c) 80% (d) 75%

AP EAPCET 20.08.2021 Shift-II

Ans. (a):

612. 0.4g mixture of NaOH, Na_2CO_3 and some inert impurities was first titrated with $\frac{N}{10}$ HCl using phenolphthalein as an indicator, 17.5 mL of HCl was required at the end point. After this methyl orange was added and titrated. 1.5 mL of same HCl was required for the next end point. The weight percentage of Na_2CO_3 in the mixture is ______. (Rounded – off to the nearest integer)

JEE Main 25-02-2021, Shift-I

Ans. (4%) : Let, m moles of NaOH = x
m moles of Na_2CO_3 = y
So, First end point reaction is–

$$NaOH + HCl \rightarrow NaCl + H_2O$$

Second end point reaction is–

$$Na_2CO_3 + HCl \rightarrow NaHCO_3 + NaCl$$

@apna_pdf

$$x + y = \frac{1}{10} \times 17.5 \qquad .....(i)$$

$NaHCO_3 + HCl \rightarrow NaCl + H_2O$

$$y = \frac{1}{10} \times 1.5 \qquad .....(ii)$$

So, $x = 1.60,\ y = 0.15$

∴ Weight of $Na_2CO_3 = 0.15 \times 10^{-3} \times 106$

$= 1.59 \times 10^{-2}$ g

$$\%\ \text{Weight of } Na_2CO_3 = \frac{1.59 \times 10^{-2}}{0.4} \times 100$$

$= 3.975\%$

$\approx 4\%$

613. Complete combustion of 1.80 g of an oxygen containing compound ($C_xH_yO_z$) gave 2.64 g of CO_2 and 1.08 g of H_2O. The percentage of oxygen in the organic compound is:

(a) 63.53 (b) 53.33

(c) 51.63 (d) 50.33

JEE Main 25-02-2021, Shift-I

Ans. (b) : Liebig's method for % of C,H,O

$$\text{(i) } H_2 = \frac{2}{18} \times \frac{\text{Mass of } H_2O \text{ formed}}{\text{Mass of organic compound}} \times 100$$

$$= \frac{2}{18} \times \frac{1.08}{1.80} \times 100$$

$$= \frac{2.16}{32.4} \times 100 = 6.66\%$$

$$\text{(ii) } CO_2 = \frac{12}{44} \times \frac{\text{Mass of } CO_2 \text{ formed}}{\text{Mass of organic compound}} \times 100$$

$$= \frac{12}{44} \times \frac{2.64}{1.80} \times 100$$

$$= \frac{31.68}{79.2} \times 100 = 40\%$$

(iii) For O_2 percentage = 100 – (% of H_2 + % of CO_2)

= 100 – (6.66% + 40%)

= 53.34%

614. When benzyl alcohol is reacted with concentrated HBr produces the product 'P'. The product 'P' on reaction with KCN gives "Q". The product "Q" on heating with H_3O^+ generates "R" The molecular formula of "R" is

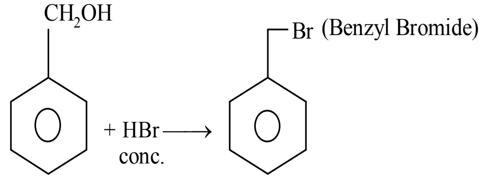
(a) $C_8H_8O_2$ (b) $C_7H_6O_2$

(c) $C_8H_9NO_2$ (d) C_8H_7N

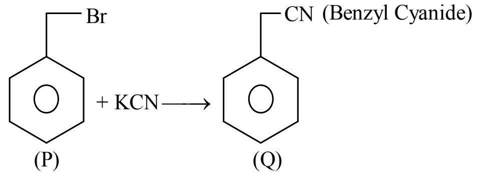
TS-EAMCET 09.08.2021, Shift-I

Ans. (a) :

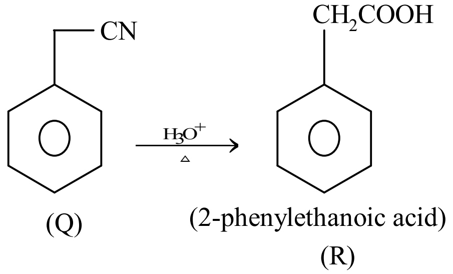
(1) $\text{Benzyl alcohol} + HBr \longrightarrow P$



(2) $\text{P(Benzyl Bromide)} + KCN \longrightarrow Q$



(3) $\text{Q(Benzyl Cyanide)} + H_3O^+ \xrightarrow[\Delta]{} R$



The molecular formula of product R is $C_8H_8O_2$.

615. Complete combustion of 750 g of an organic compound provides 420 g of CO_2 and 210 g of H_2O. The percentage composition of carbon and hydrogen in organic compound is 15.3 and _______ respectively. (Round off to the Nearest Integer).

JEE Main 16.03.2021, Shift-I

Ans. (3%) : Given, mass of H_2O = 210,

Mass of compound = 750

By Liebig method–

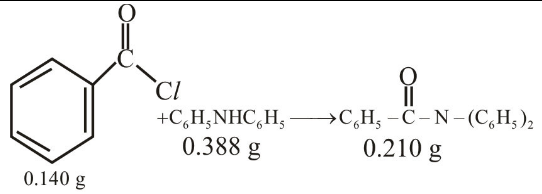
$$\%\ \text{of H-element} = \frac{2}{18} \times \frac{\text{Mass of } H_2O}{\text{Mass of compound}} \times 100$$

$$= \frac{2}{18} \times \frac{210}{750} \times 100$$

$$= \frac{1}{3} \times \frac{7}{75} \times 100$$

$$= \frac{7}{225} \times 100 = 3.11\% \approx 3\%$$

616.

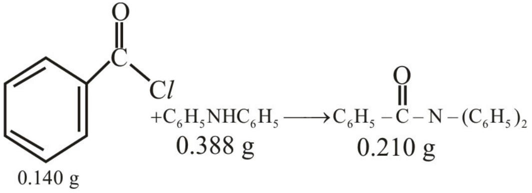


Consider the above reaction. The percentage yield of amide product is ____ (Round off to the Nearest Integer).

(Given : Atomic mass : C : 12.0 u, H: 1.0 u, N: 14.0 u, O: 16.0 u, Cl: 35.5 u

JEE Main 17.03.2021, Shift-II

Ans. (77)



@apna_pdf

Number of mole of Ph–CO–Cl $= \frac{0.140}{140} = 10^{-3}$ mol

Theoritical mass of product = $10^{-3} \times 273 = 273 \times 10^{-3}$ g

Observed mass of product= 210×10^{-3} g

$$\therefore \% \text{ yield of product} = \frac{210 \times 10^{-3}}{273 \times 10^{-3}} \times 100 = 76.9\% \approx 77\%$$

617. Methylation of 10 g of benzene gave 9.2 g of toluene. Calculate the percentage yield of toluene .... (Nearest integer).

[JEE Main 2021, 22 July Shift-II]

Ans. (78%) : $C_6H_6 + CH_3Cl \rightarrow C_6H_5CH_3 + HCl$

10 gm of C_6H_6 $= \frac{10}{78}$ mole

Moles of methylbenzene should be obtained =

$= \frac{10}{78}$ mole

$= \left(\frac{10}{78} \times 92\right)$ gm

$$\therefore \quad \frac{A_y}{T_y} = \% \text{ yield} = \frac{9.2}{920} \times 78 \times 100 \Rightarrow 78\%$$

618. When 0.15 g of an organic compound was analysed using Carius method for estimation of bromine, 0.2397 g of AgBr was obtained. The percentage of bromine in the organic compound is .... (Nearest integer)
[Atomic mass : Silver = 108,
bromine = 80]

[JEE Main 20/08 /2021 Shift-II]
[JEE Main 16/03/2021 Shift-II]

Ans. (68%) : Given,

Mass of Bromine = 80u

Mass of AgBr = 188u

Weight of AgBr = 0.2397g

Weight of organic compound = 0.15g

$$\text{Percentage of Bromine} = \frac{\text{Molar mass of bromine}}{\text{Molar mass of AgBr}} \times \frac{\text{Weight of AgBr}}{\text{Weight of organic}} \times 100$$

$$\text{Percentage of Bromine} = \frac{80}{188} \times \frac{0.2397}{0.15} \times 100 = 68\%$$

619. .... grams of 3-hydroxy propanal (MW = 74) must be dehydrated to produce 7.8 g of acrolein (MW = 56) (C_3H_4O), if the percentage yield is 64 (Round off to the nearest integer). [Given : Atomic masses : C = 12.0 u, H = 1.0 u, O = 16.0 u]

[JEE Main 2021, 18 March Shift-I]

Ans. (16.11g) : 3-hydroxy propanol → Acrolein

$\frac{x}{74}$ mol $\qquad \frac{x}{74} \times \frac{64}{100} = \frac{7.8}{56}$

∴ Mass of acrolein–

$$\Rightarrow \quad \frac{x}{74} \times 0.64 = \frac{7.8}{56}$$

$$x = \frac{7.8 \times 74}{56 \times 0.64} = \frac{577.2}{35.84} = 16.10 = 16\text{g}$$

620. In the sulphur estimation, 0.471 g of an organic compound gave 1.44 g of barium sulphate. The percentage of sulphur in the compound is .... %
(Nearest integer)
(Atomic mass of Ba = 137 u)

[JEE Main 2021, 26 Aug Shift-II]

Ans. (42%): Given,

Mass of organic compound = 0.471 g

Mass of barium sulphate = 0.4813 g

Molecular mass of $BaSO_4$ = 137 + 32 + 64 = 233g

∵ 233 $BaSO_4$ contain → 32 g sulphur

∴ 1.44g $BaSO_4$ contain → $\frac{32}{233} \times 1.44$g sulphur

Given 0.471 g of organic compound

$$\% \text{ of S} = \frac{32 \times 1.44}{233 \times 0.471} \times 100 = 41.98\% \approx 42\%$$

621. The formula of a gaseous hydrocarbon, which requires 6 times of its own volume of O_2 for complete oxidation and produces 4 times its own volume of CO_2 is C_xH_y. The value of y is .....

[JEE Main 2021, 24 Feb Shift-II]

Ans. (8) :

$C_xH_y + 6O_24CO_2 + y/2H_2O$

Applying POAC on 'O' atoms

$6 \times 2 = 4 \times 2 + y/2 \times 1$

$y/2 = 4$

$y = 8$

622. A pure compound contains 2.4g of C, 1.2×10^{23} atoms. Its empirical formula is

(a) C_2HO (b) $C_2H_2O_2$
(c) CH_2O (d) CHO

Karnataka-CET-2021

Ans. (d) : Number of moles of C = $\frac{2.4}{12} = 0.2$

Number of moles of H = $\frac{1.2 \times 10}{6.0 \times 10} = 0.2$

Number of moles of O = 0.2 mol

Empirical formula is CHO

623. An organic compound contains 78% (by wt) carbon and remaining percentage of hydrogen. The right option for the empirical formula of this compound is [Atomic wt. of C is 12, h is 1]

(a) CH_4 (b) CH
(c) CH_2 (d) CH_3

NEET-2021

Ans. (d) :

Element	Mass %	At. weight	$\frac{\%}{\text{At. Weight}}$	Simplest ratio.
C	78	12	78/12 = 6.5	65/6.5 = 1
H	22	1	22/1 = 22	22/6.5 = 3

Empirical formula of this compound is CH_3.

@apna_pdf

624. 0.12 g of an organic compound 'X' containing phosphorus on reacting with magnesia mixture gave 0.22 g of magnesium pyrophosphate ($Mg_2P_2O_7$). The percentage of phosphorus in the compound 'X' is ....

(a) 45.30% (b) 28.70%
(c) 64.25% (d) 51.20%

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (d) : Estimation of phosphorus in organic compound is done by using magnesia mixture. It uses the working formula.

Given, w = 0.22g , W = 0.12 g

$$P\% = \frac{62}{222}\times\frac{w_1}{W}\times 100 = \frac{62}{222}\times\frac{0.22}{0.12}\times 100 = 51.20\%$$

625. In Kjeldahl's method, ammonia from 5 g of food neutralizes 30 cm^3 of 0.1 N acid. The percentage of nitrogen in the food is

(a) 0.84 (b) 8.4
(c) 16.8 (d) 1.68

COMEDK-2020

Ans. (a) : Given that

N = 0.1

V = 30

Percentage of nitrogen in the food is–

$$= \frac{1.4\times N\times V}{\text{Mass of given compond}}$$

$$= \frac{1.4\times 0.1\times 30}{5} = 0.84\%$$

626. If 0.2 gram of an organic compound containing carbon, hydrogen and oxygen on combustion, yielded 0.147 gram carbon dioxide and 0.12 gram water. What will be the content of oxygen in the substance?

(a) 73.29 (b) 78.45%
(c) 83.23% (d) 89.50%

[BITSAT-2020]

Ans. (a) : $\underset{0.2g}{\text{Organic compound}} + O_2 \rightarrow \underset{0.02g}{H_2O} + \underset{0.147g}{CO_2} + \text{Heat}$

$$\text{Percentage of C} = \frac{12}{44}\times\frac{\text{Mass of } CO_2}{\text{Mass of compound}}\times 100$$

$$= \frac{12}{44}\times\frac{0.147}{0.2}\times 100 \Rightarrow C = 20.04\%$$

$$\text{Percentage of H} = \frac{2}{18}\times\frac{\text{Mass of } H_2O}{\text{Mass of compound}}\times 100$$

$$= \frac{2}{18}\times\frac{0.12}{0.2}\times 100$$

$$H = 6.66\%$$

$$\text{Percentage of O} = 100-(\%C+\%H)$$

$$= 100-(20.04+6.66)$$

$$= 100-26.70$$

$$\text{Percentage of O} = 73.29\%$$

627. On electrolysis of aqueous solution of a halide of a metal 'M' by passing 1.5 ampere current for 10 minutes deposits 0.2938 g of metal. If the atomic mass of the metal is 63 gm/ mole, then what will be the formula of the metal halide?

(a) MCl_2 (b) MCl_3
(c) MCl (d) MCl_4

GUJCET-2020

Ans. (a) :

From Faraday's 1st law of electrolysis, m=Zit

$$0.2938 = \frac{63}{n\times 96500}\times 1.5\times 10\times 60$$

$$n = \frac{63\times 1.5\times 600}{96500\times 0.2938}$$

$$n = 2$$

$\therefore$ Formula = MCl_2

628. in an estimation of bromine by Carius method, 1.6 g of an organic compound gave 1.88 g of AgBr. The mass percentage of bromine in the compound is .... (Atomic mass, Ag = 108, Br = 80g mol^{-1})

[JEE Main 2020, 6 Sep Shift-I]

Ans. (50%) Given that,

Mass of organic compound = 1.6 gm

Mass of AgBr = 1.88 gm

Moles of Br = moles of AgBr = $\frac{1.88}{188} = 0.01$

Mass of Br = 0.01 × 80 = 0.80 gm

Percentage of Br = $\frac{0.80\times 100}{1.60} = 50\%$

629. The strengths of 5.6 volume hydrogen peroxide (of density 1 g/mL) in terms of mass percentage and morality (M), respectively, are (Take molar mass of hydrogen peroxide as 34 g/mol)

[JEE Main 2020, 3 Sep Shift-II]

Ans. (1.7%): Given that,

Volume strength = 5.6V

Morality = $\frac{5.6}{11.2} = 0.5$ (assuming 1 liter solution)

Mass of solution = 1000 ml × 1g/ml = 1000 g

Mass of solute = Moles × Molar mass

= 0.5 mol × 34g/mol

= 17 gm.

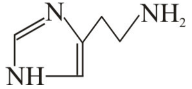
$$\therefore \quad \text{Mass }\% = \frac{\text{Mass of solute}}{\text{Mass of solution}}\times 100$$

$$= \frac{17}{1000}\times 100 = 1.7\%$$

630. The mass percentage of nitrogen in histamine is...... .

[JEE Main 2020, 9 Jan Shift-I]

Ans. (37.84): Structure of Histamine is



Molecular formula of Histamine = $C_5H_9N_3$

Molecular mass of Histamine = 111

Percentage nitrogen by mass in Histamine =

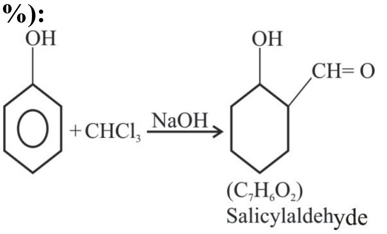
$$\frac{42}{111}\times 100 = 37.84$$

@apna_pdf

631. A solution of phenol in chloroform when treated with aqueous NaOH given compound P as a major product. The mass percentage of carbon in P is……. .
(to the nearest integer)
(Atomic mass: C=12; H=1; O=16)

[JEE Main 2020, 6 Sep Shift-II]

Ans. (69%):



Mass of Salicylaldehyde = 12 × 7 + 6 × 1 + 16 × 2
= 122

Mass of carbon = 12 × 7 = 84

$\therefore$ Mass % of C in P $= \frac{84}{122} \times 100 = 68.85\% \simeq 69\%$

632. A gas mixture contains 25% He and 75% CH_4 by volume at a given temperature and pressure. The percentage by mass of methane in the mixture is approximately –
(a) 75%
(b) 25%
(c) 92%
(d) 8%

Karnataka-CET-2020

Ans. (c): Given that,
Volume % of gas = mole % of gas [At STP]
Volume ratio = molar ratio

$$\frac{\text{Volume \% of He}}{\text{Volume \% of } CH_4} = \frac{25}{75} = \frac{1}{3}$$

Molar ratio = $\frac{1}{3}$

1 mole for (He) means

Mole = $\frac{\text{Weight}}{\text{At.weight}}$ [At. weight of (He) is 4]

$1 = \frac{\text{weight}}{4} = 4\text{g} = \text{weight of (He)}$

Then 3 mole of CH_4
Weight = 16 × 3 = 48 gm

Mass % of CH_4 = $\frac{\text{weight of } CH_4}{\text{total weight}} \times 100$

$\frac{48}{48+4} \times 100 \quad \Rightarrow \frac{48}{52} \times 100 \quad \Rightarrow 92.3\%$

Hence, the mass percentage of CH_4 = 92.3%

633. The formula of dichlorobis (urea) copper (II) is
(a) $[Cu\{O{=}C(NH_2)_2\}Cl]Cl$
(b) $[CuCl_2]\ \{O{=}C(NH_2)_2\}$
(c) $[Cu\{O{=}C(NH_2)_2\}]Cl_2$
(d) $[CuCl_2\{O{=}C(NH_2)_2\}_2]$

COMEDK-2019

Ans. (d) : The formula of dichlorobis (Urea) copper (II) is $\left[CuCl_2\{CO(NH_2)_2\}_2\right]$. The complex contains the two chloride and urea legend and shows the +2 oxidation state. This is the heteroleptic complex.

634. An organic compound is found to contain C= 54.5% , O=36.4% and H=9.1% by mass. Its empirical formula is
(a) C_2H_4O
(b) CH_2O
(c) C_3H_4O
(d) CHO_2

COMEDK-2019

Ans. (a) :
% age of carbon = 54.5%
% age of Hydrogen = 9.1%
% age of Oxygen = 100 – (54.5+9.1) = 36.4 %

Element	% age of mass	molar mass	n	ratio
O	36.4	16	$\frac{36.4}{16} = 2.27$	$\frac{2.27}{2.27} = 1$
C	54.5	12	$\frac{54.5}{12} = 4.54$	$\frac{4.54}{2.27} = 2$
H	9.1	1	$\frac{9.1}{1} = 9.1$	$\frac{9.1}{2.27} = 4$

Formula = C_2H_4O

635. The empirical formula of the compound if M = 68% (atomic mass = 34) and remaining 32% oxygen is?
(a) MO
(b) M_2O
(c) MO_2
(d) M_2O_3

AIIMS 25 May 2019 (Morning)

Ans. (a): We know that,

$$\text{No. of moles} = \frac{\text{Percentage of element}}{\text{At. mass}}$$

$$\text{No. of moles of element (M)} = \frac{68}{34} = 2$$

$$\text{No. of moles of oxygen} = \frac{100-68}{16} = 2$$

$$\text{Empirical formula of compound} = M_2O_2 = MO$$

636. An organic compound is estimated through Dumas method and was found to evolved 6 moles of CO_2, 4 moles of H_2O and 1 mole of nitrogen gas. The formula of the compound is
(a) C_6H_8N
(b) $C_{12}H_8N$
(c) $C_{12}H_8N_2$
(d) $C_6H_8N_2$

[JEE Main 2019, 11 Jan Shift-I]

Ans. (d) : $[C_x\ H_y\ N_z] \xrightarrow[\text{Method}]{\text{Duma}} 6CO_2 + 4H_2O + N_2$

$C \rightarrow 6$
$H \rightarrow 8$
$N \rightarrow 2$

Hence, $C_6H_8N_2$
$\therefore$ Molecular formula of the compound is $C_6H_8N_2$.

637. At 300 K and 1 atmospheric pressure, 10 mL of a hydrocarbon required 55 mL of O_2 for complete combustion and 40 mL of CO_2 is formed. The formula of the hydrocarbon is
(a) C_4H_7Cl
(b) C_4H_6
(c) C_4H_{10}
(d) C_4H_8

[JEE Main 2019, 10 April Shift-I]

@apna_pdf

Ans. (b) :

$$\underset{10\text{ml}}{C_xH_y(g)}+\underset{10\text{ml}\left(x+\frac{y}{4}\right)}{\left(x+\frac{y}{4}\right)O_2}\longrightarrow \underset{10x}{xCO_2(g)}+\frac{y}{2}H_2O$$

We have, formed of CO_2 = 40 mL

$$10x = 40$$

$$x = 4$$

For complete combustion required O_2 = 55 mL

$$10\left(x+\frac{y}{4}\right)=55$$

$$10\left(4+\frac{y}{4}\right)=55$$

$$10\left(\frac{16+y}{4}\right)=55$$

$$16+y=\frac{55\times 4}{10}$$

$$16 + y = 22$$

$$y = 22 - 16 = 6$$

So, the formula of hydrocarbon is = C_4H_6.

638. A 10 mg effervescent tablet containing sodium bicarbonate and oxalic acid releases 0.25 mL of CO_2 at T = 298.15 K and p = 1 bar. If molar volume of CO_2 is 25.0 L under such condition, what is the percentage of sodium bicarbonate in each tablet? [molar mass of $NaHCO_3$ = 84 g mol^{-1}]

(a) 8.4 (b) 0.84

(c) 16.8 (d) 33.6

[JEE Main 2019, 11 Jan Shift-I]

Ans. (a):

$2NaHCO_3 + H_2C_2O_4 \rightarrow 2CO_2 + Na_2C_2O_4 + 2H_2O$

Number of moles of CO_2 produced

$$n=\frac{pV}{RT}=\frac{1\,\text{bar}\times 0.25\times 10^{-3}\,\text{L}}{0.82\,\text{L atm K}^{-1}\text{mol}^{-1}\times 298.15\text{K}}$$

$$=1.02\times 10^{-5}\ \text{mol}$$

$$\text{Number of mole of NaHCO}_3=\frac{\text{Weight of NaHCO}_3}{\text{Molecular mass of NaHCO}_3}$$

$$\therefore\ W_{NaHCO_3}=1.02\times 10^{-5}\times 84\times 10^3\,\text{mg}$$

$$NaHCO_3\,\%=\frac{0.85\text{mg}}{10}=8.56\%$$

639. Which of the following is an example of Law of Multiple proportion?

(a) H_2O, H_2O_2 (b) CH_4, CO_2

(c) H_2O, CO_2 (d) SO_2, CS_2

J & K CET-(2019)

Ans. (a): According to Law of Multiple proportions when two elements combine to form more than one compound, the fixed amount of one element combining with other element have simple whole number ratio.

- H_2O and H_2O_2 here 2 part of hydrogen react with 16 and 32 part of oxygen 16 : 32 = 1:2 which is simple whole number ratio. It follows Law of Multiple proportions.
- CH_4 and CO_2 are not example of Law of Multiple proportions because elements are different.
- H_2O and CO_2 are not example of Law of Multiple proportions because elements are different.
- SO_2 and CS_2 are not example of Law of Multiple proportions because elements are different.

640. What is the percentage of carbon in urea? (Atomic mass C = 12, H = 1, N = 14, O = 16)

(a) 20% (b) 26.6%

(c) 6.67% (d) 46.0%

MHT CET-02.05.2019, SHIFT-III

Ans. (a) : Given that,

Molar mass of urea (NH_2CONH_2) = 60g

Mass % of an element

$$=\frac{\text{Mass of that element in compound}}{\text{Molar mass of the compound}}$$

$$\text{Percentage of C}=\frac{1\times 12}{60}\times 100=20\%$$

641. A compound contains 26% nitrogen and 74% oxygen. Its molecular formula will be

(a) N_2O (b) NO

(c) NO_2 (d) N_2O_5

Tripura JEE-2019

Ans. (d) : Percentage of N in compound = 26%

Percentage of O in compound = 74%

$$\text{Mass of nitrogen in 1 mole}=\frac{26}{100}\times 108\approx 28\text{g}$$

$$\text{Mass of oxygen in 1 mole}=\frac{74}{100}\times 108\approx 80\text{g}$$

$$\text{No. of moles of nitrogen}=\frac{28}{14}=2\,\text{moles}$$

$$\text{No. of moles of nitrogen}=\frac{80}{16}=5\ \text{moles}$$

So, the molecular formula is N_2O_5.

642. In the crystalline solid MSO_4. nH_2O of molar mass 250 g mol^{-1}, the percentage of anhydrous salt is 64 by weight.

The value of n is

(a) 2 (b) 3

(c) 5 (d) 7

WB-JEE-2019

Ans. (c) : MSO_4, $nH_2O \Rightarrow$ Molecular mass = 250 g or molar mass = 250 gm/mol.

We have to calculate molar mass of MSO_4, then we have to calculate the value of 'n'.

$$\frac{\text{Molar mass of MSO}_4\text{ (anhydrous salt)}}{\text{Total molar mass}}\times 100=$$

Percentage weight of anhydrous salt.

$$\frac{\text{Molar mass of MSO}_4}{250\,\text{gm. mol}^{-1}}\times 100=64$$

$$\text{Molar mass of MSO}_4=\frac{250\times 64}{100}\,\text{gm/mol}$$

$$=160\ \text{gm mol}^{-1}$$

@apna_pdf

nH_2O = Molar mass

$= (250 - 160)\ \text{gm. mol}^{-1}$

$= 90\ \text{gm. mol}^{-1}$ $\quad \because H_2O \rightarrow 2 \times 1 + 16$

$= 18\ \text{gm mol}^{-1}$

$$n = \frac{90\,\text{gm.mal}^{-1}}{18\,\text{gm.mol}^{-1}}$$

$n = 5$

643. A binary mixture of bivalent metals having mass 2 g, molecular mass of A and B are 15 and 30 respectively, is dissolved in HCl, it evolves 2.24L H_2 at STP, what is the mass of A present in mixture? (Atomic mass of A = 15μ, B = 30μ)

(a) 1 g (b) 1.5 g

(c) 0.5 g (d) 0.75 g

AIIMS-26 May, 2018 (E)

Ans. (a): For metal A let the mass of metal is x

No. of moles = x/15

$$A + 2HCl \rightarrow ACl_2 + H_2$$

one mole of metal gives one mole of H_2 gas

Mole : $\frac{x}{15}$ $\qquad \frac{x}{15}$

$$B + 2HCl \rightarrow BCl_2 + H_2$$

Mole $\frac{2-x}{30}$ $\qquad \frac{2-x}{30}$

Total moles of $H_2 = \frac{x}{15} + \frac{2-x}{30} = \frac{2.24}{22.4} = \frac{1}{10}$

$$\frac{2+x}{30} = \frac{1}{10}$$

$20 + 10x = 30$

$10 = 10x$

$x = 1g$

644. The formulas of the following compounds respectively are Bleaching powder; Quicklime; Plaster of Paris; Slaked lime

(a) $CaO, Ca(OH)_2, Ca(OCl)_2, CaSO_4\frac{1}{2}H_2O$

(b) $Ca(OCl)_2, CaO, CaSO_4\frac{1}{2}H_2O, Ca(OH)_2$

(c) $Ca(OCl)_2, Ca(OH)_2, CaSO_4\frac{1}{2}H_2O, CaO$

(d) $Ca(OH)_2, CaO, Ca(OCl)_2, CaSO_4\frac{1}{2}H_2O$

Assam CEE-2018

Ans. (b) : Bleaching powder = $Ca(OCl)_2$

Quicklime = CaO

Plaster of Paris = $CaSO_4.\frac{1}{2}H_2O$

Slaked lime = $Ca(OH)_2$

So, correct answer is $Ca(OCl)_2$, CaO, $CaSO_4\frac{1}{2}H_2O$, $Ca(OH)_2$.

645. The ratio of mass per cent of C and H of an organic compound ($C_xH_yO_z$) is 6 : 1. If one molecule of the above compound ($C_xH_yO_z$) contains half as much oxygen as required to burn one molecule of compound C_xH_y completely to CO_2 and H_2O. The empirical formula of compound $C_xH_yO_z$ is

(a) $C_3H_6O_3$ (b) C_2H_4O

(c) $C_3H_4O_2$ (d) $C_2H_4O_3$

[JEE Main 2018]

Ans. (d):

Element	Relative mass	Relative mole	Simplest no.ratio
C	6	$\frac{6}{12} = 0.5$	1
H	1	$\frac{1}{1} = 1$	1

So, $\quad x = 1, y = 2$

Now, $\quad C_xH_y + \left(x + \frac{y}{4}\right)O_2 \rightarrow xCO_2 + \frac{y}{2}H_2O$

O_2 atoms required $= 2\left(x + \frac{y}{4}\right)$

According to question–

$$2\left(x + \frac{y}{4}\right) = 2z$$

$$\left(1 + \frac{2}{4}\right) = z \qquad (\because x = 1, y = 2)$$

$z = 1.5$

Molecule can be written as–

$$C_xH_yO_z = C_1H_2O_{3/2} = C_2H_4O_3$$

646. What will be the percentage of dimerization of 61 g of benzoic acid in 1000 g of a solvent and producing a depression in freezing point of 2 °C? Consider K_f to be 6.

(a) 72% (b) 67%

(c) 43% (d) 28%

J & K CET-(2018)

Ans. (b): Given,

$W_{\text{benzoic acid}} = 61g;$

$W_{\text{solvent}} = 1000g$

$\Delta T_f = 2°C; K_f = 6$

We know that-

$$\Delta T_f = i K_f m$$

$$m = \frac{61/122}{1000} \times 1000 = 0.5;$$

$$i = \frac{\Delta T_f}{k_{f_m}} = \frac{2}{6 \times 0.5} = 0.67$$

Now from the equation

$$\alpha = \frac{1-i}{1-1/n} \qquad [\therefore n = 2\,\text{for benzoic acid}]$$

$$\alpha = \frac{1-0.67}{1-0.5} = 0.66 = 66\%$$

@apna_pdf

647. A compound, containing only carbon, hydrogen and oxygen has a molecular weight of 44. On complete oxidation, it is converted into a compound of molecular weight is 60.
The original compound is

(a) Alcohol	(b) Acid
(c) Aldehyde	(d) Ether

JIPMER-2018, MPPET-2013

Ans. (c) : As the compound is containing (C, H, O) the expected compound is an aldehyde, alcohol or ether.
On complete oxidation the obtained compound shows increment in molecular weight of only 16. It means only one oxygen atom is added here. This condition is fulfilled by only aldehyde which on oxidation gives acid.

$$RCHO \xrightarrow{[O]} RCOOH$$

Hence, original compound will be aldehyde

$$\underset{\text{mol. wt. 44}}{CH_3CHO} \xrightarrow{[O]} \underset{\text{mol. wt. 60}}{CH_3COOH}$$

648. If a mixture of FeO and Fe_3O_4 contains 75% Fe, what will be the percentage amount of each oxide in the mixture?
(a) 64.10% FeO and 35.90% Fe_2O_3
(b) 50% FeO and 50% Fe_2O_3
(c) 75% FeO and 25% Fe_2O_4
(d) 35.90% FeO and 64.10% Fe_2O_3

UPTU/UPSEE-2018

Ans. (a) : The percentage of Fe in FeO

$$= \frac{\text{Atomic weight of Fe}}{\text{Formula weight of FeO}} \times 100$$

$$= \frac{56}{72} \times 100 = 77.78\%$$

The percentage of Fe in Fe_2O_3

$$= \frac{(\text{Atomic weight of Fe}) \times 2}{\text{Formula weight of } Fe_2O_3} \times 100$$

$$= \frac{112}{160} \times 100 = 70.00\%$$

Suppose, 'x' g of FeO (in total) and 'y' g of Fe_2O_3 form the mixture that contains 75% Fe.
77.78% of x + 70.00% y = 75.00 of x + 75.00% of y
(77.78 – 75.00%) of x = (75.00 – 70.00)% of y
2.77% of x = 5.00% of y

$$\frac{x}{y} = \frac{5.00}{2.78}\% = \frac{500}{278} = \frac{250}{139}$$

$\Rightarrow$ x : y = 250 : 139
Now percent amount of FeO in mixture (x)

$$= \frac{250}{(250+139)} \times 100 = \frac{25000}{389}\% = 64.3\%$$

Hence, percent amount of Fe_2O_3 in mixture (y)
= (100 – 64.3)% = 35.7%

649. A metal M (specific heat 0.16) forms a metal chloride with 65% chlorine present in it. The formula of the metal chloride will be

(a) MCl	(b) MCl_2
(c) MCl_3	(d) MCl_4

WB-JEE-2018

Ans. (b): Given, specific heat = 0.16
According to Dulong Petit's law
Let MCl_x be the metal chloride.

$$\frac{6.4}{\text{Specific heat}} = \text{Atomic weight of metal}$$

$$\frac{6.4}{0.16} = \text{Atomic weight of metal}$$

Atomic weight = 40
40 is the atomic weight of Calcium, According to question, metal chloride (MCl_x) have ≈ 65% chlorine present in it.

$$\frac{x \times \text{Atomic weight of Chlorine}}{(40+x) \times \text{Atomic weight of Chlorine}} \times 100 = 65$$

$$\frac{x \times 35.5}{40 + x \times 355} \times 100 = 65$$

x = 2 (approx)
So, the formula of metal chloride will be MCl_2.

650. Two oxides of an non-metal X contain 50% and 40% of non-metal respectively. If the formula of the first oxide is XO_2, Then the formula of second oxide is

(a) X_2O_3	(b) X_2O_5
(c) XO_3	(d) X_2O

AP EAMCET-2017

Ans. (c) : Given that, the formula of first oxide is XO_2
For, second oxide 40% of (X) we have 60% of oxygen.
∴ For 100% of (X) (i.e. one mole) we get

$$\therefore \text{ Moles of oxygen} = \frac{2 \times 60}{40} = 3$$

Hence the formula of second oxide is XO_3.

651. An alkane has a C/H ratio (by mass) of 5.1428. Its molecular formula is

(a) C_8H_{18}	(b) C_5H_{12}
(c) C_7H_{10}	(d) C_6H_{14}

COMEDK-2017

Ans. (d) : Given that,
Carbon and hydrogen ratio (C/H) = 5.1428.
Atomic mass of C = 12
Atomic mass of H = 1
So,

$$\text{(a) } C_8H_{18} = \frac{C}{H} = \frac{12\times8}{1\times18} = \frac{96}{18} = 5.33$$

$$\text{(b) } C_5H_{12} = \frac{C}{H} = \frac{12\times5}{1\times12} = \frac{60}{12} = 5$$

$$\text{(c) } C_7H_{10} = \frac{C}{H} = \frac{12\times7}{1\times10} = \frac{84}{10} = 8.4$$

$$\text{(d) } C_6H_{14} = \frac{C}{H} = \frac{12\times6}{1\times14} = \frac{72}{14} = 5.1428$$

Thus, molecular formula of alkane having C/H ratio by mass 5.1428 is C_6H_{14}.

652. 0.0833 mole of a carbohydrate of empirical formula CH_2O contains 1.00 g of hydrogen. The molecular formula of the carbohydrate is

(a) $C_5H_{10}O_5$	(b) $C_3H_4O_3$
(c) $C_{12}H_{22}O_{11}$	(d) $C_6H_{12}O_6$

CG PET -2017

@apna_pdf

Ans. (d): Given, Empirical formula = CH_2O
Mole ratio of C, H and O = 1:2:1
Also 0.0833 moles contains 1g of hydrogen
$\therefore$ 0.0833 × n=1g of hydrogen
Where n = Number of moles of hydrogen
(a) For $C_5H_{10}O_5 (n = 10)$
$\therefore \quad 0.0833 \times 10 = 0.833 \neq 1$
(b) For $C_3H_4O_3 (n = 4)$
$\therefore \quad 0.0833 \times 4 = 0.333 \neq 1$
(c) For $C_{12}H_{22}O_{11} (n = 22)$
$\therefore \quad 0.0833 \times 22 = 1.8326 \neq 1$
(d) For $C_6H_{12}O_6 (n = 12)$
$\therefore \quad 0.0833 \times 12 = 0.9996 \approx 1$
The molecular formula of the carbohydrate is $C_6H_{12}O_6$.

653. 10g of $MgCO_3$ decomposes on heating to 0.1 mole CO_2 and 4g MgO. The percent purity of $MgCO_3$ is
(a) 24% (b) 44%
(c) 54% (d) 74%
(e) 84%

Kerala-CEE-2017

Ans. (e): Mole ratio = 1 : 1 : 1
Mass ratio = 84 : 40 : 44
Since, $MgCO_3 \xrightarrow{\Delta} MgO + CO_2$
(i) 84 gm of $MgCO_3$ give MgO = 40gm
10 gm of $MgCO_3$ give MgO = $\frac{40 \times 10}{84} = 4.76$ gm
MgO obtained is less by = 4.76 × 4.0 = 0.76gm

(ii) 84 gm of $MgCO_3$ give CO_2 = 44gm
10 gm of $MgCO_3$ give CO_2 = $\frac{44 \times 10}{84} = 5.23$ gm
Thus, CO_2 obtained is less by 5.23 – 4.4 = 0.83gm
Total short = 0.76 + 0.84 = 1.59 ≅ 1.60
∵ 10 gm of $MgCO_3$ give less products by = 1.60 gm
∴ 100 gm of $MgCO_3$ give less products by = 1.600 gm
$MgCO_3$ = 100 –16 = 84%

654. A 6% solution of sucrose $C_{22}H_{22}O_{11}$ is isotonic with 3% solution of an unknown organic substance. The molecular weight of unknown organic substance will be
(a) 684 (b) 171
(c) 100 (d) 342

UPTU/UPSEE-2017

Ans. (b) : Both the solution are isotonic they have same concentration in mole/litre.
Sucrose solution concentration = 6g/100 cm^3
= 60g/litre
Molar mass of sucrose $C_{12}H_{22}O_{11}$ =342
Therefore, we got = $\frac{60}{342}$ moles/litre
For unknown substance let N be the molecular mass then concentration
= 3g/100 cm^3
= 30g/litre
= 30/N moles/litre
Comparing the both equation
$$\frac{30}{N} = \frac{60}{342}$$
$$N = \frac{30 \times 342}{60} = 171$$
N = 171.
Hence the molecular weight of unknown organic substance is 171.

655. Blister copper contains ____ percentage of copper.
(a) 2 (b) 98
(c) 50 (d) 0

SRMJEEE-2016

Ans. (b): Blister copper contains 98% of copper. Blister copper is a metallic copper which has a black blistered surface. The other percentage consists of impurities are oxygen etc.
$2\,Cu_2O + Cu_2S \rightarrow 6Cu\downarrow + SO_2$

656. In Dumas method, 0.3 g of an organic compound gave 45 mL of nitrogen at STP. The percentage of nitrogen is
(a) 16.9 (b) 18.7
(c) 23.2 (d) 29.6

BITSAT-2016
AP-EAMCET – 2016

Ans. (b) : Dumas method is a method for quantitative determination of nitrogen in the chemical substances.
We have weight of organic compound = 0.3g
And, volume (V) = 45mL
∴The volume of N_2 at STP, the percentage of nitrogen is calculated as –
$$\text{Percentage of nitrogen} = \frac{28V \times 100}{22400 \times W}$$
$$= \frac{V}{8W}$$
$$= \frac{45}{8 \times 0.3}$$
$$= 18.75$$
Hence, the required percentage of nitrogen is 18.75.

657. 1 g of an impure sample of calcium carbonate (containing no complete thermally decomposition impurities) on complete thermal decomposition gave 0.33 g of carbon dioxide gas. The percentage of impurity in this sample is (Atomic masses of C, O and Ca are respectively 12, 16 and 40 g mol^{-1})
(a) 25 (b) 20
(c) 30 (d) 33

J & K CET-(2016)

Ans. (a): Given, the amount of $CaCO_3$ = 1g
amount of CO_2 = 0.33g
$CaCO_3 \xrightarrow{\Delta} CaO + CO_2$
44g of CO_2 is obtained from 100g of $CaCO_3$
0.33 g of CO_2 is obtained from $\frac{100}{44} \times 0.33$ = 0.75 g of $CaCO_3$

@apna_pdf

percentage of impurity in the sample of $CaCO_3$ is = $100\% - \frac{0.75}{100}\%$ = 100% – 75% = 25%.

Hence, 25% of impurity present in the given sample.

658. A compound contain three elements X, Y and Z. The oxidation number. Of X, Y and Z are +3, +5 and –2 respectively. The possible formula of the compound is –

(a) X_2YZ (b) XYZ_3

(c) $X_3(YZ_4)_3$ (d) X_2Y_2Z

BCECE-2016

Ans. (c) : The sum of all oxidation values must be equal to zero.

Let, number of atoms of X, Y and Z are respectively a, b and c.

Then, (+3)a + (+5)b + (–2c) = 0 or 3a + 5b – 2c = 0

Now, putting values of a, b and c for all the given options, which will give sum equal to zero, will be our formula.

(a) For, X_2YZ

$a = 2, b = 1, c = 1$

$3a + 5b - 2c = 0 \Rightarrow 3 \times 2 + 5 - 2 = 9 \neq 0$

(b) For, XYZ_3

$a = 1, b = 1, c = 3$

$3a + 5b - 2c = 0$

$3 + 5 - 6 = 2 \neq 0$

(c) For, $X_3(YZ_4)_3$

$a = 3, b = 3, c = 12$

$3a+5b-2c = 0 \Rightarrow (3 \times 3 + 5 \times 3) - (2 \times 12) = 0$

$9 + 15 - 24 = 0$

(d) For, X_2Y_2Z

$a = 2, b = 3, c = 1$

$3a+5b-2c = 0 \Rightarrow (3 \times 2) + (5 \times 2) - (2 \times 1) = 0$

$6 + 15 - 2 = 19 \neq 0$

The possible formula of compound is $X_3(YZ_4)_3$.

659. 1.25 g of a sample of Na_2CO_3 and $NaSO_4$ is dissolved in 250 mL solution. 25 mL of this solution neutralizes 20 mL of 0.1 N H_2SO_4. The % of Na_2CO_3 in this sample is

(a) 84.8% (b) 8.48%

(c) 15.2% (d) 42.4%

BITSAT 2016

Ans. (a) : Let the amount of Na_2CO_3 present in the mixture be x g. Na_2SO_4 will not react with H_2SO_4. Then

$$\frac{x}{53} = \frac{20 \times 0.1 \times 10}{1000} \quad \therefore x = 1.06\text{g}$$

∴ Percentage of Na_2CO_3

$$= \frac{1.06 \times 100}{1.25} = 84.8\%$$

Hence, 84.8% of Na_2CO_3 present in this sample.

660. The percentage of oxygen in CH_2O is

(a) 40% (b) 6.6%

(c) 53.33% (d) 49%

JCECE - 2016

Ans. (c) : As per molecular formula

$CH_2O = 12 + 2 + 16 = 30$

Molecular mass of O = 16

$$\text{Percentage of oxygen} = \frac{16}{30} \times 100$$

$$\text{Percentage of oxygen} = 53.33\%.$$

661. An organic compound contains C = 40%, H = 13.33% and N = 46.67%. Its empirical formula is

(a) C_2H_2N (b) C_3H_7N

(c) CH_4N (d) CHN

Karnataka-CET-2016

Ans. (c) : Given, amount of C = 40%

Amount of H = 13.33%

Amount of N = 46.67%

Convert percentile to weight in grams.

Then, convert wt. in grams to moles.

$$\text{Moles of C} = \frac{40}{12} = 3.33$$

$$\text{Moles of H} = \frac{13.33}{1} = 13.33$$

$$\text{Moles of N} = \frac{46.6}{14} = 3.33$$

Now, divide each mole value by lowest value of n as;

C = 3.33/ 3.33 = 1

H = 13.33/ 3.33 = 4.00

N = 3.33/ 3.33 = 1

Hence, the required empirical formula is CH_4N

662. A gaseous compounds having carbon, hydrogen and oxygen was burnt in the presence of oxygen. After combustion, 1 volume of the gaseous compound produces 2 volumes of CO_2 and 2 volumes of steam. Determines the molecular formula of the compound, it all the volumes were measured under the same conditions of pressure and temperature.

(a) $C_2H_4O_2$ (b) $C_3H_6O_3$

(c) $C_4H_8O_2$ (d) $C_5H_{10}O_3$

Manipal-2016

Ans. (a): Let the chemical formula of the compound is $C_XH_YO_Z$

$$C_x H_y O_z + mO_2 \longrightarrow xCO_z + \frac{y}{2}H_2O(\text{steam})$$

1Vol 2 Vol 2 Vol 2 Vol

For, gaseous reactants and products that are at same temperature and pressure, the molar ratio is equal to the volume ratio.

2 moles of CO_2 have atoms of carbon and this carbon must have come from the compound.

X = 2

2 moles of steam contain 4 atoms of hydrogen and they have come from the compound.

Y = 4

Molecular formula of compound = $C_2H_4O_2$

663. The percentage of pyridine (C_5H_5N) that forms pyridinium ion (C_5H_5NH) in a 0.10 M aqueous pyridine solution (K_b for $C_5H_5N = 1.7 \times 10^{-9}$) is

(a) 0.0060% (b) 0.013%

(c) 0.77% (d) 1.6%

NEET-II 2016

@apna_pdf

Ans. (b): Given, K_b for $C_5H_5N = 1.7 \times 10^{-9}$
Pyridine solution concentration is 0.01M
Therefore, keeping the value in reaction
$C_5H_5N + H_2O \rightleftharpoons C_5H_5N^+H + OH^-$
We know that,
$K_b = C\alpha^2$

$$\alpha = \sqrt{\frac{K_b}{C}}$$

$$= \sqrt{\frac{1.7 \times 10^{-9}}{0.10}}$$

$$= \sqrt{1.7 \times 10^{-8}}$$

$= 1.30 \times 10^{-4}$
Where,
α = Constant dissociation
C = Concentration
K_b = base ionization constant
Hence, percentage of pyridine that forms pyridinium ion $= \alpha \times 100\%$
$= 1.30 \times 10^{-4} \times 100$
$= 0.013\%$
So, the percentage of pyridine is 0.013%

664. 0.222 g of iron ore was brought into solution. Fe^{3+} is reduced to Fe^{2+} with $SnCl_2$. The reduced solution required 20 ml of 0.1N $KMnO_4$ solution. The percentage of iron present in the ore is (equivalent weight of iron is 55.5)

(a) 55.5% (b) 45.0%
(c) 50.0 % (d) 40.0%

SCRA-2015

Ans. (c): Given that, V = 20 ml
Equivalent weight of iron = 55.5
∴ Number of equivalent of Fe = Number of equivalent of $KMnO_4$

$$\text{Number of equivalent of Fe} = \frac{0.1 \times 20}{1000} = 0.002 = NV/100$$

Mass of iron (pure) = 0.002 × 55.5 = 0.111gm

$$\text{Percentage of iron present in ore} = \frac{\text{Mass of pure iron}}{\text{Mass of iron ore}} \times 100$$

$$= \frac{0.111}{0.222} \times 100$$

$$= 50\%$$

Hence, 50% of iron present in ore.

665. Beryllium given a compound X with the following percentage composition : Be-6.1%, N-37.8%, Cl-48%, H-8.1%. Molecular weight of X is 148g mol^{-1} and that of Be is 9g mol^{-1}. The molecular formula of the compound is:

(a) $BeN_4Cl_2H_{12}$ (b) BeN_4ClH_6
(c) $BeN_4Cl_2H_6$ (d) BeN_4ClH_8

BCECE-2015

Ans. (a):

$$\text{Mass composition\%} = \frac{\text{Total mass of element}}{\text{Molar mass of compound}}$$

Therefore, total mass of element = Mass % of each element one by one.

For, Be

$$\text{Total mass of Be } = \frac{6.1}{100} \times 148 \simeq 9$$

Similarily,
$N \simeq 56$
$Cl \simeq 71$
$H \simeq 12$

$$\text{Now, Moles of element} = \frac{\text{Total mass of element}}{\text{Atomic mass of element}}$$

For, Be

$$\text{Moles of Be} = \frac{9}{9} = 1$$

$$N = \frac{56}{14} = 4$$

$$Cl = \frac{71}{35.5} = 2$$

$$H = \frac{12}{1} = 12$$

For calculating Molecular formula,

Atom	Atomic Weight (A)	%	%A	Simple ratio
Be	9	6.1	0.68	1
N	14	37.8	2.70	4
Cl	35.5	48.0	1.35	2
H	1	8.1	8.10	12

Thus, we can deduce the empirical formula to be $BeN_4Cl_2H_{12}$
Therefore, $BeN_4Cl_2H_{12}$ is the molecular formula.

666. The empirical formula of a compound is CH_2.One mole of this compound has a mass 42g. Its molecular formula is

(a) C_3H_6 (b) C_2H_6
(c) CH_2 (d) C_2H_2

CG PET- 2015

Ans. (a) : Given, Empirical formula of a compound is CH_2
Then the empirical weight is = 14
Molecular weight = 42gm
We know that,

$$\therefore \quad n = \frac{\text{molecular weight}}{\text{Emprical weight}} = \frac{42}{14} = 3$$

Molecular formula = (Empirical formula) n
Molecular formula = $(CH_2)_3$
$= C_3H_6$
Hence, the molecular formula of compound is C_3H_6.

667. In Carius method of estimation of halogens, 250 mg of an organic compound gave 141 mg of AgBr. The percentage of bromine in the compound is (at, mass Ag = 108, Br = 80)

(a) 24 (b) 36
(c) 48 (d) 60

JEE Main-2015

@apna_pdf

Ans. (a) : Given that,
Weight of AgBr = 141 mg
Weight of organic compound = 250 g
According to carious methods

$$\text{Percentage of Br} = \frac{\text{At. wt. of Br}}{\text{Molecular wt. of AgBr}} \times \frac{\text{Wt. of AgBr}}{\text{Wt. of organic compound}} \times 100$$

$$= \frac{80}{188} \times \frac{141}{250} \times 100$$

$$= \frac{112800}{47000}$$

$$= 24\%$$

668. The molecular formula of a commercial resin used for exchanging ions in water softening is $C_8H_7SO_3$ Na (mol. wt. = 206). What would be the maximum uptake of Ca^{2+} ions by the resin when expressed in mole per gram resin?

(a) $\frac{1}{103}$ (b) $\frac{1}{206}$

(c) $\frac{2}{309}$ (d) $\frac{1}{412}$

[JEE Main-2015]

Ans. (d) : The molecular weight of resin is 206 g/mol.

1g of resin corresponds to $\frac{1}{206}$ moles.

$C_8H_7SO_3Na + Ca^{2+} \rightarrow (C_8H_2SO_3)_2Ca + 2Na^+$
2 mole 1mole

1 mole of calcium ions will displace 2 moles of sodium ions from resin.

1 mole of resin contains 1 mole of sodium ions and can uptake upto 0.5 moles of calcium ions.

Hence, 1g of resin will uptake $\frac{1}{206} \times 0.5 = \frac{1}{412}$ moles of calcium ions.

669. The molal freezing point depression constant for benzene (C_6H_6) is 4.90 K Kg mol^{-1}. Selenium exists as a polymer of the type Se_x. When 3.26 g of selenium is dissolved in 226g of benzene, the observed freezing point is 0.112°C lower than that of pure benzene. The molecular formula of selenium is
(Atomic mass of Se = 78.8 g mol^{-1})

(a) Se_8 (b) Se_6

(c) Se_4 (d) Se_2

JIPMER-2015

Ans. (a): Given that,
Depression in freezing point (ΔT_f) = 0.112°C
Mass of Selenium (W_A) = 226 gm =0.226 kg
Mass of Selenium (W_B) = 3. 26 gm
Molar depression constant (K_f) = 4.9K kg mol
Molar mass of selenium which can be furthur calculated by the formula–

$$M_B = \frac{K_f \times W_B}{\Delta T_f \times W_A}$$

$$= \frac{4.9 \times 3.26}{0.112 \times 0.226} = 631.08 \text{g mol}^{-1}$$

And, given that atomic mass of Se_x = 78.8 g mol^{-1}

So, the value of x can be calculated as–

$$\frac{631.08}{78.8} = 8$$

Thus, molecular formula of selenium = Se_8.

670. 0.30 g of an organic compound containing C, H and oxygen on combustion yields 0.44 g of CO_2 and 0.18 g of H_2O. If one mole of compound weighs 60, then molecular formula of the compound is

(a) CH_2O (b) C_3H_8O

(c) C_4H_6O (d) $C_2H_4O_2$

Karnataka-CET-2015

Ans. (d): Given that, weight of CO_2 = 0.44g
Weight of H_2O = 0.18g

$$\% \text{ of C} = \frac{12}{44} \times \frac{\text{Weight of CO}_2 \text{ formed}}{\text{Weight of organic compound}} \times 100$$

$$= \frac{12}{44} \times \frac{0.44}{0.30} \times 100 = 40$$

$$\% \text{ of H} = \frac{2}{18} \times \frac{\text{Weight of H}_2\text{O formed}}{\text{Weight of organic compound}} \times 100$$

$$= \frac{2}{18} \times \frac{0.18}{0.30} \times 100 = 6.66$$

% of O = 100 – (% of C + % of H)
= 100 – (40 + 6.66) = 53.34

For empirical formula

Element	Mass	Relative no. of moles	ratio
C	12	$\frac{40}{12} = 3.33$	1
H	1	$\frac{6.66}{1} = 6.66$	2
O	16	$\frac{53.34}{16} = 3.33$	1

Empirical formula CH_2O
Molecular formula = n × EF

$$n = \frac{MF_{mass}}{EF_{mass}} = \frac{60}{30} = 2$$

MF is $(CH_2O)_2 = C_2H_4O_2$
Hence, molecular formula of the compound is $C_2H_4O_2$.

671. An organic compound contains 90% carbon and 10% hydrogen by mass. Its empirical formula is

(a) C_2H_4 (b) C_3H_6

(c) C_3H_8 (d) C_3H_4

(e) C_2C_6

Kerala-CEE-2015

Ans. (d): Given,
percent of carbon = 90%
percent of hydrogen = 10%

$$\therefore \text{Empirical formula} = C_{\frac{90}{12}\times100} H_{\frac{10}{1}\times100}$$

$$= C_{750}H_{1000}$$

$$= C_3H_4$$

@apna_pdf

672. In Duma's method for estimation of nitrogen, 0.25 g of an organic compound gave 40 mL of nitrogen collected at 300 K temperature and 725 mm pressure. If the aqueous tension at 300 K is 25 mm, the percentage of nitrogen in the compound is

(a) 16.76 (b) 15.76
(c) 17.36 (d) 18.20

NEET-2015, cancelled

Ans. (a): According to the question,

m = 0.25g
v_1 = 40 mL
v_2 = ?
T_1 = 300K
T_2 = 273
P_1 = 725 – 25 = 700 mm
P_2 760 mm

from combined gas law,

$$\frac{700\times 40}{300}=\frac{760\times v_2}{273}$$

v_2 = 33.52 mL

Now finding the mass of nitrogen which corresponds to 33.53 ml-

22400 mL of N_2 at STP weights = 28g

Therefore, 33.52 mL of N_2 at STP will weigh

$$=\frac{28\times 33.52}{22400}=0.0419\text{g}$$

for percentage of nitrogen.

$$\%\text{ of nitrogen}=\frac{0.419}{0.25}\times 100=16.76\%$$

673. The formula for sodium trioxalatoaluminate (III) is

(a) $Na_4[Al(C_2O_4)_3]$ (b) $Na_3[Al(C_2O_4)]_3$
(c) $Na_3[Al(C_2O_4)_3]$ (d) $Na_2[Al(C_2O_4)_3]$

COMEDK-2015

Ans. (c) : The formula for sodium trioxalatoaluminate (III) is $Na_3[Al(C_2O_4)_3]$. The aluminum shows the +3 oxidation state and this is the homoleptic complex compound.

674. An organic compound weighing 0.15g gave on Carius estimation, 0.12 g of AgBr. The percentage of Br in the compound will be close to (At. Mass of Ag = 108, Br = 80)

(a) 46% (b) 34.1%
(c) 3.41% (d) 4.6%

COMEDK-2015

Ans. (b) : The Percentage of bromine in the compound

$$=\frac{80}{188}\times\frac{\text{Mass of AgBr formed}}{\text{Mass of substance taken}}\times 100$$

$$=\frac{80}{188}\times\frac{0.12}{0.15}\times 100=34.04\%$$

675. 2 g of benzoic acid (C_6H_6COOH) is dissolved in 25 g of benzene. The observed molar mass of benzoic acid is found to be 241.98. What is the percentage association of acid if it forms dimer in solution?

(a) 85.2% (b) 89.2%
(c) 95.2% (d) 99.2%

AMU-2015

Ans. (d) : Given, $(W_A)_{\text{benzoic acid}}$ = 2g
$(W_B)_{\text{benzen}}$ = 25g
K_f = 4.9 Kg mol^{-1}
T_f = 1.62K
M_B = 241.98

Normal molecular mass of C_6H_5COOH = [12(6) + 1(5) + 12(1) + 16(2) + 1(1)]
= 122 g mol^{-1}

Observed molecular mass of C_6H_5COOH=241.98gmol^{-1}

So, Van't Hoff factor,

$$i=\frac{\text{Normal molecular mass}}{\text{Observed molecular mass}}$$

$$i=\frac{122}{241.98}=0.504 \qquad .....(i)$$

Now, $\alpha_{\text{association}}=(1-i)\dfrac{n}{n-1}$

$\Rightarrow$ $\alpha=(1-0.504)\dfrac{2}{2-1}$ [n = 2 as it forms a dimer]

α = 0.496 × 2
α = 0.992

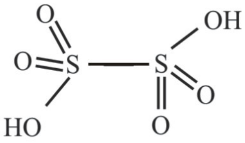
% of α = 0.992 × 100 = 99.2%

676. The molecular formula of Dithionic acid is

(a) $H_2S_2O_4$ (b) $H_2S_2O_6$
(c) $H_2S_2O_5$ (d) $H_2S_2O_7$

SRMJEEE – 2014

Ans. (b) : $H_2S_2O_6$ is Dithionic acid



Dithionic acid

677. A 5.82 g silver coin is dissolved in nitric acid. When sodium chloride is added to the solution, all the silver is precipitated as AgCl. The AgCl precipitate weighs 7.20 g. The percentage of silver in the coin is

(a) 60.3% (b) 80%
(c) 93.1% (d) 70%

AMU-2014

Ans. (c) : Fraction of Ag in AgCl $=\dfrac{107.9}{143.3}=0.753$

Weight of Ag in AgCl = 0.753 × 7.20
= 5.42 g

Hence, 5.82g coin contains 5.42 g of Ag

Now, fraction of Ag in coin $=\dfrac{5.42}{5.82}=0.931\text{g}$

% of Ag in the coin = 93.1%

678. Two oxides of a metal contain 50% and 40% metal (M) respectively. If the formula of first oxide is MO_2, the formula of second oxide will be

(a) MO_2 (b) MO_3
(c) M_2O (d) M_2O_5

Assam CEE-2014

@apna_pdf

Ans. (b) : Formula of 1st oxide is MO_2
Which contains 50% of metal.
So, remaining is O_2
Amount of metal = Amount of O_2
$= 32$ gm
When 40% of M is the second oxide
So, $0.4(MO_x) = 32$

$$(MO_x) = \frac{32}{0.4} = \frac{320}{4} = 80$$

Where, (MO_x) is the oxide–
So, mass of O = 80 – 32 = 48
$\therefore \quad x \times 16 = 48$
$x = 3$
$\therefore$ Formula is MO_3.

679. For the estimation of nitrogen 1.4 g of an organic compound was digested by Kjeldahl's method and the evolved ammonia was absorbed in 60 mL of M/10 sulphuric acid. The unreacted acid required 20 mL of M/10 sodium hydroxide for the complete neutralization. The percentage of nitrogen in the compound is

(a) 6% (b) 10%
(c) 3% (d) 5%

JEE Main 2014

Ans. (b) : Given that,
Weight of $N_2 = 1.4$ g

$$\% \text{ of N} = \frac{1.4 \times \text{meq. of acid}}{\text{Mass of organic compound}}$$

$$\text{meq. of } H_2SO_4 = 60 \times \frac{1}{10} \times 2 = 12$$

$$\text{meq. of NaOH} = 20 \times \frac{1}{10} = 2$$

$\therefore$ meq. of acid consumed = 12 – 2 = 10

$$\% \text{ of N} = \frac{1.4 \times 10}{1.4} = 10\%$$

680. The percentage of water of crystallisation of a sample of blue vitriol is

(a) 34.07% (b) 35.07%
(c) 36.07% (d) 37.07%

JCECE - 2014

Ans. (c) : Blue vitriol is $CuSO_4 \cdot 5H_2O$
Molecular weight of $CuSO_4 \cdot 5H_2O = 249.5$

$$\% \text{ of water of crystallisation} = \frac{5 \times 18}{249.5} \times 100 = 36.07\%$$

681. 10 g of a mixture of BaO and CaO requires 100 cm^3 of 2.5 M HCl to react completely. The percentage of calcium oxide in the mixture is approximately (Given: molar mass of BaO = 153)

(a) 52.6 (b) 55.1
(c) 44.9 (d) 47.4

Karnataka-CET-2014

Ans. (a) : Let mass of CaO = x g
$\therefore$ Mass of BaO = (10 – x)g

$$\because \text{ equivalent mass of BaO} = \frac{\text{Molar mass}}{2} = \frac{153}{2} = 76.5$$

$$\text{Number of moles of BaO} = \frac{10 - x}{76.5}$$

$$\text{equivalent mass of CaO} = \frac{56}{2} = 28$$

$$\text{Number of moles of CaO} = \frac{x}{28}$$

We know that,

$$\text{Molarity} = \frac{\text{moles of solute}}{\text{Volume of solution (in L)}}$$

$$2.5 = \frac{\text{moles of solute}}{\frac{100}{1000}}$$

$$\therefore \text{ Moles of solute} = \frac{2.5 \times 100}{1000}$$

$$\text{or } \frac{x}{28} + \frac{10 - x}{76.5} = 0.25$$

$76.5x + 28(10 - x) = 0.25 \times 28 \times 76.5$

$$48.5x = 255.5 = x = \frac{255.5}{48.5} = 5.26$$

$$\therefore \% \text{ of CaO} = \frac{5.26}{10} \times 100 = 52.6\%$$

Hence, 52.6% of CaO present in the mixture.

682. In the Kjeldahl's method for estimation of nitrogen present in a soil sample, ammonia evolved from 0.75 g of sample neutralized 10 mL of 1 M H_2SO_4. The percentage of nitrogen in the soil is

(a) 37.33 (b) 45.33
(c) 35.33 (d) 43.33

NEET-2014

Ans. (a): In the Kjeldahl's method, percentage of N

$$(\% \text{ N}) = \frac{1.4 \times \text{Normality of acid} \times \text{Volume of acid}}{\text{Weight of compound}}$$

$1M \ H_2SO_4 = 2N \ H_2SO_4$

$$\% \text{ N} = \frac{1.4 \times 2 \times 1}{0.75} = 37.33\%$$

It will neutralize 20M of NH_3.

683. A compound contains 38.8% C, 16% H, 42.5% N. The formula of compound will be :

(a) CH_3NH_2 (b) CH_3CN
(c) C_2H_5CN (d) $CH_2(NH_2)_2$

MPPET-2013

Ans. (a) : Given that,
Percentage of C in a compound = 38.8%
Percentage of H in a compound = 16%
Percentage of N in a compound = 42.5%

@apna_pdf

Element	%	Ratio%/ at wt.	Simple ratio
C	38.8	$\frac{38.8}{12}=3.2$	1
H	16.0	$\frac{16}{1}=16$	5
N	42.5	$\frac{42.5}{14}=3.2$	1

Hence, the formula of compound will be CNH_5 or CH_3NH_2.

684. For which of the following, both the empirical formula and molecular formula are the same?

(a) Naphthalene (b) Sucrose
(c) Glucose (d) 1-Butene

SRMJEEE-2013

Ans. (b) : Molecular formula - Indicates exact no. of all the atoms in a molecules.

Emprical formula - Indicated simplest ratio of the atoms in a molecules.

Both the empirical formula and molecular formula are same for Sucrose ($C_{12}H_{22}O_{11}$).

685. The arsenic content of an agricultural insecticide was reported as 28% As_2O_5. What is percentage of arsenic in this preparation?

(a) 16% (b) 18%
(c) 15% (d) 20%

AMU-2013

Ans. (b) :

Molar mass of $As_2O_5 = (2 \times 75) + (5 \times 16) = 230g$

230g As_2O_5 contains = 150g As

28g As_2O_5 contain = $\frac{150 \times 28}{230}$ = 18.26g As

18.26g As is present in 100g insecticide so it is 18.26% ≈ 18%

686. Analysis shows that a binary compound of X (atomic mass = 10) and Y (atomic mass = 20) contains 50% X. The formula of the compound is

(a) XY (b) X_2Y
(c) XY_2 (d) X_2Y_3

AMU-2013

Ans. (c): Assume total mass = 100g

Percentage = grams per 100 grams

We have 50g of X atomic mass 10

And, 50 g of Y atomic mass 20.

Atomic Mass of X < Atomic Mass of Y

$\boxed{Y = 2X}$ .....(i)

Empirical formula, $X = \frac{50\%}{10} = 5$

X = 5

y = 10 (from (i) eq^n.)

The formula for compound = X_5Y_{10}

$= XY_2$

687. Empirical formula of a compound is CH_2O and its molecular mass is 90, the molecular formula of the compound is

(a) $C_3H_6O_3$ (b) $C_2H_4O_2$
(c) $C_6H_{12}O_6$ (d) CH_2O

Karnataka-CET-2013

Ans. (a): Given that, Empirical formula = CH_2O

We know that,

Molecular formula = n × empirical formula

$$n = \frac{\text{molecular formula weight}}{\text{emperical formula weight}}$$

Empirical formula weight of CH_2O is 30(12 + 2 + 16)

Molecular formula weight is 90

$$n = \frac{90}{3} = 3$$

Molecular formula = 3 × CH_2O

Molecular formula is $C_3H_6O_3$

688. In an experiment it showed that 10 ml of 0.05 M solution of chloride required 10 mL of 0.1 M solution of $AgNO_3$, which of the following will be the formula of the chloride (X stands for the symbol of the element other than chlorine)?

(a) X_2CL_2 (b) XCL_2
(c) XCL_4 (d) X_2CL

Karnataka NEET-2013

Ans. (b): Given that,

Molarity of $AgNO_3$ = 0.1

Molarity = 0.05M

Volume of chloride = 10 ml

So, no. of moles of chloride

$$= \frac{10}{100} \times 0.05$$

$$= \frac{0.5}{1000}$$

& no. of moles of $AgNO_3$

$$= 0.1 \times \frac{10}{100}$$

$$= \frac{1}{1000}$$

Gram of chloride = gram equivalent of $AgNO_3$

$$\Rightarrow \frac{0.5n}{1000} = \frac{1}{1000} \quad \begin{pmatrix} \text{Where} \\ n = \text{no.of chlorides} \end{pmatrix}$$

∴ n = 2

So, formula in XCl_2

689. An organic compound contains 38.8% carbon, 16% hydrogen & 45.2% nitrogen. Its empirical formula is:

(a) CH_3CN (b) C_2H_5CN
(c) $CH_2(NH_2)_2$ (d) CH_3NH_2

MPPET - 2012

Ans. (d): For calculating in the empirical formula,

S. No.	Element	%	Atomic Wt.	Relative No. of moles	Simple ratio moles
1.	C	38.8	12	$\frac{38.8}{12}=3.23$	3.23/3.23 = 1
2.	H	16	1	$\frac{16}{1}=16.0$	16/3.23 = 5
3.	N	45.2	14	$\frac{45.2}{14}=3.23$	3.23/3.23 = 1

The Empirical Formula is– CH_5N (or) $\boxed{CH_3NH_2}$

@apna_pdf

690. In a hydrocarbon, mass ratio of hydrogen and carbon is 1:3, the empirical formula of hydrocarbon is

(a) CH_4 (b) CH_2

(c) C_2H (d) CH_3

AIIMS-2012

Ans. (a): Given, $\frac{C}{H}=\frac{1}{3}$

Atomic mass of H = 1

Atomic mass of C = 12

According to the option

In,

$$CH_2 \rightarrow \frac{C}{H}=\frac{2}{12}=1:6$$

$$C_2H\rightarrow \frac{C}{H}=\frac{1}{24}=1:24$$

$$CH_3 \rightarrow \frac{C}{H}=\frac{3}{12}=1:4$$

$$CH_4 \rightarrow \frac{C}{H}=\frac{4}{12}=1:3$$

691. The density of a 3 M sodium thiosulphate ($Na_2S_2O_3$) solution is 1.25 g/mL. Calculate the percent by weight of sodium thiosulphate.

(a) 12.64% (b) 37.92%

(c) 0.87% (d) 63.21%

AMU-2012

Ans. (b): Given that,

Molarity of $Na_2S_2O_3$ = 3mol/L

density of 3M of sodium thiosulphate = 1.25g/ml

Moles of $Na_2S_2O_3$ = 3

Weight of $Na_2S_2O_3$ = 3 × 158 = 474g

And, volume (V) of solution = 1L = 1000 mL

m = d × v = 1.25 g/mL × 1000 mL

m = 1250 g

$$\text{\% by weight of } Na_2S_2O_3=\frac{\text{Wt.of } Na_2S_2O_3}{\text{Wt.of solution}}\times 100$$

$$=\frac{474}{1250}\times 100 = 37.92\ \%$$

692. The formula of chloral is

(a) $CHCl_3$ (b) CH_2ClCHO

(c) CCl_3CHO (d) $CHCl_2CHO$

JCECE - 2012

Ans. (c) : The formula of chloral is CCl_3CHO.

693. In the estimation of sulphur by Carius method, 0.480 g of an organic compound gives 0.699 g of barium sulphate. The percentage of sulphur in this compound is (Atomic masses Ba = 137, S = 32, O = 16)

(a) 20% (b) 15%

(c) 35% (d) 30%

(e) 40%

Kerala-CEE-2012

Ans. (a): Given that,

Amount of $BaSO_4$ = 0.699g

weight of organic compound = 0.48g

$$\text{\% of S } = \frac{32}{233}\times\frac{\text{Wt.of } BaSO_4}{\text{Wt.of organic compound}}\times 100$$

$$=\frac{32}{233}\times\frac{0.699}{0.480}\times 100$$

= 20%

Hence, 20% sulphur present in this compound

694. 0.833 mol of a carbohydrate with empirical formula CH_2O, has 10g of hydrogen. Molecular formula of carbohydrate is

(a) $C_3H_5O_3$ (b) $C_6H_{12}O_6$

(c) $C_3H_{10}O_5$ (d) $C_3H_4O_3$

UP CPMT-2012

Ans. (b): Given that,

Weight of hydrogen = 10g

Moles of carbohydrate = 0.833

weight of hydrogen = 10g

0.833 moles of carbohydrate has hydrogen = 10g

1 mole of carbohydrate has hydrogen

$$=\frac{10\times 1}{0.833}=12\text{g}$$

Given, empirical formula of carbohydrate = CH_2O

CH_2O contains hydrogen = 2 g/mole

∴ Molecular formula should contain hydrogen

$$=\frac{12\times 2}{2}=12$$

Molecular formula = $C_6H_{12}O_6$

695. 0.16g of an organic compound containing sulphur produces 0.233 g of $BaSO_4$. Percentage of sulphur in the compound is

(a) 20 (b) 80

(c) 50 (d) 10

AP-EAMCET- (Engg.)-2011

Ans. (a) : Given that, weight of $BaSO_4$ = 0.233g

weight of compound = 0.16

$$\text{percentage of sulphur} = \frac{32\times \text{weight of } BaSO_4 \times 100}{233\times \text{weight of compound}}$$

$$=\frac{32\times 0.233\times 100}{233\times 0.16}$$

$$=\frac{7.45\times 100}{37.28}$$

$$= 19.98 \approx 20$$

Hence, 20% of sulphur present in the compound.

696. The empirical formula of a non-electrolyte is CH_2O. A solution containing 3g of the compound exerts the same osmotic pressure as that of 0.05 M glucose solution. The molecular formula of the compound is

(a) CH_2O (b) $C_2H_4O_2$

(c) $C_4H_8O_4$ (d) $C_3H_6O_3$

Karnataka-CET-2011

Ans. (b) : For isotonic solution (solution with same osmotic pressure)

$$\frac{W_1}{m_1V_1}=\frac{W_2}{m_2V_2}$$

@apna_pdf

Where, W_1 = Mass of glucose = 0.05 × 180 g = 9 g

m_1 = Molecular mass of glucose = 180 g

Assuming $V_1 = V_2 = 1L$

W_2 = Mass of compound = 3 g

m_2 = ?

$$\therefore \quad \frac{9}{180} = \frac{3}{x}$$

$$x = \frac{3\times180}{9}$$

x = 60 g

Molecular formula = n × empirical formula

Empirical formula = CH_2O

Empirical formula mass = 12 + 2 + 16 = 30

$$n = \frac{\text{molecular mass}}{\text{empirical formula mass}}$$

$$= \frac{60}{30} = 2$$

Molecular formula = 2 × CH_2O = $C_2H_4O_2$

697. The percentage composition by weight of an aqueous solution of solute (molar mass 150) which boils at 373.26K(k_b=0.52) is

(a) 7
(b) 6
(c) 9
(d) 15

CG PET- 2011

Ans. (a): Given,

$\Delta T_b = (B.P)_{soln.} - (B.P)_{solvent} = 373.26 - 373 = 0.26$ K

$\Delta T_b = 0.26$,

$K_b = 0.52$

We know that,

$\Delta T_b = K_b \times m$,

$$m = \frac{\Delta T_b}{K_b} = \frac{0.26}{0.52} = 0.5$$

0.5 × 150 = 75g of solute in 1000g of the water

$$\Delta T_b = \frac{K_b \times W_2 \times 1000}{W_1 M_1}$$

$$0.26 = \frac{0.52 \times W_2 \times 1000}{1000 \times 150}$$

$W_2 = 75$

$$\text{Percentage composition} = \frac{75\times100}{1000} = 7.5\%$$

698. 1 g of silver gets distributed between 10 cm^3 molten zinc and 100 cm^3 of molten lead at 800°C. The percentage of silver still left in the lead layer is approximately

(a) 2
(b) 5
(c) 3
(d) 1

Karnataka-CET-2011

Ans. (c) : Partition coefficient

$$= \frac{\text{Conc. of Ag in molten Zn}}{\text{Conc. of Ag in molten Pb}}$$

Mass of Ag in lead at equilibrium = 1 – x

Mass of Ag in Zn at equilibrium = x

$$300 = \frac{x/10}{1-x/100} = \frac{10x}{1-x}$$

10 x = 300 – 300 x

10 x = 300 – 300 x

310 x = 300

$$x = \frac{300}{310}$$

$$x = \frac{30}{31}$$

Amount of silver in molten lead

$$= 1 - x = 1 - \frac{30}{31} = \frac{31-30}{31} = \frac{1}{31}$$

$$\Rightarrow \quad \%\text{ of silver} = \frac{1}{31}\times100 \simeq 3\%$$

699. 1.2 g of organic compound of Kjeldahlization liberates ammonia which consumes 30 cm^3 of 1 N HCl. The percentage of nitrogen in the organic compound is

(a) 30
(b) 35
(c) 46.67
(d) 20.8

Karnataka-CET-2011

Ans. (b) : Given, Organic compound (w) = 1.2g

Ammonia consumes = 30 cm^3 = 30 ml

Normality of HCl = 1 N

Percentage of nitrogen =

$$\frac{1.4 \times \text{N of acid} \times \text{Vol. used with } NH_3}{\text{Weight of organic compound}}$$

$$= \frac{1.4\times1\times30}{1.2}$$

= 35%

Hence, 35% of nitrogen present in the organic compound.

700. Two organic compounds X and Y on analysis gave the same percentage composition namely C = (12/13) × 100% and H = (1/13) × 100% However, compound X decolourises bromine water while compound Y does not. The two compounds X and Y may be respectively

(a) acetylene and ethylene
(b) acetylene and benzene
(c) ethylene and benzene
(d) toluene and benzene
(e) benzene and styrene

Kerala-CEE-2011

Ans. (b) : Given that,

percentage composition of X and Y.

$$\frac{12}{13}\times100 \text{ percent} : \frac{1}{13}\times100 \text{ percent}$$

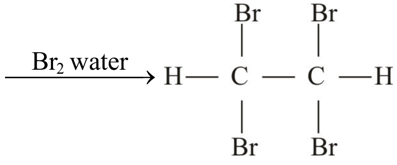
i.e. the ratio of masses of C and H in the organic compound

$$C \quad : \quad H$$

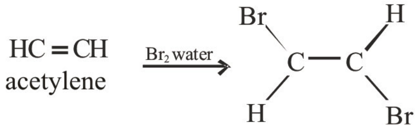
$$\frac{12}{13} \quad : \quad \frac{1}{13}$$

@apna_pdf

The empirical formula of the compound X and Y is CH and X decolorize bromine water while Y does not thus X and Y must be acetylene ($CH\equiv CH$) and benzene (C_6H_6) respectively.



1, 1, 2, 2- tetrabromoethane



trans –1, 2– dibromo ethene

701. An organic contains 49.3% carbon, 6.84% hydrogen and its vapour density is 73. Molecular formula of the compound is

(a) $C_3H_5O_2$ (b) $C_4H_{10}O_2$

(c) $C_6H_{10}O_4$ (d) $C_3H_{10}O_2$

BCECE-2010

Ans. (c): For calculating molecular formula,

Element	**%**	**Relative no.of atom**	**Simple ratio**
C	49.3	$\frac{49.3}{12}=4.10$	$\frac{4.10}{2.74}=1.5\times2=3$
H	6.84	$\frac{6.84}{1}=6.84$	$\frac{6.84}{2.74}=2.5\times2=5$
O	43.68	$\frac{43.68}{16}=2.74$	$\frac{2.74}{2.74}=1\times2=2$

∴ The empirical formula is $C_3H_5O_2$

Empirical formula weight = 12 × 3 + 1 × 5 + 16 × 2=73

Melecular weight of the compound = 2 × vapour density

= 2 × 73 = 146

$$n=\frac{\text{Molecular weight}}{\text{Empirical formula weight}}$$

$$=\frac{146}{73}=2$$

Molecular formula = Empirical formula × 2

$= 2(C_3H_5O_2) = C_6H_{10}O_4$

702. Molecular formula of Glauber's salt is

(a) $MgSO_4\cdot7H_2O$ (b) $CuSO_4\cdot5H_2O$

(c) $FeSO_4\cdot7H_2O$ (d) $Na_2SO_4\cdot10H_2O$

JCECE - 2010

Ans. (d) : Sodium sulphate decahydrate ($Na_2SO_4\cdot10H_2O$) is also known as Glauber's salt.

703. 0.765 g of an acid gives 0.535 g of CO_2 and 0.138 g of H_2O. Then, the ratio of the percentage of carbon and hydrogen is

(a) 19 : 2 (b) 18 : 11

(c) 20 : 17 (d) 1 : 7

JCECE - 2010

Ans. (a): Given, $W_{acid} = 0.765g$

$W_{CO_2} = 0.535g$ & $W_{H_2O} = 0.138g$

$$\text{Pecentage of C} = \frac{12}{44}\times\frac{\text{Mass of }CO_2}{\text{Mass of compund}}\times100$$

$$\text{Percentage of C} = \frac{12}{44}\times\frac{0.535}{0.765}\times100=19.07$$

$$\text{Percentage of H} = \frac{2}{18}\times\frac{\text{Mass of }H_2O}{\text{Mass of compund}}\times100$$

$$\text{Percentage of H} = \frac{2}{18}\times\frac{0.138}{0.765}\times100=2.004$$

Ratio of % of C : H = 19 : 2 (approx)

704. 1.5 g of $CdCl_2$ was found to contain 0.9 g of Cd. Calculate the atomic weight of Cd.

(a) 118 (b) 112

(c) 106.5 (d) 53.25

VITEEE- 2009

Ans. (c) : Mass percent of Cd in $CdCl_2$

$$=\frac{0.9}{1.5}\times100=60\%$$

∴ Mass percent of Cl_2 in $CdCl_2$

= 100 – 60 = 40%

∵40% part (Cl_2) has atomic weight

= 2 × 35.5 = 71.0

∴ 60% part (Cd) has atomic weight

$$=\frac{71.0\times60}{40}=106.5$$

Hence, the atomic weight of Cd is 106.5g.

705. In an organic compound, C =68.5% and H = 4.91%. Which empirical formula is correct for it?

(a) C_6H_{10} (b) $C_7H_6O_2$

(c) C_5H_8O (d) C_9H_3O

UP CPMT-2009

Ans. (b): For calculating Empirical formula,

Element	At.wt.	Percent composition	No.of moles	Simple molar ratio
C	12	68.5	$\frac{68.5}{12}=5.708$	$\frac{5.708}{1.67}=3.41\times2=7$
H	1	4.91	$\frac{4.91}{1}=4.91$	$\frac{4.91}{1.67}=2.95\times2=6$
O	16	$(100-68.5-4.91)$ $=26.59$	$\frac{26.59}{16}=1.67$	$\frac{1.67}{1.67}=1\times2=2$

Hence, the empirical formula of the compound is $C_7H_6O_2$.

706. The percentage (by weight) of sodium hydroxide in a 1.25 molal NaOH solution is

(a) 4.76% (b) 1.25%

(c) 5% (d) 40%

MHT CET-2009

Ans. (a): We know that,

$$\text{molality}=\frac{\text{moles of solute}}{\text{mass of solvent (kg)}}$$

$$1.25=\frac{n_A}{1\text{kg}}$$

@apna_pdf

n_A = moles of NaOH = 1 · 25 moles
weight of NaOH = moles × molar mass
$= 1\cdot 25 \times 40 = 50$ g
weight of solution = 1000 + 50 = 1050 g

$$\% \text{ (by weight) of NaOH} = \frac{50}{1050}\times 100$$
$$= 4.76\%$$

707. An organic compound made of C,H and N contains 20% nitrogen. Its molecular weight is

(a) 70
(b) 140
(c) 100
(d) 65

WB-JEE-2009

Ans. (a) : Atomic mass of nitrogen = 14

$$\% \text{ of N} = \frac{\text{Atomic mass of N}}{\text{Minimum mol mass of compund}}\times 100$$

$$20\% = \frac{14}{\text{Minimum mol mass}}\times 100$$

$$\text{Minimum mol mass} = \frac{14\times 100}{20} = 70$$

Therefore, Minimum molecular weight of the organic compound = 70.

708. A compound with molecular formula $C_4H_{10}O_3$ is converted by the action of acetyl chloride to a compound of molecular mass 190. The original compound ($C_4H_{10}O_3$) has

(a) two OH groups
(b) four OH groups
(c) one OH group
(d) three OH groups.

SRMJEEE-2008

Ans. (a) : Molecular mass of $C_4H_{10}O_3$
$= 4 \times 12 + 10 \times 1 + 3 \times 16$
$= 106$
Molecular mass of CH_3CO
$= 12 \times 2 + 3 \times 1 + 16 = 43$
Hence, the no. of – OH groups in the compound = M. mass of $C_4H_{10}O_3$ + 2 × M. mass of CH_3CO – 190
$= 106 + 2 \times 43 - 190$
$= 2$
Hence, the original compound $C_4H_{10}O_2$ has two – OH groups.

709. In a compound C, H and N are present in 9 : 1 : 3.5 by weight. If molecular weight of the compound is 108, then molecular formula of the compound is–

(a) $C_2H_6N_2$
(b) C_3H_4N
(c) $C_6H_8N_2$
(d) $C_9H_{12}N_3$

BCECE-2008

Ans. (c) : Molecular weight of compound = 108

	C	H	N
	9	1	3.5
Number of atom,	$\frac{9}{12} = 0.75$	$\frac{1}{1} = 1$	$\frac{3.5}{14} = 0.25$
simplest ratio,	$\frac{0.75}{0.25} = 3$	$\frac{1}{0.25} = 4$	$\frac{0.25}{0.25} = 1$

So, empirical formula = C_3H_4N

$$n = \frac{108}{54} = 2$$

Molecular formula = $(C_3H_4N)_2$
$= C_6H_8N_2$

710. 0.1 mole of a carbohydrate with empirical formula CH_2O contains 1 g of hydrogen. What is its molecular formula?

(a) $C_5H_{10}O_5$
(b) $C_6H_{12}O_6$
(c) $C_4H_8O_4$
(d) $C_3H_6O_3$
(e) $C_2H_4O_2$

Kerala-CEE-2008

Ans. (a): Assume molecular formula be $(CH_2O)n$
In one mol of carbohydrate, there is 2n g of hydrogen present.

∴ 0.1 mole of carbohydrate there is $\frac{2n}{1}\times 0.1$g of hydrogen which is equal to 1g

$$\frac{2n}{1}\times 0.1 = 1 \Rightarrow n = 5$$

Molecular formula = $C_5H_{10}O_5$
Hence, the required molecular formula is $C_5H_{10}O_5$

711. The percentage of an element M is 53 in its oxide of molecular formula M_2O_3. Its atomic mass is about

(a) 45
(b) 9
(c) 18
(d) 36
(e) 27

Kerala-CEE-2008

Ans. (e): Let atomic mass of M is x
Molecular weight of compound = 2x + 16 × 3
= 2x + 48

$$\% \text{ of weight of M} = \frac{2x\times 100}{2x+48} = 53 \text{ (given)}$$

Solve for x, $x \simeq 27.06$
x = 27
Hence, the atomic mass of M is 27.

712. An organic compound contains carbon, hydrogen and oxygen. Its element analysis gave C, 38.71% and H, 9.67%. The empirical formula of the compound would be

(a) CHO
(b) CH_4O
(c) CH_3O
(d) CH_2O

NEET-2008

@apna_pdf

Ans. (c): For calculating Empeirical formula,

Element	%	At. Wt.	Relative No. of atoms	Simplest ratio of atoms
C	38.71	12	3.23	3.23/3.23=1
H	9.67	1	9.67	9.67/3.23=3
O	51.62	16	3.23	3.23/3.23=1

Hence, empirical formula is CH_3O.

713. Composition of azurite mineral is

(a) $CuCO_3 \cdot CuO$

(b) $Cu(HCO_3)_2 \cdot Cu(OH)_2$

(c) $2CuCO_3 \cdot Cu(OH)_2$

(d) $CuCO_3 \cdot 2Cu(OH)_2$

WB-JEE-2008

Ans. (c) : Azurite is the ore of copper, its molecule or formula is $Cu(OH)_2.2CuCO_3$

- It is best known for its characteristic deep blue to violet blue color.

714. An unknown element forms an oxide. What will be the equivalent wt. of the element if the oxygen content is 20% by wt

(a) 16 (b) 32

(c) 8 (d) 64

WB-JEE-2008

Ans. (b): Given that,

Oxygen contents in element oxide is 20% by weight.

Element contents in element oxide is 8% by weight.

Then, equivalent weight of unknown element = $\frac{80}{20} \times 8$

∴ Equivalent weight of unknown element 32.

715. When 30 litres of H_2 and 30 litre of N_2 are reacted NH_3 is formed and the yield is only 50%. The composition of the gaseous mixture will be :

(a) 5L of N_2, 5L of H_2 and 5L of NH_3.

(b) 5L of N_2, 10L of H_2 and 10L of NH_3.

(c) 10L of N_2, 15L of H_2 and 5L of NH_3.

(d) 5L of N_2, 15L of H_2 and 10L of NH_3.

BITSAT-2007

Ans. (d) : $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$;

H_2 is the limiting reagent in this reaction. 10L N_2 will react with 30L H_2 to produce 20L of NH_3. As only 50% of the expected product is formed, hence the composition of resultant mixture will be 5L of N_2, 15L of H_2 and 10L of NH_3.

716. A compound has the empirical formula CH_2 O. Its vapour density is 30. Its molecular formula is

(a) $C_2H_4O_2$ (b) C_2H_6O

(c) $C_2H_6O_2$ (d) C_2H_4O

CG PET -2007

Ans. (a) : We know that,

Molecular mass = 2 × vapour density

Empirical formula mass (CH_2O) = 12 + 2 + 16 = 30

$\Rightarrow \quad n = \frac{\text{Molecular weight}}{\text{Empirical mass}} = \frac{60}{30} = 2$

$\Rightarrow$ Molecular formula is $(CH_2O)_2 = C_2H_4O_2$

717. An aromatic hydrocarbon with empirical formula C_5H_4 on treatment with concentrated H_2SO_4 gave a monosulphonic acid. 0.104 g of the acid required 10 mL of $\frac{N}{20}$ NaOH for complete neutralization. The molecular formula of hydrocarbon is

(a) C_5H_4 (b) $C_{10}H_8$

(c) $C_{15}H_{12}$ (d) $C_{20}H_{16}$

(e) $C_{15}H_{20}$

Kerala-CEE-2007

Ans. (b) : The equivalent of acid = Equivalent of base

Basicity of acid × number of moles of acid = acidity of the base × number of mol of the base

$\Rightarrow \quad \frac{1 \times 0.104g}{M} = 1 \times \text{normality} \times \text{volume in litre}$

$\frac{0.104}{M} = \frac{10}{1000} 1 \times \frac{1}{20} N$

M = 0.104 × 2000 = 208g/mol

Molecular mass of acid is 208g/mol

Empirical formula of mono sulphonic acid = $R–SO_3H$

Molecular mass= Molecular mass of –R + (32 + 48 + 1)

$\Rightarrow$ 208g/ mol = x × (mass empirical formula of hydrocarbon, C_5H_4) + 80g/mol

$\Rightarrow$ 208 – 80 = x × (12 × 5 +4)

$\Rightarrow$ x = 2

∴ Molecular formula of Hydrocarbon = 2 (C_5H_4)

= $C_{10}H_8$

718. 5.6 g of an organic compound on burning with excess of oxygen gave 17.6 g of CO_2 and 7.2 g of H_2O. The organic compound is :

(a) C_2H_6 (b) C_4H_8

(c) C_3H_8 (d) CH_3COOH

(e) CH_3CHO

Kerala-CEE-2006

Ans. (b) : Let the organic compound be a hydrocarbon

$$Cx\ Hy + O_2 \rightarrow xCO_2 + \frac{y}{2}H_2O$$

17.6g of CO_2 = 0.4 moles

7.2g of H_2O = 0.4 moles

From reaction x = 0.4 and $\frac{y}{2} = 0.4$

$\therefore \frac{x}{y} = \frac{1}{2}$

Hence, the organic compound is C_4H_8 is in ratio 1:2

719. In a compound C, H and N are present in 9 : 1 : 3.5 by weight. If molecular weight of the compound is 108, then the molecular formula of the compound is

(a) $C_2H_6N_2$ (b) C_3H_4N

(c) $C_6H_8N_2$ (d) $C_9H_{12}N_3$

UP CPMT-2006

@apna_pdf

Ans. (c) : Molecular weight of compound = 108

C	H	N
9	1	3.5
$\frac{9}{12}=0.75$	$\frac{1}{1}=1$	$\frac{3.5}{14}=0.25$
$\frac{0.75}{0.25}=3$	$\frac{1}{0.25}=4$	$\frac{0.25}{0.25}=1$

So, empirical formula = C_3H_4N

Molecular weight of C_3H_4N = 54

$$\Rightarrow \quad n=\frac{108}{54}=2$$

$\therefore$ Molecular formula = $(C_3H_4N)_2$
= $C_6H_8N_2$

720. Equal moles of water and urea are taken in a flask. What is mass percentage of urea in the solution?

(a) 23.077% (b) 230.77%
(c) 2.3077% (d) 0.23077%

UPTU/UPSEE-2006

Ans. (a) : If H_2O = x mol = 18x g

Then urea = x mol = 60x g

Total mass of the solution = 18x + 60x = 78x g

Mass % of urea = $\frac{18x}{78x}\times100=23.077\%$

721. 4g of hydrogen (C_xH_y) on complete combustion gave 12g of CO_2. What is the empirical formula of the hydrocarbon? (C = 12, H = 1)

(a) CH_3 (b) C_4H_9
(c) CH (d) C_3H_8

AP-EAMCET (Engg.)-2005

Ans. (d) : $C_xH_y+\left(x+\frac{y}{4}\right)O_2\rightarrow xCO_2+\frac{y}{2}H_2O$

1 mole of C_xH_y gives x moles of CO_2.

Given:- $\frac{4}{12x+y}$ mole of C_xH_y gives $\frac{12}{44}$ moles of CO_2.

$$\therefore \quad \frac{4x}{12x+y}=\frac{12}{44}$$

$$\Rightarrow \quad \frac{x}{12x+y}=\frac{3}{44}$$

$$44x = 36x + 3y$$

$$8x = 3y$$

$$\Rightarrow \quad \boxed{\frac{x}{y}=\frac{3}{8}}$$

The empirical formula of the hydrocarbon is C_3H_8.

722. Dry air is passed through a solution containing 10 g of a solute in 90 g of water and then through pure water. The loss in weight of solution is 2.5 g and that of pure solvent of 0.05 g. Calculate the molecular weight of the solute.

(a) 50 (b) 180
(c) 100 (d) 25
(e) 51

Kerala-CEE-2005

Ans. (c) :

Loss of weight of the solution = V.P of solution

Loss of weight of the solvent ∝ P^O-P_S

$$\therefore \frac{P^o-P_s}{P_s}=\frac{\text{Loss in weight of solvent}}{\text{Loss in weight of solution}}$$

$$\frac{\frac{W_2}{M_2}}{\frac{W_1}{M_1}}=\frac{W_2M_1}{W_1M_2}\Rightarrow\frac{0.05}{2.5}=\frac{\frac{10}{M_2}}{\frac{90}{18}}=\frac{2}{M_2}$$

M_2 = 100g/mol

723. The molecular formula of potash alum is

(a) $KAl_2S_4H_{48}O_{40}$ (b) $K_2Al_2S_4H_{48}O_{39}$
(c) $K_2Al_2S_4H_{48}O_{40}$ (d) $KAl_2S_4H_{48}O_{40}$

AP EAMCET- 2004

Ans. (c) : Potash alum is a double salt of potassium sulphate and aluminium sulphate.

$K_2SO_4.\ Al_2(SO_4)_3\cdot 24H_2O$ or $K_2Al_2S_4H_{48}O_{40}$.

724. Study the following table

	Compound (molecular wt.) (in g) taken	Weight of compound
I.	CO_2 (44)	4.4
II.	NO_2 (46)	2.3
III.	H_2O_2 (34)	6.8
IV.	SO_2 (64)	1.6

Which two compounds have least weight of oxygen ? (molecular weights of compounds are given in brackets)

(a) II and IV (b) I and III
(c) I and II (d) III and IV

AP-EAMCET (Engg.)-2004

Ans. (a) : (I) Mass of oxygen present in CO_2 $=\frac{4.4\times32}{44}=3.2\,g$

(II) Mass of oxygen present in NO_2 $=\frac{2.3}{46}\times32=1.6\,g$

(III) Mass of oxygen present in H_2O_2 $=\frac{6.8}{34}\times32=6.4\,g$

(IV) Mass of oxygen present in SO_2 $=\frac{1.6}{64}\times32=0.8\,g$

$\therefore$ II and IV have least mass of oxygen.

725. A compound contains 54.55% carbon, 9.09% hydrogen, 36.36% oxygen. The empirical formula of this compound is

(a) C_3H_5O (b) $C_4H_8O_2$
(c) $C_2H_4O_2$ (d) C_2H_4O

UPTU/UPSEE-2004

Ans. (d) :

Element	%comp.	moles	Ratio moles
C	54.55	$54.55/12=4.54$	$4.54/2.27\approx2$
H	9.09	$9.09/1=9.09$	$9.09/2.27\approx4$
O	36.36	$36.36/16=2.27$	$2.27/2.27=1$

C : H : O = 2 : 4 : 1

$\therefore$ Empirical formula is C_2H_4O.

@apna_pdf

726. A petroleum fraction having boiling range 70-200°C and containing 6-10 carbon atoms per molecule is called:

(a) Natural gas (b) Gas oil
(c) Gasoline (d) Kerosene

UPTU/UPSEE-2004

Ans. (c) : $(70^o - 200^oC)$ $(C_6 - C_{10})$ = Gasoline
$(200^oC - 275^oC)$ $(C_{10} - C_{16})$ = Kerosene
$(250^oC - 400^oC)$ $(C_{17} - C_{20})$ = fuel oil or gas oil
$> 400^oC$ lubricating oil.
So, a petroleum fraction having boiling range to – 200^oC and containing 6–10 carbon atoms per molecule is called gasoline.

727. 0.078 g of hydrocarbon occupy 22.144 mL off volume at STP. The empirical formula of the hydrocarbon is CH. The molecular formula of the hydrocarbon is :

(a) C_2H_2 (b) C_6H_6
(c) C_8H_8 (d) C_4H_4

AP-EAMCET (Medical), 2002

Ans. (b) : 22.414 mL of gaseous hydrocarbon at S.T.P. has mass = 0.078 g.
22414 mL of gaseous hydrocarbon at STP will have mass $= \frac{0.078}{22.4} \times 22400\text{g} = 78\text{g}$.
$\therefore$ Molar mass of hydrocarbon = 78 g mol^{-1}
Empirical formula mass of hydrocarbon (CH) = 12 + 1 = 13

$$\therefore \quad n = \frac{\text{Molecular mass}}{\text{Empirical formula Mass}} = \frac{78}{13} = 6$$

$\therefore$ Molecular formula of hydrocarbon = $(CH)_6$ = C_6H_6 (Benzene).

728. In an organic compound of molar mass 108 g mol^{-1} C, H and N atoms are present in 9 : 1 : 3.5 by weight. Molecular formula can be

(a) $C_6H_8N_2$ (b) $C_7H_{10}N$
(c) $C_5H_5N_3$ (d) $C_4H_{18}N_3$

[AIEEE-2002]

Ans. (a): Given,
Molar mass= 108g/mol.
Total part by weigh = 9+1+3.5=13.5

Weight of carbon $= \frac{9}{13.5} \times 108 = 72\text{g}$

Number of carbon atoms$= \frac{72}{12} = 6$

Weight of hydrogen $= \frac{1}{13.5} \times 108 = 8\text{g}$

Number of hydrogen atoms $= \frac{8}{1} = 8$

Weight of nitrogen $= \frac{3.5}{13.5} \times 108 = 28\text{g}$

Number of nitrogen atom$= \frac{28}{14} = 2$

The mole ratio C:H:M = 6:8:2
The molecular formula is $C_6H_8N_2$

729. A compound is 60g on analysis produce carbon, hydrogen and oxygen 24g, 4g and 32g respectively. The empirical formula is

(a) $C_2H_2O_2$ (b) $C_2H_4O_2$
(c) CH_2O (d) $C_2H_4O_6$

UP CPMT-2002

Ans. (c) :

Element	Analysis produce	% of element	Relative number
C	24	$\frac{24}{60} \times 100 = 40\%$	$\frac{40}{12} = 3.33 = 1$
H	4	$\frac{4}{60} \times 100 = 6.66\%$	$\frac{6.66}{1} = 6.66 = 2$
N	32	$\frac{32}{60} \times 100 = 53.33\%$	$\frac{53.33}{14} = 3.33 = 1$

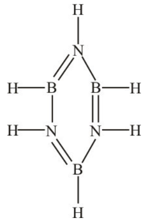
Hence, the empirical formula is CH_2O.

730. What is the molecular formula of borazole?

(a) B_2H_6 (b) $B_6N_6H_6$
(c) $B_3N_3H_6$ (d) $B_3N_3H_3$

AP EAMCET- 2001

Ans. (c) : Borazine, also known as **borazole**, is a polar inorganic compound with the chemical formula $B_3N_3H_6$.



• B_2H_6 is the molecular formula of diborane.

731. Percentage of Se in peroxidase anhydrous enzyme is 0.5% by weight (at wt. = 78.4) then minimum molecules weight of peroxidase anhydrous enzyme is

(a) 1.568×10^4 (b) 1.568×10^3
(c) 15.68 (d) 2.136×10^4

NEET-2001

Ans. (a) : Since, 0.5g Se = 100 gm peroxidase anhydrous enzyme

$$78.4\text{g Se} = \frac{100 \times 78.4}{0.5} = 1.568 \times 10^4$$

Minimum molecular mass of peroxidase anhydrous enzyme means molecule atleast contains one selenium atom.

732. What is the molecular formula of gypsum?

(a) $CaSO_4.H_2O$ (b) $CaSO_4.2H_2O$
(c) $2CaSO_4.H_2O$ (d) $CaSO_4.3H_2O$

AP EAMCET- 2000

Ans. (b) : Gypsum is a soft sulfate mineral composed of calcium sulfate dihydrate, with the chemical formula $CaSO_4.2H_2O$. The major use of Gypsum are in the cement industries.

733. What is the molecular formula of white phosphorus?

(a) P_2 (b) P_4
(c) P_5 (d) P_{16}

AP EAMCET- 2000

@apna_pdf

Ans. (b) : The molecular formula of white phosphorus is P_4. P_4 is very poisonous and explosive. It is used as reagent to prepare the phosphene gas (PH_3).

734. The empirical formula of a compound is CH_2O. Its molecular weight is 180. The molecular formula of compounds is:

(a) $C_2H_4O_2$ (b) $C_3H_6O_3$
(c) $C_6H_{12}O_6$ (d) $C_5H_{10}O_5$

AIIMS-1999

Ans. (c): Given,
Molecular formula weight = 180
Empirical formula weight of CH_2O is = 12+2+16=30
We know that,

$$n = \frac{\text{Molecular formula weight}}{\text{Emperical formula weight}} = \frac{180}{30} = 6$$

Molecular formula = $6\times CH_2O$
= $C_6H_{12}O_6$
Therefore, Molecular formula of compound is $C_6H_{12}O_6$

735. 60g of an organic compound on analysis is found to have, C=24 g, H=4 g and O=32g. The empirical formula of compound is:

(a) CH_2O (b) C_2H_4O
(c) C_2H_2O (d) $C_2H_2O_2$

AIIMS-1998

Ans. (a): Given, Organic compound = 60g
Mass of C = 24 g, mass of H = 4g , mass of O=32g
The ratio of number of gram atoms

$$C : H : O$$

$$\frac{24}{12} : \frac{4}{1} : \frac{32}{16}$$

$$2 : 4 : 2$$

The Empirical formula is = $C_2H_4O_2 = CH_2O$

736. The percentage of oxygen in NaOH is

(a) 16% (b) 4%
(c) 40% (d) 8%

AIIMS-1996

Ans. (c): Given that,
Molar mass of sodium atom = 23
Molar mass of oxygen atom = 16
Molar mass of hydrogen atom = 1
Total molar mass of NaOH = 40

$$\% \text{ composition of oxygen } = \frac{\text{Mass of oxygen}}{\text{Mass of NaOH}}\times 100$$

$$= \frac{16}{40}\times 100$$

= 40 %

737. The mole percentage of oxygen in a mixture of 7.0 g of nitrogen and 8.0 g of oxygen is

(a) 8 (b) 16
(c) 24 (d) 50

A-P EAMCET-1995

Ans. (d) : Given,
mass of O_2 = 8 gm

$$\therefore \text{ No. of moles of } O_2 = \frac{8}{32} = 0.25 \text{ mole}$$

and mass of N_2 = 7 gm

$$\text{No. of moles of } N_2 = \frac{7}{28} = 0.25$$

$$\text{Since, mole percentage of oxygen } = \frac{0.25}{0.25+0.25}\times 100$$

$$= \frac{25}{50}\times 100$$

= 50%

738. Which of the following fertilizers has the highest nitrogen percentage?

(a) Ammonium sulphate (b) Calcium cyanamide
(c) Urea (d) Ammonium nitrate

NEET-1993

Ans. (c):
(a) Mass of N in $(NH_4)_2$ SO_4 = 28 g
Mass of $(NH_4)_2$ SO_4 = 132 g

$$\% \text{ of N in } (NH_4)_2 SO_4 = \frac{28}{132}\times 100 = 21.2\%$$

(b) Mass of N in $CaCN_2$ = 28 g.
Mass of $CaCN_2$ = 80 g

$$\% \text{ of N} = \frac{28}{80}\times 100 = 35\%$$

(c) Mass of N in NH_2 $CONH_2$ = 28 g
Mass of NH_2CONH_2 = 60 g

$$\% \text{ of N} = \frac{28}{60}\times 100 = 46.6\%$$

(d) Mass of N in NH_4NO_3 = 28 g
Mass of NH_4NO_3 = 80g

$$\% \text{ of N} = \frac{28}{80}\times 100 = 35\%$$

739. An organic compound having carbon, hydrogen and sulphur contains 4% of sulphur. The minimum molecular weight of the compound is

(a) 200 (b) 400
(c) 600 (d) 800

VITEEE 2015

Ans. (d) : The minimum molecular weight must contain at least one S atom.

$$\therefore \ \% S = \frac{\text{weight of one S} - \text{atom}}{\text{minimum m. wt.}}\times 100$$

$$4 = \frac{32}{\text{minimum m. wt.}}\times 100 \qquad (\because 4\% \text{ of S})$$

$$\text{minimum m. wt.} = \frac{32\times 100}{4} = 800 \text{ g mol}^{-1}.$$

740. Caffeine has a molecular weight of 194 u. If it contains 28.9% by mass of nitrogen, number of atom of nitrogen in one molecule of caffeine is

(a) 4 (b) 6
(c) 2 (d) 3

VITEEE 2015

@apna_pdf

Ans. (a) : Given that,

Molecular weight of Caffeine = 194 amu

∵ % of N present in one molecule of caffeine is 28.9%.

$$\therefore \text{ Mass of nitrogen in } 194\text{amu} = \frac{28.9}{100} \times 194 = 56\,\text{amu}$$

$$\text{Mass of 1N atom} = 14\text{m} \quad (\because 14\text{m} = 14\,\text{u})$$

$$\therefore \text{ One molecule of caffeine} = \frac{56}{14} = 4 \text{ atoms of nitrogen}$$

6. Stoichiometry Calculation

741. An organic compound has an empirical formula CH_2O. Its vapour density is 45. The molecular formula of compound is

(a) CH_2O (b) C_2H_5O

(c) $C_2H_4O_2$ (d) $C_3H_6O_3$

A.P.EAMCET-1995, 1991

Ans. (d) : Given that,

Vapour density = 45

∴ Molecular weight = 2 × vapour density

= 2 × 45 = 90

Hence, Empirical formula weight (CH_2O)

= 12 + 2 + 16 = 30

$$\text{No. of mole (n)} = \frac{\text{Molecular weight}}{\text{Empirical weight}}$$

$$n = \frac{90}{30} = 3 \text{ mole}$$

∴ Molecular formula = n × empirical formula

= 3 × CH_2O

= $C_3H_6O_3$

742. An organic compound containing C,H and N gives the following on analysis :C=40%, H= 13.33% and N=46.67%. What would be its empirical formula?

(a) C_2H_7N (b) $C_2H_7N_2$

(c) CH_4N (d) CH_3N

CG PET- 2012, 2006

Ans. (c): C : H : N

$$\frac{40}{12} : \frac{13.33}{1} : \frac{46.67}{14} \quad \text{(dividing by wt.)}$$

= 3.33 : 13.33 : 3.33

$$= \frac{3.33}{3.33} : \frac{13.33}{3.33} : \frac{3.33}{3.33} \quad \text{(dividing by smallest quotient)}$$

= 1 : 4 : 1

∴ Empirical formula = CH_4N

743. If one atom of an element X weighs 6.643×10^{-23} g. Then find the number of moles of atoms in 50 kg of element X.

(a) 500 moles (b) 125 moles

(c) 1250 moles (d) 50 moles

AP EAPCET 23-08-2021 Shift-I

Ans. (c) : Given, atomic weight of an element

$= 6.643\times10^{-23}\ N_A$

$= 6.643\times10^{-23} \times 6.022\times10^{23}$

= 40

$$\text{No. of moles} = \frac{\text{Weight}}{\text{Molecular weight}}$$

$$= \frac{50\times1000}{40}$$

= 1250 moles.

744. In a non-stoichiometric sample of cuprous sulphide. With the composition $Cu_{1.8}S$. Cupric ions are also present in the lattice. What mole percent of Cu^{2+} is present in the copper content of the crystal?

(a) 99.99% (b) 11.11%

(c) 88.88 % (d) 18%

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (b) : Given that, Non-Stoichiometric sample of cuprous sulphide

$$Cu_{1.8}S \left\{ \begin{array}{l} 10\times2=20\ (-\text{ve})\ \text{charge} \\ 18\times1=18\ (+\text{ve})\ \text{charge} \end{array} \right.$$

$$\Rightarrow 2Cu^{2+}\text{ions} = \frac{2}{18}\times100 = \frac{1}{a}\times100$$

$$= 11.11\%$$

$$= 16\ Cu^{+}\text{ions} = \frac{16}{18}\times100$$

$$= \frac{8}{4}\times100 = 88.89\%$$

Hence, 11.11% of Cu^{2+} is present in the copper content of the crystal.

745. For the reaction: $NH_3 + OCl^- \longrightarrow N_2H_4 + Cl^-$ in basic medium, the coefficients of NH_3, OCl^- and N_2H_4 for the balanced equation are respectively

(a) 2, 2, 2 (b) 2, 2, 1

(c) 2, 1, 1 (d) 4, 4, 2

BITSAT-2021

Ans. (c) : For ammonia

$2NH_3 \rightarrow N_2H_4 + 2H^+ + 2e^-$ (Basic medium) ...(i)

For OCl^-

$OCl^- + 2H^+ + 2e^- \rightarrow Cl^- + H_2O$ ...(ii)

Adding both equation (i) and (ii)

$2NH_3 + OCl^- \rightarrow N_2H_4 + Cl^- + H_2O$

Co-efficients of NH_3, ClO^- and N_2H_4 are 2, 1 and 1.

746. A pure compound contains 2.4 g of C, 1.2×10^{-23} atoms of H, 0.2 moles of oxygen atoms. Its empirical formula is

(a) C_2HO (b) $C_2H_2O_2$

(c) CH_2O (d) CHO

Kerala-CEE-29.08.2021

Ans. (d) : Convert each element into number of moles.

$$\text{Moles of carbon} = \frac{2.4}{12} = 0.2$$

$$\text{Moles of hydrogen} = \frac{1.2\times10^{23}}{6.023\times10^{23}} = 0.199$$

Moles of oxygen = 0.2

Empirical formula is CHO.

@apna_pdf

747. **Calculate the amount of CO_2 gas produced, when 32 g moles of CH_4 is burned with sufficient amount of oxygen. (Given, atomic weights of C = 12, O = 16, H = 1)**

(a) 132 g (b) 44 g
(c) 88 g (d) 176 g

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (c) : $\underset{\substack{1\text{mol}\\16\text{g}\\32\text{g}}}{CH_4}+2O_2 \rightarrow \underset{\substack{1\text{mol}\\44\text{g}\\88\text{g}}}{CO_2}+2H_2O$

$\rightarrow$

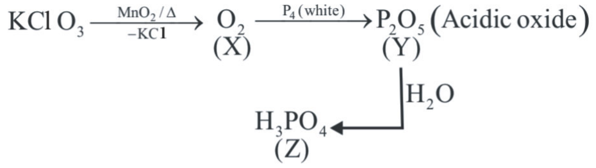
Hence, 88g CO_2 gas produced.

748. **Gas 'X' is obtained on heating $KClO_3$ with catalyst MnO_2. This gas (in excess) on reaction with white phosphorus forms as acidic oxide 'Y'. 'Y' on dissolving in water forms a compound 'Z'. Identify X, Y and Z.**

(a) O_2, P_2O_5, H_3PO_4 (b) O_3, P_2O_5, H_3PO_4
(c) O_2, P_2O_3, H_3PO_3 (d) O_2, P_2O_5, H_3PO_3

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (a) :



$$2KClO_3 \xrightarrow[\Delta]{MnO_2} 2KCl + 3O_2$$

$$P_4 + 5O_2 \rightarrow 2P_2O_5$$

$$P_2O_5 + 3H_2O \rightarrow 2H_3PO_4$$

749. **What are the fractions of Fe^{2+} and Fe^{3+} in $Fe_{0.93}O$ respectively?**

(a) 0.93, 0.07 (b) 0.85, 0.15
(c) 0.75, 0.25 (d) 0.80, 0.20

GUJCET-2020

Ans. (b) : Let Fe^{2+} = x & Fe^{3+} = (0.93 – x)
By charge conservation
$+ 2 (x) + 3(0.93 – x) – 2(1) = 0$
$–x + 0.79 = 0$
$\Rightarrow x = 0.79$

Fraction of $Fe^{2+} = \frac{0.79}{0.93} = 0.85$

Fraction of Fe^{3+} = (1 – 0.85) = 0.15

750. **Consider the following equations:**

$2Fe^{2+} + H_2O_2 \rightarrow x\,A + yB$
(in basic medium)

$2MnO_4^- + 6H^+ + 5H_2O_2 \rightarrow x'\,C + y'\,D + z'E$
(in acidic medium)

The sum of the stoichiometric coefficients x, y, x', y' and z' for products A, B, C, and E, respectively, is..........

[JEE Main 2020, 4 Sep, Shift-II]

Ans. (19) :
$2Fe^{2+} + H_2O_2 \rightarrow xA + yB \rightarrow 2Fe^{3+} + 2OH^-$
$2\,MnO_4^- + 6H^+ + 5H_2O_2 \rightarrow x'C + y'D + z'E \rightarrow 2Mn^{+2} + 5O_2 + 8H_2O$
x = 2; y = 2, x' = 2, y' = 5, z' = 8
2 + 2 + 2 + 5 + 8 = 19

751. **An organic compound contains 24% carbon, 4% hydrogen and remaining chlorine. Its empirical formula is**

(a) CHCl (b) CH_2Cl
(c) $CHCl_2$ (d) CH_2Cl
(e) CH_2Cl_2

Kerala-CEE-2020

Ans. (d) : Given C = 24%
H = 4%
Cl = 100 – (24 + 4)
= 100 – 28 = 72%

Element	%	Ratio	Simplified
C	24%	24/12	2
H	4%	4/1	4
Cl	72%	72/35.5	2.02 ≈ 2

The, empirical formula = $C_2H_4Cl_2$ or CH_2Cl

752. **The amount of calcium carbonate that reacts with 500 cc of 0.5 N hydrochloric acid is**

(a) 150 g (b) 125 g
(c) 12.5 g (d) 100g

COMEDK-2019

Ans. (c) : We know that

$$N = \frac{w \times 1000}{eq.wt \times V(in\,cc)}$$

Mass of HCl in 500 cc of 0.5 N HCl;

$$\Rightarrow w = \frac{0.5 \times 36.5 \times 500}{1000}$$

= 9.125g

The balanced equation for the reaction is

$$\underset{100g}{CaCO_3} + \underset{2\times36.5g}{2HCl} \longrightarrow CaCl_2 + H_2O + CO_2$$

2×36.5 g of HCl react with 100 g of $CaCO_3$

$\therefore$ 9.125 g of HCl will react with $\frac{100 \times 9.125}{2 \times 36.5}$ g of $CaCO_3$

=12.5 g of $CaCO_3$

753. **Pink colour of non-stoichiometric LiCl is due to**

(a) Cl^- ion in the lattice
(b) Li^+ ion in the lattice
(c) electrons in the lattice
(d) Both the ions in the lattice

CG PET -2018

Ans. (c): Metal excess defect caused due to anion vacancies is responsible for the pink colour of LiCl. When LiCl is heated, Li atoms gets deposited on the surface of the crystal. The Cl^- ions diffuse into the surface and combine with Li atoms to give LiCl. This is because of loss of electrons Li atoms to forms Li^+. The released electrons diffuse excess into crystal and occupy anionic sites. As a result, there is an excess of Li. The anionic sites occupied by unpaired electrons imparts a pink color to LiCl crystals.

754. **5 g of $CaCO_3$ completely reacts with**

(a) 36.5 g of HCl (b) 3.65 g of HCl
(c) 0.36 g of HCl (d) 7. 30 g of HCl

COMEDK-2016

@apna_pdf

Ans. (b) : The balanced equation for the reaction is:

$$\underset{100g}{CaCO_3}+\underset{2\times36.5g}{2HCl}\longrightarrow CaCl_2+CO_2+H_2O$$

From the above equation,

100 g of $CaCO_3$ reacts completely with 73 g of HCl So, 5 g of $CaCO_3$ will react with

$$\frac{73}{100}\times 5g \text{ of HCl}= 3.65 \text{ g of HCl}$$

755. The mass of oxygen gas which occupies 5.6 litres at STP would be

(a) the gram atomic mass of oxygen
(b) one-fourth of the gram atomic mass of oxygen
(c) double the gram atomic mass of oxyen
(d) half of the gram atomic mass of oxygen.

COMEDK-2015

Ans. (d) : 32 g of oxygen at STP occupies = 22.4 L

5.6 L of oxygen at STP occupies

$$=\frac{32}{22.4}\times 5.6 = 8 \text{ g of oxygen}$$

$$=\frac{1}{2}\times \text{Gram atomic mass of oxygen}$$

756. 20 mL of acetic acid reacts with 20 mL of ethyl alcohol to form ethyl acetate. The density of acid and alcohol are 1 g/mL and 0.7g/mL respectively. The limiting reagent in this reaction is

(a) acetic acid
(b) ethyl alcohol
(c) acetic acid and ethyl alcohol
(d) ester.

COMEDK-2015

Ans. (b) : Mass of 20 mL of acetic acid = 20 ×1= 20 g

Mass of 20 mL of ethyl alcohol = 20 ×0.7 = 14 g

$$\underset{60g}{CH_3COOH}+\underset{46g}{C_2H_5OH}\xrightarrow[-H_2O]{}CH_3COOC_2H_5$$

60 g of acetic acid= 46 g of ethyl alcohol

20 g of acetic acid= 15.3g of ethyl alcohol

Therefore, ethyl alcohol is the limiting reagent.

757. A gas 'X' is dissolved in water at 2 bar pressure. Its mole fraction is 0.02 in solution. The mole fraction of water when the pressure of gas is doubled at the same temperature is :

(a) 0.04 (b) 0.98
(c) 0.96 (d) 0.02

AP-EAMCET (Engg.)-2015

Ans. (c) : Given that, $P_1 = 2$ bar

$P_2 = 2 \times 2 = 4$ bar, $X_1 = 0.02$

∵ We know that

$$\frac{P_1}{P_2}=\frac{X_1}{X_2}$$

Putting the value, we get–

$$\frac{2}{4}=\frac{0.02}{X_2}$$

$X_2 = 0.04$

Therefore, In solution, $X_{solute} + X_{solvent} = 1$

$0.04 + X_{solvent} = 1$

or $X_{solvent} = 1 – 0.04 = 0.96$

758. A metal oxide has the empirical formula, $M_{0.96}O_{1.00}$. What will be the percentage of M^{2+} ions in the crystal?

(a) 90.67 (b) 91.67
(c) 8.33 (d) 9.33

AMU-2015

Ans. (b) : $M_{0.96}$ $O_{1.00}$ may contains M^{2+}, M^{3+} ions.

Amount of M^{2+} ions in crystals = x

Amount of M^{3+} ions will be = 0.96 – x

We know that negative and positive ions are equal.

∴ $2x + 3(0.96 – x) = 2$

$2x + 3 (0.96 – x) – 2 = 0$

$2x + 2.88 – 3x – 2 = 0$

$0.88 – x = 0$

⇒ $x = 0.88$

$$\% \text{ of } M^{2+} \text{ ions in the crystal} = \frac{0.88}{0.96}\times 100 = 91.67\%$$

759. If NaCl is doped with 10^{-3} mol% of $SrCl_2$, the number of cation vacancies will be

(a) 6.023×10^{18} (b) 1×10^{-3}
(c) 6×10^{12} (d) 6.023×10^{23}

CG PET- 2015

Ans. (a): 1 cation of Sr^{2+} will create 1 cation vacancy in NaCl. Therefore, the number of cation vacancy created in the lattice of NaCl is equal to the number of divalent Sr^{2+} ions added.

Concentration of cation vacancy on being doped with 10^{-3} mol% of $SrCl_2$.

$= 10^{-3}$ mol% $= 10^{-3}/100 = 10^{-5}$ mol

$= 10^{-5} \times 6.023 \times 10^{23} = 6.023 \times10^{18}$

Therefore, Number of cation vacancies = 6.023×10^{18}

760. 20.0 g of magnesium carbonate sample decomposes on heating to give carbon dioxide and 8.0 g magnesium oxide. What will be the percentage purity of magnesium carbonate in the sample?

(At. wt. of Mg = 24)

(a) 96 (b) 60
(c) 84 (d) 75

NEET-2015

Ans. (c) : $MgCO_3(s)\xrightarrow{\Delta}MgO(s)+CO_2(g)$

Molar mass of $MgCO_3$ = 24 +12 + 48 = 84g/mol

Molar mass of MgO = 24 + 16 = 40g/mol

∴ 84g of $MgCO_3$ ≡ 40g of MgO

$$\text{And } 20g \text{ of } MgCO_3 \equiv \frac{40}{84}\times 20 = 9.52 \text{ g of MgO}$$

But actual yield = 8g of MgO

$$\therefore \% \text{ purity} = \frac{8}{9.52}\times 100 = 84\%$$

@apna_pdf

761. Experimentally, it was found that a metal oxide has formula $M_{0.98}O$. Metal M, present as M^{2+} and M^{3+} in its oxide. Fraction of the metal which exists as M^{3+} would be

(a) 7.01% (b) 4.08%
(c) 6.05% (d) 5.08%

[JEE Main-2013]

Ans. (b) : Given,
Metal oxide = $M_{0.98}O$
Consider one mole of the oxide.
Moles of M = 0.98 mole of O^{2-}=1
Let
Moles of M^{3+}= x
Moles of M^{2+}= 0.98–x
On balancing charge,
(0.98–x)×2+ 3x–2=0
1.96–2x+3x–2=0
X=0.04

$$\% \text{ of } M^{3+} = \frac{0.04}{0.98}\times 100 = 4.08\%$$

762. The number of moles of electrons required to deposit 36g of Al from an aqueous solution of $Al(NO_3)_3$ is (At. wt. of Al = 27)

(a) 4 (b) 2
(c) 3 (d) 1

AP EAMCET (Engg.) - 2012

Ans. (a): Mass of Al in 1 mol of Al $(NO_3)_3$ is the 27g. For 1 mole of Al (27g), 3 mole of electrons are required to deposit 27g of Al.
As 3 mole of electrons required to deposit → 27g of Al

$$\text{So, for } 36g \rightarrow 36\times\frac{3}{27} = \frac{36}{9} = 4\,\text{moles}$$

763. 100 mL of N/5 HCI was added to 1g of pure $CaCO_3$. What would remain after the reaction?

(a) 0.5 g of $CaCO_3$
(b) Neither $CaCO_3$ nor HCl
(c) 50 mL of HCl
(d) 25 mL of HCl

COMEDK-2012

Ans. (b) : ∵ Molar Mass of $CaCO_3 = 100\,g\,mol^{-1}$

$$\therefore \text{No. of moles of } CaCO_3 = \frac{w}{M} = \frac{1}{100} = 0.01\text{ mol}$$

Now, molarity of 100 mL of N/5 HCl=$\frac{100}{1000}\times\frac{1}{5} = 0.02\,\text{mol}$

Thus, the reaction can be represented as :

$$CaCO_3 + 2HCl \longrightarrow CaCl_2 + CO_2 + H_2O$$

∵ 1 mole of $CaCO_3$ reacts with 2 moles of HCl.

Hence, 0.01 mole of $CaCO_3$ will react completely with 0.02 mole of HCl and neither $CaCO_3$ nor HCl would remained after the reaction.

764. 12 g of Mg with excess of HCl at NTP gives

(a) 11.2 dm^3 of H_2 (b) 22.4 dm^3 of H_2
(c) 5.6 dm^3 of H_2 (d) 15.6 dm^3 of H_2

COMEDK-2011

Ans. (a) : $\underset{(24g)}{Mg} + 2HCl \rightarrow MgCl_2 + \underset{(2g\,or\,22.4\,dm^3)}{H_2}$

Thus, 12 g of Mg produces = 1g or 11.2 dm^3 H_2 at NTP.

765. The reaction of calcium with water is represented by the equation:

$$Ca + 2H_2O \rightarrow Ca(OH)_2 + H_2$$

What volume of H_2 at STP would be liberated when 8 g of calcium completely reacts with water?

(a) 0.2cm^3 (b) 0.4cm^3
(c) 2240cm^3 (d) 4480cm^3

AIIMS-2010

Ans. (d): $Ca + 2H_2O \rightarrow Ca(OH)_2 + H_2$
40 gm of Ca on complete reaction with water liberates = 2 gm H_2
∴ 8 gm of Ca, on complete reaction with water will liberates = $\frac{2}{40}\times 8\,gm\ H_2 = 0.40\ gm\ H_2$
At STP, 2g of H_2 have the volume = 22.4 litre = 22400 cm^3

$$\therefore 0.40 \text{ gm of } H_2 \text{ having} = \frac{0.40}{2}\times 22400\,cm^3$$

= 4480 cm^3 of H_2 at S.T.P.

766. The vapour of a substance effuses through a small hole at the rate of 1.3 times faster than SO_2 gas at 1 atm pressure and 500 K. The molecular weight of the gas is

(a) 49.2 (b) 37.9
(c) 41.6 (d) 83.2

AP - EAMCET(Medical)-2009

Ans. (b) : Given that,
$r_1 = 1.3$ $M_1 = ?$
$r_{so_2} = 1$ $M_{so_2} = 64$
From Graham's law–

$$\frac{r_1}{r_{so_2}} = \sqrt{\frac{M_{so_2}}{M_1}}$$

$$\frac{1.3}{1} = \sqrt{\frac{64}{M_1}}$$

or $M_1 = 37.86$
or $M_1 \approx 37.9$

767. The ratio of moles of hydrogen produced when two moles of aluminium react with excess HCl and NaOH separately is

(a) 1 : 1 (b) 1 : 2
(c) 2 : 1 (d) 3 : 2

AP - EAMCET(Medical)-2009

Ans. (a) : The following reactions occurred during the process–

$$2Al + 6HCl \rightarrow 2AlCl_3 + 3H_2\uparrow$$

$$2Al + 2NaOH + 2H_2O \rightarrow 2NaAlO_2 + 3H_2\uparrow$$

∴ The ratio of moles of hydrogen = 3 : 3 = 1 : 1

768. During electrolysis of water the volume of O_2 liberated is 2.24 dm^3. The volume of hydrogen liberated, under same conditions will be

@apna_pdf

(a) 2.24 dm^3 (b) 1.12 dm^3
(c) 4.48 dm^3 (d) 0.56 dm^3

AIIMS-2008

Ans. (c) : $\underset{2\,Vol.}{2H_2O} \xrightarrow{\text{Electrolysis}} \underset{2\,Vol.}{2H_2} + \underset{1\,Vol.}{O_2}$

The volume of hydrogen liberated is twice that of the volume of oxygen liberated. When 2.24 dm^3 of oxygen is liberated the volume of hydrogen liberated will be 2 × 2.24 dm^3 or 4.48 dm^3.

769. The stoichiometry of the following reaction is $K_2S_2O_8(aq) + 2KI(aq) \rightarrow 2K_2SO_4(aq) + I_2(aq)$

(a) 2 : 2 (b) 1 : 1
(c) 1 : 2 (d) 2 : 1

J & K CET-(2008)

Ans. (c) : $K_2S_2O_8(aq) + 2KI\ (aq) \rightarrow 2K_2SO_4\ (aq) + I_2(aq)$

In the reaction one mole of $K_2S_2O_8$ reacts with 2 moles of KI, so the stoichiometry of this reaction is 1 : 2.

770. 64 g of an organic compound contains 24 g of carbon, 8 g of hydrogen and the rest oxygen. The empirical formula of the compound is

(a) CH_2O (b) C_2H_4O
(c) CH_4O (d) $C_2H_8O_2$

CG PET-2007

Ans. (c) : Mass of oxygen = 64 – 24 – 8 = 32

Element	**Mole ratio**	**Simple ratio**
C	$\frac{24}{12} = 2$	$\frac{2}{2} = 1$
H	$\frac{8}{1} = 8$	$\frac{8}{2} = 4$
O	$\frac{32}{16} = 2$	$\frac{2}{2} = 1$

Empirical formula is CH_4O.

771. What is the stoichiometric coefficient of Ca in the reaction?

$$Ca + Al^{3+} \rightarrow Ca^{2+} + Al$$

(a) 2 (b) 1
(c) 3 (d) 4

UP CPMT-2007

Ans. (c) : $Ca \rightarrow Ca^{2+} + 2e^-$ ……(i)

$Al^{3+} + 3e^- \rightarrow Al$ …...(ii)

Eq. (i) multiply by 3 and Eq. (ii) multiply by 2, and add Eqs. (i) and (ii)

$3Ca \rightarrow 3\,Ca^{2+} + 6e^-$

$2Al^{3+} + 6e^- \rightarrow 2Al$

$3Ca + 2Al^{3+} \rightarrow 3Ca^{2+} + 2Al$

Therefore, the stoichiometric coefficient of Ca in the given reaction is 3.

772. Value of x in potash alum, $K_2SO_4.Al_x\ (SO_4)_3 \cdot 24H_2O$ is

(a) 4 (b) 1
(c) 2 (d) None of these

UP CPMT-2007

Ans. (c) : Potash alum is double salt.

Given Potash alum, $K_2SO_4 \cdot Al_x(SO_4)_3 \cdot 24H_2O$ ... (1)

But formula of potash alum is

$K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$ ... (2)

After comparing both equations,

Value of x = 2

773. The number of molecules of CO_2 present in 44g of CO_2 is :

(a) 6.0×10^{23} (b) 3×10^{23}
(c) 12×10^{23} (d) 3×10^{10}

BCECE-2005

Ans. (a) : Given mass of CO_2, W = 44g

Molar mass of CO_2, M = 44g/mol

Number of moles, $n = \frac{W}{M} = \frac{44}{44} = 1$ mol

Number of molecules, N $= n \times N_A$

$= 1 \times 6.022 \times 10^{23}$

$= 6.022 \times 10^{23}$ molecule.

774. The weight of one molecule of a compound of molecular formula $C_{60}\,H_{122}$ is

(a) 1.2×10^{-20} g (b) 5.025×10^{-23} g
(c) 1.4×10^{-21} g (d) 6.023×10^{-20} g

AIIMS-2002

Ans. (c) : The molecular weight of $C_{60}H_{122}$ is 842g/mol one mole of $C_{60}H_{122}$ weight 6.02×10^{23} g.

Weight of one molecule of $C_{60}H_{122}$ is

$$\frac{842}{6.02 \times 10^{23}} = 1.4 \times 10^{-21}\,g$$

775. 3 moles of ethanol reacts with one mole of phosphorus tribromide to form 3 moles of bromo-ethane and one mole of X. Which of the following is X?

(a) H_3PO_4 (b) H_3PO_2
(c) HPO_3 (d) H_3PO_3

AP-EAMCET (Engg.)-2001

Ans. (d) : 3 moles of ethanol reacts with 1 mole of phosphorous tribromide to form 3 moles of bromoethane and 1 mole of arthophosphorus acid (H_3PO_3)

$3C_2H_5OH + PBr_3 \rightarrow 3C_2H_5Br + H_3PO_3$

776. What is the value (in litres) of CO_2 liberated at STP when 2.12 g of sodium carbonate (mol. wt. 106) is treated with excess dilute HCl?

(a) 2.28 L (b) 0.448 L
(c) 44.8 L (d) 22.4 L

AP-EAMCET-2000

Ans. (b) : The balanced chemical equation is,

$$\underset{\substack{106g \\ 2.12g}}{Na_2CO_3} + 2HCl \rightarrow 2NaCl + H_2O + \underset{\substack{22.4L \\ ?}}{CO_2}$$

∴ 106 gm Na_2CO_3 required to CO_2 is = 22.4 L

Volume of CO_2 is required to 2.12 gm of Na_2CO_3 is $= \frac{22.4}{106} \times 2.12 = 0.448$ L

Thus, 2.12g of sodium carbonate will produce 0.448L at STP CO_2.

@apna_pdf

777. The molecular weight of an organic compound is 180. Its empirical formula is CH_2O. Its molecular formula is

(a) $C_6H_{12}O_6$ (b) $C_7H_{16}O_5$
(c) $C_8H_4O_5$ (d) $C_5H_8O_7$

A.P.EAMCET-1996

Ans. (a) : Given that, the empirical formula $=CH_2O$

$\because$ Molecular weight of $CH_2O = 12 + 2 + 16 = 30$

$$\Rightarrow \text{No. of mole (n)} = \frac{180}{30} = 6\,\text{mole}$$

Hence, the molecular formula = n × empirical formula

$= 6 \times CH_2O$

$= C_6H_{12}O_6$

778. The formula of a metal chloride is MCl_3, it contains 20% of the metal. The atomic weight of the metal is approximately :

(a) 26.5 (b) 11.8
(c) 21.3 (d) 106.5

AP-EAMCET-1994

Ans. (a) : Given that 20 gm of metal in MCl_3.

$\therefore$ 80 gm of Cl combines with 20 g of metal.

$$\therefore \text{ 35.5 gm of Cl combine with } = \frac{35.5\times20}{80} = 8.875$$

$\therefore$ Equivalent weight of metal = 8.875g.

$\therefore$ Atomic weight = Eq. wt. × valency

$= 8.875\times3$

$= 26.5$ gm.

779. The number of molecules present in 3.5 g of CO at 0ºC and 760 mm pressure is :

(a) 6.02×10^{23} (b) $1.25\times6.02\times10^{23}$
(c) $0.125\times6.02\times10^{23}$ (d) $1.25\ N_A$

AP-EAMCET-1992

Ans. (c) : 28 gm CO at STP $= 6.023 \times 10^{23}$ molecules

$$\therefore \text{ 3.5 gm of CO at STP } = \frac{1}{28}\times3.5\times6.023\times10^{23}$$

$= 0.125 \times 6.02 \times 10^{23}$

7. Empirical Formula for Molecular Formula

780. Compound A contains 8.7% Hydrogen, 74% Carbone and 17.3% nitrogen. The molecular formula of the compound is,
Given : Atomic masses of C,H and N are 12, 1 and 14 amu respectively.

(a) $C_4H_6N_2$ (b) C_2H_3N
(c) C_5H_7N (d) $C_{10}H_{14}N_2$

JEE Main-28.06.2022, Shift-II

Ans. (d)

Element of compound A	Mass percentage	Atomic mass	Moles	Ratio
H	8.7	1	$\frac{8.7}{1} = 8.7$	$\frac{8.7}{1.236} = 7.03 \approx 7$
C	74	12	$\frac{74}{12} = 6.176$	$\frac{6.167}{1.236} = 4.989 \approx 5$
N	17.3	14	$\frac{17.3}{14} = 1.236$	$\frac{1.236}{1.236} = 1$

So, Empirical formula is C_5H_7N

Empirical mass $= 5 \times 12 + 7 \times 1 + 14 = 81$g

Molar mass of compound A is 162 g/mol

$$\text{Multiplying factor (n)} = \frac{162}{81} = 2$$

Molecular formula = n × Empirical formula

$= 2 \times C_5H_7N$

Hence, molecular formula $= C_{10}H_{14}N_2$

781. The elemental analysis of an organic compound gave C: 38.71%, H: 9.67% What is the empirical formula of the compound?

(a) CH_2O (b) CH_3O
(c) CH_4O (d) CHO
(e) CH_5O

Kerala CEE -03.07.2022

Ans. (b) : Given,

% of carbon = 38.71

% of hydrogen = 9.67

Then,

% of oxygen = 100 – 38.71 – 9.67

= 51.62

Element	% abundance	At. wt.	Molar ratio	simple ratio
C	38.71	12	$\frac{38.71}{12} = 3.23$	$\frac{3.23}{3.23} = 1$
H	9.67	1	$\frac{9.67}{1} = 9.67$	$\frac{9.67}{3.23} = 3$
O	100 – 38.71 + 9.67 = 51.62	16	$\frac{51.62}{16} = 3.23$	$\frac{3.23}{3.23} = 1$

So, the empirical formula of the compound $= CH_3O$

782. Consider the following reaction:

$$xAs_2S_3 + yO_2 \rightarrow zAs_2O_3 + wSO_2$$

What is y (the coefficient for O_2) when this equation is balanced using whole molecule coefficients?

(a) 5 (b) 7
(c) 9 (d) 11

NDA (II)-2014

Ans. (c) : Balance eq. of the following reaction is-

$x\ As_2S_3 + y\ O_2 \rightarrow z\ As_2O_3 + w\ SO_2$

$2\ As_2S_3 + 9\ O_2 \rightarrow 2\ As_2O_3 + 6\ SO_2$

Here,

x = 2
w = 6
y = 9
z = 2

So, the value of y after the balanced eq. is 9.

@apna_pdf

02.

Structure of Atom

1. Atomic Number, Mass Number, Atomic Species

1. **The pair, in which ions are isoelectronic with Al^{3+} is:**
   (a) Br^- and Be^{2+} (b) Cl^- and Li^+
   (c) S^{2-} and K^+ (d) O^{2-} and Mg^{2+}

JEE Main-25.06.2022, Shift-I

Ans. (d) : O^{2-}, Mg^{2+} and Al^{3+} are isoelectronic. Because all have 10 electrons.

2. **Given below are two statements: one is labelled as**
   Assertion (A) and the other is labelled as Reason (R).
   Reason (A): The ionic radii of O^{2-} and Mg^{2+} are same.
   Reason (R): Both O^{2-} and Mg^{2+} are isoelectronic species.
   In the light of the above statements, choose the correct answer form the options given below
   (a) Both (A) and (R) and true and (R) is the correct explanation of (A)
   (b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
   (c) (A) is true but (R) is false
   (d) (A) is false but (R) is true

JEE Main-27.06.2022, Shift-I

Ans. (d) : For ionic radii–

Ion	O^{2-}	Mg^{2+}
Electrons	$(8+2) = 10$	$12-2 = 10$
Atomic number (Z)	8	12

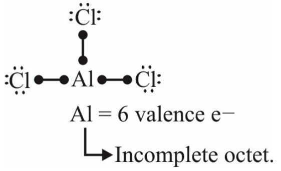
O^{2-} is greater than Mg^{2+}. O^{2-} and Mg^{2+} are isoelectronic species both have 10 electrons.

3. **Which one of the following molecules contains an incomplete octet of the central atom?**
   (a) SF_6 (b) $AlCl_3$
   (c) CH_4 (d) PF_5
   (e) H_2O

Kerala CEE -03.07.2022

Ans. (b) : As we know that octet means 8 electrons in valence shell. Here, $AlCl_3$ contains an incomplete octet atom.

		K	L	M	N
$AlCl_3 \Rightarrow {}_{13}Al$	=	2	8	3	
${}_{17}Cl$	=	2	8	7	



4. **A dinegative ion of the element X consists of 10 electrons and 8 neutrons. A dipositive ion of the element Y consists of 12 protons. The number of neutrons in Y is 1.5 times the number of electrons in atom X. Then the mass numbers of X and Y would be in the ratio**
   (a) 1 : 2 (b) 2 : 3
   (c) 3 : 2 (d) 2 : 5
   (e) 1 : 3

Kerala CEE -03.07.2022

Ans. (b) :

	Proton	Neutron	Electrons
X^{2-}	8	8	10
Y^{2+}	12	$1.5\times 8 = 12$	12

$$\frac{\text{Mass of } X^{2-}}{\text{Mass of } Y^{2+}} = \frac{(8+8)}{12+12} = \frac{16}{24}$$

$X^{2-} : Y^{2+} = 16 : 24$ Or $X^{2-} : Y^{2+} = 2 : 3$

5. **The oxide which contains an odd electron at the nitrogen atom is**
   (a) N_2O (b) NO_2
   (c) N_2O_3 (d) N_2O_5

JEE Main-26.06.2022, Shift-II

Ans. (b) :

Species	Total electron
N_2O	22
NO_2	23
N_2O_3	38
N_2O_5	54

Hence, NO_2 contain an odd electron at the nitrogen atom is 23.

6. **Which of the following is isoelectronic?**
   (a) CO_2, NO_2 (b) NO_2^-, CO_2
   (c) CN^-, CO (d) SO_2, CO_2

NEET-2002

Ans. (c) : CN^- and CO are isoelectronic because they have equal number of electrons. Therefore, in CN^- the number of electrons $\Rightarrow 6+7+1=14$

And, in CO the number of electrons $\Rightarrow 6+8=14$

7. **The cause of instability of nucleus is:**
   (a) High proton to electron ratio
   (b) High proton to neutron ratio
   (c) Low proton to electron ratio
   (d) Low proton to neutron ratio

MPPET - 2012

Ans. (d) : The cause of instability of a nucleus is due to low proton to neutron ratio. when neutron to proton ratio is less than 1, alpha emission occurs. When it is greater than 1.5, beta emission occurs.

8. **The difference between number of Neutrons and Protons is positive for :**
   (a) Hydrogen atom (b) Deuterium atom
   (c) Tritium atom (d) None of these

MPPET-2013

@apna_pdf

Ans. (c) : Isotopes	**n**	**P**	**Difference (n- P)**
Hydrogen (H)	0	1	–1
Deuterium	1	1	0
Tritium	2	1	1

Hence, the difference between number of Neutrons and Protons is positive for tritium atom.

9. One atom of $^{39}_{19}K$ contains :

(a) 19p; 20n and $19e^-$ (b) 19p; 20n and $20e^-$

(c) 20p; 19n and $20e^-$ (d) 20p; 19n and $19e^-$

AP-EAMCET/1991

Ans. (a) : In potassium (K), no. of proton (p) = 19
Number of neutron (n) = 39 – 19 = 20
Number of electron = 19

10. Which one of the following is not an isolectronic pair ?

(a) Mg^{2+}, C^{4-} (b) N^{3-}, O^{2-}

(c) N^{2-}, O^{2-} (d) F^-, Al^{3+}

AP-EAMCET-2002

Ans. (c) : Isoelectronic species have same number of electrons.

$N^{2-} = 7 + 2 = 9$

$O^{2-} = 8 + 2 = 10$

N^{2-} and O^{2-} is not an isoelectronic species.

11. Assertion (A) : Equal moles of different substances contain same number of constituent particles.

Reason (R) : Equal weights of different substances contain the same number of constituent particles.

The correct answer is :

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)

(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A)

(c) (A) is true, but (R) is false

(d) (A) is false, but (R) is true

AP-EAMCET-2007

Ans. (c) : Equal moles of different substances contain same number of constituent particles, but equal weights of different substance do not contain the same number of constituent particles.
Hence, assertion (A) is true but reason (R) is not true.

12. Match of following columns :

Column-I	**Column-II (At STP)**
(A) 10 g $CaCO_3$ $\xrightarrow[\text{Decomposition}]{\Delta}$	(1) 0.224 L CO_2
(B) 1.06 g Na_2CO_3 $\xrightarrow{\text{Excess HCl}}$	(2) 4.48 L CO_2
(C) 2.4 g C $\xrightarrow[\text{combustion}]{\text{Excess } O_2}$	(3) 0.448 L CO_2
(D) 0.56 g CO $\xrightarrow[\text{combustion}]{\text{Excess } O_2}$	(4) 2.24 L CO_2
	(5) 22.4 L CO_2

Codes :

	(A)	**(B)**	**(C)**	**(D)**
(a)	4	1	2	3
(b)	5	1	2	3
(c)	4	1	3	2
(d)	1	4	2	3

AP-EAMCET-2008

Ans. (a) : (A) $\underset{100gm}{CaCO_3} \xrightarrow[\text{Dcomposition}]{\Delta} CaO + \underset{22.4L}{CO_2}$

$\because$ 10 g $CaCO_3$ decomposition $= \dfrac{22.4 \times 10}{100}$

$= 2.24$ L CO_2

(B) $Na_2CO_3 \xrightarrow{\text{Excess HCl}} 2NaCl + H_2O + \underset{22.4L}{CO_2}$

$\therefore$ 1.06 g Na_2CO_3 $= \dfrac{22.4 \times 1.06}{106}$ L CO_2

$= 0.224$ L CO_2

(C) $\underset{12g}{C} \xrightarrow{\text{Excess } O_2} \underset{22.4L}{CO_2}$

$\therefore$ 2.4 g carbon on combustion will give,

$= \dfrac{22.4 \times 2.4}{12} = 4.48$L CO_2

(D) $\underset{56g}{2CO} \xrightarrow[\text{Combustion}]{\text{Excess } O_2} \underset{2\times22.4L}{2CO_2}$

$\therefore$ 0.56 gm Carbon monoxide $= \dfrac{2 \times 22.4 \times 0.56}{56}$

$= 0.448$ L CO_2

13. Among the following, the isoelectronic species is/are

(i) O^{2-}, F^-, Na^+, Mg^{2+} **(ii) Na^+, Mg^+, Al^{3+}, F^-**

(iii) N^{3-}, O^{2-}, F^-, Ne

(a) (i) and (ii) (b) (i), (ii) and (iii)

(c) (ii) and (iii) (d) (i) and (iii)

TS-EAMCET-2016

Ans. (d) : The isoelectronic species are elements that have the same number of electrons. O^{2-}, F^-, Na^+, Mg^{2+}, have 10 electron and N^{3-}, O^{2-}, F^- and Ne have also 10 electrons.

14. There are six electrons, six protons and six neutrons in an atom of an element. What is the atomic number of the element?

(a) 6 (b) 12

(c) 18 (d) 24

NDA (II)-2016

Ans. (a) Given, No. of electron = 6
No. of proton = 6
No. of neutron = 6
We know that,
Atomic No. = No. of Proton
Atomic No. = 6
Hence, the atomic number of element = 6.

15. What is the atomic number of the element with symbol Uus?

(a) 117 (b) 116

(c) 115 (d) 114

TS-EAMCET-2016

@apna_pdf

Ans. (a) : The atomic number of the element with symbol Uus is 117. Ununseptium (Uus) is the second heaviest known element and its electronic configuration is $_5f^{14}\ _6d^{10}\ _7s^2\ _7p^6$.

16. The sum of the total number of neutrons present in protium, deuterium and tritium is

(a) 5 (b) 3

(c) 4 (d) 6

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (b) : No. of neutrons –

Protium $\left({}^1_1H\right)=0$

Deuterium $\left({}^2_1H\right)=1$

Tritium $\left({}^3_1H\right)=2$

The sum of the total number of neutrons is

$\Rightarrow 0+1+2$

$\Rightarrow 3$

17. The number of protons, electrons and neutrons in a species are equal to 17, 18 and 18 respectively. Which of the following will be the proper symbol of this species ?

(a) ${}^{35}_{17}C\ell$ (b) ${}^{35}_{17}C\ell^-$

(c) ${}^{36}_{17}C\ell$ (d) ${}^{36}_{17}C\ell^-$

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (b) : p = 17, e = 18, n = 18 means, Z = 17 ⇒ element is chlorine, which contains one electron more (17 + 1), so it is chloride ion, $C\ell^-$.

⇒ Symbol: ${}^{35}_{17}C\ell^-$;

Mass number, A = n + p = 18 + 17 = 35

Atomic number, Z = 17

18. Which of the following has magic number of protons and neutrons?

(a) $_8O^{17}$ (b) $_{13}Al^{27}$

(c) $_9F^{17}$ (d) $_{20}Ca^{40}$

AP EAMCET (Medical) -1998

Ans. (d): Magic numbers are 2, 8, 20, 28, 50, 82 protons and 2, 8, 20, 28, 50, 82, 126 neutrons in the nucleus. These numbers impart stability to the nucleus.

(a) $_8O^{17} \longrightarrow \text{proton} = 8$

$\text{neutron} = 9$

(b) $_{13}Al^{27} \longrightarrow \text{proton} = 13$

$\text{neutron} = 14$

(c) $_9F^{17} \longrightarrow \text{proton} = 9$

$\text{neutron} = 8$

(d) $_{20}Ca^{40} \longrightarrow \text{proton} = 20$

$\text{neutron} = 20$

Thus, the calcium nucleic has the both proton and neutrons number is 20.

19. The species that has the same number of electrons as ${}^{35}_{17}Cl$ is

(a) ${}^{32}_{16}S$ (b) ${}^{34}_{16}S^+$

(c) ${}^{40}_{18}Ar^+$ (d) ${}^{35}_{16}S^{2-}$

NDA (II)-2017

Ans. (c) : Given, ${}^{35}_{17}Cl$

No. of electron in ${}^{35}_{17}Cl = 17$

No. of electron in ${}^{32}_{16}S$ = 16

No. of electron in ${}^{34}_{16}S^+$ = 16–1=15

No. of electron in ${}^{40}_{18}Ar^+$ = 18–1=17

No. of electron in ${}^{35}_{16}S^{2-} = 16+2 = 18$

Hence, ${}^{40}_{18}Ar^+$ contain same no. of electron as ${}^{35}_{17}Cl$.

20. S + Conc. $H_2SO_4 \longrightarrow$ X+Y

Here X is a gas and Y is a liquid and both are triatomic molecules. The number of electron lone pars present on the central atoms of X and Y are respectively.

(a) 2, 1 (b) 1, 0

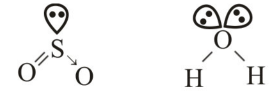
(c) 1, 2 (d) 2, 2

AP EAMCET-2017

Ans. (c) : $S + 2H_2SO_4 \longrightarrow 3SO_2 + 2H_2O$

X and Y are SO_2 and H_2O

The structure of SO_2 and H_2O



1 lone pair 2 lone pair

Hence the option (c) is correct

21. The characteristics of elements X, Y and Z with atomic numbers, respectively, 33, 53 and 83 are:

(a) X, Y and Z are metals.

(b) X and Z are non-metals and Y is a metalloid.

(c) X is a metalloid, Y is a non-metal and Z is a metal.

(d) X and Y are metalloids and Z is metal.

JEE Main 16.03.2021, Shift-II

Ans. (c) : The characteristics of elements X, Y and Z with atomic numbers respectively 33, 53 and 83 are the arsenic, iodine and bismuth. As we know the properties of that iodine, arsenic is metalloid in nature whereas Bismuth is metal.

22. Which of the following is true about sodium chloride ?

(a) Molecular mass = 58.5 amu

(b) Formula mass = 58.5 amu

(c) Molecular mass = 5.85 amu

(d) Formula mass = 5.85 amu

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (b) : Sodium chloride is an ionic crystal of rock salt structure in which 4 NaCl units are present in one unit cell of coordination number, $Na^+ : Cl^{\ominus} = 6 : 6$. So, actual molecule of sodium chloride is not NaCl, NaCl is the molecular formula of formula mass = (23 + 35.5) = 58.5 amu.

23. An alloy of metals X and Y weighs 12g & contains atoms X and Y is the ratio of 2: 5 The percentage of Metal X in the alloy is 20 by mass. If the atomic mass of X is 40. What is the atomic mass of metal Y.

@apna_pdf

(a) 64 amu (b) 32 amu
(c) 60 amu (d) 50 amu

AP EAPCET 20.08.2021 Shift-I

Ans. (a): Mass of metal X in alloy $=\frac{12}{100}\times 20 = 2.40\text{g}$

Mass of metal Y in alloy =12–2.4=9.6g

No. of atoms of X = $\frac{2.4}{40}\times 6.02\times 10^{23}$

Ratio of atoms of X and Y = 2:5

No of atoms of Y = $\frac{2.4\times 6.02\times 10^{23}}{40}\times\frac{5}{2}$

$= 9.03\times 10^{22}$ atom

Now, $9,03\times 10^{22}$ atoms of Y are present in 9.6 g

∴ 6.02×1023 atoms of Y area present in

$\Rightarrow \frac{9.6}{9.03\times 10^{22}}\times 6.02\times 10^{23}$ =64 g

∴ atomic mass of Y = 64 amu.

24. The masses of an electron, a proton and a neutron respectively will be in the ratio —

(a) 1836.15 : 1838.68 (b) 1856.15 : 1858.68
(c) 1834.15 : 1836.68 (d) 1846.15 : 1848.68

AP EAPCET 20.08.2021 Shift-I

Ans. (a) : Mass of proton $= 1.673 \times 10^{-27}$ kg
Mass of neutron = 1.675×10^{-27} kg
Mass of electron = 9.109×10^{-31}

∴ Mass ratio of proton and electron = $\frac{m_p}{m_e}$

$= \frac{1.673\times 10^{-27}}{9.1\times 10^{-31}}$

= 1835.16

And Mass ratio of neutron and electron = $\frac{m_n}{m_e}$

$= \frac{1.675\times 10^{-27}}{9.1\times 10^{-31}}$

= 1838.68

25. In the following sets of ions, which one is not isoelectronic with the rest of the species?

O^{2-},F^-,Na,Mg^{2+},Al^{3+}, Ne

(a) Mg^{2+} (b) Al^{3+}
(c) O^{2-} (d) Na

COMEDK-2014

Ans. (d) : $O^{2-}(10e^-), F^-(10e^-), Na(11e^-), Mg^{2+}(10e^-)$, $Al^{3+}(10e^-)$ and $Ne(10e^-)$

Thus, Na is not isoelectronic with the rest of the species.

26. An ion with mass number 56 contains three units of positive charge and 30.4% more neutrons than electrons. The ion is

(a) $^{56}_{28}Ni^{3+}$ (b) $^{56}_{26}Fe^{3+}$
(c) $^{56}_{27}Co^{3+}$ (d) $^{56}_{24}Cr^{3+}$

COMEDK-2016

Ans. (b) : Let no. of electrons in the ion M^{3+} = x

$\therefore$ No. of neutrons $= x + \frac{30.4x}{100} = 1.304x$

No. of electrons in the neutral atom = x+3

$\therefore$ No. of protons $= x + 3 = 23 + 3 = 26$

Hence, the ion is $^{56}_{26}Fe^{3+}$

27. Which of the following clement represents is isoelectronic sequence?

(a) N, O, F, Ne (b) Na^+, Mn^{2+}, Al^{3+}, Si^{4+}
(c) Cl^-, Ar, Ca^{2+}, Ti^{4+} (d) Be, Mg^{2+}, Ca, Si^{2+}

AP-EAMCET (Medical), 2006

Ans. (c) : The species which have same number of electrons are called the isoelectronic

Cl^- = atomic no. ± no. of charge = 17+1 = $18e^{\ominus}$

Similarly,

Ar = 18 + 0 = $18e^{\ominus}$

Ca^{2+} = 20-2 = $18e^{\ominus}$

Ti^{4+} = 22-4 = $18e^{\ominus}$

∴ All these are isoelectronic. Hence, the correct option is (c).

28. Elements X and Y belong to the same group. Which one of the following set of atomic numbers represent X and Y?

(a) 15, 30 (b) 20, 31
(c) 19, 55 (d) 33, 16

AP-EAMCET (Medical), 2002

Ans. (c) : The atomic number 19, 55 belongs to the alkali metal. The name of the atomic number 19, 55 elements is potassium, cesium respectively.

29. The number of protons in a negatively charged atom (anion) is

(a) more than the atomic number of the element
(b) less than the atomic number of the element
(c) more than the number of electrons in the atom
(d) less than the number of electrons in the atom

NDA (II)-2011

Ans : (d) The number of protons in a negatively charged atom. It is less than the number of electron in the atom.

- The atoms of a component are impartial in nature since it contains equivalent number of electrons and protons.

30. Which one among the following most correctly determines the atomic number of an element ?

(a) Number of protons
(b) Number of protons and electrons
(c) Number of ions
(d) Number of nucleons

NDA (II)-2011

Ans : (a) Number of protons are most correctly determines the atomic number of an element.

- Atomic number the quantity of a chemical component in the periodic system by which the component are organized arranged by expanding number of protons in the nucleus.

31. A stable nucleus (light with A < 10) has

(a) exactly the same number of neutrons and protons
(b) more neutrons than protons
(c) no neutrons
(d) no protons

NDA (II)-2011

@apna_pdf

Ans : (a) A stable nucleus has exactly the same number of neutrons and protons.

32. Which of the following ratio will give stability to daughter element, when radioactive parent element has less number of protons compared to number of neutrons?

(a) $\frac{N+1}{Z+1}$ (b) $\frac{N-1}{Z+1}$

(c) $\frac{N-1}{Z-1}$ (d) $\frac{N+1}{Z-1}$

GUJCET-2011

Ans. (b): $^1_0n \rightarrow ^1_1H$

or $^1_1p + ^0_{-1}\beta$ (β - particle)

i.e. emitting β-particles the newly formed nuclide has its n/p value lower than its parent nucleide and hence approaches closer to the zone of stability and become stable.

Hence, stability ratio of daughter element $\frac{N-1}{Z+1}$.

33. Isotope used in brain scan is

(a) $_1H^3$ (b) $_6C^{11}$

(c) $_6C^{14}$ (d) $_{80}Hg^{197}$

SRMJEEE-2010

Ans. (b) : The isotope of $_6C^{11}$ is (Choline) used in the scanning of the brain in medical sector.

34. Observe the following statements regarding isotones:

I. ^{39}K and ^{40}Ca are isotones.

II. Nuclides having different atomic (Z) and mass numbers (A) but same number of neutrons (n) are called isotones.

III. ^{19}F and ^{23}Na are isotones.

The correct answer is

(a) 1, 2 and 3 are correct

(b) Only 1 and 2 are correct

(c) Only 1 and 3 are correct

(d) Only 2 and 3 are correct

AP-EAMCET (Engg.)-2005

Ans. (b) : We know that when nuclides have same number of neutrons (N) but have different mass number (A) and proton number (Z) are called isotones.

(i) For $^{39}_{19}K$

atomic number (Z) = 19

atomic mass (A) = 39

neutrons (N) = A – Z = 39 – 19 = 20

For $^{40}_{20}Ca$

atomic number = 20

atomic mass = 40

neutrons = 40 – 20 = 20

Hence, ^{39}K and ^{40}Ca are isotones.

(iii) For $^{19}_{9}F$

atomic number = 9

atomic mass = 19

neutrons = 19–9 = 10

For $^{23}_{11}Na$

atomic number = 11

atomic mass = 23

neutrons = 23 –11

= 12

Hence, (I) and (II) statements are correct.

35. The radius of La^{3+} (Atomic number of La = 57) is 1.06 Å. Which one of the following given values will be closest to the radius of Lu^{3+} (Atomic number of Lu = 71) ?

(a) 1.40 Å (b) 1.06 Å

(c) 0.85 Å (d) 1.60 Å

VITEEE-2018

Ans. (c) : As we move left to right in lanthanide series, there is increase in atomic number but the size of cation get decreases.

So, possible radius for Lu^{3+} is 0.85 Å

36. Assertion: The chemical properties of different isotopes are same.

Reason: Isotopes have same number of neutron.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Morning)

Ans. (c) : The chemical proporties of different isotopes are same. But isotopes does'nt have same number of neutron.

37. The number of electrons and neutrons of an element is 18 and 20 respectively. Its mass number is

(a) 37 (b) 17

(c) 38 (d) 22

AIIMS-1994

Ans. (c) : Mass no = No. of protons + No. of neutrons

No. of protons = No of electrons

⇒ No of Protons ⇒ 18

⇒ Mass No. = 20+18= 38

38. The number of electrons in $[_{19}K^{40}]^{-1}$ is

(a) 28 (b) 19

(c) 40 (d) 20

AIIMS-1994

Ans. (d): The electronic configuration of the given K(19): $1s^2, 2s^2, 2p^6, 3s^2, 3P^6, 4P^1$

The number of electrons present originally = 19

∴ Total number of electrons = 19+1= 20 (from negative charge).

39. Which of the following is the correct sequence of atomic weights of the given elements?

(a) Ni > Co > Fe (b) Fe > Co > Ni

(c) Co > Fe > Ni (d) Co > Ni > Fe

AIIMS-1996

Ans. (d) : Atomic weight of Fe (z=26)=55.85 amu.

Atomic weight of Co(z=27)⇒58.90 amu

@apna_pdf

Atomic weight of Ni (z=28) ⇒58.69 amu
Hence, the correct order of atomic weight is follow CO>Ni>Fe.

40. Assertion: Nuclear binding energy per nucleon in the order $^{9}_{4}$Be > $^{7}_{3}$Li > $^{4}_{2}$He

Reason: Binding energy per nucleon increases linearly with difference in number of neutrons and protons.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason, are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2004

Ans. (d): Binding energy per nucleon of $_3Li^7$ (5.38 Mev) is less than $_2He^4$ (7.08 Mev) as helium is found to be more stable than Li. As the atomic mass number increases the binding energy per nucleon decreases. As the atomic number and the atomic mass number increase the repulsive electrostatic force within the nucleus increase due to the greater number of protons in the heavy elements. To overcome this increased repulsion, the proportion of neutrons in the nucleus must increase to maintain stability. This increase in the neutron to proton ratio only partially compensates for the growing proton-proton repulsive force in the heavier naturally occurring element.

41. Assertion: Atoms are not electrically neutral.

Reason: Number of protons and electrons are different

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason, are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-1999

Ans. (d): Atoms are electrically neutral because they have an equal number of protons and electrons, and as we know that the protons and electrons contain opposite types of charges, hence their negatively charged electrons are completely balanced with their positively charged protons.
Hence, given both the assertion and reason are false.

42. Let m_p be the mass of a proton, m_n that of a neutron, M_1 that of a $^{20}_{10}$Ne nucleus and M_2 that of a $^{40}_{20}$Ca nucleus. Then

(a) $M_2=2M_1$ (b) $M_1<10(m_p+m_n)$
(c) $M_2>2M_1$ (d) $M_1=M_2$

AIIMS-2015

Ans. (a): $^{20}_{10}$Ne contains 10 protons and 10 neutrons
∴ M_1= 10mp+10 Mn
$^{40}_{20}$Ca contains 20 protons and 20 neutrons
∴ M_2= 20Mp+20 Mn
∴ M_2 = $2M_1$

43. Deuterium nucleus contains:

(a) 1 proton, 1 electron (b) 1 proton, 1 neutron
(c) 2 protons, 1 electron (d) 1 proton, 2 electrons

AIIMS-1998

Ans. (b): Deuterium nucleus contains 1 proton and 1 neutron because it is isotope of hydrogen.

44. If $e = 1.60206\times10^{-19}$C, $\frac{e}{m} = 1.75875\times10^{11}$ Ckg^{-1} then the mass of electron is

(a) 7.5678×10^{-31}kg (b) 9.1091×10^{-31}kg
(c) 11.2531×10^{-31}kg (d) 13.0513×10^{-31}kg

AIIMS-1999

Ans. (b): Mass of electron $= \frac{1.60206\times10^{-19}}{1.75875\times10^{11}}$
$= 9.1091\times10^{-31}$

OR

$$\frac{e}{m} = 1.75875\times10^{11}\,\text{C kg}^{-1}$$

$$e = 1.60206\times10^{-19}\text{ C}$$

$$m = \frac{e/e}{m} = \frac{1.60206\times10^{-19}}{1.75875\times10^{11}}\text{Kg}$$

$= 9.1091\times10^{-31}$ Kg

45. Positron is:

(a) Electron with positive charge
(b) A nucleus with one neutron and one proton
(c) A nucleus with two protons
(d) A helium nucleus

AIIMS-1998

Ans. (a): The positron is the antiparticle or the antimattery counter part of the electron. The positron has an electric charge of +1, an spin of , and has the same mass as an electron. When a low–energy positron collides with a low energy electron, annihilation occurs, resulting in the production of two or more gamma ray photons Positrons may be generated by positron emission radiative energetic photon which is in teracting with an atom is a material.

46. The nitride ion in lithium nitride is composed of

(a) 7 protons + 7 electrons
(b) 10 protons + 7 electrons
(c) 7 protons + 10 electrons
(d) 10 protons + 10 electrons

CG PET -2018

Ans. (c) : Nitride ion can be represented as N^{3-},
Number of protons = 7
Number of electrons = 7+3= 10
Therefore, nitride ion contains 7 protons +10 electrons.

@apna_pdf

47. **Increasing order (lowest first) for the values of e/m for electron (e), proton (p), neutron (n) and α-particles is**

(a) e, p, n, α (b) n, α, p, e
(c) n, p, e, α (d) n, p, α, e

CG PET -2009

Ans. (b) : $(e/m)_n = \dfrac{0}{1.675\times10^{-27}}$

$$(e/m)_\alpha = \frac{2\times1.6602\times10^{-19}\,C}{4\times1.675\times10^{-27}\,kg}$$

$$(e/m)_p = \frac{1.602\times10^{-19}\,C}{1.675\times10^{-27}\,kg}$$

$$(e/m)_e = \frac{1.602\times10^{-19}\,C}{9.108\times10^{-31}\,kg}$$

48. **Isoelectronic pair among the following is**

(a) Ca and K (b) Ar and Ca^{2+}
(c) K and Ca^{2+} (d) Ar and K

UPTU/UPSEE-2008

Ans. (b) : Ar and Ca^{2+} are isoelectronic species as they have same number of electrons i.e. 18.

49. **Which of the following is isoelectronic pair?**

(a) CN^-, O_3 (b) ClO_2, BrF_2
(c) BrO_2^-, BrF_2^+ (d) ICl_2, ClO_3

JCECE - 2013

Ans. (c) : Both $BrO_2^-(35+2\times8+1=52)$ and $BrF_2^+(35+2\times9-1=52)$ have 52 electrons.

50. **N_2 and CO are**

(a) Isomers (b) Isoelectronic
(c) Isotopes (d) Isobars

J & K CET-(2002)

Ans. (b) : N_2 have 14×2=28 electrons
CO have 12+16 = 28 electrons
Thus both are iso electronic

OR

Both N_2 and CO contain 14 electrons each thus N_2 and CO are isoelectronic.

51. **Pick out the isoelectronic structures from the following**

$$\underset{\text{I}}{CH_3^+}\quad \underset{\text{II}}{H_3O^+}\quad \underset{\text{III}}{NH_3}\quad \underset{\text{IV}}{CH_3^-}$$

(a) I and II (b) I and VI
(c) I and III (d) II,III and IV

CG PET- 2010

Ans. (d) : CH_3^+ has 6+3–1= 8

Electrons H_3O + has 3+8–1=10 electrons NH_3 has 7+3=10 electrons CH_3^- has 6+3+1=10 electrons so II, III, IV are isoelectronic structures as they have the same number of electrons. Hence, the correct option (d).

OR

H_3O^+, NH_3 and CH_3^- have same number of electrons.

52. **Which of the following is not isoelectronic?**

(a) Na^+ (b) Mg^{2+}
(c) O^{2-} (d) Cl^-

CG PET -2007

Ans. (d) : Na^+, Mg^{2+}, O^- contain 10 electrons each Cl^- has 18 electrons.

53. **The correct symbol of the species with number of electrons, protons and neutrons as 18, 16 and 16 respectively is**

(a) $^{32}_{16}S$ (b) $^{32}_{18}S$
(c) $^{32}_{16}S^{2-}$ (d) $^{32}_{18}S^{2-}$

AMU-2014

Ans. (c) :

Species	No of Electron	No of Protons	No of neutrons
$^{32}_{16}S$	16	16	16
$^{32}_{18}S$	18	18	14
$^{32}_{16}S^{2-}$	$16+2e^-$ 18	16	16
$^{32}_{18}S^{2}$	$18+2e^-$ 20	18	14

54. **The magnitude of the charge on the electron is 4.8 × 10^{-10} esu. What is the magnitude of the charge on the proton on the nucleus of helium atom?**

(a) 4.8 × 10^{-10} esu (b) 9.6 × 10^{-10} esu
(c) 6.4 × 10^{-10} esu (d) 14.4 × 10^{-10} esu

AMU-2013

Ans. (b) : Since, the charge on the proton is equal in magnitude to that on the electron, the charge on the proton is also 4.8×10^{-10} esu. Since, a helium nucleus contains 2 protons, its charge is 9.6×10^{-10} esu.

55. **Atomic number equal to the**

(a) Atomic mass of the element
(b) Sum of protons and neutrons
(c) Number of the protons in the nucleus
(d) Number of the neutrons in the nucleus.

AMU–2001

Ans. (c) : Atomic number is equal to the number of protons in the nucleus.

56. **The ratio of electron, proton and neutron in tritium is**

(a) 1 : 1 : 1 (b) 1 : 1 : 2
(c) 1 : 1 : 3 (d) 1 : 2 : 3

Assam CEE-2014

Ans. (b) : The atomic number and the mass number of tritium are 1 and 3 respectively. Tritium contains 1 electron, 1 proton and 2 neutrons.
Hence, the ratio of the number of electrons. Protons and neutrons in tritium is 1:1:2

57. **The atomic numbers of elements X, Y and Z are 19, 21 and 25 respectively. The number of electrons present in the M shells of these elements follow the order.**

(a) Z > X > Y (b) X > Y > Z
(c) Z > Y > X (d) Y > Z > X

Assam CEE-2014

@apna_pdf

Ans. (c) : The electronic configuration of X with atomic number 19 is $1s^2\ 2s^2\ 2p^6\ 3p^6\ 4s^1$. Now the M shell is the 3rd energy level and hence, it contains (2+6=8) electrons.
The electronic configuration of with atomic number 21 is $1s^2\ 2s^2\ 2p^6\ 3x^2\ 3p^6\ 4s^2\ 3d^1$. Now the M shell is the 3rd energy level and hence, it contains (2+6+1=9) electron.
The electronic configuration of Z with atomic number 25 is $1s^2\ 2s^2\ 2p^6\ 3s^2\ 4s^2\ 3d^5$. Now the M shell is the 3rd energy level and hence it contains (2+6+5=13 electrons).
Since Z contains more electrons in the M shell than Y and Y contains more electrons in the M shell than X. So the number of electrons present in the M–shell of these elements follows the order Z>Y>X Hence, the correct option is c.

58. The number of electrons, protons and neutrons in phosphide ion (P^{3-}) is-
(a) 15, 15, 16 (b) 15, 16, 15
(c) 18, 15, 16 (d) 15, 16, 18

Assam CEE-2021

Ans. (c) : P^{3-} (PHOSPHIDE)
Electron = 15 + 3 = 18
Proton = 15
Neutron = 31 – 15 = 16

59. Nuclides :
(a) Have specific atomic numbers
(b) Have same number of protons
(c) Have specific atomic number and mass numbers
(d) Are isotopes

BCECE-2006

Ans. (c): Nuclides have a definite number of protons and neutrons and consequently definite atomic number and mass number. Such as oxygen nuclei contain 8 protons and 8 neutrons (${}_8O^{16}$).

60. The energy released in an atom bomb explosion is mainly due to
(a) Release of neutrons
(b) Release of electrons
(c) Greater mass of products than initial material
(d) Lesser mass of products than initial material

BCECE-2006

Ans. (d) : The source of large energy, produced during atom bomb explosion, is the mass defect occurring during the fission reaction, which is converted into energy equivalent to mass defect.

61. Number of neutron in C^{12} is :
(a) 6 (b) 7
(c) 8 (d) 9

BCECE-2005

Ans. (a) : Number of neutron = atomic mass– atomic number. For C^{12} number of neutron = 12–6=6

62. The atomic number of elements A, B, C, and D are Z–1, Z+1, Z+2 respectively. If B is a noble gas, choose the correct option.
(1) (A) has higher electron affinity.
(2) (C) exists in +2 oxidation state.
(3) (D) is an alkaline earth metal.
(a) (1) and (2) (b) (2) and (3)
(c) (1) and (3) (d) (1), (2) and (3)

BCECE-2017

Ans. (c) : B is a noble gas so the next element will be in the next period and will be alkali metals. Next element will be than alkaline earth metal.
1 'A' has higher electron affinity. It belongs to halogen family.
2 'C' exists in +1 oxidation state
3 'D' is an alkaline earth metal
Hence, the Statements (1) and (3) are correct.

63. n/p ratio during positron decay
(a) Increases (b) Decreases
(c) Remains constant (d) All of these

CG PET- 2015

Ans. (a) ${}_0n^1 \rightarrow {}_1p^1 + {}_{-1}p^0 + \bar{v}$ i.e. n decreases, p increases.

64. The electronic configuration of an element is $1s^2, 2s^2\ 2p^6, 3s^2\ 3p^6, 3d^{10}, 4s^2\ 4p^3$.
To which of the following elements it is similar in properties?
(a) Boron (b) Oxygen
(c) Nitrogen (d) Chlorine

CG PET -2008

Ans. (c) : The valance shell electronic configuration is $4s^2\ 4p^3$ similar to nitrogen $3s^2 3p^2$.

65. If the de-Broglie wavelength of the electron in n^{th} Bohr orbit in a hydrogenic atom is equal to $1.5\pi a_0$ (a_0 is Bohr radius), then the value of n/Z is
(a) 1.0 (b) 0.75
(c) 0.40 (d) 1.50

[JEE Main 2019, 12 Jan Shift-II]

Ans. (b) : $2\pi rn = n\lambda;\ 2\pi a_o \times \frac{n^2}{z} = n\lambda$

$$2\pi a_o = \frac{n}{z} = 1.5\pi a_o = \frac{n}{z} = \frac{1.5\pi a_o}{2\pi a_o} = 0.75$$

66. The introduction of a neutron into the nucleus of an atom would lead to a change in
(a) Atomic number
(b) Atomic mass
(c) Chemical nature of the atom
(d) Number of electron

CG PET -2019

Ans. (b) : The introduction of a neutron into the nuclear composition, of an atom would lead to a change in its atomic mass. However, its atomic number, the chemical nature of the atom and the number of the electron s will remain unchanged as they are related to the number of protons and they are independent of the number of neutron.

67. The element with atomic number 55 belongs to which block of the periodic table?
(a) s-block (b) p- block
(c) d- block (d) f- block

CG PET -2004

@apna_pdf

Ans. (a) : The electronic configuration of the above element is [Xe]$6s^1$. Since the valence electrons are in the S subshell, the element belongs to S–block.

68. Neutrons are found in atoms of all elements except in

(a) Chlorine (b) Oxygen
(c) Argon (d) Hydrogen

CG PET -2004

Ans. (d) : Neutrons can be found in all atomic nuclear except hydrogen. Hydrogen is that atomic nucleus and it consists of no charge and a mass of slightly over 1 amu.

69. The atomic weight of an element is 39. The number of neutrons in its nucleus is one more than the number of protons. The number of protons, neutrons and electrons-respectively in its atoms would be

(a) 19, 20, 19 (b) 19, 19, 20
(c) 20, 19, 19 (d) 20, 19, 20

CG PET -2004

Ans. (a) : Atomic weight of an element = 39 unit

∴ Atomic weight = no of proton + no of neutron

Hence According to question.

no. of neutron = no. of proton +1

So,

39= no. of neutron + no. of proton

39= no. of proton +1 +no. of proton

2×no. of proton = 38

no. of proton = 19

Also, no. of electron = no. of proton

They, no. of electron = 19

And no. of neutron = 19+1 = 20

Hence, no. of proton = 19

no. of neutron = 20

no. of electron=19

70. In the following reaction

$${}_3Li^6 + ? \rightarrow {}_2He^4 + 1H^3$$

the missing particle is

(a) Electron (b) Neutron
(c) Proton (d) Deuteron

CG PET- 2010

Ans. (b) : In the given reaction

$${}_3Li^6 + ? \rightarrow {}_2He^4 + 1H^3$$

Mass number and atomic number on LHS and RHS will be equal.

Let us assume the missing particle be ${}_xA^y$

Atomic number

$3 + x = 2 + 1$

$x = 0$

Mass number,

$6 + y = 4 + 3$

$y = 1$

It represents neutron,

$${}_3Li^6 + {}_0n^1 \rightarrow {}_2He^4 + 1H^3$$

71. The atomic number of an element is 8. How many electrons will it gain to form a compound with sodium?

(a) One (b) Two
(c) Three (d) Four

NDA (II)-2018

Ans. (b) : It will gain two electron to form a compound with sodium (Na).

Given, atomic no. of element = 8 i.e. oxygen

Electronic configuration of oxygen= $1s^2$, $2s^2$, $2p^4$.

Therefore, valency = 2, 6

Electronic configuration of Na= 2, 8, 1

Valency = 1 (As it is easier to donate one electron)

Hence, the given element will gain 2 electron form two sodium atoms to completes its octet.

Reaction involved –

$$4Na^+ + O_2 \rightarrow 2Na_2O$$

72. The triad of the nuclei that is isotonic :

(a) ${}_6C^{14}, {}_7N^{14}, {}_9F^{19}$ (b) ${}_6C^{14}, {}_7N^{15}, {}_9F^{17}$
(c) ${}_6C^{14}, {}_7N^{14}, {}_9F^{17}$ (d) ${}_6C^{12}, {}_7N^{14}, {}_9F^{19}$

HP CET-2018

Ans. (b) : Isotones are nuclides with same number of neutrons

∴ ${}_6C^{14}, {}_7N^{15}, {}_9F^{17}$ are isotones with 8 neutrons in each case.

73. Three elements X, Y and Z are in the 3rd period of the periodic table. The oxides of X, Y and Z, respectively, are basic, amphoteric and acidic. The correct order of the atomic number of X, Y and Z is

(a) Z < Y < X (b) X < Y < Z
(c) X < Z < Y (d) Y < X < Z

(JEE Main 2020, 2 Sep Shift-II)

Ans. (b) : X<Y<Z $MgO<Al_2O_3<SiO_2$

74. The group having isoelectronic species is

(a) $O^{2-}, F^-, Na^+, Mg^{2+}$ (b) O^-, F^-, Na, Mg^+
(c) O^{2-}, F^-, Na, Mg^{2+} (d) O^-, F^-, Na^+, Mg^{2+}

(JEE Main-2017)

Ans. (a) : Isoelectronic species are those which contains same number of electrons

Species	Atomic number	Number of electrons
O^{2-}	8	10
F^-	9	10
Na^+	11	10
Mg^{2+}	12	10
O^-	8	9
Na	11	11
Mg^+	12	11

Option (a) is correct which contains isoelectronic species $O^{2-}, F^-, Na^+, Mg^{2+}$

75. Which one of the following sets of ions represents a collection of isoelectronic species ?

(a) $K^+, Cl^-, Ca^{2+}, Sc^{3+}$ (b) $Ba^{2+}, Sr^{2+}, K^+, S^{2-}$
(c) $N^{3-}, O^{2-}, F^-, S^{2-}$ (d) $Li^+, Na^+, Mg^{2+}, Ca^{2+}$

Assam CEE-2020
(AIEEE 2006)

Ans. (a) : The ions which have the same number of electrons are called isoelectronic

K^+	Cl^-	Ca^{2+}	Sc^{3+}
(2,8,8)	(2,8,8)	(2,8,8)	(2,8,8)

All these ions contains 18 electrons each. So all these ions are isoelectronic.

@apna_pdf

76. According to the periodic law of elements, the variation in properties of elements is related to their

(a) Atomic masses
(b) Nuclear masses
(c) Atomic numbers
(d) Nuclear neutron-proton number ratios

(AIEEE 2003)

Ans. (c) : The modern form of periodic table is the one in which the chemical elements are arranged in order of increasing atomic number.

Elements with similar properties are arranged in the same column (called a group) and elements with the same number of electron shells are arranged in the same row (called a period).

77. The group number, number of valence electrons and valency of an element with atomic number 15, respectively, are

(a) 16, 5 and 2 (b) 15, 5 and 3
(c) 16, 6 and 3 (d) 15, 6 and 2

(JEE Main 2019, 12 April Shift-I)

Ans. (b) : The group number, number of valence electrons and valency of an element with atomic number is are 15, 5 and 3 respectively. Modern periodic table is based on the atomic number. Modern periodic table is based on the atomic number. Number of valence electrons present in an atom decides the group number.

Electronic configuration of element have atomic number 15–$1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^3$

As five electrons are present in valence shell. Its group number is 15. Valency of element having atomic number 15 is +3 (8–5=3).

78. The isoelectronic set of ions is

(a) F^-, Li^+, Na^+ and Mg^{2+}
(b) N^{3-}, Li^+, Mg^{2+} and O^{2-}
(c) Li^+, Na^+, O^{2-} and F^-
(d) N^{3-}, O^{2-}, F^- and Na^+

(JEE Main 2019, 10 April Shift-I)

Ans. (d) : Key idea = Isoelectronic species contains same number of electron.

The species with its atomic number and number of electrons are as follows:

Species (ions)	Atomic number (z)	Number of electrons
N^{3-}	7	7+3=10
O^{2-}	8	8+2=10
F^-	9	9+1=10
Na^+	11	11–1=10
Li^+	3	3–1=2
Mg^{2+}	12	12–2=10

Isoelectronic set of ions are N^{3-}, O^{2-}, F^-, Na^+ and Mg^{2+}.

79. The size of the iso-electronic species Cl^-, Ar and Ca^{2+} is affected by

(a) azimuthal quantum number of valence shell
(b) electron-electron interaction in the outer orbitals
(c) principal quantum number of valence shell
(d) nuclear charge

(JEE Main 2019, 8 April Shift-I)

Ans. (d) : Isoelectronic species contain same number of shells so their size is effected by the nuclear charge.

80. The atomic number of unnilunium is ......

(JEE Main 2020, 6 Sep Shift-II)

Ans. (101) : Synthetic radioactive element, symbol=md with atomic number 101 made by bombarding lighter elements with light nuclei accelerated in cyclotrons.

81. Which one of the following constitutes a group of the isoelectronic species?

(a) C_2^{2-}, O_2^-, CO, NO
(b) NO^+, C_2^{2-}, CN^-, N_2
(c) CN^-, N_2, O_2^{2-}, CO_2^{2-}
(d) N_2, O_2^-, NO^+, CO

JEE Main-09.10.2018

Ans. (b) : Number of electrons in each species are given below

N_2=14 CN^- =14
O_2^- =17 C_2^{2-} =14
NO^+ =14 O_2^- =18
CO = 14 No = 15

It is quite evident from the above that NO^+, C_2^{2-}, CN^-, N_2 and Co are isoelectronic in natures.

82. Hydrogen has three isotopes (A), (B) and (C). If the number of neutron(s) in (A), (B) and (C) respectively, are (x), (y) and (z), the sum of (x), (y) and (z) is

(a) 4 (b) 3
(c) 2 (d) 1

[JEE Main 2020, 8 Jan Shift-II]

Ans. (b) : Number of neutrons in protium $\left({}_1^1H\right)$ is zero (x), number of neutron in deuterium $\left({}_1^2H \text{ or } {}_1^2D\right)$ is 1(y) and number of neutrons in tritium $\left({}_1^3H \text{ or}, {}^3T\right)$ is 2(z) the sum of x, y and z is x+y+z = 3.

83. Atoms with identical atomic number but different atomic mass number are known as

(a) Polymers (b) Isobars
(c) Isotopes (d) Isomers.

J & K CET-(2014)

Ans. (c) : Isotope, one of two or more species of atoms of a chemical element with the same atomic number and position in the periodic table and nearly identical chemical behavior but with different atomic masses and physical properties every chemical element has one or more isotopes.

Example:– H_1^1, H_1^2, H_1^3 are the isotopes of hydrogen.

84. Negatively charged particles are called

(a) Electrons (b) Protons
(c) Neutrons (d) None of the above

J & K CET-(2014)

Ans. (a) :

Particles	Symbol	Relative charge
Electrons	e	–1
Protons	p	+1
Neutrons	n	0

@apna_pdf

85. Mass number of an atom is the sum of

(a) Number of protons + number of neutrons + number of electrons
(b) Number of protons + number of neutrons
(c) Number of protons + number of electrons
(d) Number of electrons + number of neutrons.

J & K CET-(2014)

Ans. (b) : The total number of nucleous is termed as mass number (A) of the atom.
Hence, mass number (A)= No. of protons (p)+No. of neutrons(n).

86. Mass of a proton is

(a) 0.00727 amu
(b) 1.0087 amu
(c) 0.00054 amu
(d) 1.00727 amu.

J & K CET-(2014)

Ans. (d) : A mass of proton is 1.00727 amu. A proton is a subatomic particle, with a positive electrical charge of +1e elementary charge and a mass slightly less than that of a neutrons. Protons and neutrons, each with masses of approximately one atomic mass unit, are collectively referred to as "nucleons" (particles present in atomic nuclei).

87 $^{39}_{19}$K and $^{40}_{20}$C are

(a) Isomers
(b) Isobars
(c) Isotones
(d) Isotopes

J & K CET-(2001)

Ans. (c) : No. of neutron in K= 39–19= 20
No. of neutron in Ca= 40–20= 20
So, No, of neutron are equal
∴ They are isotones.

88. Neutron is a fundamental particle carrying

(a) A charge of +1 unit and a mass of one unit
(b) No charge and a mass of one unit
(c) No charge and no mass
(d) A charge of–1 unit and no mass

J & K CET-(2000)

Ans. (b) : Proton and e^- which are electrically charged, neutron have no charge they are electrically neutral. The mass of a neutron is slightly greater than the mass of a proton, which is 1 atomic mass unit (amu.)

89. The specific heat of a metal is 0.11 and its equivalent weight is 18.61. Its exact atomic weight is

(a) 58.2
(b) 29.1
(c) 55.83
(d) 27.91

J & K CET-(1998)

Ans. (c) : Approximate atomic wt. of the metal

$$= \frac{6.4}{\text{specific heat}} = \frac{6.4}{0.11} = 58.18$$

$$\text{Valency of the metal} = \frac{\text{Approx at.wt}}{\text{Eq.wt.}}$$

$$= \frac{58.18}{18.61} = 3(\text{whole no.})$$

So, exact at. wt. of the element = eq.wt.×Valency
= 18.61×3
= 55.83

90. Which of the following species is isotonic with $_{37}Rb^{86}$?

(a) $_{36}Kr^{84}$
(b) $_{37}Mg^{85}$
(c) $_{38}Sr^{87}$
(d) $_{39}Y^{89}$

J & K CET-(1997)

Ans. (c) : The number of neutrons in Rb= (86–37)= 49 and in Sr = (87–38) = 49.
Therefore, both of them are isotonic species.

91. Atoms with same atomic number and different mass numbers are called

(a) isobars
(b) isomers
(c) isotones
(d) isotopes

JCECE - 2009

Ans. (d) : Isobars, are the atom having the same mass number but different atomic number. For example, the atomic number of carbon and nitrogen is 6 and 7 respectively. Isotopes are the atoms with same atomic no and different atomic mass Ex. $_6C^{14}$, $_6C^{13}$.

92. The number of electrons, neutrons and protons in a species are equal to 10,8 and 8 respectively. The proper symbol of the species is

(a) $^{16}_{8}O$
(b) $^{18}_{8}O$
(c) $^{18}_{10}Ne$
(d) $^{16}_{8}O^{2-}$

JIPMER-2011

Ans. (d) : From the given data, it is clear that the atomic number z, of the species is 8 (number of protons).
Since the number of electron are two more than the number of protons, hence, it is a binegative species.
Thus, the species is $^{16}_{8}O^{2-}$.

93. In long form of periodic Table the properties of the elements are a periodic function of their

(a) Atomic size
(b) Ionization energy
(c) Atomic mass
(d) Atomic number

JIPMER-2010

Ans. (d): In modern periodic table, the physical and chemical properties of the element are a periodic function their atomic number, i.e. if the element are arrange in order of their atomic number, the element with similar properties are repeated after certain regular intervals.

94. An element with mass number 81 contains 31.7% more neutrons as compared to protons. It symbol is

(a) $_{40}X^{81}$
(b) $_{35}X^{81}$
(c) $_{81}X^{317}$
(d) $_{40}X^{81}$

JIPMER-2019

Ans. (b) : Let, the number of protons= x

$$\text{Number of neutrons} = x + \frac{31.7x}{100} = \frac{131.7x}{100}$$

Mass number= number of protons + number of neutrons

$$81 = x + \frac{131.7x}{100}$$

∴ x= 35
Thus, the symbol of the element is $_{35}X^{81}$.

95. Which of the following is not iso electronic with H_2S?

(a) F_2 gas
(b) Oxide ion
(c) Ca^{+2}
(d) Sc^{+3}

JIPMER-2019

@apna_pdf

Ans. (b) : Iso electronic species are those which have same number of electron. The total number of electron in the given species are as follows.

H_2S= 2+16 = 18 electron
F_2= 9+9 = 18 electron
O^{2-}= 8+2=10 electron
Ca^{2+} = 20–2 18 electron
Sc^{3+} = 21–3 = 18 electron

Thus O^{2-} (Oxide ion) is not iso–electronic with H_2S.

96. If two atoms have equal number of electron it is called

(a) isoelectronic (b) isotone
(c) isobar (d) None of these

JIPMER-2019

Ans. (a) : The species having same number of electrons are called isoelectronic. For example Na^+ and Mg^{2+} have 10 electron thus are isoelectronic.

97. An odd electron molecule among the following is

(a) CO (b) SO_2
(c) CO_2 (d) NO
(e) OF_2

Kerala-CEE-2015

Ans. (c) : N(z=7) and O (z=8)
have 7 and 8 electrons respectively
∴ number of electrons in NO= 7+8= 15
Hence, no is an odd electron molecule.

98. The effective nuclear charge of an elements with three valence electrons is 2.60. What is the atomic number of the element?

(a) 1 (b) 2
(c) 3 (d) 4
(e) 5

Kerala-CEE-2018

Ans. (e) : Effective nuclear charge = 2.60 and valence shell contain 3 electrons.

Thus, the minimum number of main shells for the given element are two i.e. (x=2) and its configuration will be $1s^2, 2s^2, 2p^1$

So, that the given element has 5 electrons in all also, for a neutral atom.

Therefore, no. of electrons= Atomic number

There, the atomic number of the element is 5.

99. The number of electrons, protons and neutrons in a species are equal to 10, 11 and 12 respectively. The proper symbol of the species is

(a) ${}^{22}_{11}Na^+$ (b) ${}^{23}_{11}Na$
(c) ${}^{23}_{10}Ne$ (d) ${}^{23}_{11}Na^+$
(e) ${}^{23}_{11}Na^{2+}$

Kerala-CEE-2020

Ans. (d) : No. of electron present = no. of atomic no.

No. of protons = No. of electron = atomic no.

${}^{22}_{11}Na^+$ ⇒ No. of electron = 10
⇒ No. of proton = 11
⇒ No. of neutron = A – Z
= 23 – 11
= 12

100. 1 u (amu) is equal to

(a) 1.492×10^{-10} J (b) 1.492×10^{-7} J
(c) 1.492×10^{-13} J (d) 6.023×10^{23} J

MHT CET-2010

Ans. (a) : 1u (unified mass) is equal to exactly 1/12th of the mass of C^{12} atom.

$$\text{Thus, } 1u = \frac{1}{12}\times\frac{12g}{6.022\times10^{23}}$$

$$1u = 1.66\times10^{-24} = -1.66\times10^{-27}\ Kg$$

Since, $E = mc^2$, thus

$$= 1.66\times10^{-27}\times(3\times10^8)\ Kg\ m^2s^2$$
$$= 1.492\times10^{-10}\ J$$

101. Chlorine (Cl^{17}) free radical contains how many electrons around the nucleus?

(a) 16 (b) 17
(c) 18 (d) 19

MHT CET-2010

Ans. (b) : In free radicals, the number of electrons are same as that in isolated neutral atom.

∵ In Cl atom, the number of electrons= 17

∴ In Cl free radicals, the number of electrons, = 17.

102. From the following pairs of ions which one is not an iso-electronic pair?

(a) Fe^{2+}, Mn^{2+} (b) O^2, F
(c) Na^+, Mg^{2+} (d) Mn^{2+}, Fe^{3+}

NEET-2021

Ans. (a) : Total no. of e–
${}_{26}Fe \rightarrow 3d^6\,4s^2$, $Fe^{2+}\rightarrow 3d^6$ 24
${}_{25}Mn \rightarrow 3d^5\,4s^2$, $Mn^{2+}\rightarrow 3d^5$ 23

103. The number of protons, neutrons and electrons in ${}^{175}_{71}Lu$, respectively, are

(a) 71, 107 and 71 (b) 104, 71 and 71
(c) 71, 104and 71 (d) 175, 104 and 71

NEET-2020

Ans. (c) : ${}^{104}_{71}Lu$

Number of protons = number of element = 71
Number of neutrons = 175 = 71 104

104. Be^{2+} is isoelectronic with which of the following ions?

(a) H^+ (b) Li^+
(c) Na^+ (d) Mg^+

NEET-2014

Ans. (b) : Be^{2+} = (4–2) = 2 is isoelectronic with Li+ (3–1=2) since, both have the same number of electron in their outermost shell.

105. Isoelectronic speicies are

(a) CO, CN^-, NO^+, C_2^{2-} (b) CO–, CN, NO, C_2^-
(c) CO^+, CN^+, NO^-, C_2 (d) CO, CN^-, NO^+, C_2^{2-}

AMU-2011
NEET-2000

Ans. (a) : Species having same no. of electrons are called isoelectronics.

The no of electrons in $CO = CN^- = NO^+ = C_2^{2-} = 14$

So, these are isoelectronic species.

@apna_pdf

106. Which one of the following is not isoelectronic with O^{2-}?

(a) Tl^+ (b) Na^+

(c) N^{3-} (d) F^-

NEET-1994

Ans. (a) : O^{2-}, N^{3-} F^- and Na^+ have 10 electrons.

107. The mass number and atomic number of Z in the following sequence are respectively

$${}^{A}_{B}X \xrightarrow{-2\alpha} Y \xrightarrow{-1\beta} Z$$

(a) A – 4, B + 1 (b) A, B –1

(c) A – 4, B – 2 (d) A – 4, B – 1

UP CPMT-2010

Ans. (d) : ${}^{A}_{B}X \xrightarrow{-2\alpha} {}^{A-4}_{B-2}Y \xrightarrow{-1\beta} {}^{A-4}_{B-1}Z$

Thus, the mass umber and atomic number of Z are A – 4 and B – 1 respectively.

108. The atomic number of an element 'M' is 26. How many electrons are present in the M-shell of the element in its M^{3+} state?

(a) 11 (b) 15

(c) 14 (d) 13

UP CPMT-2008

Ans. (d):

	K	L	M	N
M(26)	$1s^2$,	$2s^2\ 2p^6$,	$3s^23p^63d^6$	$4s^2$
M^{3+}	$1s^2$,	$2s^2\ 2p^6$,	$3s^23p^63d^5$	$4s^0$

Hence, 13 electrons are present in the M-shell of M^{3+} state.

109. Atomic number of an element is equal to the number of

(a) protons (b) neutrons

(c) protons+electrons (d) protons+neutrons

UP CPMT-2005

Ans. (a) : Atomic number= number of protons
=number of electrons
Mass number = number of protons
+ number of neutrons

110. How many neutrons are present in tritium nucleus?

(a) 2 (b) 3

(c) 1 (d) 0

UP CPMT-2003

Ans. (a) : Tritium $({}^{3}_{1}H)$ is an isotope of hydrogen

$\therefore$ atomic number = 1

$\therefore$ protons = electrons = 1

No. of neutrons = Atomic mass–No. of protons
= 3–1
= 2

111. Which one of the following has unit positive charge and 1 amu mass?

(a) Electron (b) Neutron

(c) Proton (d) None of these

UP CPMT-2003

Ans. (c) : Mass of neutron = 1.675×10^{-24} g = 1.008 amu,
Charge = 0
Mass of electron = 9.11×10^{-28} g,
Charge unit negative = -1.602×10^{-19}C
Proton has mass of 1.677×10^{-24} g = 1.007 amu and proton has one unit positive charge = 1.602×10^{-19}C

112. The atomic number of an element is 17. The number of orbitals containing electron pairs in its valence shell is

(a) 3 (b) 4

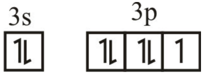
(c) 6 (d) 8

UP CPMT-2001

Ans. (a) : Write the electronic configuration and then count number of paired electrons in valence shell.

Atomic number 17 = $1s^2, 2s^2, 2p^6, 3s^2, 3p^5$

Valence shell has $3s^2$ and $3p^5$ orbitals



$\therefore$ Valence shell has 3 paired electrons.

113. The binding energy of an atom is 128 MeV. The binding energy per nucleon is 8, the number of nucleon is

(a) 4 (b) 8

(c) 16 (d) 32

UP CPMT-2001

Ans. (c) : Number of nucleons in an atom

$$= \frac{\text{binding energy of atom}}{\text{binding energy per nucleon}}$$

$$= \frac{128}{8} = 16$$

$\therefore$ Atom has 16 nucleons.

114. Which of the following is correct increasing order for the value of $\frac{e}{m}$?

(a) e < p < n < α (b) n < p < e < α

(c) n < p < α < e (d) n < α < p < e

UPTU/UPSEE-2015

Ans. (d) : n < α < p < e

	n	α	p	e
e	0	+2	+1	1
m	1	4	1	1/1836
$\frac{e}{m}$	0	$\frac{1}{2}$	1	1836

115. For which element the inertness of the electron pair will not be observe?

(a) Sn (b) Fe

(c) Pb (d) In

WB-JEE-2010

Ans. (b) : Inert pair effect is exhibited only by heavy metals of p–block elements. Fe belongs to d–block elements.

116. If species has 16 protons, 18 electrons 16 neutrons, find the species and its charge

(a) S^{1-} (b) Si^{2+}

(c) P^{3-} (d) S^{2-}

AP EAMCET (Engg.) 21.09.2020, Shift-II
COMEDK-2017
WB-JEE-2010

Ans. (d) : 16p means z=16
18 e means 2 unit negative charge is present.
Hence, species is S^{2-}

@apna_pdf

2. Atomic Models

117. Which one of the following statements is correct?
(a) Rutherford's alpha-particle scattering experiment lead to the discovery of electron
(b) J. J. Thomson suggested that the nucleus of an atom contains protons
(c) The atomic number of an element is the same as the number of protons in the nucleus of its atom
(d) The mass number of an atom is equal to the number of electrons in its shells

NDA (II)-2015

Ans : (c) The atomic number of an element is the same as the number of proton in the nucleus of its atom.

118. Rutherford's alpha-particle scattering experiment was responsible for the discovery of
(a) Electron (b) Proton
(c) Nucleus (d) Helium

NDA (I)-2017

Ans : (c) Rutherford's alpha–particle scattering was responsible for the discovery of atomic nucleus. Nucleus contains most of the mass. Most of atom has empty space.

119. The number of periods present in the long form of the periodic table is :
(a) 6 (b) 7
(c) 8 (d) 18

AP-EAMCET (Med.)-1999

Ans. (b) : The number of groups in the long form of periodic table is 18. The number of periods in the long form of periodic table is 7.

120. Who discovered that cathode rays are made up of electrons
(a) William Crookes (b) G. J. Stoney
(c) R. A. Millikan (d) J. J. Thomson

MPPET- 2009

Ans. (d) :
- J.J. Thomson discovered that cathode rays are made up of electrons.
- William Crookes investigated cathode rays in 1879 and found that they were bent by a magnetic field.
- Robert Millikan was a physicist who discovered the elementary charge of electron using the oil drop experiment.
- G.J. Stoney – He is introducing the term electron as the "Fundamental unit quantity of electricity".

121. When 4p orbital in any atom is filled completely, the next electron goes in :
(a) 5s (b) 3d
(c) 4d (d) 4f

AP-EAMCET-1991

Ans. (a) : According to the Aufbau principle and (n + 1) rule, the orbitals with increasing order their energies is as follows,

$$\boxed{1s < 2s < 2p < 3s < 3p < 4s < 3d < 4p < 5s}$$

Therefore, after 4p orbital is completely filled, the next electron goes in 5s orbital.

122. According to Aufbau principle, the sub-shell which is occupied by the electron first has :
(a) higher energy (b) lower stability
(c) lower energy (d) can't b predicted

AP-EAMCET-1993

Ans. (c) : The Aufbau Principle states that in the ground state of atom or ion, electron fill atomic orbital of the lowest available energy level's before occupying higher levels (e.g. is before 2s). In this way, the electron of an atom or ion from the most stable electron configuration possible.

123. The constancy of $\frac{e}{m}$ ratio for electrons inspite of variations of gas present in the discharge tube or of the material of the cathode shows that :
(a) electrons are negatively charged
(b) electrons are universal constituents of matter
(c) electrons are the lightest of all particles
(d) mass of the electron is $\frac{1}{1838}$ of the mass of H-atom

AP-EAMCET-1994

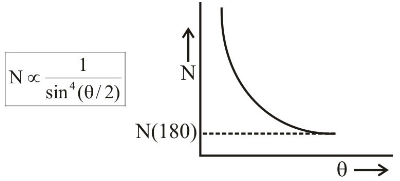
Ans. (b) : The constancy of e/m ratio for electrons inspite of variation of gas present in the discharge tube or the material of the cathode shows that electrons are universal constituents of matters.

124. Rutherford's experiment on scattering of α-particles showed for the first time that the atom has :
(a) nucleus (b) electron
(c) proton (d) neutron

AP-EAMCET-1995

Ans. (a) : Rutherford's show that for first time atom has positively charged nucleus through his □-particles scattering experiment.

Number of scattered particles–



125. In Rutherford's α-ray scattering experiment, the alpha particles are detected using a screen coated with :
(a) carbon black
(b) platinum black
(c) zinc sulphide
(d) polytetrafluoro ethylene

AP-EAMCET-1999

Ans. (c) : Rutherford's Alpha Scattering Experiment directed high energy streams of α-particles from a radioactive source at a thin sheet (100 nm thickness) of gold.

- In order to study the deflection caused to the α-particles, he placed a fluorescent zinc sulphide screen around the thin gold foil.

@apna_pdf

126. Which of the following statements is correct about the cathode rays ?

1. These rays start from anode and move towards cathode.

2. They are visible with human eye.

3. In presence of electric and magnetic fields, they behave like positively charged particles.

4. Their characteristic does not depend on the nature of material electrode.

(a) 1 (b) 2

(c) 3 (d) 4

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (d) : Characteristics of cathode rays are:

(1) The cathode rays start from cathode and move towards the anode. Thus, statement (1) is incorrect.

(2) These rays themselves are not visible but their behaviour can be observed with the help of phosphor materials such as ZnS. Thus, statement (2) is incorrect.

(3) In the absence of electrical or magnetic field, these rays travel in straight lines. In the presence of electrical or magnetic field, the behaviour of cathode rays are similar to that expected from negatively charged particles, suggesting that the cathode rays consist of negatively charged particles, called electrons. Thus statement (3) is incorrect.

(4) The characteristics of cathode rays (electrons) do not depend upon the material of electrodes and the nature of the gas present in the cathode ray tube. Hence, statement (4) is correct.

127. The nucleus of an atom contains

(a) Proton and electron

(b) Neutron and electron

(c) Proton and neutron

(d) Proton, neutron and electron

MPPET-2008

Ans. (c) : The nucleus of an atom contain of proton and neutron.

128. "The properties of elements are periodic functions of their atomic weights." This periodic law was given by

(a) Dobereiner (b) Lother Meyer

(c) Mendeleev (d) Alexander

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (c) : "The properties of elements are periodic functions of their atomic weights."

It is Mendeleev's periodic ion.

129. If the velocity of the electron in the hydrogen atom in its first orbit is 2.18 × 10^6 ms^{-1}, then will be the velocity of the electron in the second orbit of Li^{2+} ?

(a) $2.18\times10^6\text{ms}^{-1}$ (b) $3.27\times10^6\text{ms}^{-1}$

(c) $6.54\times10^6\text{ms}^{-1}$ (d) $1.45\times10^6\text{ms}^{-1}$

SCRA - 2009

Ans. (b) : Given: The velocity of electron in the first orbit $=2.18\times10^6\text{ms}^{-1}$

We know that, $V=2.18\times10^6\dfrac{z}{n}\text{ms}^{-1}$

There, n = 2 and z = 3 for Li

Putting these values, we get-

$$\Rightarrow V=\frac{2.18\times10^6\times3}{2}=3.27\times10^6\text{ms}^{-1}$$

So, option (b) is correct.

130. The number of protons. Neutrons and electrons in $^{13}_{6}$C respectively are —

(a) 6, 7, 6 (b) 13, 6, 6

(c) 6, 7, 13 (d) 6, 6, 13

AP EAPCET 20.08.2021 Shift-I

Ans. (a) : For 13_{C_6}

Atomic number = Number of protons = 6

Number of neutrons = Atomic mass number of protons

= 13 – 6 = 7

Number of electrons = number of protons = 6

131. The wavelength of a spectral line emitted by hydrogen atom in the Lyman series is $\dfrac{16}{15R}$ cm. What is the value of n$_2$? (R = Rydberg constant)

(a) 2 (b) 3

(c) 4 (d) 1

AIIMS-2011

Ans. (c) : For Lyman series.

$$\frac{1}{\lambda}=R\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right]$$

$$\frac{15R}{16}=R\left[\frac{1}{1^2}-\frac{1}{n_2^2}\right]$$

$$\frac{15R}{16R}=\left[\frac{n_2^2-1}{n_2^2}\right]$$

$$\frac{15}{16}=\left[\frac{n_2^2-1}{n_2^2}\right]$$

$$16n_2^2-15n_2^2-16=0$$

$$n_2^2-16=0$$

$$n_2=4$$

132. In which of the following options, the law of triad is applicable?

(a) Na, K, Rb (b) Cl, Br, I

(c) C, N, O (d) Ca, Sr

TS-EAMCET 09.08.2021, Shift-I

Ans. (b) : For Dobereiner's triads, the atomic weight of a middle element is almost average of the other two.

The law of triad is applicable to following species.

1) For $\underset{35.5}{\text{Cl}}$ $\underset{80}{\text{Br}}$ and $\underset{126.9}{\text{I}}$ $=\dfrac{35.5+126.9}{2}=81.2$

2) For $\underset{7}{\text{Li}}$ $\underset{23}{\text{Na}}$ and $\underset{39}{\text{K}}$ $=\dfrac{7+39}{2}=23$

3) For $\underset{40}{\text{Ca}}$ $\underset{88}{\text{Sr}}$ and $\underset{137}{\text{Ba}}$ $=\dfrac{40+137}{2}=88.5$

@apna_pdf

133. Match the following

	List-I		List-II
A.	Chadwick	I.	Cathode rays
B.	Rutherford	II.	X-rays spectra
C.	Mosley	III.	Discovery of neutrons
D.	J.J. Thomson	IV.	Nuclear atom model

The correct match is

	A	B	C	D
(a)	IV	I	II	III
(b)	III	II	IV	I
(c)	III	II	I	IV
(d)	III	IV	II	I

TS-EAMCET (Engg.), 06.08.2021

Ans. (d): List-I **List-II**

Chadwick → Discovery of neutrons

Rutherford → Nuclear atom model

Mosley → X-rays spectra

J.J. Thomson → Cathode rays

134. According to Moseley, a straight line group is obtained on plotting

(a) the frequencies of characteristics X-rays of elements against their atomic numbers

(b) the square of the frequencies of characteristics X-rays of elements against their atomic numbers

(c) the square root of the frequencies of characteristics X-rays of elements against the atomic numbers

(d) the reciprocal of the frequencies of characteristics X-rays of elements against the atomic numbers.

SRMJEEE – 2008

Ans. (c) : According to Moseley, the square root of the frequencies of characteristic X-rays of elements against the atomic numbers. $\sqrt{v} = a(Z-b)$

where, a = Proportionality constant

b = Another constant

Z = Atomic number

135. The position of both an electron and helium atom is known within 1.0 nm. The momentum of the electron is known within 5.0×10^{-26} kg ms^{-1}. The minimum uncertainty in the measurement of the momentum of the helium atom is

(a) 7.0×10^{-26} kg ms^{-1}

(b) 5.0×10^{-26} kg ms^{-1}

(c) 8.0×10^{-26} kg ms^{-1}

(d) 6.0×10^{-26} kg ms^{-1}

AIIMS-1994

Ans. (b) : The Heisenberg uncertainty principle

$$\Delta x \times \Delta p \geq \frac{h}{4\pi}$$

Where Δx = Uncertainty in position,

Δp = Uncertainty in momentum

$$\frac{h}{4\pi} = \text{constant}$$

As Δx is same for electron and helium and $\frac{h}{4\pi}$ is a constant, therefore minimum uncertainty in the measurement of the momentum of the helium atom will be same as that of an electron which is 5.0×10^{-26} kg ms^{-1}.

136. Television picture tube is basically

(a) cathode ray tube

(b) anode ray tube

(c) hybrid of cathode and anode tube

(d) none of the above

AMU-2014

Ans. (a) : The CRT (cathode ray tube) is basically the picture tube of a television set. A television screen is the front surface of a large picture tube, properly called a cathode ray tube.

137. The charge on an electron was discovered by :

(a) J.J. Thomson

(b) Neil Bohr

(c) James Chadwick

(d) Mullikan

BCECE-2004

Ans. (d) : The charge of the electron was measured by Mullikan in 1909 and it was found to be 1.602×10^{-19} coulombs.

138. Rutherford's famous experiment with α-particles used this metal

(a) Ni

(b) Au

(c) Fe

(d) Zn

BCECE-2009

Ans. (b) : Rutherford conducted an experiment by bombarding a thin sheet of gold (Au) with α-particles and then studied the trajectory of these particles after their interaction with gold foil.

139. Which of the following transition of an electron in H-atom will emit maximum energy?

(a) $n_6 \longrightarrow n_5$

(b) $n_1 \longrightarrow n_2$

(c) $n_3 \longrightarrow n_2$

(d) $n_4 \longrightarrow n_3$

BCECE-2017

Ans. (c) : We know that energy can we calculated by using formula $(E) = \frac{hc}{\lambda}$.

$$\frac{1}{\lambda} = RZ^2\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$$

$$E = RZ^2hc\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$$

When, transition is from $n_3 - n_2$, it produce highest energy.

140. The energy of an electron in nth orbit of hydrogen atom is

(a) $\frac{13.6}{n^4}$eV

(b) $\frac{13.6}{n^3}$eV

(c) $-\frac{13.6}{n^2}$eV

(d) $\frac{13.6}{n}$eV

CG PET -2007

Ans. (c) : Energy of an electron in Bohr's orbit is given by the relationship.

$$E_n = -\frac{13.6}{n^2}\text{eV}$$

141. Which of the following is incorrect regarding Rutherford's atomic model?

(a) Atom contains nucleus

(b) Size of nucleus is very small in comparison to that of atom

@apna_pdf

(c) Nucleus contains about 90% mass of the atom
(d) Electrons revolve around the nucleus with uniform speed.

HP CET-2018

Ans. (c) : According to Rutherford's majority of the mass was concentrated in a minute positively changed region (the nucleus surrounded by electrons).

142. Given below are two statements:
Statement-I Rutherford's gold foil experiment cannot explain the line spectrum of hydrogen atom.
Statement-II Bohr's model of hydrogen atom contradicts Heisenberg's uncertainty principle.
In the light of the above statements, choose the most appropriate answer from the options given below:
(a) Statement I is false but statement II is true.
(b) Statement I is true but statement II is false.
(c) Both statement I and statement II are false.
(d) Both statement I and statement II are true.

[JEE Main 2021, 27 July Shift-I]

Ans. (d) : Rutherford's gold foil experiment only proved that electrons are held towards nucleus by electrostatic forces of attraction and move in circular orbit with very high speeds.

Bohr's model gave exact formula for simultaneous calculation of speed and distance of electrons from the nucleus, something which was deemed impossible according to Heisenberg.

143. If the Thomson model of the atom was correct, then the result of Rutherford's gold foil experiment would have been
(a) All of the α-particles pass through the gold foil without decrease in speed.
(b) α-particles are deflected over a wide range of angles
(c) all α-particles get bounced back by 180^0.
(d) α-particles pass through the gold foil deflected by small angles and with reduced speed.

[JEE Main 2021, 27 July Shift-II]

Ans. (d) : As in Thomson model, protons are diffused (charge is not centered) α–
Particles deviate by small angles and due to repulsion from protons this speed decreases.

144. For d-electron, the orbital angular momentum is

(a) $\frac{\sqrt{6}\,h}{2\pi}$	(b) $\frac{\sqrt{2}\,h}{2\pi}$
(c) $h/2\pi$	(d) $2h/\pi$

J & K CET-(2004)

Ans. (a) : The angular momentum $L=\sqrt{l(l+1)}\cdot\frac{h}{2\pi}$

For d orbital, $l = 2$

$$\therefore L=\sqrt{2(2+1)}\cdot\frac{h}{2\pi}=\sqrt{6}.\frac{h}{2\pi}$$

145. Neutron is discovered by

(a) Chandwick	(b) Rutherford
(c) Yukawa	(d) Dalton

JIPMER-2008

Ans. (a) : Neutron was discovered by J. Chadwick in may 1932. According to Chadwick it is another sub-atomic particle and part of an atom. It has no charge i.e. it is electrically neutral and it is represented by n.

146. Which of the following is not true in Rutherford's nuclear model of atom?
(a) Protons and neutrons are present inside nucleus
(b) Volume of nucleus is very small as compared to volume of atom
(c) The number of protons and neutrons are always equal
(d) The number of electrons and protons are always equal

Manipal-2019

Ans. (c) : The sum of protons and neutrons give the mass number, the number of neutrons can be very different to the number of protons.

147. Rutherford's experiment on the scattering of α-particles showed for the first time that the atom has:

(a) electrons	(b) Protons
(c) Nucleus	(d) neutrons

UPTU/UPSEE-2005

Ans. (c) : The conclusion of Rutherford from his α-ray experiment are:
(i) Most of the space inside the atom is empty because most of the alpha–particles passed through the gold foil without getting deflected.
(ii) Very few particles were deflected from their path, indicating that the positive charge of the atom occupies very little space.
(iii) A very small fraction of alpha–particles were deflected by 180^o.

Indicating that all the positive charges and mass of the gold atom were concentrated in very small volume within the atom. From the data he also calculated that the radius of the nucleus is about 105 times less the radius of the atom.

3. Dual Nature of Electron

148. The energy of mole of photons of radiation of wavelength 300 nm is (given $h = 6.63 \times 10^{-34}$Js, $N_A = 6.02 \times 10^{23}$ mol^{-1} $C = 3 \times 10^8$ ms^{-1})

(a) 235 kJ mol^{-1}	(b) 325 kJ mol^{-1}
(c) 399 kJ mol^{-1}	(d) 435 kJ mol^{-1}

JEE Main-24.06.2022, Shift-II

Ans. (c) : Given,
Wavelength of photon = 300 nm
Planck's constant = 6.63×10^{-34} Js
$N_A = 6.02 \times 10^{23}$mol^{-1}
$C = 3 \times 10^8$ ms^{-1}

As we know that–

$$\text{Energy} = \frac{hc}{\lambda}$$

$$\text{Energy} = \frac{6.63\times10^{-34}\times3\times10^{8}}{300\times10^{-9}}$$

$$= 6.63 \times 10^{-19}\text{ J}$$

@apna_pdf

Energy of one mole of photon

$= 6.63 \times 10^{-19} \times 6.02 \times 10^{23}\ \text{mol}^{-1}$

$= 399$ kJ/mol.

149. If wavelength of photon is 2.2×10^{-11} m and $h = 6.6\times10^{-34}$ J s, then momentum of photon

(a) $1.452\times10^{-44}\,\text{kg m s}^{-1}$ (b) $6.89\times10^{43}\,\text{kg m s}^{-1}$

(c) $3\times10^{-23}\,\text{kg m s}^{-1}$ (d) $3.33\times10^{-22}\,\text{kg m s}^{-1}$

Karnataka CET-17.06.2022, Shift-II

Ans. (c) : Given that –

Wavelength of proton (λ) = 2.2×10^{-11} m

Planck's constant = 6.6×10^{-34} Js.

Momentum of photon = ?

According to de – Broglie equation

$$\lambda = \frac{h}{p}$$

$$p = \frac{h}{\lambda}$$

$$p = \frac{6.6\times10^{-34}}{2.2\times10^{-11}}$$

$$p = 3 \times 10^{-34} \times 10^{11}$$

$$p = 3 \times 10^{-23}\ \text{kg. ms}^{-1}$$

150. The minimum energy that must be possessed by photons in order to produce the photoelectric effect with platinum metal is [Given: The threshold frequency of platinum is $1.3\times 10^{15}\ s^{-1}$ and $h = 6.6 \times 10^{-34}$ Js.]

(a) 3.21×10^{-14} J (b) 6.24×10^{-16} J

(c) 8.58×10^{-19} J (d) 9.76×10^{-20} J

JEE Main-25.06.2022, Shift-II

Ans. (c) : Given,

Threshold frequency of platinum = $1.3 \times 10^{15}\ s^{-1}$

Planck's constant (h) = 6.6×10^{-34} Js

As we know that–

$$\text{Energy} = \frac{hc}{\lambda}$$

And frequency (ν) $= \frac{c}{\lambda}$

Then,

Energy = hν

$= 6.6 \times 10^{-34}\ \text{Js} \times 1.3 \times 10^{15}\ s^{-1}$

$= 8.58 \times 10^{-19}$ J

151. A particle of mass 6.6×10^{-31} kg is moving with a velocity of $1 \times 10^{7}\ ms^{-1}$. The de Broglie wavelength (in Å) associated with the particle, is ($h = 6.6 \times 10^{-34}$ Js)

(a) 1 (b) 10

(c) 5 (d) 2

(e) 4

Kerala CEE -03.07.2022

Ans. (a) : Given that –

Mass particle (m) = 6.6×10^{-31} kg

Velocity of particle (v) = 1×10^{7} m/s

Wave length (λ) = ?

$h = 6.6 \times 10^{-34}$ Js

We know that –

$$\lambda = \frac{h}{mv}$$

$$\lambda = \frac{6.6\times10^{-34}}{6.6\times10^{-31}\times10^{7}}$$

$$\lambda = 10^{-34} \times 10^{24}$$

$$\lambda = 10^{-10}$$

$$\lambda = 1\text{A}^{o}$$

$\therefore\ 1\text{A}^{o} = 10^{-10}$

152. What is the approximate wavelength in Å of a photon having energy 2eV? [Planck's constant = 6.63×10^{-34}J.s]

(a) 6200 (b) 5100

(c) 4600 (d) 3900

SCRA-2010

Ans. (a) : We know that, E = nhν

Where, h = Planck's constant (6.67×10^{-34} Js)

ν = Frequency of radiation

c = Velocity of light (3×10^{8} m/s)

$$\therefore \quad E = nh\frac{c}{\lambda}$$

$$\text{or} \quad \lambda = \frac{nhc}{E}$$

$$\text{or} \quad \lambda = \frac{6.67\times10^{-34}\times3\times10^{8}}{1.6\times10^{-19}} \qquad (1\text{eV}) = 1.6\times10^{-19}\ \text{J}$$

$$\lambda = \frac{20.01\times10^{-7}}{2\times1.6}$$

$$\lambda = 6.2531\times10^{-7}$$

$$\lambda = 6253\times10^{-10}$$

$$\text{or} \quad \lambda = 6253\text{Å}$$

153. The longest wavelength present in Balmer series lines is [Given Rydberg constant = $1.097 \times 10^{7}\ m^{-1}$]

(a) 640 nm (b) 656 nm

(c) 662 nm (d) 670 nm

SCRA-2014

Ans. (b) : In the Balmer series, the energy gap is very less between n = 2 to n = 3.

So, the wavelength high in nature.

Given that, Rydberg constant = $1.097 \times 10^{7}\ m^{-1}$

Using the following Formula–

$$\bar{\nu} = 1.097 \times 10^{7}\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

$$\text{or} \quad \bar{\nu} = 1.097\times10^{7}\left(\frac{1}{4}-\frac{1}{9}\right)$$

$$\text{or} \quad \bar{\nu} = 1.097\times10^{7}\times\frac{5}{36}$$

$$\text{or} \quad \bar{\nu} = 0.1523\times10^{7}\ \text{m}^{-1}$$

We know that,

$$\lambda = \frac{1}{\bar{\nu}}$$

@apna_pdf

$$\lambda = \frac{1}{0.1523\times10^{7}\,m^{-1}}$$

$$\lambda = 6.56\times10^{-7}\,m$$

or $\lambda = 656nm$

154. The energy of an electromagnetic radiation is 19.875×10^{-13} erg. What is its wave number in cm^{-1} ? ($h=6.625\times10^{-27}$ erg-s; $c=3\times10^{10}$ cm s^{-1})

(a) 1000 (b) 10^{6}

(c) 100 (d) 10,000

AP-EAMCET-2002

Ans. (d) : Given that :

$E = 19.875 \times 10^{-13}$ erg

$h = 6.625 \times 10^{-27}$ erg sec.

$C = 3 \times 10^{10}$ cm.sec^{-1}

$\therefore$ $E = h\overline{v}$

$$\overline{v} = \frac{E}{h}$$

$$\overline{v} = \frac{19.875\times10^{-13}}{6.625\times10^{-27}\times3\times10^{10}}$$

$\overline{v} = 10^{4} = 10,000$

155. If the wavelength of an electromagnetic radiation is 2000 Å, what is its energy in erg?

(a) 9.94×10^{-12} (b) 9.94×10^{-19}

(c) 4.97×10^{-12} (d) 4.97×10^{-19}

AP-EAMCET-2003

Ans. (a) : Given, □ = 2000 Å = 2000 × 10^{-10}m, E = ?

$$\therefore \quad E = \frac{hc}{\lambda} = \frac{6.626\times10^{-27}\,\text{erg sec}\times3\times10^{8}\,m/sec}{2000\times10^{-10}\,m}$$

$= 9.94 \times 10^{-12}$ erg

156. The energy of a photon is 3×10^{-12} erg. What is its wavelength in nm?
($h = 6.62 \times 10^{-27}$ erg-s, $c = 3 \times 10^{10}$ cm s^{-1})

(a) 662 (b) 1324

(c) 66.2 (d) 6.62

AP-EAMCET-2006

Ans. (a) : Given that :

$E = 3 \times 10^{-12}$ erg

$h = 6.62 \times 10^{-27}$ erg – s

$C = 3 \times 10^{10}$ cm/sec

$\therefore$ we know that :

$$E = \frac{hc}{\lambda}$$

$$\lambda = \frac{6.62\times10^{-27}\times3\times10^{10}}{3\times10^{-12}}$$

$\lambda = 6.62 \times 10^{-27+22}$

$\lambda = 6.62 \times 10^{-5}$ cm

$\lambda = 662 \times 10^{-7}$ cm

$\lambda = 662 \times 10^{-9}$ m

$\lambda = 662$ nm

157. The velocities of two particles A and B are 0.05 and 0.02 ms^{-1} respectively. The mass of B is five times the mass of A. The ratio of their de-Broglie's wavelength is :

(a) 2 : 1 (b) 1 : 4

(c) 1 : 1 (d) 4 : 1

AP-EAMCET-2008

Ans. (a) : Given that :

velocity of A = 0.05 m/sec.

velocity of B = 0.02 m/sec.

Let, the mass of particle A = x

$\therefore$ mass of particle B = 5x

According to de-Broglie equation

$$\lambda = \frac{h}{mv}$$

For particle A : $\lambda_A = \dfrac{h}{x\times0.05}$ (i)

For particle B : $\lambda_B = \dfrac{h}{5x\times0.02}$ (ii)

Divide equation (i) and (ii) we get

$$\frac{\lambda_A}{\lambda_B} = \frac{5x\times0.02}{x\times0.05} = \frac{2}{1}$$

$\lambda_A : \lambda_B = 2 : 1$

158. Two particles of masses m & 2m have equal kinetic energies. The de-Broglie wavelength are in the ratio of_____

(a) 1 : 1 (b) 1 : 2

(c) $1 : \sqrt{2}$ (d) $\sqrt{2} : 1$

AP EAPCET 23-08-2021 Shift-I

Ans. (d) : de-Broglie wavelength equation is-

$$\lambda = \frac{h}{p} = \frac{h}{mv}$$

where,

λ = Wavelength

h = Planck's constant

P = Momentum

m = Mass of the particle

v = Velocity

$\therefore$ P = mv

Squaring both side and divide 1/2 we get-

$$\frac{1}{2}P^2 = \frac{1}{2}m^2v^2$$

$$\frac{1}{2}P^2 = (K.E.).m \qquad \left\{\therefore K.E. = \frac{1}{2}mv^2\right\}$$

$$P = \sqrt{2(K.E.)m}$$

$$\text{So, } \lambda = \frac{h}{\sqrt{2(K.E.)m}}$$

Given, two particles of mass m and 2m and kinetic energy are same –

$$\lambda_1 = \frac{h}{\sqrt{2(K.E.).m}} \qquad ....(i)$$

$$\lambda_2 = \frac{h}{\sqrt{2(K.E.)2m}} \qquad ....(ii)$$

dividing (i) & (ii) we get

$$\frac{\lambda_1}{\lambda_2} = \frac{h}{\sqrt{2(KE)m}} \times \frac{\sqrt{2(KE)2m}}{h}$$

$$\frac{\lambda_1}{\lambda_2} = \frac{\sqrt{2}}{1}$$

$\therefore$ Wavelength ratio $= \sqrt{2} : 1$

@apna_pdf

159. With what velocity must an electron travel so that its momentum is equal to that of a photon of wavelength 663 nm?

(a) 1098 m/s (b) 109.8 m/s

(c) 10.98 m/s (d) 1.098 m/s

AP EAPCET 23-08-2021 Shift-I

Ans. (a) : Given, $\lambda = 663\text{ nm} = 663\times10^{-9}$ m

$m_e = 9.1\times10^{-31}$ kg

V = ?

$$\therefore \quad \lambda = \frac{h}{p} = \frac{h}{m_e v}$$

Where, h = Planck's constant

p = Momentum

$$V = \frac{h}{m_e\lambda}$$

$$V = \frac{6.626\times10^{-34}}{9.1\times10^{-31}\times663\times10^{-9}}$$

$$V = \frac{6.626}{9.1\times663}\times10^{6}$$

V = 1098 m/sec.

160. The ratio of de-Broglie wavelength of two particles A and B is 2 : 1. If the velocities of A and B are 0.05 ms^{-1} and 0.02 ms^{-1} respectively then the ratio of their masses $M_A : M_B$ must be ______.

(a) 5 : 1 (b) 10 : 1

(c) 1 : 5 (d) 1 : 8

AP-EAMCET 25-08-2021 Shift - I

Ans. (c) : From de-Broglie equation–

$$\lambda = \frac{h}{mv}$$

Where, λ = Wavelength

h = Planck's constant

$$\therefore \quad \frac{\lambda_A}{\lambda_B} = \frac{m_B V_B}{m_A V_A}$$

$$\frac{m_A}{m_B} = \frac{\lambda_B V_B}{\lambda_A V_A}$$

$$= \frac{1\times0.02}{2\times0.05}$$

$$= \frac{0.01}{0.05}$$

$$\boxed{m_A : m_B = 1:5}$$

161. The relation between the stopping potential (V_0) and frequency (ν) is correctly represented in [ϕ = Work function]

(a) $V_0 = \frac{\phi}{e} - \frac{h\nu^2}{e}$ (b) $V_0 = \frac{he}{\nu} + \frac{\phi}{e}$

(c) $V_0 = \frac{h\nu}{e} - \frac{\phi}{e}$ (d) $V_0 = \frac{h\nu}{e^2}$

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (c) : The relation between the stopping potential (V_0) and frequency (ν) is correctly represented by the following equation.

$$\boxed{V_0 = \frac{h\nu}{e} - \frac{\phi}{e}}$$

Where, V_0 = Stopping potential

ν = Frequency

ϕ = Work function

162. The energy required to overcome the attractive forces on the electrons, w, of some metals is listed below. The number of metals showing photoelectric effect when light of 300 nm wavelength falls on it is

(1eV = 1.6 × 10^{-19} J)

Metal	**Li**	**Na**	**K**	**Mg**	**Cu**	**Ag**	**Fe**	**Pt**	**W**
w(eV)	**2.4**	**2.3**	**2.2**	**3.7**	**4.8**	**4.3**	**4.7**	**6.3**	**4.75**

(a) 6 (b) 8

(c) 5 (d) 4

AP EAMCET (Medical) - 2013

Ans. (d) : Given:

wavelength (λ) = 300 nm = 300×10^{-9} m

1 eV = 1.6 × 10^{-19} J

∴ Energy of a photon of radiation of wavelength 300nm will be -

E = hν

or $E = \frac{hc}{\lambda}$

or $E = \frac{6.6\times10^{-34}(\text{JS})\times3\times10^{8}\left(\text{ms}^{-1}\right)}{300\times10^{-9}\text{m}}$

or $E = 6.6\times10^{-19}$J

$E = \frac{6.6\times10^{-19}}{1.6\times10^{-19}}$eV

or E = 4.14 eV

There are 4 metals for which the energy required to overcome the attractive forces on the electrons, w, is less than 4.14 eV, the energy of light of wavelength 300 nm. Thus the number of metals showing a photoelectric effect is 4.

163. If, the binding energy of electrons in a metal is 250 kJ/mol, what should be the threshold frequency of the striking photons in order to free an electron from the metal surface ?

(a) 6.26 × 10^{14} s^{-1} (b) 12.4 × 10^{14} s^{-1}

(c) 6.26 × 10^{12} s^{-1} (d) 12.4 × 10^{12} s^{-1}

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (a) Binding energy of 1 mole of electrons = 250 kJ

Binding energy of 1 electron = (250)/(6.022 × 10^{23}) kJ

= 4.15 × 10^{-22} kJ

= 4.15 × 10^{-19} J

Threshold energy ($h\nu_0$) = Binding energy

∴ $h\nu_0$ = 4.15 × 10^{-19} J

or ν_0 = (4.15 × 10^{-19} J)/ h

= (4.15 × 10^{-19} J)/(6.626 × 10^{-34} J s)

= 6.26 × 10^{14} s^{-1}

Hence, the correct option is (a).

164. de Broglie was awarded the Nobel Prize in the year

(a) 1921 (b) 1922

(c) 1929 (d) 1928

TS EAMCET 10.08.2021, Shift-I

@apna_pdf

Ans. (c) : de Broglie was awarded by Nobel Prize in 1929 for his discovery of the wave nature of electrons.

165. Upon irradiation with radiation of a suitable wavelength on the cathode, the photocurrent produced was reduced to zero by applying a stopping potential of 2.63 V. If the work function of the cathode is 4.3 eV. Find the approximate wavelength of the radiation (in nm)How many among the given species have the highest bond order? CN^-, CO, NO^+, O_2^+, O_2, N_2

(a) 224 (b) 179

(c) 190 (d) 165

TS EAMCET 10.08.2021, Shift-I

Ans. (b) : By Einstein photoelectric equation

$$KE_{max} = h\nu - \phi, \boxed{KE_{max} = ev}$$

$$ev = \frac{hc}{\lambda} - \phi \qquad \phi = \text{wort function}$$

$$\frac{hc}{\lambda} = ev + \phi \qquad c = 3\times10^8 m/s$$

$$\lambda = \frac{hc}{ev+\phi} \qquad h = 6.63\times10^{-34}/s$$

$$\lambda = \frac{6.63\times10^{-34}\times3\times10^8}{1.6\times10^{-19}\times2.63+1.6\times10^{-19}\times4.3}$$

$$\lambda = \frac{19.89\times10^{-26}}{1.6\times10^{-19}(2.63+4.3)}$$

$$\lambda = \frac{19.89\times10^{-26}\times10^{19}}{1.6\times6.93}$$

$$\lambda = 1.792\times10^{-7}$$

$$\lambda = 179.2\times10^{-9}$$

$$\boxed{\lambda = 179nm}$$

166. The work functions of Ag, Mg, K and Na respectively in eV are 4.3, 3.7, 2.25, 2.30, When an electromagnetic radiation of wavelength of 300 nm is allowed to fall on these metal surface, the number of metals from which the electrons are ejected is (1ev = 1.6022 × 10^{-19}J)

(a) 4 (b) 3

(c) 2 (d) 5

AP EAMCET-2017

Ans. (b) : Given that,

λ = 300 nm = 300 × 10^{-9} m

$$E = \frac{hc}{\lambda}$$

$$E = \frac{6.6\times10^{-34}\times3\times10^8}{300\times10^{-9}}$$

$$E = \frac{19.8\times10^{-26}}{300\times10^{-9}}$$

E = 6.6 × 10^{-19} Joule

And work function for Ag, Mg, K and Na in Joules are –

Ag = 4.3 × 1.6022 × 10^{-19} = 6.89 ×10^{-19} Joule

Mg = 3.7 × 1.6022 × 10^{-19} = 5.93 × 10^{-19} joule

K = 2.25 × 1.6022 × 10^{-19} = 3.60 × 10^{-19} joule

Na = 2.30 × 1.6022 × 10^{-19} = 3.68 × 10^{-19} Joule

Thus Mg, K and Na metal will eject electron only when W ≤ $E_{(300)}$.

Hence the option (b) is correct

167. $[Ti(H_2O)_6]^{3+}$ absorbs light of wavelength 498 nm during a d - d transition. The octahedral splitting energy for the above complex is ---------×10^{-19} J. (Round off to the Nearest Integer). h = 6.626×10^{-34} Js; c = 3×10^8 ms^{-1}

JEE Main 16.03.2021, Shift-II

Ans. (4) : Given-λ = 498nm

The octahedral splitting energy is:

$$\Delta_0 \text{ or } E = \frac{hc}{\lambda}$$

$$E = \frac{6.66\times10^{-34}\times3\times10^8}{498\times10^{-9}}$$

or E = 4.00×10^{-19}J (rounding off)

168. Calculate the wave number and frequency of orange radiation having wavelength 6300 Å.

(a) $1.587\times10^8 m^{-1}, 4.761\times10^{16} s^{-1}$

(b) $1.587\times10^4 m^{-1}, 4.761\times10^{14} s^{-1}$

(c) $1.587\times10^6 m^{-1}, 4.761\times10^{14} s^{-1}$

(d) $1.587\times10^6 m^{-1}, 4.761\times10^{16} s^{-1}$

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (c) : For orange radiation (EMR) of λ = 6300Å

(i) Wave number,

$$\bar{v} = \frac{1}{\lambda} = \frac{1}{6300Å} = \frac{1}{6300\times10^{-10}m}$$

= 1.587 × 10^6 m^{-1}

(ii) Frequency, $$\frac{c}{\lambda} = \frac{3\times10^8 ms^{-1}}{6300\times10^{-10}m}$$

= 4.761 × $10^{14}$$s^{-1}$

169. Which of the following statements is correct about photoelectric effect ?

(A) The number of electrons ejected from metal surface is inversely proportional to intensity of light.

(B) Below threshold frequency, photoelectric effect can be observed.

(C) At higher frequency than threshold frequency, the ejected electrons have certain kinetic energy.

(D) At higher frequency than threshold frequency, the electron is still on the metal surface.

(a) 1 (b) 2

(c) 3 (d) 4

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (c) : Kinetic energy of photoelectrons

KE = hv – hv_0

⇒ When > V_0, KE > 0

So, statement C is correct.

Where, v = Frequency of incident light

V_0 = Threshold frequency

@apna_pdf

Now, other options will be correct when

A. Number of photoelectrons ejected from metal surface intensity of light.

B. When, $v < V_0$, $KE < 0$ phtoelectric effect cannot be observed.

D. When, $v = v_0$, $KE = 0$ the electrons will be still on the metal surface.

170. Calculate energy of half mole of photons of a radiation with frequency 3×10^{12} Hz.

(a) 598.2 kJ mol^{-1} (b) 0.598 kJ mol^{-1}

(c) 1.196 kJ mol^{-1} (d) 119.6 kJ mol^{-1}

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (b) : Energy of a photon, E = hv, where,

v = Frequency = 3×10^{12} Hz

Therefore, energy

$= 6.6 \times 10^{-34} \times 3 \times 10^{12}$ Hz $= 1.9878 \times 10^{-21}$ J

1 mole $= 6.02 \times 10^{23}$ photons,

Therefore, $\frac{1}{2}$ mole $= 3.01 \times 10^{23}$ photons

Therefore, energy of $\frac{1}{2}$ mole of photons

$= 1.9878 \times 10^{-21} \times 3.01 \times 10^{23}$

= 0.5982 kJ/mol

Hence, the correct option is (b).

171. One mole of alkene $\underline{X}$ on ozonolysis gave one mole of acetaldehyde and one mole of acetone. The IUPAC name of $\underline{X}$ is

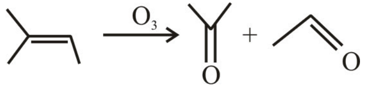
(a) 2-methyl-2butene (b) 2-methyl-1-butene

(c) 2-butene (d) 1-butene

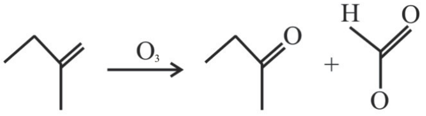
AP EAMCET (Engg.)-2009

Ans. (a): $X \xrightarrow{O_3} CH_3CHO + CH_3COCH_3$

The molecule X must be a compound containing 5 carbon atoms, and thus, X cannot be 1–butene or 2–butene as they contain 4 carbon atoms only.



2–methyl–2–butene



2-methyl – 1 – butene

2–methybut –2– ene gives desired products.

172. The de-Broglie wavelength of a tennis ball of mass 60 g moving with a velocity of 10 ms^{-1} is approximately .... (Planck's constant h = 6.63 × 10^{-34} J. s)

(a) 1.1×10^{-31} m (b) 1.1×10^{-33} m

(c) 1.1×10^{-34} m (d) 1.1×10^{-32} m

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (b) : de-Broglie's wave equation is

$$\lambda = \frac{h}{mv} = \frac{6.63 \times 10^{-34}}{\left(60 \times 10^{-3}\right) \times 10} = 1.10 \times 10^{-33} \text{m}$$

[m = Mass of the ball = 60g = 60×10^{-3}kg,

v = velocity of the ball = 10 ms^{-1}]

173. If two particles A and B are moving with the same velocity. But wavelength of A is found to be double than that of B. Which of the following statements are correct?

(a) Both A and B have same mass

(b) Mass of A is half that of B

(c) Mass of B is half that of A

(d) Mass of B is one-fourth that of A

AP EAPCET 19-08-2021 Shift-I

Ans. (b) : From the equation of De-Broglie

$\lambda = \frac{h}{p}$ Where λ = wavelength

Or $\lambda = \frac{h}{m.v}$ h = Plank's constant

P = Momentum

For particle A –

$$2\lambda = \frac{h}{m_A v} \ \ldots\ldots (i)$$

For particle B –

$$\lambda = \frac{h}{m_B v} \ \ldots\ldots (ii)$$

From equation (i) and (ii)

$$2 = \frac{h}{m_A v} \times \frac{m_B v}{h}$$

Or $$2 = \frac{m_B}{m_A}$$

$$m_A = \frac{m_B}{2}$$

174. Identify the correct statements regarding Balmer series: The wave number of each line in the spectrum of atomic hydrogen is given the equation $\bar{v} = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$ where R_H is a constant and n_1 and n_2 are integers.

(i) As wave length decrease, the lines in the series constant

(ii) The integer n_1 is equal to 2

(iii) The ionization energy of hydrogen can be calculated from the wave number of these lines

(iv) The line of longest wavelength corresponds to $n_2 = 3$

Options:

(a) (i), (ii) & (iii) only (b) (i), (iii) & (iv) only

(c) (ii) & (iv) only (d) (ii), (iii) & (iv) only

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c) : Explanation:– For Balmer series in the spectrum of hydrogen,

$$\bar{v} = R_H\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$$

Where, R_H = Rydberg's constant Incase of Balmer series, transition takes place from various energy levels such as n_2 =3,4,5…..to n_1=2.

@apna_pdf

For longest wavelength, minimum energy transition takes place $n_2 = 3$ to $n_1 = 2$. Since, energy is inversely proportional to wavelength.

i.e, $\boxed{E \propto \frac{1}{\lambda}}$ As, the wavelength decreases, the lines in the series converge.

175. It the work function for the photoelectron emission of a mental is 3.75 e*V*, then the threshold wave length of the radiation needed for the ejection of the electron is approximately_____.

(a) 315 nm (b) 280 nm
(c) 330 nm (d) 290 nm

AP EAPCET 20.08.2021 Shift-II

Ans. (c): $\lambda(\in \text{Å}) = \frac{12.375}{3.75}\text{Å} \approx 3300\text{Å}$

$\text{Or}\,\lambda \approx 330\,\text{nm} \quad [\because 1\,\text{Å} = 0.1\text{ nm}]$

176. A 150 watt bulb emits light of wavelength 6600 Å and only 8% of the energy is emitted as light. How many photons are emitted by the bulb per second?

(a) 4×10^{19} (b) 3.24×10^{19}
(c) 4.23×10^{20} (d) 3×10^{20}

COMEDK-2014

Ans. (a) : Power of the bulb= 150 watt= 150 J s^{-1}

As only 8% of the energy is emitted as light so, the total energy emitted per second

$$= \frac{150\text{J}\times 8}{100} = 12\text{J}$$

Energy of one photon, $E = h\upsilon = \frac{hc}{\lambda}$

$$= \frac{(6.626\times10^{-34}\,\text{Js})\times(3\times10^{8}\,\text{m s}^{-1})}{6600\times10^{-10}\,\text{m}} = 3.0118\times10^{-19}\text{ J}$$

$\therefore$ Number of photons emitted

$$= \frac{12\text{J}}{3.0118\times10^{-19}\,\text{J}} = 3.98\times10^{19} \approx 4.0\times10^{19}$$

177. The energy of an electromagnetic radiation is 3 × 10^{-12} ergs. What is the wavelength in nanometers?
h = 6.625 × 10^{-27} erg sec.,
c = 3 × 10^{10} cm sec.$^{-1}$

(a) 400 (b) 228.3
(c) 3000 (d) 662.5

AP-EAMCET (Medical), 2002

Ans. (d) : Given that –

$E = 3 \times 10^{-12}$ ergs
λ = ? (nanometer)
$h = 6.625 \times 10^{-27}$ erg. sec
$C = 3 \times 10^{10}$ cm sec^{-1}

Now, $E = \frac{hc}{\lambda}$

or $\lambda = \frac{hc}{E}$

or $\lambda = \frac{6.625\times10^{-27}\,(\text{erg.sec})\times 3\times10^{10}\,(\text{cm sec}^{-1})}{3\times10^{-12}\,(\text{ergs})}$

or $\lambda = 6.625 \times 10^{-5}$ cm
or $\lambda = 6.625 \times 10^{-7}$ m
or $\lambda = 662.5 \times 10^{-9}$ m
or $\lambda = 662.5$ nm

178. Calculate the velocity of an electron having wavelength of 0.15 nm. Mass of an electron is 9.109 × 10^{-28} grams. (h = 6.626 × 10^{-27} erg-second).

(a) 4.85×10^{8} cm. sec.$^{-1}$
(b) 2.062×10^{15} cm. sec.$^{-1}$
(c) 2.062×10^{10} cm. sec.$^{-1}$
(d) 4.85×10^{9} cm. sec.$^{-1}$

GUJCET-2011

Ans. (a): Given that,

$\lambda = 0.15\text{ nm} = 0.15 \times 10^{-9}$ m
$M = 9.109 \times 10^{-28}$ gm $= 9.109 \times 10^{-31}$ kg
$h = 6.626 \times 10^{-27}$ erg-second $= 6.626 \times 10^{-34}$ J sec.

According to de Broglie equation–

$$\lambda = \frac{h}{p} = \frac{h}{mv}$$

$$v = \frac{h}{m\lambda} = \frac{6.626\times10^{-34}}{9.109\times10^{-31}\times0.15\times10^{-9}}$$

$v = 4.8494 \times 10^{6}$ m/sec $= 4.849 \times 10^{8}$ cm/sec.

179. Which of the following relations is correct, if the wavelength (λ) is equal to the distance travelled by the electron in one second?
h is the Planck's constant and m is the mass of electron

(a) $\lambda = h/p$ (b) $\lambda = h/m$
(c) $\lambda = \sqrt{h/p}$ (d) $\lambda = \sqrt{h/m}$

TS EAMCET 04.08.2021, Shift-I

Ans. (d) : We know that–

$$\lambda = \frac{h}{mv} \quad .....(i)$$

Here, m = Mass of electron
v = Velocity of electron
λ = Wavelength of electron

If wavelength (λ) is equal to distance travelled by the electron in one second i.e.

$\lambda = v$

Put in equation (i), we get–

$$\lambda = \frac{h}{m\lambda}$$

$$\Rightarrow \quad \lambda^2 = \frac{h}{m}$$

$$\boxed{\lambda = \sqrt{\frac{h}{m}}}$$

180. When light of wavelength 248nm falls on a metal of threshold energy 3.0 eV, the de-Broglie wavelength of emitted electrons is______Å. (Round off to the Nearest Integer).

$[m_e = 9.1\times10^{-31}\text{kg}; c = 3.0\times10^{8}\text{ms}^{-1}; 1\text{eV} = 1.6\times10^{-19}\text{Js}]$

JEE Main 16.03.2021, Shift-I

@apna_pdf

Ans. (9Å) : Given that, Wavelength $(\lambda) = 248\text{nm}$

Threshold energy $(\phi) = 3.0\text{eV}$

de–Broglie wavelength $(\lambda) = ?$

Now, Energy incident $= \frac{hc}{\lambda}$

Where, h = Planck's constant
c = Speed of light
$\lambda =$ Wavelength

$$\therefore\ E = \frac{6.6\times10^{-34}\times3\times10^{8}}{248\times10^{-19}\times1.6\times10^{-19}}\text{eV}$$

$E = 5\text{eV}$

From the Einstein photoelectric equation–

$E = \phi + \text{K.E.}$

or K.E. = 5 eV – 3 eV

or K.E. = 2 eV

or K.E. $= 2\times1.6\times10^{-19} = 3.2\times10^{-19}$ J

For de-Broglie wavelength $(\lambda) = \frac{h}{mv}$

$$\text{K.E.} = \frac{1}{2}mv^2$$

So, $v = \sqrt{\frac{2(\text{K.E.})}{m}}$

Hence, $\lambda = \frac{h}{\sqrt{2(\text{K.E.})\times m}}$

or $\lambda = \frac{6.6\times10^{-34}}{\sqrt{2\times3.2\times10^{-19}\times9.1\times10^{-31}}}$

or $\lambda = \frac{6.6\times10^{-34}}{\sqrt{58.24\times10^{-50}}}$

or $\lambda = 9$ Å

181. If the energies of two light radiations E_1 and E_2 are 25 eV and 100 eV respectively, then their respective wavelength λ_1 and λ_2 would be in the ratio $\lambda_1 : \lambda_2 =$ ______

(a) 2:1 (b) 4:1
(c) 1:4 (d) 1:2

AP EAPCET 19-08-2021, Shift-II

Ans. (b) : Given that, $E_1 = 25$ eV, $E_2 = 100$ eV

$\lambda_1 : \lambda_2 = ?$

From the equation of energy -

$$E = \frac{hc}{\lambda}$$

Where, E = Energy
h = Planck's constant
λ = Wavelength
c = Speed of light

For first radiation–

$$E_1 = \frac{hc}{\lambda_1} \Rightarrow \frac{hc}{25\text{ eV}} = \lambda_1 \quad \text{...(i)}$$

For second radiation–

$$E_2 = \frac{hc}{\lambda_2} \Rightarrow \frac{hc}{100\text{ eV}} = \lambda_2 \quad \text{...(ii)}$$

Dividing equation (i) by (ii) we get–

$$\frac{\lambda_1}{\lambda_2} = \frac{hc}{25\text{ eV}}\times\frac{100\text{eV}}{hc}$$

$\lambda_1 : \lambda_2 = 4 : 1$

182. de Broglie relationship has no significance for

(a) An electron (b) A proton
(c) A neutron (d) An iron ball.

SRMJEEE – 2009

Ans. (d) : According to the de-Broglie, every object in motion has a wave character. The wavelength associated with ordinary objects are so sort because of their large masses that their wave properties cannot be detected. The light mass of the particle can be detected experimentally but not in the case of large mass.

183. The wavelength associated with a particle of mass 3.313×10^{-31} kg moving with velocity 10^3 m/s is

(a) 2×10^{-6} m (b) 2×10^{-6} cm
(c) 2×10^{-7} m (d) 2×10^{-7} cm

SRMJEEE – 2010

Ans. (a) : Given that, Mass of particle = 3.313×10^{-31}kg

$v = 10^3$ m/s, λ = ?

Now, from de–Broglie equation –

$$\lambda = \frac{h}{p}$$

Where, λ = Wavelength
h = Planck's constant
p = Momentum

$$\therefore\ \lambda = \frac{6.626\times10^{-34}\text{kgm}^2\text{s}^{-1}}{3.313\times10^{-31}\text{kg}\times10^{3}\text{ms}^{-1}}$$

$= 2 \times 10^{-6}$ m

184. Which one of the following frequencies of radiation (in Hz) has a wavelength of 600 nm?

(a) 2.0×10^{13} (b) 5.0×10^{16}
(c) 2.0×10^{14} (d) 5.0×10^{14}

AP-EAMCET- (Engg.)-2011

Ans. (d) : Given that,

Wavelength (λ) = 600 nm = 600×10^{-9} m

We know that–

$$\nu = \frac{c}{\lambda} = \frac{3\times10^{8}}{600\times10^{-9}}$$

$\nu = 5\times10^{14}$ Hz.

185. If the kinetic energy of a particle is reduced to half, de-Broglie wavelength becomes :

(a) 2 times (b) $\frac{1}{\sqrt{2}}$ times
(c) 4 times (d) $\sqrt{2}$ times

AP-EAMCET (Engg.) 2015

Ans. (d) : Given that, $(\text{K.E.})_2 = 1/2\ (\text{K.E.})_1$

According to de-Broglie equation

$$\lambda = \frac{h}{mv} = \frac{h}{p} = \frac{h}{\sqrt{2m\text{K.E.}}}$$

Where, K.E. = Kinetic energy

@apna_pdf

So, the de-Broglie wavelength is inversely proportional to square root of kinetic energy (K.E.)

Therefore, $\frac{\lambda_1}{\lambda_2} = \sqrt{\frac{(\text{K.E.})_2}{(\text{K.E.})_1}}$

Then, $\frac{\lambda_1}{\lambda_2} = \sqrt{\frac{1}{2}\frac{(\text{K.E.})_1}{(\text{K.E.})_1}}$

or $\lambda_2 = \sqrt{2}\lambda_1$

Thus, de-Broglie wavelength becomes $\sqrt{2}$ times to the original wavelength.

186. The frequency of radiation emitted, when an electron falls from n = 3 to n = 1. in a hydrogen atom would be _____

(a) $2.92 \times 10^3 \text{hour}^{-1}$
(b) $2.92 \times 10^{-15} \text{s}^{-1}$
(c) $2.92 \times 10^{15} \text{s}^{-1}$
(d) 2.92 min^{-1}

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c) : Given that, $n_1 = 1$, $n_2 = 3$

According to the Rydberg's formula–

$$\therefore \quad \frac{1}{\lambda} = R_H\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$$

$$\frac{1}{\lambda} = 1.096 \times 10^5\left[\frac{1}{1} - \frac{1}{3^2}\right]$$

$$\frac{1}{\lambda} = 1.096 \times 10^5 \times \frac{8}{9} = 0.968 \times 10^5 \text{cm}^{-1}$$

We know that,

$$\therefore \quad v = \frac{c}{\lambda}$$

$$= 3 \times 10^{10} \times 0.968 \times 10^5$$

$$= 2.92 \times 10^{15} \text{ sec}^{-1}$$

187. Which one of the following transitions of an electron in hydrogen atom emits radiation of the lowest wavelength?

(a) $n_2 = \infty$ to $n_1 = 2$
(b) $n_2 = 4$ to $n_1 = 3$
(c) $n_2 = 2$ to $n_1 = 1$
(d) $n_2 = 5$ to $n_1 = 3$

AP-EAMCET- (Engg.) - 2010

Ans. (c) : $\Delta E = \frac{hc}{\lambda}$

When the value of 'n' increases the difference of energy between successive orbit decreases.

i.e, $E_2 - E_1 > E_3 - E_2 > E_4 - E_3$ so on---

$\therefore$ λ is lowest for n_2=2 to n_1 =1 transitions.

188. The basis of quantum mechanical model of an atom is

(a) Angular momentum of electron
(b) Quantum numbers
(c) Dual nature of electron
(d) Black body radiation

AP-EAMCET (Engg.) 2013

Ans. (c) : The basis of quantum mechanical model of an atom is dual nature of electron i.e. electron possesses particle nature as well as wave nature. It means when the matter is moving its shows the wave property are associated with it and when it is in the state.

189. What is the wave number of 4th line in Balmer series of hydrogen spectrum? (R = 1,09,677 cm^{-1})

(a) $24{,}630 \text{ cm}^{-1}$
(b) $24{,}360 \text{ cm}^{-1}$
(c) $24{,}730 \text{ cm}^{-1}$
(d) $24{,}372 \text{ cm}^{-1}$

AP - EAMCET (Medical) - 2007

Ans. (d) : We know that,

$$\bar{v} = R\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

Where, $\bar{v}$ = Wave number

R = Rydberg constant

4th line in Balmer series that means–

$n_1 = 2$, $n_2 = 6$

$$\therefore \quad \bar{v} = 1{,}09{,}677\left(\frac{1}{2^2} - \frac{1}{6^2}\right)\text{cm}^{-1}$$

$$\bar{v} = 1{,}09{,}677\left(\frac{1}{4} - \frac{1}{36}\right)\text{cm}^{-1}$$

or $\bar{v} = 24372 \text{cm}^{-1}$

190. What is the wavelength (in m) of a particle of mass 6.62 × 10^{-29} g moving with a velocity of 10^3 ms^{-1}?

(a) 6.62×10^{-4}
(b) 6.62×10^{-3}
(c) 10^{-5}
(d) 10^5

AP-EAMCET (Engg.)-2005

Ans. (c) : Given that, $m = 6.62 \times 10^{-29}\text{g} = 6.62 \times 10^{-32}$ kg

$v = 10^3 \text{ ms}^{-1}$, λ (in m) = ?

Now, from the de-Broglie equation–

$$\because \quad \lambda = \frac{h}{mv}$$

$$\therefore \quad \lambda = \frac{6.6 \times 10^{-34} \text{J s}}{6.62 \times 10^{-32}(\text{kg}) \times 10^3(\text{ms}^{-1})}$$

or $\lambda = 1 \times 10^{-5}$ m

191. The wavelengths of two photons are 2000Å and 4000Å respectively. What is the ratio of their energies?

(a) 1/4
(b) 4
(c) 1/2
(d) 2

VITEEE 2019

Ans. (d) : Given that, $\lambda_1 = 2000\,\text{Å}$, $\lambda_2 = 4000\,\text{Å}$

We know that,

$$\therefore \quad E = \frac{hc}{\lambda}$$

$$\text{So,} \quad \frac{E_1}{E_2} = \frac{hc}{\lambda_1} \times \frac{\lambda_2}{hc}$$

$$\frac{E_1}{E_2} = \frac{4000\,\text{Å}}{2000\,\text{Å}}$$

$$\frac{E_1}{E_2} = 2$$

192. The values of Planck's constant is 6.63 × 10^{-34} Js. The velocity of light is 3.0 × 10^8 m s^{-1}. Which value is closest to the wavelength in nanometers of a quantum of light with frequency of 8 × 10^{15} s^{-1}?

@apna_pdf

(a) 5×10^{-18} (b) 4×10^{1}
(c) 3×10^{7} (d) 2×10^{-25}

AIPMT 2003

Ans. (b) : Given that, $h = 6.626\times10^{-34}\,\text{J sec.}$

$$c = 3\times10^{8}\,\text{m/sec.},\ \nu = 8\times10^{15}\,\text{sec}^{-1}$$

$$\because \quad E = h\nu = \frac{hc}{\lambda}$$

$$8\times10^{15} = \frac{3\times10^{8}}{\lambda}$$

$$\lambda = \frac{3\times10^{8}}{8\times10^{15}} = 0.375\times10^{-7} \approx 4\times10^{1}\,\text{nm}$$

193. The ratio of slopes of K_{max} vs ν and ν_0 vs ν curves in the photoelectric effects gives (ν = frequency, K_{max} = maximum kinetic energy, ν_0 = stopping potential)

(a) The ratio of Planck's constant of electronic charge
(b) Work function
(c) Planck's constant
(d) Charge of electron

VITEEE 2015

Ans. (d) : We know that, $h\nu = h\nu_0 + e\nu_0$

$$e\nu_0 = h\nu - h\nu_0\,, \qquad \nu_0 = \frac{h}{e}\nu - \frac{h}{e}\nu_0$$

On comparing this equation with the straight line equation i.e $y = mx + c$

The slope of ν_0 vs ν is

$$(\text{slope})_1 = \frac{h}{e}$$

$h\nu = h\nu_0 + KE$
$KE = h\nu - h\nu_0$ (constant)
$y = mx + (-h\nu_0)$
Thus, slope of K_{max} vs ν is

$$(\text{slope})_2 = h$$

$$\therefore \frac{(\text{slope})_2}{(\text{slope})_1} = \frac{h}{h/e} = e \text{ (charge of electron)}$$

194. A certain metal when irradiated by light (r = 3.2×10^{16}Hz) emits photoelectrons with twice kinetic energy as did photoelectrons when the same metal is irradiated by light (r = 2.0×10^{16}Hz). The ν_0 of metal is

(a) 1.2×10^{14} Hz (b) 8×10^{15} Hz
(c) 1.2×10^{16} Hz (d) 4×10^{12} Hz

Ans. (b) : According to question

$$(KE)_1 = 2\times(KE)_2$$
$$h\nu_1 - h\nu_0 = 2(h\nu_2 - h\nu_0)$$
$$h\nu_0 = 2h\nu_2 - h\nu_1$$
$$\nu_0 = 2\nu_2 - \nu_1$$
$$\nu_0 = 2\times(2\times10^{16}) - (3.2\times10^{16})$$
$$\nu_0 = 8\times10^{15}\,\text{Hz}$$

195. A near UV photon of 300 nm is absorbed by a gas and then re-emitted as two photons. One photon is red with wavelength of the second photon is

(a) 1060 nm (b) 496 nm
(c) 300 nm (d) 215 nm

VITEEE 2013

Ans. (b) : $E = E_1 + E_2$

$$\frac{hc}{\lambda} = \frac{hc}{\lambda_1} + \frac{hc}{\lambda_2}$$

$$\frac{1}{300} = \frac{1}{760} + \frac{1}{\lambda_2}$$

$$\frac{1}{\lambda_2} = \frac{1}{300} - \frac{1}{760}$$

$$\lambda_2 = 496\,\text{nm}$$

196. Electrons with a kinetic energy of 6.023×10^{4} J/mol are evolved from the surface of a metal, when it is exposed to radiation of wavelength of 600 nm. The minimum amount of energy required to remove an electron from the metal atom is

(a) 2.3125×10^{-19} J (b) 3×10^{-19} J
(c) 6.02×10^{-19} J (d) 6.62×10^{-34} J

VITEEE- 2009

Ans. (a) : Given that, KE of 1 mol = 6.023×10^{4} J
or KE of 6.023×10^{23} atoms = 6.023×10^{4} J

$$\therefore \quad \text{KE of 1 atom} = \frac{6.023\times10^{4}}{6.023\times10^{23}}$$

we know that, $= 1.0 \times 10^{-19}$ J

$$\because \quad h\nu_{energy} = \frac{hc}{\lambda} = \frac{6.626\times10^{-34}\times3\times10^{8}}{600\times10^{-9}}$$

$= 3.313 \times 10^{-19}$ J

Now Threshold energy $= h\nu - KE$

$= 3.313 \times 10^{-19} - 1.0 \times 10^{-19}$

$= 2.313 \times 10^{-19}$J

Hence minimum amount of energy required to remove an electron from the metal ion will be 2.313×10^{-19} J

197. The wavelengths of electron waves in two orbits is 3 : 5. The ratio of kinetic energy of electrons will be

(a) 25 :9 (b) 5 : 3
(c) 9 : 25 (d) 3 : 5

VITEEE- 2009

Ans. (a) : According to de-Broglie's equation -

$$\lambda = \frac{h}{mv}$$

squaring both side, we get –

$$\lambda^2 = \frac{h^2}{m^2v^2}$$

$$\text{or} \quad mv^2 = \frac{h^2}{m\lambda^2}$$

$$\because KE = \frac{1}{2}mv^2$$

$$\text{Therefore,} \quad \frac{K_1}{K_2} = \left(\frac{\lambda_2}{\lambda_1}\right)^2 = \left(\frac{5}{3}\right)^2$$

$$\therefore \quad K_1 : K_2 = 25 : 9$$

@apna_pdf

198. A bulb emitted electromagnetic radiation of 660 nm wavelength. The total energy of radiation is 3×10^{-18} J. The number of emitted photon will be:
($h = 6.6 \times 10^{-34}$ Js, $c = 3 \times 10^8$ m/s)

(a) 1 (b) 10
(c) 100 (d) 1000

AIIMS 26 May 2019 (Morning)

Ans. (b): Given that, total energy of radiation = 3×10^{-18}J

$h = 6.6\times10^{-34}$ Js, $c = 3\times10^8$, $\lambda = 660\times10^{-9}$

Number of photons emitted = n

We know that,

$$E = \frac{nhc}{\lambda}$$

Where, h = the plank's constant
c = the speed of light
and λ = wavelength

Now, by substituting the value of these, we get–

$$3\times10^{-18} = \frac{6.6\times10^{-34}\times3\times10^8\times n}{660\times10^{-9}}$$

$$n = \frac{30}{3} = 10$$

199. Assertion: Threshold frequency is the maximum frequency required for the ejection of electron from the metal surface.
Reason: Threshold frequency is characteristic of a metal.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-26 May, 2018

Ans. (d): Threshold frequency is a minimum frequency required for the emission of electron from the metal surface.

200. Assertion: All photons possess the same amount of energy.
Reason: Energy of photon does not depend upon wavelength of light used.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason, are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-1998

Ans. (d): Energy of a photon = hν

$$\because \nu = \frac{c}{\lambda}$$

Hence, $E = \frac{hc}{\lambda}$

So, energy depends on wavelength.

201. Wavelength of a particular transition for H atom is 400 nm. What can be wavelength of He^+ for same transition?

(a) 400 nm (b) 100 nm
(c) 1600 nm (d) 200 nm

AIIMS-26 May, 2018

Ans. (b): According to the Rhyberg's equation–

$$\frac{1}{\lambda} = R_H\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)\times Z^2$$

$$\frac{1}{400} = R_H\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)(1)^2 \quad .....(i)$$

$$\frac{1}{\lambda_{He^+}} = R_H\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)(2)^2 \quad .....(ii)$$

On dividing equation (i) by (ii), we get

$$\lambda_{He+} = \frac{400}{2^2} = \frac{400}{4} = 100\,nm$$

202. Find the frequency of light that corresponds to photons of energy 5.0×10^{-5} erg?

(a) $7.5\times10^{-21}\,sec^{-1}$ (b) $7.5\times10^{-21}\,sec$
(c) $7.5\times10^{21}\,sec^{-1}$ (d) $7.5\times10^{21}\,sec$

AIIMS-2010

Ans. (c): We know that, E= hν.

$$\nu = \frac{E}{h} = \frac{5.0\times10^{-5}\,erg}{6.63\times10^{-34}\,Js}$$

$$\nu = \frac{5.0\times10^{-5}\,erg}{6.63\times10^{-34}\times10^{7}\,erg\,sec}$$

$\therefore$ [1J= 10^7 erg]

$\nu = 7.54\times10^{21}\,sec^{-1}$

203. Ratio of energy of photon of wavelength 3000Å and 6000Å is

(a) 3 : 1 (b) 2 : 1
(c) 1 : 2 (d) 1 : 3

AIIMS-2012

Ans. (b): Given that, ratio of energy of photon of wavelength 3000Å and 6000Å

$$E = \frac{hc}{\lambda}$$

$$\frac{E_1}{E_2} = \frac{\lambda_2}{\lambda_1} = \frac{6000}{3000} = 2:1$$

204. The de Broglie wavelength associated with a ball of mass 1 kg having kinetic energy 0.5 J is :

(a) 6.626×10^{-34} m (b) 13.20×10^{-34} m
(c) 10.38×10^{-21} m (d) 6.626×10^{-34} Å

AIIMS-2006

@apna_pdf

Ans. (a): Given data, mass of ball = 1 kg

Kinetic energy (K.E) = 0.5 J

de-Broglie wavelength (λ) = ?

Now, as we know that,

$$\text{K.E.} = \frac{1}{2}mv^2$$

$$0.5 = \frac{1}{2} \times 1 \times v^2$$

$$v^2 = 1$$

$$v = 1\ ms^{-1}$$

Therefore, de-Broglie wavelength $\lambda = \frac{h}{mv}$

$$= \frac{6.63 \times 10^{-34}}{1 \times 1}$$

$$= 6.63 \times 10^{-34}\ m$$

205. The de- Broglie wavelength of an electron in the ground state of hydrogen atoms is: (K.E.= 13.6eV; 1ev=1.602×10^{-19} J)

(b) 33.28nm
(b) 3.328nm
(c) 0.3328nm
(d) 0.0332 nm

AIIMS-2000

Ans. (c): For electron in the ground state,

$$\because \quad mvr = \frac{h}{2\pi}$$

Or $$mv = \frac{h}{2\pi r}$$

Now, $$mv = \frac{h}{\lambda}$$

So, $$\frac{h}{\lambda} = \frac{h}{2\pi r}$$

$$\lambda = 2\pi r$$

$$\lambda = 2 \times 3.14 \times 0.53\ \text{Å} = 3.328\ \text{Å}$$

$$= 3.328 \times 10^{-10}\ m \quad \because 1\ \text{Å} = 10^{-10} m$$

$$= 0.3328 \times 10^{-9}\ m$$

$$= 0.3328\ nm$$

206. The de- Broglie wavelength associated with a particle of mass 10^{-6} Kg moving with a velocity of 10 ms^{-1} is :

(a) 6.63×10^{-7} m
(b) 6.63×10^{-16} m
(c) 6.63×10^{-21} m
(d) 6.63×10^{-29} m

AIIMS-2001

Ans. (d): According to the de Broglie equation, $\lambda = \frac{h}{mv}$

Where, h = Planck's constant

v = velocity

m = mass of the particle

λ = wavelength of the particle.

$$\lambda = \frac{6.63 \times 10^{-34}\ Js}{10^{-6} Kg \times 10 ms^{-1}}$$

$$= \frac{6.63 \times 10^{-34}}{10^{-5}}$$

$$= 6.63 \times 10^{-29}\ m$$

207. The wavelength of visible light is:

(a) 2000Å–3700Å
(b) 7800Å–8900Å
(c) 3800Å–7600Å
(d) None of these

AIIMS-1998

Ans. (c): The visible spectrum is the portion of the electromagnetic spectrum that is visible to the human eye.

Electromagnetic radiation in this range of wavelengths is called visible light or simple light. A typical human eye will respond to wavelengths from about.

380 to 700 nm or 3800Å – 7600Å

The visible spectrum is VIBGYOR. Violet has the shortest wavelength, at around 380 nanometers, and red has the longest wavelength, at around 700 nanometers in this spectrum.

208. The wavelength of a 150 g rubber ball moving with a velocity of 50 ms^{-1} is :

(a) 3.43×10^{-33} cm
(b) 5.86×10^{-33} cm
(c) 7.77×10^{-33} cm
(d) 8.83×10^{-33} cm

AIIMS-1998

Ans. (d): Given that, v = 50 m/sec, m = 150 gm = 150×10^{-3} kg

According to de-Broglie –

$$\lambda = \frac{h}{mv} = \frac{6.626 \times 10^{-34}}{(150 \times 10^{-3}) \times 50}$$

$$\Rightarrow 8.83 \times 10^{-35}\ m$$

$$\Rightarrow 8.83 \times 10^{-33}\ cm$$

209. The de-Broglie wavelength of a particle with mass 1 g and velocity 100 m/s is

(a) 6.63 × 10^{-35} m
(b) 6.63 × 10^{-34} m
(c) 6.63 × 10^{-33} m
(d) 6.65 × 10^{-35} m

NEET-1999

Ans. (c) : Given that, m=1g, v=100 m/s

h= 6.63×10^{-34} J-s

According to de-Broglie wave equation –

$$\lambda = \frac{h}{mv} = \frac{6.63 \times 10^{-34} J\text{-}s}{1 \times 10^{-3} Kg \times 100 m/s}$$

$$= 6.63 \times 10^{-33}\ m$$

210. If the Planck's constant h = 6.6 × 10^{-34} Js, the de Broglie wavelength of a particle having momentum of 3.3 × 10^{-24} kg ms^{-1} will be

(a) 0.002 Å
(b) 0.5 Å
(c) 2 Å
(d) 500 Å

BITSAT 2018

Ans. (c) : Given that,h = 6.6 × 10^{-34}, p = 3.3 × 10^{-24}

We know that, $\lambda = \frac{h}{mv}$ $(\because p = mv)$

Or $$\lambda = \frac{h}{p}$$

$$\lambda = \frac{h}{p} = \frac{6.6 \times 10^{-34}}{3.3 \times 10^{-24}} = 2 \times 10^{-10} m = 2\text{Å}$$

211. The energy required to remove an electron from metal X is E = 3.31 × 10^{-20} J. Calculate the maximum wavelength of light that can photo eject an electron from metal X.

@apna_pdf

(a) 6.01×10^{-6} m (b) 3.01×10^{-3} m
(c) 5.01×10^{-6} m (d) None of these

AMU-2014

Ans. (a) : Given that, $E = 3.31 \times 10^{-20}$ J
$h = 6.626 \times 10^{-34}$ J.sec ,$c = 3 \times 10^{8}$ m/s

$$\text{Energy (E)} = \frac{hc}{\lambda}$$

$$\text{Or } \lambda = \frac{hc}{E} = \frac{6.626\times10^{-34}\times3\times10^{8}}{3.31\times10^{-20}}$$

$$\Rightarrow 6.01\times10^{-6}\ \text{m}$$

212. The energy of one mole of photons of radiation whose frequency is 5×10^{14} Hz will be

(a) 19.951 KJ mol^{-1} (b) 199.51 KJ mol^{-1}
(c) 39.90 KJ mol^{-1} (d) 399.0 KJ mol^{-1}

AMU-2015, 2007

Ans. (b) : Energy of quantum (or photon), $E=h\nu$
Where, Planck's constant, $h = 6.62 \times 10^{-34}$ J-s
1 mol of photon = 6.023×10^{23} molecules of photon so the Energy of 1 mole of photon will be,
$E= N_0h\nu$
$=6.023\times10^{23}\times6.62\times10^{-34}\times5\times10^{14}$ J/mole
$=199.36 \times 10^{3}$ J/mole
or 199.36KJ mol^{-1}

213. In hydrogen atom, the de Broglie wavelength of an electron in the second Bohr orbit is [Given that Bohr radius, a_0 =52.9 pm]

(a) 211.6 pm (b) 211.6 π pm
(c) 52.9 π pm (d) 105.8 pm

NEET-Odisha 2019

Ans. (b) : According to Bohr,

$$mvr = \frac{nh}{2\pi}$$

$$2\pi r= \frac{nh}{mv} =n\lambda \qquad \text{………..(i)}$$

Where, r= Radius
λ= Wavelength
n= Number of orbit

$$\text{Also, } r= \frac{a_o n^2}{z} \qquad \text{………..(ii)}$$

Where, a_o = Bohr radius= 52.9 pm
Z= Atomic number
On substituting the value of 'r' from equation (ii) to equation (i) we get

$$n\lambda = \frac{2\pi n^2 a_o}{z}$$

$$\lambda = \frac{2\pi n a_o}{z}$$

$$\lambda = 2\pi\times2\times52.9 \qquad [\because n = 2,\ z = 1]$$

$$\lambda = 211.6\pi\ \text{pm}$$

214. The mass of a photon with wavelength 3.6Å shall be

(a) 61.35×10^{-34} kg (b) 6.135×10^{-29} kg
(c) 7.185×10^{-29} kg (d) 71.85×10^{-29} kg

AMU-2006

Ans. (a) : We know that, $E=h\nu=\frac{hc}{\lambda}$

Again, $E=mc^2$

$$\therefore \quad mc^2= \frac{hc}{\lambda}$$

$$\text{or} \quad m = \frac{h}{c\lambda} = \frac{6.626\times10^{-37}}{3\times10^{8}\times3.6\times10^{-10}}\text{kg}$$

$$=0.6135\times10^{-32}\ \text{kg} =61.35\times10^{-34}\ \text{kg}$$

215. The de-Broglie wavelength (λ) associated with a photoelectron varies with the frequency (ν) of the incident radiation as, [ν_0 is threshold frequency]

(a) $\lambda \propto \frac{1}{(\nu-\nu_0)^{\frac{1}{4}}}$ (b) $\lambda \propto \frac{1}{(\nu-\nu_0)^{\frac{3}{2}}}$
(c) $\lambda \propto \frac{1}{(\nu-\nu_0)}$ (d) $\lambda \propto \frac{1}{(\nu-\nu_0)^{\frac{1}{2}}}$

[JEE Main 2019, 11 Jan Shift-II]

Ans. (d) : For electron

$$\lambda_{DB} = \frac{\lambda}{\sqrt{2mK.E}} \qquad (\text{de-broglie wave length})$$

Where λ = Wavelength of particles
h = Planck's constant
K.E = Kinetic energy
According to photoelectric effect

$$h\nu = h\nu_0 + KE$$

$$KE= h\nu - h\nu_0$$

$$\lambda_{DB} = \frac{h}{\sqrt{2m\times(h\nu-h\nu_0)}}\ ,\quad \lambda_{DB} \propto \frac{1}{(\nu-\nu_0)^{\frac{1}{2}}}$$

216. The energy of a photon is given as, ΔE/atom = 3.03×10^{-19} J $atom^{-1}$ then, the wavelength (λ) of the photon is

(a) 0.656 nm (b) 6.56 nm
(c) 65.6 nm (d) 656 nm

AMU–2001

Ans. (d) : Given that, $\Delta E = 3.03\times10^{-19}$J $atom^{-1}$
According to formula –

$$\Delta E = \frac{hc}{\lambda} = \frac{6.626\times10^{-34}\times3\times10^{8}}{\lambda}$$

$$\lambda= \frac{hc}{\lambda} = 656\ \text{nm}$$

217. The wavelength of a ball of mass 100 g moving with a velocity of 100 ms^{-1} be

(a) 6.626×10^{-30} m (b) 6.626×10^{-35} m
(c) 6.626×10^{-32} m (d) 6.626×10^{-34} m

Assam CEE-2020

Ans. (b) : Given that, m = 100g , v = 100 m/s
According to the de-Broglie equation –

$$\lambda = \frac{h}{mv} = \frac{6.626\times10^{-34}\text{kg}-\text{m}^2/\text{sec}}{0.1\text{kg}\times100\,\text{m/sec}}$$

$$=6.626\times10^{-35}\text{m}$$

@apna_pdf

218. The energy ratio of a photon of wavelength 3000 Å and 6000 Å is

(a) 1 : 1 (b) 2 : 1

(c) 1 : 2 (d) 1 : 4

BCECE-2007

Ans. (b) : Given that, λ_1=3000 Å, λ_2=6000 Å

$$E_1 = \frac{hc}{\lambda_1} = \frac{hc}{3000} \text{ and } E_2 = \frac{hc}{\lambda_2} = \frac{hc}{6000}$$

$$\frac{E_1}{E_2} = \frac{\frac{hc}{3000}}{\frac{hc}{6000}} = \frac{hc}{3000} \times \frac{6000}{hc} = \frac{2}{1}$$

$E_1:E_2=2:1$

219. A photon having a wavelength of 845 Å, causes the ionisation of N atom. What is the ionisation energy of N?

(a) 1.4 kJ (b) 1.4×10^4 kJ

(c) 1.4×10^2 kJ (d) 1.4×10^3 kJ

BCECE-2003

Ans. (d) : The ionisation energy is the amount of energy required to take out most loosely bonded electron from isolated gaseous atom.

∴ Ionisation energy of nitrogen

= energy of photon

$$= N h \frac{c}{\lambda}$$

Where $N = 6.02 \times 10^{23}$

$c = 3 \times 10^8$

$$\lambda = 854\,\overset{0}{A} = 854 \times 10^{-10}\,M$$

$$= \frac{6.02\times10^{23}\times6.6\times10^{-34}\times3\times10^{8}}{854\times10^{-10}}$$

$= 1.4 \times 10^6$ J mol^{-1} = 1.4×10^3 kJ mol^{-1}

220. The increasing order of wavelength for He^+ ion, neutron (n) and electron (e) particles, moving with the same velocity is–

(a) $\lambda_{He^+} < \lambda_e < \lambda_n$ (b) $\lambda_{He^+} = \lambda_n = \lambda_e$

(c) $\lambda_{He^+} < \lambda_n < \lambda_e$ (d) $\lambda_e < \lambda_n < \lambda_{He^+}$

BCECE-2016

Ans. (c) : $\lambda = \frac{h}{m.v}$

(As per de–Broglie relation)

$\therefore \lambda \propto \frac{1}{m}$ (h and v are constant)

Also; $\because m_{He^+} > m_n > m_e$

$\therefore \lambda_{He+} < \lambda_n < \lambda_e$

221. The relationship between energy (E) of wavelengths 2000 Å and 8000 Å, respectively is–

(a) $E_1 = 4E_2$ (b) $E_1 = 2E_2$

(c) $E_1 = \frac{E_2}{2}$ (d) $E_1 = \frac{E_2}{4}$

BCECE-2016

Ans. (a) : Given that, λ_1 = 2000 Å and λ_2 = 8000 Å

Using the equation of energy–

$$E = \frac{hc}{\lambda}$$

$$\frac{E_1}{E_2} = \frac{\lambda_2}{\lambda_1} \qquad \left(\because E \propto \frac{1}{\lambda}\right)$$

Thus, $\frac{E_1}{E_2} = \frac{8000}{2000} = 4$

∴ $E_1 = 4E_2$

222. Which of the following equations represent de-Broglie relation?

(a) $\frac{h}{mv} = p$ (b) $\lambda m = \frac{v}{p}$

(c) $\lambda = \frac{h}{mp}$ (d) $\lambda = \frac{h}{mv}$

CG PET -2008
WB-JEE-2008
J & K CET-(1999)
AIIMS-1994

Ans. (d) : De-Broglie proposed that an electron like light behaves both as a material particle and as a wave. This proposal gave birth to a new theory known as wave mechanical theory of matter. De-Broglie equation is given as–

$$\lambda = \frac{h}{mv}$$

$$\lambda = \frac{h}{p}$$

Where, λ = Wavelength of light
h = Planck's constant
m = Mass of particle
v = Velocity of particle

223. If radius of first Bohr's orbit of hydrogen atom is 'X', then the de- Broglie wavelength of electron in 3rd orbit is nearly

(a) $2\pi x$ (b) $6\pi x$

(c) 9x (d) $\frac{x}{3}$

CG PET- 2016

Ans. (b) : For a particular element, radius of an orbit–

$$r_n \propto n^2$$

Where, n is the principal quantum number–

$$\therefore \quad \frac{r_1}{r_2} = \frac{1}{3^2}$$

If, $r_1 = X$ then $r_3 = 9X$

For third shell,

$2\pi r_3 = 3\lambda$

$$\lambda = \frac{2\pi.9X}{3} \Rightarrow 6\pi X$$

224. A particle 'A' moving with a certain velocity has the de- Broglie wavelength 1 Å. For a particle 'B' with mass 25%of 'A' and velocity 75% of 'A'. The de- Broglie wave length of 'B' will be

@apna_pdf

(a) 3 Å (b) 5.33 Å
(c) 6.88 Å (d) 0.68 Å

CG PET- 2013

Ans. (b) : Given,
For, particle 'A'–

$\lambda_A = 1$ Å

Let, the mass of particle A(m_A) = x
Velocity of particle A(V_A) = y
For, particle 'B'–

$$\text{Mass of particle (B)} = \frac{x \times 25}{100} = \frac{x}{4}$$

$$\text{Velocity of particle (B)} = \frac{y \times 75}{100} = \frac{3y}{4}$$

de-Broglie equation for the particle 'A', we get–

$$\lambda_A = \frac{h}{m_A V_A}$$

$$1\times10^{-10} = \frac{h}{x \times y} \quad .....(i)$$

de-Broglie equation for the particle 'B', we get–

$$\lambda_B = \frac{h}{m_B V_B}$$

$$\lambda_B = \frac{h}{\left(\frac{x}{4}\right)\left(\frac{3y}{4}\right)}$$

or $$\lambda_B = \frac{16}{3}\frac{h}{xy} \quad .....(ii)$$

From equation (i) and (ii), we get–

$$\lambda_B = \frac{16}{3} \times 1\times10^{-10}$$

$\lambda_B = 5.33 \times 10^{-10}$

or $\lambda_B = 5.33$ Å

225. The wavelength of associated wave of a particle moving with a speed of one-tenth that of light is 7Å. The particle must be

(a) Electron (b) Proton
(c) Nanoparticle (d) Photo

CG PET -2017

Ans. (a) : Given that, $\lambda = 7\,\text{Å} = 7\times10^{-10}\,\text{m}$

Particle moves with a speed of $\left(\frac{1}{10}\right)^{\text{th}}$ of speed of light–

$$\therefore \text{ Velocity of particle} = \frac{1}{10}\times3\times10^{8} = 3\times10^{7}\,\text{ms}^{-1}$$

From de-Broglie equation we get–

$$\because \quad \lambda = \frac{h}{mv}$$

$$m = \frac{h}{\lambda v} = \frac{6.6\times10^{-34}\,\text{Js}}{7\times10^{-10}\times3\times10^{7}}$$

$$m = 0.3142\times10^{-31}\,\text{kg}$$

$$m = 0.31\times10^{-31} \approx 10^{-31}\,\text{kg}$$

Which is in accordance with mass of electron Thus among the given particles, electron is the correct choice.

226. What is the work function of the metal, if the light of wavelength 4000Å generates photoelectron of velocity 6×10^5 ms^{-1} from it? (Mass of electron = 9×10^{-31} kg Velocity of light = 3×10^8 ms^{-1} Planck's constant = 6.626×10^{-34} Js Charge of electron = 1.6×10^{-19} JeV^{-1}

(a) 4.0 eV (b) 2.1 eV
(c) 0.9 eV (d) 3.1 eV

[JEE Main 2019, 12 Jan Shift-I]

Ans. (b) : Given that, λ= 4000 $\overset{\circ}{\text{A}}$

$v = 6 \times 10^5$ ms^{-1}

From the Einstein's photoelectric equation–

$$h\nu = w_o + \frac{1}{2}mv^2$$

$$w_o = h\nu - \frac{1}{2}mv^2$$

$$= \frac{6.626\times10^{-34}\times3\times10^{8}}{4000\times10^{-10}} - \frac{1}{2}\times9\times10^{-31}\times(6\times10^{5})^2$$

$= (4.9695–1.62)10^{-19}$

$= 3.3495\times10^{-19}$ J

$$w_o = \frac{3.3495\times10^{-19}}{1.6\times10^{-19}}\text{eV} = 2.0934 = 2.1\,\text{eV}$$

227. If p is the momentum of the fastest electron ejected from a metal surface after the irradiation of light having wave length λ then for 1.5 p momentum of the photoelectron, the wavelength of the light should be (Assume kinetic energy of ejected photoelectron to be very high in comparison to work function)

(a) $\frac{4}{9}\lambda$ (b) $\frac{3}{4}\lambda$
(c) $\frac{2}{3}\lambda$ (d) $\frac{1}{2}\lambda$

[JEE Main 2019, 8 April Shift-II]

Ans. (a) : $h\nu - \phi = \text{KE}$

$$\left(\frac{hc}{\lambda}\right)_{\text{incident}} = \text{KE} + \phi$$

$$\text{K.E} = \frac{1}{2}mv^2 \times \frac{m}{m} = \frac{1}{2}\frac{P^2}{m}$$

$$\text{KE} = \frac{P^2}{2m} = \frac{hc}{\lambda_{\text{incident}}} = \frac{hc}{\lambda} \quad ....(i)$$

$$\frac{P^2\times(1.5)^2}{2m} = \frac{hc}{\lambda'} \quad ....(ii)$$

On dividing equation (ii) by (i), we get

$$\lambda' = \frac{4\lambda}{9}$$

228. The work function of sodium metal is 4.41×10^{-19} J. If photons of wavelength 300 nm are incident on the metal, the kinetic energy of the ejected electrons will be ($h = 6.63\times10^{-34}$ J s; $c = 3\times10^8$ m/s)..........$\times10^{-21}$J.

[JEE Main 2020, 2 Sep Shift-II]

Ans. (2.23×10^{-19}J) : Given that:–

ϕ work function of sodium = 4.41×10^{-19} J

Wavelength (λ) = 300 nm

@apna_pdf

We have to find kinetic energy, E_k=?

We know the equation, $\frac{hc}{\lambda} = E_k + \phi$

$$E_k = \frac{hc}{\lambda} - \phi$$

$$= \frac{6.64\times10^{-34}\times3\times10^{8}}{300\times10^{-9}} - 4.41\times10^{-19}\,J$$

$$= 6.64\times10^{-34+8+9-2} - 4.41\times10^{-19}\,J$$

$$E_k = 2.23\times10^{-19}\,J$$

229. A source of monochromatic radiation of wavelength 400 nm provides 1000J of energy in 10 seconds. When this radiation falls on the surface of sodium, x×10^{20} electrons are ejected per second. Assume that wavelength 400 nm is sufficient for ejection of electron from the surface of sodium metal. The value of x is.......... (Nearest integer)

(h = 6.626×10^{-34} Js)

[JEE Main 2021, 25 July Shift-I]

Ans. (2) : According to the question, work function of metal is equal to energy of photon

λ_{photon} = 400nm

$$E_{photon} = \frac{hc}{\lambda} = \frac{6.626\times10^{-34}\times3\times10^{8}}{400\times10^{-9}}$$

$= 4.95 \times 10^{-19}$J

In 10 second, the amount of energy provided is 1000J. In 1 second, the amount of energy provided is 100J.

Number of photons emitted per second

$$= \frac{\text{Total energy}}{\text{Energy of one photon}}$$

$$\text{Number of photons} = \frac{100}{4.95\times10^{-19}}$$

$= 2.02 \times 10^{20}$ photons

So, 2.02×10^{20} photons eject 2.02×10^{20} electrons from the sodium metal.

230. The wavelength of electrons accelerated from rest through a potential difference of 40 kV is x×10^{-12}m. The value of x is ....(Nearest integer) Given : Mass of electron = 9.1×10^{-31} kg Charge on an electron = 1.6×10^{-19}C, Plank's constant = 6.63×10^{-34} Js

[JEE Main 2021, 20 July Shift-II]

Ans. (6) : $\lambda = \frac{h}{p} = \frac{h}{\sqrt{2meV}}$

$$= \frac{6.6\times10^{-34}}{\sqrt{2\times9.1\times10^{-31}\times1.6\times10^{-19}\times40\times10^{3}}}\,m$$

$= 0.614 \times 10^{-11}$m

$= 6.14 \times 10^{-12}$m

So,

x = 6

231. When light of wavelength 248 nm falls on a metal of threshold energy 3.0 eV, the de–Broglie wavelength of emitted electrons is.........Å. [Round off to the nearest integer]

[Use : $\sqrt{3}$ =1.73, h = 6.63×10^{-34} Js, m_e = 9.1×10^{-31} kg, c = 3.0×10^{8} ms^{-1}, 1eV = 1.6×10^{-19}J]

[JEE Main 2021, 16 March Shift-I]

Ans. (9) : $\lambda = 248\times10^{-9}\,m;\quad w_0 = 3\times1.6\times10^{-9}\,J$

$$\frac{hc}{\lambda} = w_0 + K.E$$

$$K.E = \frac{6.63\times10^{-34}\times3\times10^{8}}{246\times10^{-9}} - 3\times1.6\times10^{-19}$$

K.E = 3.2×10^{-19}J

$$p = \sqrt{2m\,K.E}$$

$$= \sqrt{2\times9.1\times10^{-31}\times3.2\times10^{-19}}$$

$= 7.63 \times 10^{-25}$

$$\lambda = \frac{h}{p} = \frac{6.63\times10^{-34}}{7.63\times10^{-25}}$$

$\lambda = 8.7 \times 10^{-10}$

$\lambda = 8.7Å$ $\qquad \because 1Å = 10^{-10}\,m$

$\boxed{\lambda \approx 9}$

232. A 50 watt bulb emits monochromatic red light of wavelength of 795 nm. The number of photons emitted per second by the bulb is x × 10^{20}. The value of x is ....

[Given, h = 6.63×10^{-34} Js and c = 3.0×10^{8} ms^{-1}

[JEE Main 2021, 1 Sep Shift-II]

Ans. (2) : Total energy per sec = 50 J

$$E = \frac{nhc}{\lambda}$$

$$50 = \frac{n\times6.63\times10^{-34}\times3\times10^{8}}{795\times10^{-9}}$$

$n = 1998.49\times10^{17}$ [n = no. of photons per second]

$\Rightarrow 1.998\times10^{20}$

$\Rightarrow 2\times10^{20}$

$\Rightarrow x\times10^{20}$

x=2

233. The number of photons emitted by a monochromatic (single frequency) infrared range finder of power 1 mW and wavelength of 1000 nm, in 0.1 second is x × 10^{13}. The value of x is ....(Nearest integer)

(h = 6.63×10^{-34} Js, c = 3.00×10^{8} ms^{-1})

[JEE Main 2021, 27 Aug Shift-II]

Ans. (50) : Given data, P = 1mW

10^{-3} J → 1 sec.

10^{-4} → 0.1 sec.

$$\therefore E = \frac{nhc}{\lambda}$$

$$10^{-4} = \frac{n\times6.63\times10^{-34}\times3\times10^{8}}{1000\times10^{-9}}$$

$n = 50.2\times10^{13}$

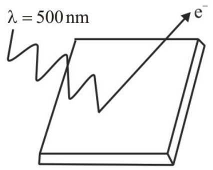
$\therefore$ x = 50

234. A metal surface is exposed to 500 nm radiation. The threshold frequency of the metal for photoelectric current is 4.3×10^{14} Hz. The velocity of ejected electron is ....×10^{5} ms^{-1} (Nearest integer) (Use h = 6.63×10^{-34} Js, m_e = 9.0×10^{-31} kg]

[JEE Main 2021, 26 Aug Shift-II]

@apna_pdf

Ans. (5) : Given data,



Let v be speed of electron having max. K.E.

We know that, E = ϕ + $K.E_{max}$

$$\frac{hc}{\lambda} = h\nu_o + \frac{1}{2}mv^2$$

$$\frac{6.63\times10^{-34}\times3\times10^{8}}{500\times10^{-9}} = 6.63\times10^{-34}\times4.3\times10^{14}+\frac{1}{2}mv^2$$

$$\frac{6.63\times30\times10^{-20}}{5} = 6.63\times4.3\times10^{-20}+\frac{1}{2}mv^2$$

$$11.271\times10^{-20}\,J = \frac{1}{2}\times9\times10^{-31}\times v^2$$

$$v = 5\times10^{5}\ m/sec.$$

235. A gas absorbs photon of 355 nm and emits at two wavelengths. If one of the emission is at 680 nm, the other is at

(a) 1035 nm
(b) 325 nm
(c) 743 nm
(d) 518 nm

[AIEEE-2011]

Ans. (c) : We know that –

$\lambda = 355$ mm

$\lambda_1 = 680$ nm

$$E = h\nu = \frac{hc}{\lambda}$$

$$E = E_1 + E_2 \text{ or } \frac{hc}{\lambda} = \frac{hc}{\lambda_1}+\frac{hc}{\lambda_2}$$

$$\frac{1}{\lambda} = \frac{1}{\lambda_1}+\frac{1}{\lambda_2} \Rightarrow \frac{1}{355} = \frac{1}{680}+\frac{1}{\lambda_2}$$

$$\frac{1}{\lambda_2} = \frac{1}{355}-\frac{1}{680}$$

$$\frac{355\times680}{680-355} = 742.769\,nm \approx 743nm.$$

236. For emission line of atomic hydrogen from n_i = 8 to n_f = n, the plot of wave number (ν) against $\left(\frac{1}{n^2}\right)$ will be (The Rydberge constant, R_H is in wave number unit)

(a) non linear
(b) linear with slope $-R_H$
(c) linear with slope R_H
(d) linear with intercept $-R_H$

[JEE Main 2019, 9 Jan Shift-I]

Ans. (c) : $\frac{1}{\lambda} = \bar{v} = R_H z^2\left(\frac{1}{n_f^2}-\frac{1}{8^2}\right)$

Let n_f = n and z = 1 for H,

$$\bar{v} = R_H\times\left(\frac{1}{n^2}-\frac{1}{8^2}\right)$$

$$\bar{v} = R_H\times\frac{1}{n^2}-\frac{R_H}{8^2}$$

$$\bar{v} = R_H\times\frac{1}{n^2}-\frac{R_H}{64}$$

Compounding it with y = mx+c

$m=R_H$

Linear with slope R_H.

237. The de Broglie wavelength of particle is

(a) Proportional to its mass
(b) Proportional to its velocity
(c) Inversely proportional to its momentum
(d) Proportional to its total energy

J & K CET-(2012)

Ans. (c) : De-Broglie wavelength (λ) is given by–

$$\lambda = \frac{h}{mv} = \frac{h}{p} = \frac{k}{p}$$

$$\therefore \quad \lambda \propto \frac{1}{p}$$

238. Calculate the wavelength associated with an electron moving with a velocity of 10^6 m/s. (mass of e^-=9.1 × 10^{-31} kg, h = 6.6 × 10^{-34} kg m^2s^{-1})

(a) 6.2 × 10^{-8}m
(b) 7.25 × 10^{-8}m
(c) 6.25 $\overset{0}{A}$
(d) none of these

J & K CET-(2013)

Ans. (d) : From de– Broglie equation –

$$\lambda = \frac{h}{mv}$$

$$= \frac{6.6\times10^{-34}}{9.1\times10^{-31}\times10^{6}}$$

$= 7.325\times10^{-10}$ m.

239. The de Broglie wavelength of a ball of mass 10 g moving with a velocity of 10 ms^{-1} is [h = 6.626 × 10^{-34} Js]

(a) 6.626 × 10^{-33}m
(b) 6.626 × 10^{-29}m
(c) 6.626 × 10^{-31}m
(d) 6.626 × 10^{-36}m

J & K CET-(2011)

Ans. (a) : We know that –

$$\lambda = \frac{h}{mv}$$

h= 6.626×10^{-34}Js, m $=\frac{10}{1000}$ =0.01 kg,

v=10ms^{-1}

Putting the values,

$$\lambda = \frac{6.626\times10^{-34}}{0.01\times10} = 6.626\times10^{-33}\,m$$

240. Two oxides of a metal contain 36.4% and 53.4% of oxygen by mass respectively. If the formula of the first oxide is M_2O then that of the second is

(a) M_2O_3
(b) MO
(c) MO_2
(d) M_2O_5

J & K CET-(2011)

@apna_pdf

Ans. (b) : Consider atomic mass of metal = x
We know that,

$$\%\text{ of oxygen in } M_2O = \frac{16}{2x+16}\times 100 = 36.4$$

$$\Rightarrow \frac{1600}{2x+16} = 36.4$$

$$\Rightarrow 1600 = 72.8x + 582.4$$

$$x = 13.978$$

Second oxide oxygen % = 53.4%
Second oxide metal % = 46.6%
Atomic Ratio M : O

$$\frac{46.6}{13.978} : \frac{53.4}{16}$$

$$3{\cdot}3 \ : \ 3{\cdot}3$$

$$1 \ : \ 1$$

Hence, the formula of metal oxide = MO.

241. If the de-Broglie wavelength of a particle of mass m is 100 times its velocity, then its value in terms of its mass (m) and planck's constant (h) is

(a) $\frac{1}{10}\sqrt{\frac{m}{h}}$ (b) $10\sqrt{\frac{h}{m}}$
(c) $\frac{1}{10}\sqrt{\frac{h}{m}}$ (d) $10\sqrt{\frac{m}{h}}$

J & K CET-(2009)

Ans. (b) : Let wavelength of particle be x

Velocity, $v = \frac{x}{100}$

We know that –

$$\lambda = \frac{h}{mv}$$

$$x = \frac{h\times 100}{m\times x}$$

$$x^2 = 100\frac{h}{m}$$

$$\Rightarrow x = \sqrt{100\frac{h}{m}}$$

$$x = 10\sqrt{\frac{h}{m}}$$

242. The de-Broglie wavelength of helium atom at room temperature is

(a) 6.6×10^{-34} m (b) 4.39×10^{-10} m
(c) 7.34×10^{-11} m (d) 2.335×10^{-20} m

JCECE - 2013

Ans. (c) : $V_{rms} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3\times 8.314\times 298}{4\times 10^{-3}}} = 1363\,ms^{-1}$

$$\lambda = \frac{h}{mv} = \frac{6.626\times 10^{-34}\times 6.023\times 10^{23}}{4\times 10^{-3}\times 1363}$$

$= 7.32\times 10^{-11}$ m

243. Which particle among the following will have the smallest de-Broglie wavelength, assuming that they have the same velocity?

(a) A positron (b) A photon
(c) An α-particle (d) A neutron

JCECE - 2014

Ans. (c) : The de-Broglie equation is $\lambda = \frac{h}{p} = \frac{h}{mv}$.

Here, h and v are constant. So, $\lambda \propto \frac{1}{m}$. Since, the α-particle has the highest mass among the given entities, it has the smallest de-Broglie wavelength.

244. A 600 W mercury lamp emits monochromatic radiation of wavelength 331.3 nm. How many photons are emitted form the lamp per second?($h=6.626\times10^{-34}$J-s; velocity of light $=3\times10^{8}$ ms^{-1})

(a) 1×10^{19} (b) 1×10^{20}
(c) 1×10^{21} (d) 1×10^{23}

JIPMER-2011

Ans. (c): We know that–

$$E = \frac{nhc}{\lambda}$$

$$n = \frac{E\lambda}{hc}$$

$$n = \frac{600\times 331{\cdot}3\times 10^{-9}}{6.626\times 10^{-34}\times 3\times 10^{8}}$$

So, $n = 1\times 10^{21}$ photons/second

245. What is the wavelength (in m) of a particle of mass 6.62×10^{-29} g moving with a velocity of 10^3 ms^{-1}?

(a) 6.62×10^{-4} (b) 6.62×10^{-3}
(c) 10^{-5} (d) 10^{5}

JIPMER-2009

Ans. (c) : According to de–Broglie equation

$$\lambda = \frac{h}{mv}$$

$$\lambda = \frac{6.62\times 10^{-34}}{6.62\times 10^{-29}\times 10^{-3}\times 10^{3}}$$

$\lambda = 10^{-5}$ m.

246. Dual nature of particle was given by

(a) Bohr theory
(b) Thomson model
(c) Heisenberg principle
(d) de-Broglie equation

J&K CET (2010)
JIPMER-2005

Ans. (d): Dual nature of particle was given by de–Broglie in 1923.

De-Broglie equation relate the particle character with the wave character of matter.

247. Number of photons emitted by a 100 W (Js^{-1}) yellow lamp in 1.0 s. Take the wavelength of yellow light as 560 nm, and assume 100 percent efficiency.

(a) 1.6×10^{18} (b) 1.4×10^{18}
(c) 2.8×10^{20} (d) 2.1×10^{20}

JIPMER-2018

@apna_pdf

Ans. (c): As per the Plank's quantum theory,

$$E = Nh\nu = N\frac{hc}{\lambda}$$

$$N=\frac{E\lambda}{hc} \quad \text{............(i)}$$

$E = 100\ w\ (Js^{-1})\times 1s = 100\ J$

Putting the value in equation (i), we get

$$N=\frac{100J\times 560\times 10^{-9}m}{6.626\times 10^{-34}Js\times 3\times 10^{8}ms^{-1}}$$

$= 2.82\times 10^{20}$.

248. With regard to photoelectric effect, identify the correct statement among the following.

(a) Energy of electron ejected increases with the increase in the intensity on incident light.

(b) Number of electron ejected increases with the increase in the frequency of incident light.

(c) Number of electron ejected increases with the increase in work function

(d) Number of electron ejected increases with the increase in the intensity of incident light.

Karnataka-CET-2020

Ans. (d) : The number of electron ejected increases with the increase in the intensity of incident light, an increase in the intensity of incident light means that the number of photons incident per unit surface area of the metal increase. (Provided the incident photons has its frequency more than threshold frequency).

The equation for the photoelectric effect is

$$h\nu = h\nu_0 + KE$$

Where, ν = frequency of the incident radiation

$h\nu_0$ = work function

It is clear that the number of electron elected does not depend of work function.

249. Two particle A and B are in motion. If the wavelength associated with 'A' is 33.33 nm, the wavelength associated with 'B' whose momentum is $\frac{1}{3}$rd of 'A' is

(a) 1.0×10^{-8} m (b) 2.5×10^{-8} m

(c) 1.25×10^{-7} m (d) 1.0×10^{-7} m

Karnataka-CET-2019

Ans. (d) : Given that,

$\lambda_A = 33.3$ nm or 33.33×10^{-9} m

$$P_B = \frac{1}{3}P_A$$

According to de-Broglie–

$$\lambda = \frac{h}{p}$$

$$\lambda_A = \frac{h}{P_A} \quad \text{......... (i)}$$

$$\lambda_B = \frac{h}{\frac{P_A}{3}} = \frac{3h}{P_A} \quad \text{......... (ii)}$$

From equation (i) and (ii), we get

$$\frac{\lambda_A}{\lambda_B} = \frac{1}{3} \Rightarrow \lambda_B = 33.33\times 10^{-9}\times 3 = 99.99\times 10^{-9}\,m$$

$= 1.0\times 10^{-7}$ m.

250. A body of mass x kg is moving with a velocity of 100 ms^{-1}. Its de-Broglie wavelength is 6.62 × 10^{-35} m. Hence, x is (h = 6.62 × 10^{-34} Js)

(a) 0.1 kg (b) 0.25 kg

(c) 0.15 kg (d) 0.2 kg

Karnataka-CET, 2009

Ans. (a): Given,

$h = 6.62\times 10^{-34}$ Js

$v = 100\ ms^{-1}$

$\lambda = 6.62\times 10^{-35}$

According to de-Broglie equation-

$$\lambda = \frac{h}{mv}$$

$$x = \frac{6.62\times 10^{-34}}{6.62\times 10^{-35}\times 100}$$

$$x = \frac{10^{-34}}{10^{-34}\times 10^{-1}\times 10^{2}} = \frac{1}{10}$$

= 0.1 kg

251. A body of mass 10 mg is moving with a velocity of 100 ms^{-1}. The wavelength of de-Broglie wave associated with it would be (h = 6.6. × 10^{-34} Js)

(a) 6.63×10^{-35} m (b) 6.63×10^{-34} m

(c) 6.63×10^{-31} m (d) 6.63×10^{-37} m

Karnataka-CET-2007

Ans. (c) : Given that,

$m = 10\ mg = 10 \times 10^{-6}$ kg

$\nu = 100\ ms^{-1}$

From de-Broglie equation,

$$\lambda = \frac{h}{mv}$$

$$\lambda = \frac{h}{mv} = \frac{6.63\times 10^{-34}}{10\times 10^{-6}\times 100}$$

$$= \frac{6.63\times 10^{-34}}{10^{-3}}$$

$m = 6.63 \times 10^{-31}$ m

252. The number of photons emitted per second by a 60 W source of monochromatic light of wavelength 663 nm is (h = 6.63 × 10^{-34} Js)

(a) 4× 10^{-20} (b) 1.5× 10^{20}

(c) 3× 10^{-20} (d) 2× 10^{20}

(e) 1× 10^{-20}

Kerala-CEE-2009

Ans. (d) : Given that,

$h = 6.63 \times 10^{-34}$ J sec.

$\lambda = 663\ nm = 663 \times 10^{-9}$ m

$c = 3 \times 10^{8}$ m/sec

n = ?

$E = 60\ W = 60\ J\ sec^{-1}$

∵ We know that,

$$E = \frac{nhc}{\lambda}$$

@apna_pdf

$$\therefore \quad n = \frac{E\times\lambda}{hc}$$

$$= \frac{60\times 663\times 10^{-9}}{6.63\times 10^{-34}\times 3\times 10^{8}}$$

$$= \frac{6\times 663\times 10^{-8}}{3\times 663\times 10^{-28}}$$

$$= 2\times 10^{-8+28}$$

$$= 2\times 10^{20}$$

253. The relationship between the energy E_1 of the radiation with a wavelength 8000 Å and the energy E_2 of the radiation with a wavelength 16000 Å is:

(a) $E_1 = 6E_2$ (b) $E_1 = 2E_2$

(c) $E_1 = 4E_2$ (d) $E_1 = \frac{1}{2}E_2$

(e) $E_1 = E_2$

Kerala-CEE-2005

Ans. (b) : We know that,

$$E \propto \frac{1}{\lambda}$$

$$\frac{E_1}{E_2} = \frac{\lambda_2}{\lambda_1} = \frac{16000}{8000} \Rightarrow E_1 = 2E_2$$

254. The work function of a metal is 5 eV. What is the kinetic energy of the photoelectron ejected from the metal surface if the energy of the incident radiation is 6.2 eV? (1 eV = 1.6 × 10^{-19})

(a) 6.626 × 10^{-19} J (b) 8.10 × 10^{-19} J

(c) 1.92 × 10^{-18} J (d) 8.01 × 10^{-18} J

(e) 1.92 × 10^{-19} J

Kerala-CEE-2014

Ans. (e): Given that,

Work function ($h\nu_0$) = 5eV

Energy of incident radition ($h\nu$) = 6.2 eV

The kinetic energy of photoelectron:

$$K.E = h\nu - h\nu_0$$

= 6.2–5

= 1.2 eV

= $12\times1.6\times10^{-19}$ J= 1.92×10^{-19} J

255. A 250 W electric bulb of 80% efficiency emits a light of 6626 Å wavelength. The number of photons emitted per second by the lamp is (h = 6.636 × 10^{-34} Js)

(a) 1.42 × 10^{17} (b) 2.18 × 10^{16}

(c) 6.66 × 10^{20} (d) 2.83 × 10^{16}

(e) 4.25 × 10^{16}

Kerala-CEE-2014

Ans. (c) : Energy of one photon = $\frac{hc}{\lambda}$

$$\frac{6.626\times10^{-34}\times3\times10^{8}}{6626\times10^{-10}} = 3\times10^{-19}\,J$$

Energy emitted by bulb= $\frac{250\times80}{100} = 200J$

∴ $n\times3\times10^{-19}$= 200 (where n= no. of photons)

$$n = \frac{200}{3\times10^{-19}} = 6.66\times10^{20}$$

256. The de Broglie wavelength of the matter wave associated with an object dropped from a height x, when it reaches the ground is proportional to

(a) x^2 (b) $\frac{1}{\sqrt{x}}$

(c) $\sqrt{x}$ (d) $x^{3/2}$

(e) x

Kerala-CEE-2020

Ans. (b) : According to de-Broglie wavelength–

$$\lambda = \frac{h}{mv}$$

Since, an object dropped from a height x then,

$$v^2 = u^2 - 2gx$$

$$v = \sqrt{2gx}$$

So, $\lambda = \frac{h}{m\sqrt{2gx}}$

or $\lambda \propto \frac{1}{\sqrt{x}}$

257. Calculate the energy of photons having wavelength, 5 × 10^{-7} m falls on a metal surface of work function, 3.4 × 10^{-19} J :

(a) 3.97 × 10^{-19} J (b) 3.55 × 10^{-19} J

(c) 2.97 × 10^{-19} J (d) 2.57 × 10^{-19} J

Manipal-2016

Ans. (a) : Energy of photons, E= hν = $\frac{hc}{\lambda}$

Given that-

$$h = 6.626\times10^{-34}\,Js$$

$$c = 3\times10^{8}\,m/s$$

$$\lambda = 5\times10^{-7}\,m$$

So, $E = \frac{(6.626\times10^{-34}\,Js)\times(3\times10^{8}\,ms^{-1})}{5\times10^{-7}}$

= 3.975 ×10^{-19} J

258. Which one is the wrong statement?

(a) The uncertainty principle is $\Delta E\times\Delta t \ge \frac{h}{2\pi}$

(b) Half filled and fully filled orbital have greater stability due to greater exchange energy, greater symmetry and more balanced arrangement.

(c) The energy of 2s-orbital is less than the energy of 2p-orbital in case of hydrogen like atoms.

(d) de-Broglie's wavelength is given by $\lambda = \frac{h}{mv}$, where m = mass of the particle, v = group velocity of the particle

NEET-2017

@apna_pdf

Ans. (c): (a) According to heisenberg uncertainity principle, the uncertainties of position (Δx) and momentum (p=mΔv) are related as

$$\Delta x \cdot \Delta p \ge \frac{h}{4\pi} \text{ or } \quad \Delta x \cdot m\Delta v \ge \frac{h}{4\pi}$$

$$\Delta x \cdot m \cdot \Delta a \cdot \Delta t \ge \frac{h}{h\pi} \qquad \left[\frac{\Delta v}{\Delta t} = \Delta a, a = \text{acceleration}\right]$$

Or, $$\Delta x \cdot F \cdot \Delta t \ge \frac{h}{h\pi} \qquad [\because F = m \cdot \Delta a]$$

$$\Delta E.\Delta t \ge \frac{h}{h\pi} \qquad [\because \Delta E = F.\Delta x, E = \text{energy}]$$

Thus, statement (a) is correct.

(b) The half filled and fully filled orbitals have greater stability due to greater exchange energy, greater symmetry and more balanced arrangement.

Thus, statement (b) is correct.

(c) For a single electronic species like H, energy depends on value of x and does not depend on l. Hence energy of 2s–orbital and 2p–orbital is equal in case of hydrogen like species.

Therefore, statement (c) is incorrect.

(d) According to de-Broglie equation,

Wavelength $(\lambda) = \frac{h}{mv}$

Where, h= Planck's constant

Thus, statement (d) is correct.

259. A 0.66 kg ball is moving with a speed of 100 m/s. The associated wavelength will be (h = 6.6 ×10^{-34}) Js)

(a) 6.6×10^{-32} m
(b) 6.6×10^{-34} m
(c) 1.0×10^{-35} m
(d) 1.0 × 10–32 m

NEET-Main 2010

Ans. (c): According to de-broglie equation-

$$\lambda = \frac{h}{mv}$$

$$= \frac{6.6 \times 10^{-34}}{0.66 \times 100} = 1 \times 10^{-35} \text{ m}$$

260. The frequency of radiation emitted when the electron falls from n = 4 to n = 1 in a hydrogen atom will be (Given ionization energy of H = 2.18 ×10^{-18} J atom^{-1} and h = 6.626 × 10^{-34}J s)

(a) 1.54×10^{15} s^{-1}
(b) 1.03×10^{15} s^{-1}
(c) 3.08×10^{15} s^{-1}
(d) 2.00×10^{15} s^{-1}

NEET-2004

Ans. (c): Hydrogen like atom–

$$E_n = -\frac{E_1}{n^2} = \frac{-2.18 \times 10^{-18}}{n^2} \text{J/atom}$$

$$E_1 = \frac{-2.18 \times 10^{-18}}{(1)^2} \text{J/atom}$$

$$E_4 = -\frac{2.18 \times 10^{-18}}{(4)^2} \text{J/atom}$$

On applying $\Delta E = E_1 - E_4$

$$= -2.18 \times 10^{-18} - \left[\frac{-2.18 \times 10^{-18}}{16}\right]$$

$$= -2.04 \times 10^{-18} \text{ J/atom}$$

On applying $\Delta E = hv$

$$-2.04 \times 10^{-18} = 6.626 \times 10^{-34} \times v$$

$$v = \frac{-2.04 \times 10^{-18}}{6.626 \times 10^{-34}}$$

$$v = 3.08 \times 10^{15} \text{ s}^{-1}$$

261. Based on equation E = -2178 × 10^{-15} J $\left(\frac{Z^2}{n^2}\right)$ certain conclusions are written. What of them is not correct?

(a) Equation can be used to calculate the change in energy when the electron changes orbit.

(b) For n=1, the electron has a more negative energy than it does for n = 6 which means that the electron is more loosely bound in the smallest allowed orbit.

(c) The negative sign in equation simply means that the energy of electron bound to the nucleus is lower than it would be if the electrons were at the infinite distance from the nucleus.

(d) Larger the value of n, the larger is the orbit radius.

NEET-2013

Ans. (b): For n=1 the electron has more negative energy than it does for n=6 which means that the electron is less loosely bound in the smallest allowed orbit.

We know that,

$$E = -R_H\left(\frac{Z^2}{n^2}\right)$$

If n = 1

$$E = -R_H\left(\frac{Z^2}{1}\right) = -2.178 \times 10^{-18} \text{J}$$

If n = 6

$$E = -R_H\left(\frac{Z^2}{6^2}\right) = \frac{-2.178}{36} \times 10^{-18} \text{J}$$

$$= -6.05 \times 10^{-20} \text{J}$$

$$E_{n=1} > E_{n=6}$$

262. Calculate the energy in joule corresponding to light of wavelenth 45 nm.
Planck'e constant, h = 6.63m × 10^{-34} J s, speed of light, c = 3 × 10^{8} m s^{-1})

(a) 6.67×10^{15}
(b) 6.67×10^{11}
(c) 4.42×10^{-15}
(d) 4.42×10^{-18}

NEET-2014

Ans. (d) : Using planck's quantum theory –

$$E = \frac{hc}{\lambda} = \frac{6.63 \times 10^{-34} \times 3 \times 10^8}{45 \times 10^{-9}}$$

$$= 4.42 \times 10^{-18} \text{ J}$$

263. The value of Planck's contant is 6.63 × 10^{-34} Js. Speed of light is 3 × 10^{17} nm s^{-1}. Which a value is closed to the wavelength in nanomter of a quantum of light with frequency of 6×10^{15} s^{-1}?

(a) 50
(b) 75
(c) 10
(d) 25

NEET-2013

@apna_pdf

Ans. (a) : We know that –

$$c = \nu\lambda$$

$$\lambda = \frac{c}{\nu}$$

$$\lambda = \frac{3\times10^{17}}{6\times10^{15}} = 50\text{nm}$$

264. According to law of photochemical equivalence the energy absorbed (in ergs/mole) is given as ($h = 6.62 \times 10^{-27}$ ergs, $c = 3 \times 10^{10}$ cm s^{-1}, $N_A = 6.02 \times 10^{23}$ mol^{-1})

(a) $\frac{1.196\times10^{8}}{\lambda}$ (b) $\frac{2.859\times10^{5}}{\lambda}$

(c) $\frac{2.859\times10^{16}}{\lambda}$ (d) $\frac{1.196\times10^{16}}{\lambda}$

Karnataka NEET-2013

Ans. (a) : Given data,

$h = 6.62 \times 10^{-27}$ ergs

$c = 3 \times 10^{10}$ cm s^{-1}

$N_A = 6.02 \times 10^{23}$ mol^{-1}

$$E = \frac{hcN_A}{\lambda}$$

$$= \frac{6.62\times10^{-27}\times3\times10^{10}\times6.02\times10^{23}}{\lambda}$$

$$= \frac{1.196\times10^{8}}{\lambda}\text{ergs mol}^{-1}.$$

265. The energies E_1 and E_2 of two radiations are 25 eV and 50 eV respectively. The relation between their wavelengths i.e. λ_1 and λ_2 will be

(a) $\lambda_1 = \lambda_2$ (b) $\lambda_1 = 2\lambda_2$

(c) $\lambda_1 = 4\lambda_2$ (d) $\lambda_1 = \frac{1}{2}\lambda_2$

NEET-2011

Ans. (b) : Given, E_1= 25ev and E_2= 50 ev

$$E_1 = \frac{hc}{\lambda_1}, E_2 = \frac{hc}{\lambda_2}$$

By dividing E_1 and E_2

$$\Rightarrow \frac{25}{50} = \frac{\lambda_2}{\lambda_1}$$

$$\Rightarrow \frac{\lambda_2}{\lambda_1} = \frac{1}{2}$$

$$\Rightarrow \lambda_1 = 2\lambda_2$$

266. The value of Planck's constant is 6.63×10^{-34} Js. The velocity of light is 3.0×10^{8} ms^{-1}. Which value is closest to the wavelength in nanometers of a quantum of light with frequency of $8\times10^{15}s^{-1}$?

(a) 2×10^{-25} (b) 5×10^{-18}

(c) 4×10^{1} (d) 3×10^{7}

NEET-2003

Ans. (c): Given that –

$c = 3 \times 10^{8}$ m/s

$\lambda = 8 \times 10^{15}$ s^{-1}

We know that,

$$\lambda = \frac{c}{\upsilon}$$

$$\lambda = \frac{3\times10^{8}}{8\times10^{15}} = 0.375\times10^{-7}\text{m}$$

$$= 0.375\times10^{-7}\times10^{9}\text{ nm}$$

$$= 0.375\times10^{2}\text{ nm}$$

$$= 37.5\text{ nm}$$

$$\approx 4\times10^{1}\text{ nm}$$

267. For given energy, $E = 3.03 \times 10^{-19}$ Joules corresponding wavelength is ($h = 6.626 \times 10^{-34}$) J sec, $c = 3 \times 10^{8}$ m/sec

(a) 65.6 nm (b) 6.36 nm

(c) 3.4 nm (d) 656 nm

NEET-2000

Ans. (d) : We know that –

$$E = \frac{hc}{\lambda}$$

Given that –

$E = 3.03 \times 10^{-19}$J

$h = 6.626 \times 10^{-34}$ Js

$c = 3 \times 10^{8}$ m/s

$$\lambda = \frac{6.6\times10^{-34}\times3\times10^{8}}{3.03\times10^{-19}}$$

$$= 6.56\times10^{-7}\text{m} = 656\times10^{-9}\text{m} = 656\text{nm}$$

268. A particular station of All India Radio, New Delhi, broadcasts ona frequency of 1,368 kHz (kilohertz). The wavelength of the electromagnetic radiation emitted by the transmitter is [speed of light, $c = 3.0 \times 10^{8}$ m s^{-1}]

(a) 21.92 cm (b) 219.3 m

(c) 219.2 m (d) 2192 m

NEET-2021

Ans. (b) : We know that –

$$\text{Wave length }(\lambda) = \frac{c}{v}$$

$$\lambda = \frac{3\times10^{8}}{1368\times10^{3}} = 219.298\text{m} = 219.3\text{m}$$

269. What will be the wavelength of a photon having energy 1eV ($1eV=1.601\times10^{-19}J$)?

(a) 1.241×10^{-7}m (b) 12.41×10^{-9}m

(c) 12.41×10^{-7}m (d) 1.241×10^{-9}m

Tripura JEE-2019

Ans. (c): According to formula

$$E = \frac{hc}{\lambda}$$

$$\lambda = \frac{hc}{E} = \frac{6.626\times10^{-34}\times3\times10^{8}}{1.6\times10^{-19}}$$

$$\lambda = 12.41\times10^{-7}\text{ m.}$$

270. What is the wavelength (in m) of a particle of mass 6.62×10^{-29} g moving with a velocity of $10^{3}ms^{-1}$?

(a) 6.62×10^{-4} (b) 6.62×10^{-3}

(c) 10^{-5} (d) 10^{5}

UP CPMT-2008

@apna_pdf

Ans. (c): According to de-Broglie equation

$$\lambda = \frac{h}{m\nu}$$

Given that –

$m = 6.62 \times 10^{-29}$g
$v = 10^3$ m/s
$h = 6.62 \times 10^{-34}$Js

putting these value in the equation.

$$\lambda = \frac{6.62\times10^{-34}}{6.62\times10^{-29}\times10^{3}\times10^{-3}} = 10^{-5}\text{m}$$

271. If the energy difference between the ground state and its excited state of an atom is 4.4×10^{-14}J. The wavelength of photon required to produce the transition:

(a) 2.26×10^{-12} m (b) 1.13×10^{-12} m
(c) 4.52×10^{-16} m (d) 4.52×10^{-12} m

UPTU/UPSEE-2006

Ans. (d) : We know that –

$$\Delta E = h\nu = \frac{hc}{\lambda}$$

$$\lambda = \frac{hc}{\Delta E} = \frac{6.62\times10^{-34}\times3\times10^{8}}{4.4\times10^{-14}}$$

$$\lambda = 4.52\times10^{-12}\text{m.}$$

272. What is the wavelength associated with a tennis ball of mass 10^3g and travelling at a velocity of 6.626 ms^{-1}? [$h=6.626\times10^{-34}Js^{-1}$]

(a) 10^{-34} m (b) 10^{-31} m
(c) 6.626m (d) 6.626×10^{-31}m

UPTU/UPSEE-2011

Ans. (a) : According to de-Broglie equation –

$$\lambda = \frac{h}{mv}$$

$$\lambda = \frac{6.626\times10^{-34}\,\text{Js}}{1\text{kg}\times6.626\,\text{ms}^{-1}} = 10^{-34}\text{ m}$$

273. Time period of a wave is 5×10^{-3} sec what is the frequency.

(a) 5×10^{-3} s^{-1} (b) 2×10^{2} s^{-1}
(c) 23×10^{3} s^{-1} (d) $5\times10^{2}s^{-1}$

UPTU/UPSEE-2008

Ans. (b) : Frequency (n) = $\frac{1}{\text{time period (T)}}$

Here, T= 5×10^{-3} s

$$n = \frac{1}{5\times10^{-3}} = 0.2\times10^{3}$$

$n = 2\times10^{2}$ s^{-1}

274. As per de-Broglie's formula a macroscopic particle of mass 100 g and moving at a velocity of 100 cm s^{-1} will have a wavelength of

(a) 6.6×10^{-29} cm (b) 6.6×10^{-30} cm
(c) 6.6×10^{-31} cm (d) 6.6×10^{-32} cm

WB-JEE-2014

Ans. (c) : According to de–Broglie wavelength,

$$\lambda = \frac{h}{mv}$$

Where, h = Planck's constant
m = Mass of particle
v = Velocity

Given, m= 100 g, v= 100 cm s^{-1}
$h=6.6\times10^{-34}$ Js= 6.6×10^{-27} ergs

$$\lambda = \frac{6.6\times10^{-27}}{100\times100}$$

$\lambda= 6.6\times10^{-31}$ cm

275. Which one of the following corresponds to a photon of highest energy?

(a) $\lambda = 300$ mm (b) $\nu = 3\times10^{8}s^{-1}$
(c) $\bar{\nu} = 30\text{ cm}^{-1}$ (d) $\varepsilon = 6.626\times10^{-27}$ J

WB-JEE-2017

Ans. (a) : $\therefore$ E= $h\nu = \frac{hc}{\lambda} = hc.\bar{v}\left(\because \frac{1}{\lambda} = \bar{v}\right)$

Where E= energy of photon
c = velocity of photon (=light)
λ = wavelength of photon
h= plank's constant.

For (a)
E= $6.63\times10^{-34} \times3\times10^{8}/300\times10^{-9}$
E= 1.98×10^{-25} J/300×10^{-9}

$$E = \frac{1.98\times10^{-25}\,J}{300\times10^{-9}\,m}$$

(a) → E = 6.6×10^{-19}J
For (b)
E= $h\nu = 6.63\times10^{-34}\times3\times10^{8}$
(b) → E= 1.98×10^{-25} J

For (c) $E = hc.\bar{v}\left(\because \frac{1}{\lambda} = \bar{v}\right)$

E= $6.63\times10^{-34}\times3\times10^{8}\times30\times10^{-2}$
(c) → E= 5.96×10^{-26}
For (d) → E= 6.62×10^{-27} J
Hence highest energy for photon is in (a).

4. Uncertainty Principle

276. If the work function of a metal is 6.63×10^{-19} J, the maximum wavelength of the photon required to remove a photoelectron from the metal is ——— nm. (Nearest integer) [Given : h = 6.63×10^{-34} Js, and c = 3×10^{8} m s^{-1}]

JEE Main-28.06.2022, Shift-I

Ans. (300) : Given,

Work function of metal = 6.63×10^{-19} J
Planck's constant = 6.63×10^{-34}Js
c(velocity) = 3×10^{8} m/s

As we know that–

$$\text{Work function} = \frac{hc}{\lambda}$$

@apna_pdf

Then $\lambda = \dfrac{hc}{\text{work function}}$

$$\lambda = \frac{6.63\times10^{-34}\times3\times10^{8}}{6.63\times10^{-19}}$$

λ = 3000 nm

277. A fast moving particle of mass 6.63 × 10^{-28} g can be located with an accuracy of 1Å. The uncertainty in its velocity (in ms^{-1}) is about (h = 6.63 × 10^{-34} Js)

(a) 8 × 10^3 (b) 8 × 10^4
(c) 8 × 10^5 (d) 8 × 10^6
(e) 8 × 10^7

Kerala CEE -03.07.2022

Ans. (c) : Given that –

Mass of particle (m) = 6.63 × 10^{-28}g
= 6.63 × 10^{-31} kg

Planck's constant (h) = 6.63 × 10^{-34} Js

$\Delta x = 1A^{o} = 10^{-10}$ m

According to Heisenberg's uncertainty principle

$$\Delta x.\ \Delta p = \frac{h}{4\pi}$$

$$\Delta x.\ m\Delta v = \frac{h}{4\pi}$$

$$\Delta v = \frac{h}{4\pi\times m\times\Delta x}$$

$$\Delta v = \frac{6.63\times10^{-34}}{4\times3.14\times6.63\times10^{-31}\times10^{-10}}$$

$$\Delta v = \frac{10^{-34}\times10^{41}}{12.56}$$

$$\Delta v = \frac{10^{7}}{12.56}$$

$$\Delta v = \frac{100\times10^{5}}{12.56}$$

$$\Delta v = 8\times10^{5}$$

278. If the uncertainty in velocity and position of a minute particle in space are, 2.4 × 10^{-26} (m s^{-1}) and 10^{-7} (m) respectively. The mass of the particle in g is _____. (Nearest integer) (given : h = 6.626 × 10^{-34} Js)

JEE Main-27.06.2022, Shift-I

Ans. (29.89×10^{-3}) :

We know the uncertainty principle–

$$\Delta x.\ \Delta p = \frac{h}{4\pi}$$

$$\Delta x.\ m\Delta v \geq \frac{h}{4\pi} \because \Delta p = m\Delta v$$

$$m = \frac{h}{4\pi.\ \Delta x.\ \Delta v}$$

Given that –

$\Delta v = 2.4\times10^{-26}$

$\Delta x = 10^{-7}$

n = 6.626 × 10^{-34}

So,

$$m = \frac{6.626\times10^{-34}}{4\times3.14\times10^{-7}\times2.4\times10^{-26}}$$

$$m = \frac{6.626\times10^{-34}\times10^{33}}{4\times3.14\times2.4}$$

m = 21.89 × 10^{-3} g

279. The uncertainties in the velocities of two particles A and B are 0.05 and 0.02 ms^{-1} respectively. The mass of B is five times to that of A. What is the ratio of uncertainties $\left(\dfrac{\Delta x_A}{\Delta x_B}\right)$ their positions in :

(a) 2 (b) 0.25
(c) 4 (d) 1

AP-EAMCET-2006

Ans. (a) : Given, $\Delta v_A = 0.05\ ms^{-1}$ and m_A = m

$\Delta v_B = 0.02\ ms^{-1}$ m_B = 5 m

According to Heisenberg uncertainty principle–

$$\boxed{m\Delta v.\Delta x \geq \frac{h}{4\pi}}$$

Where, h = Planck's constant

Δx = Uncertainity in position

Δv = Uncertainity in velocity

m = Mass

For particle A :

$$m\times0.05\times\Delta x_A = \frac{h}{4\pi} \quad \text{.... (i)}$$

For particle B :

$$5\ m\times0.02\times\Delta x_B = \frac{h}{4\pi} \quad \text{.... (ii)}$$

Dividing equation (i) and (ii) we get :

$$\frac{m\times0.05\times\Delta x_A}{5m\times0.02\times\Delta x_B} = 1$$

$$\frac{\Delta x_A}{\Delta x_B} = \frac{0.02\times5}{0.05}$$

$$\boxed{\frac{\Delta x_A}{\Delta x_B} = 2}$$

280. If the uncertainty in velocity of a moving object is 1.0×10^{-6} ms^{-1} and the uncertainty in its position is 58 m, The mass of this object is approximately equal to that of (h = 6.626×10^{-34} Js)

(a) helium (b) deuterium
(c) lithium (d) electron

AP EAMCET (Medical) - 2013

Ans. (d) : Given-

Uncertainty in velocity $(\Delta v) = 1.0\times10^{-6}\ ms^{-1}$

Uncertainty in position (Δx) = 58 m

Mass (m) = ?

@apna_pdf

Now, from the Heisenberg principle-

$$\Delta x.\Delta p \ge \frac{h}{4\pi}$$

where - Δx = uncertainty in position

Δp = uncertainty in momentum

$$\therefore \Delta x.\Delta v = \frac{h}{4\pi m}$$

or $$m = \frac{6.6\times10^{-34}}{4\times3.14\times58\times1.0\times10^{-6}}$$

or $$m = \frac{6.6}{728.48}\times10^{-34+6}$$

or $$m = 9.05\times10^{-28-3}$$

or $$m = 9.05\times10^{-31}$$

Thus, the mass of moving object is approximately equal to that of electron.

281. If a cricket ball of weight 0.1 kg has an uncertainty of 0.15 ms^{-1} in its velocity then the uncertainty in the position of the cricket balls is ________

(a) 3.5×10^{-33} m (b) 35×10^{-33}m

(c) 1.7×10^{-34} m (d) 1.7×10^{-33} m

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (a) : According to Heisenberg's Uncertainty principle–

$$\Rightarrow \Delta p.\Delta x \ge \frac{h}{4\pi}$$

Where, h = Planck's constant (6.67×10^{-34} J-s)

$\because \Delta p = m\Delta v$

$$\Rightarrow m\Delta v\Delta x \ge \frac{h}{4\pi}$$

Given, m = 0.1kg, Δx=0.15m/sec

$$\Delta x = \frac{h}{4\pi m\Delta v}$$

$$= \frac{6.67\times10^{-34}}{4\times3.14\times0.1\times0.15}$$

$$= \frac{6.67}{0.1884}\times10^{-34}$$

$$\Rightarrow 35.40\times10^{-34}$$

$$\Rightarrow 3\cdot5\times10^{-33}\text{ m}$$

282. If the uncertainty in momentum and uncertainty in the position of a particle are equal. then the uncertaintiy in its velocity would be given by _______.

(a) $\Delta v \ge \sqrt{\frac{h}{2\pi}}$ (b) $\Delta v \ge \frac{1}{2m}\sqrt{\frac{h}{\pi}}$

(c) $\Delta v \ge \sqrt{\frac{h}{\pi}}$ (d) $\Delta v \ge \frac{1}{m}\sqrt{\frac{h}{\pi}}$

AP EAPCET 24.08.2021, Shift-I

CG PET -2019

Ans. (b) : Given –

Uncertainity in momentum = Uncertainity in position

i.e. $m\Delta v = \Delta x$ ... (1)

From equation of Heisenberg uncertainity principle –

$$\Delta x.\Delta v \ge \frac{h}{4\pi m}$$

Where, h = Planck's constant

Δx = Uncertainity in position

Δv = Uncertainity in velocity

From equation (1) we get

$$m\Delta v^2 \ge \frac{h}{4\pi m}$$

$$\Delta v^2 \ge \frac{h}{4\pi m^2}$$

$$\Delta v \ge \sqrt{\frac{h}{4\pi m^2}}$$

$$\Delta v \ge \frac{1}{2m}\sqrt{\frac{h}{\pi}}$$

283. Find the uncertainlity in the position of an electron which is moving with a velocity of 2.99 × 10^4 $cm.s^{-1}$. accurate up to 0.0016%. (Given, $m_e = 9.1\times10^{-28}$ g. h = 6.626×10^{-27} erg.s)

(a) 1.211 mm (b) 2.99×10^{-10} mm

(c) 0.121 mm (d) 12.11 mm

AP EAPCET 24.08.2021, Shift-I

Ans. (d) : Given –

$\Delta v = 2.99\times10^4$ cm s^{-1}, $m_e = 9.1\times10^{-28}$ gm,

h = 6.626×10^{-27} g cm^2 s^{-2}

Hence,

$$\Delta v = 2.99\times10^4 \text{ cm s}^{-1}\times\frac{0.0016}{100}$$

$$\Delta v = 0.478 \text{ cm s}^{-1}$$

From equation of Heisenberg uncertainity principle –

$$\Delta x.\Delta v \ge \frac{h}{4\pi m}$$

Where, h = Planck's constant

Δx = Uncertainity in position

Δv = Uncertainity in velocity

m = Mass

π = 3.14

or $$\Delta x = \frac{6.626\times10^{-27}\left(\text{g cm}^2\text{s}^{-2}\right)\cdot\text{s}}{4\times3.14\times0.478(\text{cm s}^{-1})\times9.1\times10^{-28}(\text{gm})}$$

Δx = 1.21 cm = 12.1 mm

284. If a proton is accelerated to a velocity of 3 × 10^7 $m.s^{-1}$ which is accurate up to ± 0.5%, then the uncertainty in its position will be ____ [mass of proton = 1.66×10^{-27} kg, h =6.6×10^{-34} J.s]

(a) 1.55×10^{-12} m (b) 3.24×10^{-13} m

(c) 1.58×10^{-13} m (d) 2.11×10^{-13} m

AP EAPCET 24.08.2021, Shift-I

Ans. (d): Given –

$\Delta v = 3\times10^7$ m s^{-1}

Δx = ?

m = 1.66×10^{-27} kg

h = 6.626×10^{-34} J-s

It is given that velocity have the ± 0.5% So, the velocity will be –

@apna_pdf

$$\Delta v = 3 \times 10^7\ ms^{-1} \times \frac{0.5}{100}$$

$$\Delta v = 3 \times 5 \times 10^4\ ms^{-1}$$

From the Heisenberg uncertainity principle –

$$\Delta x.\Delta v \geq \frac{h}{4\pi m}$$

or $$\Delta x = \frac{h}{4\pi m \cdot \Delta v}$$

$$\Delta x = \frac{6.6\times10^{-34}\left(kgm^2s^{-1}\right)}{4\times3.14\times1.66\times10^{-27}\left(kg\right)\times1.5\times10^5\left(ms^{-1}\right)}$$

$$= \frac{6.6\times10^{-12}}{31.2744}$$

$\Delta x = 2.11 \times 10^{-13}$ m

285. In an atom, an electron is moving with a speed of 600 m/s with an accuracy of 0.005%. Certainty with which position of the electron can be located is
(h= 6.6 ×10^{-34} kg m^2 s^{-1}, mass of electron e_m=9.1 ×10^{-31} kg)

(a) 1.52× 10^{-4} m (b) 5.10× 10^{-3} m
(c) 1.92× 10^{-3} m (d) 3.84× 10^{-3} m

COMEDK-2017

Ans. (c) : Given: velocity of electron, $v = 600\,ms^{-1}$

Accuracy of velocity= 0.005%

$$\therefore \Delta v = \frac{600\times0.005}{100} = 0.03 m/s$$

According to Heisenberg's uncertainty principle,

$$\Delta x.m\Delta v \geq \frac{h}{4\pi}$$

$$\Delta x = \frac{h}{4\pi m\Delta v}$$

Where, h = Planck's constant
Δx = Uncertainity in position
Δv = Uncertainity in velocity
m = Mass

$$\Rightarrow \Delta x = \frac{6.6\times10^{-34}}{4\times3.14\times9.1\times10^{-31}\times0.03} = 1.92\times10^{-3}m$$

286. A ball weighing 10 g is moving with a velocity of 90 ms^{-1}. If the uncertainty in its velocity is 5%, then the uncertainty in its position is ______ ×10^{-33} m. (Rounded off to the nearest integer) [Given: h=6.63×10^{-34} Js]

JEE Main 26.02.2021,Shift-II

Ans. (1) : Given that,
m= 10gm =10×10^{-3}=10^{-2} kg
v = 90 m/sec.

$$\Delta v = 90\times\frac{5}{100} = 4.5 m/sec$$

According to Heisenberg's principle

$$m.\ \Delta v.\Delta x \geq \frac{h}{4\pi}$$

Where, h = Planck's constant
Δx = Uncertainity in position
Δv = Uncertainity in velocity
m = Mass
π = 3.14

$$10^{-2}\times4.5\times\Delta x \geq \frac{6.63\times10^{-34}}{4\times3.14}$$

$$\Delta x \geq \frac{6.63\times10^{-34}}{4\times3.14\times10^{-2}\times4.5}$$

$$\Delta x \geq 1.17\times10^{-33}$$

So, x= 1.17 ≈ 1.

287. Both the position and exact velocity of an electron in an atom cannot be determined simultaneously and accurately. This is known as

(a) De Broglie principle
(b) Hamiltonian law
(c) Heisenberg uncertainty principle
(d) Bohr theory of hydrogen atom

TS-EAMCET 09.08.2021, Shift-I

Ans. (c) : Heisenberg uncertainty principle– It is impossible to determine the exact position and the exact momentum of the particle simultaneously.

According to Heisenberg uncertainty principle–

$$\boxed{\Delta x.\ \Delta p \geq \frac{h}{4\pi}}$$

Thus, lesser the error in the momentum more will be the error in the position of the particle.

288. A microscope using appropriate photons is engaged to track an electron in an atom within distance of 0.001 nm. What will be the uncertainty involved in measuring its velocity?

(a) 5.79 × 10^7 m/s (b) 5.79 × 10^6 m/s
(c) 4.79 × 10^7 m/s (d) 3.7 × 10^6 m/s

TS EAMCET 05.08.2021, Shift-I

Ans. (a):

According to heisenberg's uncertainty principle-

$$\Delta v \geq \frac{h}{4\pi m\Delta x}$$

Where, h = Planck's constant
Δx = Uncertainity in position
Δv = Uncertainity in velocity
m = Mass

$$\Delta v \geq \frac{6.626\times10^{-34}}{4\times3.14\times9.11\times10^{-31}\times0.01\times10^{-10}}$$

Δv ≥ 0.0579 × 10^9 m/s

Δv ≥ 5.79 × 10^7 m/s

289. Heisenberg's uncertainty principle is in general significant to

(a) Planets
(b) Cricket bal of 500 g
(c) Cars
(d) Micro particles having a very high speed

TS EAMCET 04.08.2021, Shift-I

Ans. (d) : According to Heisenberg's uncertainty principle we cannot simultaneously determine both the precise velocity and position of a particle. It is general significant to micro particles having a very high speed.

@apna_pdf

The mathematical expression of law is given below :

$$\Delta x \times \Delta y \geq \frac{h}{4\pi}$$

Δx = Change in position of the particle.
Δy = Change in momentum of particle.
h = Planck's constant.

290. A proton and a Li^{3+} nucleus are accelerated by the same potential. If λ_{Li} and λ_P denote the de Broglie wavelengths of Li^{3+} and proton respectively, then the value of $\frac{\lambda_{Li}}{\lambda_p}$ is $x \times 10^{-1}$.

The value of x is _____(Rounded off to the nearest integer)
[Mass of Li^{3+} = 8.3 mass of proton]

JEE Main 24.02.2021, Shift-I

Ans. (2) : Given –

Potential of proton = $e_p^- V$

Potential of $Li^{3+} = 3e_p^- V$

and $\frac{\lambda_{Li}}{\lambda_p} = x \times 10^{-1}$

According to de-Broglie equation

Now, $\lambda = \frac{h}{\sqrt{2M(K.E)}}$

Where, h = Planck's constant
m = Mass
K.E. = Kinetic energy

$$\therefore \quad \frac{\lambda_{Li}}{\lambda_p} = \frac{h}{\sqrt{2M_{Li^{3+}}(3e_p^- V)}} \times \frac{\sqrt{2M_p(e_p^- V)}}{h}$$

$$\therefore \quad x \times 10^{-1} = \sqrt{\frac{M_p(e_p^- V)}{M_{Li^{3+}}(3e_p^- V)}}$$

$$\left[M_{Li^{3+}} = 8.3M_p \Rightarrow \frac{M_p}{M_{Li^{3+}}} = \frac{1}{8.3}\right]$$

$$x \times 10^{-1} = \sqrt{\frac{1}{8.3 \times 3}} \Rightarrow \boxed{x = 2}$$

291. Assertion: It is impossible to determine the exact position and exact momentum of an electron simultaneously.
Reason: The path of an electron in an atom is clearly defined.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2016

Ans. (c): According to Heisenberg's uncertainty principle, we cannot determine the exact position and exact momentum of an electron simultaneously. So assertion is correct but reason is not correct.

292. The uncertainties in the velocities of two particles, A and B are 0.05 and 0.02 ms^{-1} respectively. The mass of B is five times to that of the mass of A. What is the ratio of uncertainties $\frac{\Delta x_A}{\Delta x_B}$ in their positions?

(a) 2
(b) 0.25
(c) 4
(d) 1

AIIMS-2008

Ans. (a): According to Heisenberg's uncertainty principle,

$$\Delta x \times m\Delta v = \frac{h}{4\pi}$$

Where, h = Planck's constant
Δx = Uncertainity in position
Δv = Uncertainity in velocity
m = Mass
$\pi = 3.14$

For particle A, $\Delta x = \Delta x_A$
M=m, Δv=0.05

So, $\Delta x_A \times m \times 0.05 = \frac{h}{4\pi}$ ………. (i)

For particle B, $\Delta x = \Delta x_B$ m = 5m, Δv = 0.02

So, $\Delta x_B \times 5m \times 0.02 = \frac{h}{4\pi}$ ………..(ii)

So, $\frac{\Delta x_A}{\Delta x_B} = \frac{5 \times 0.02}{0.05}$
$= 2$

293. The product of uncertainty in velocity and uncertainty in position of a micro particle of mass 'm' is not less than in which of the following?

(a) $h \times \frac{3\pi}{m}$
(b) $\frac{h}{3\pi} \times m$
(c) $\frac{h}{4\pi} \times \frac{1}{m}$
(d) $\frac{h}{4\pi} \times m$

AP-EAMCET – 2016

Ans. (c) : According to uncertainty principle

$$\Delta p.\Delta x \geq \frac{h}{4\pi} \quad \text{(i)}$$

Where, Δp = Uncertainty in momentum
Δx = Uncertainity in position
h = Planck's constant

$\therefore \quad \Delta p = m \cdot \Delta v$

Putting the value of Δp in equation (i) we get -

$$m \cdot \Delta v \cdot \Delta x \geq \frac{h}{4\pi}$$

$$\boxed{\Delta x \cdot \Delta v \geq \frac{h}{4\pi} \times \frac{1}{m}}$$

294. The exact path of electron in any orbital cannot be determined. The above statement is based on ______

(a) Hund's Rule
(b) Bohr's Rule
(c) Uncertainty Principal
(d) Aufbau Principal

AP- EAPCET- 07-09-2021, Shift-I

@apna_pdf

Ans. (c) : According to Heisenberg uncertainty principle, the position and the velocity of an object cannot both be measured exactly at the same time.

Hund's Rule- Every orbitals in a subshell is singly occupied with one electron before any one orbital is doubly occupied,

Aufbau Principle- Electrons fill lower energy atomic orbitals before filling higher energy ones.

295. The uncertainty in position and velocity of a particle are 10^{-10}m and 5.27 × 10^{-24} ms^{-1} respectively. Calculate the mass of the particle is ($h = 6.625 \times 10^{-34}$ Js) –

(a) 0.099 kg (b) 0.99 kg
(c) 0.92 kg (d) None

VITEEE 2019

Ans. (a): Given,

$$\Delta n = 10^{-10}\text{ m}$$
$$\Delta v = 5.27\times10^{-24}\text{ m.s}^{-1}$$
$$h = 6.625\times10^{-34}\text{ J-s}$$

According to Heisenberg's uncertainty principle–

$$\Delta x.m\Delta v \ge \frac{h}{4\pi} \qquad [\therefore p = m\Delta v]$$

$$m = \frac{h}{4\pi.\Delta x\times\Delta v}$$

$$m = \frac{6.625\times10^{-34}\text{ J sec}}{4\times3.14\times10^{-10}\times5.27\times10^{-24}}$$

$$m = 0.099\text{ kg.}$$

296. Which of the following pairs is not correctly matched?

(a) Hund's rule	In orbitals of equivalent energy electron spins remain unpaired if possible.
(b) Pauli's exclusion principle	No two electrons can have all the four quantum number identical.
(c) Zeeman effect	the effect of magnetic field on the atomic spectra.
(d) Uncertainty principle	It is impossible to determine the position of an electron.

J & K CET-(2013)

Ans. (d) : According to uncertainty principle, it is impossible to measure simultaneously the position and momentum of an electron with absolute accuracy.

297. The Heisenberg uncertainty principle may be stated as

(a) $\Delta x.\Delta v = h$ (b) $\Delta x.\Delta v = h/4\pi m$
(c) $\Delta x.\Delta v \ge h/4\pi m$ (d) $\Delta x.\Delta v = h/4\pi$

WB-JEE-2012, AMU-2004

Ans. (c) : According to Heisenberg's uncertainty principle : "It is impossible to determine simultaneously both the position and momentum (or velocity) of a microscopic particle with absolute accuracy.

Mathematically. $\Delta x \times \Delta v \ge \dfrac{h}{4\pi m}$

Or $\Delta x.m\Delta v \ge \dfrac{h}{4\pi}$

Δx = Uncertainty in position
Δv = Uncertainty in velocity
m = Mass of particle
h = Planck's constant

298. The measurement of the electron position if associated with an uncertainty in momentum, which is equal to 1 × 10^{-18}g cm s^{-1}. The uncertainty in electron velocity is, (mass of an electron is 9 × 10^{-28} g)

(a) 1 × 10^{9} cm s^{-1} (b) 1 × 10^{6} cm s^{-1}
(c) 1 × 10^{5} cm s^{-1} (d) 1 × 10^{11} cm s^{-1}

BITSAT 2007

Ans. (a) : Momentum, $\Delta p = m\Delta v$

Substituting the given values of Δx and m, we get

$$1\times10^{-18}\text{g cm s}^{-1} = 9\times10^{-28}\text{g}\times\Delta v$$

$$\text{or } \Delta v = \frac{1\times10^{-18}}{9\times10^{-28}}$$

$$= 1.1\times10^{9}\text{cm s}^{-1} = 1\times10^{9}\text{cm s}^{-1}$$

299. A stream of electrons from a heated filament was passed between two charged plates kept at a potential difference V esu. If e and m are charge and mass of an electron, respectively, then the value of h/λ (where, λ is wavelength associated with electron wave) is given by

(a) 2 meV (b) $\sqrt{\text{meV}}$
(c) $\sqrt{2\text{meV}}$ (d) meV

[JEE Main-2016]

Ans. (c): Wavelength, $\lambda = \dfrac{h}{mv} = \dfrac{h}{\sqrt{2m(KE)}}$

$$\therefore \frac{h}{\lambda} = \sqrt{2meV}$$

300. The de Broglie wavelength of an electron in the 4th Bohr orbit is

(a) $6\pi a_0$ (b) $2\pi a_0$
(c) $8\pi a_0$ (d) $4\pi a_0$

[JEE Main 2020, 9 Jan Shift-I]

Ans. (c) : De–Broglie wavelength of an electron

$$2\pi r = n\lambda$$

Where, r = Radius of orbit
n = no. of orbit

$$2\pi\times\frac{n^2}{z}a_0 = n\cdot\lambda$$

$$2\pi\times\frac{n}{z}a_0 = \lambda$$

$$2\pi\times\frac{4}{1}a_0 = \lambda \Rightarrow 8\pi a_0$$

301. A ball weighing 10 g is moving with a velocity of 90 ms^{-1}. If the uncertainty in its position is 5%, then the uncertainty in its position is ....×10^{-33} m(Rounded off to the nearest integer). [Given, $h = 6.63\times10^{-34}$ J-s]

[JEE Main 2021, 26 Feb Shift-II]

@apna_pdf

Ans. : According to Heisenberg uncertainty principle

$$\Delta x\Delta p \ge \frac{h}{4\pi}$$

$$\Delta x = \frac{h}{4\pi m\Delta v}\ (\Delta p = m\Delta v)$$

$$\Rightarrow \frac{6.63\times10^{-34}\text{ Js}}{4\times3.14\times10\times10^{-3}\text{ kg}\times90\text{ ms}^{-1}\times0.05}$$

$$\Rightarrow 1.173\times10^{-33}\text{ m}$$

$$\Rightarrow 1\times10^{-33}\text{ m}$$

302. A proton and a Li^{3+} nucleus are accelerated by the same potential. If λ_{Li} and λ_P denote the de-Broglie wavelengths of Li^{3+} and proton respectively, then the value of $\frac{\lambda_{Li}}{\lambda_P}$ is $x\times10^{-1}$. The value of x is..........(Rounded off to the nearest integer)

Mass of Li^{3+} = 8.3 mass of proton)

[JEE Main 2021, 24 Feb Shift-I]

Ans. $\lambda = \frac{h}{\sqrt{2mqV}}$

$$\frac{\lambda_{Li}}{\lambda_p} = \sqrt{\frac{m_p(e)(V)}{m_{Li}(3e)(V)}}, m_{Li} = 8.3$$

$$m_p = \frac{\lambda_{Li}}{\lambda_p} = \sqrt{\frac{1}{8.3\times3}} = \frac{1}{5} = 2\times10^{-1}$$

x = 2

303. An accelerated electron has a speed of 5×10^6 ms^{-1} with an uncertainty of 0.02%. The uncertainty in finding its location while in motion is $x\times10^{-9}$m. The value of x is ....(Nearest integer)

[Use mass of electron = 9.1×10^{-31} kg, h = 6.63×10^{-34} Js, $\pi = 3.14$]

[JEE Main 2021, 25 July Shift-II]

Ans. Given, $\Delta v = \frac{0.02}{100}\times5\times10^6 = 10^3\text{ m/sec}$

According to Heisenberg's uncertainty principle

$$\Delta x.\Delta v \ge \frac{h}{4\pi m}$$

$$x\times10^{-9}\times10^3 = \frac{6.63\times10^{-34}}{4\times3.14\times9.1\times10^{-31}}$$

$$x\times10^{-9}\times10^3 = 0.058\times10^{-3}$$

$$x = \frac{0.058\times10^{-6}}{10^{-9}} = 58$$

x = 58

304. The energy of a photon is 3×10^{-12} erg. What is its wavelength in nm?

(h = 6.62×10^{-27} erg-s; c = 3×10^{10} cm/s)

(a) 662
(b) 1324
(c) 66.2
(d) 6.62

JCECE - 2009

Ans. (a): $\therefore$ Energy, $E = \frac{hc}{\lambda}$

$$3\times10^{-12} = \frac{6.62\times10^{-27}\times3\times10^{10}}{\lambda}$$

$$\lambda = \frac{6.62\times10^{-27}\times3\times10^{10}}{3\times10^{-12}}$$

$$\Rightarrow 6.62\times10^{-5}\text{ cm} \Rightarrow 662\times10^{-9}\text{ m}$$

$$\Rightarrow 662\times10^{-7}\text{ cm} \Rightarrow 662\text{ nm}$$

305. A dust particle has mass equal to 10^{-11} g, diameter 10^{-4} cm and velocity 10^{-4} cm/s. The error in measurement of velocity is 0.1%. What will be the uncertainty in its position?

(a) 0.527×10^{10} cm
(b) 5.27×10^{9} cm
(c) 0.527×10^{-15} cm
(d) 0.527×10^{-9} cm

JCECE - 2014

Ans. (d) : $v = 10^{-4}\text{ cm s}^{-1}$

$$\therefore \quad \Delta v = \frac{0.1\times10^{-4}}{100}(\text{due to 1\% error})$$

$$= 1\times10^{-7}\text{ cm s}^{-1}$$

According to Heisenberg's uncertainty principle –

Now, $\Delta v.\Delta x \ge \frac{h}{4\pi m}$

Where, h = Planck's constant
m = Mass of particle
π = 3.14

$$\Delta x = \frac{6.626\times10^{-27}}{4\times3.14\times10^{-11}\times10^{-7}}$$

$$= 0.527\times10^{-9}\text{ cm}$$

306. In an atom, an electron is moving with a speed of 600 m/s with an accuracy of 0.005%. Certainty with which the position of the electron can be located is

(Given, h= 6.6×10^{-34} kg m^2s^{-1}, mass of electron e_m=9.1×10^{-31} kg)

(a) 2.15×10^{-3} m
(b) 2.78×10^{-3} m
(c) 1.92×10^{-3} m
(d) 3.24×10^{-3} m

JIPMER-2015

Ans. (c) : Given that velocity of electron, v= 600 m/s

Accuracy of velocity = 0.005 %

$$\Delta v = \frac{600\times0.005}{100} \Rightarrow 0.03$$

According to Heisenberg's uncertainty principle -

$$\Delta x.m\Delta v \ge \frac{h}{4\pi}$$

$$\Delta x = \frac{6.6\times10^{-34}}{4\times3.14\times9.1\times10^{-31}\times0.03}$$

$$= 1.92\times10^{-3}\text{ m}$$

307. The de-Broglie wavelength of a particle with mass 1 kg and velocity 100 m/s is

(a) 6.6×10^{-33} m
(b) 6.6×10^{-36} m
(c) $3.3\times10^{+33}$ m
(d) 3.3×10^{-36} m

JIPMER-2008, JCECE - 2007
AP-EAMCET (Engg.) 1997, 1996
AP – EAMCET - (Medical)-1997
NEET-1999

@apna_pdf

Ans. (b) : de-Broglie equation–

$$\lambda = \frac{h}{mv}$$

Where, h = Planck's constant
m = Mass
v = Velocity

$$= \frac{6.62\times10^{-34}\,\text{kg}\,\text{m}^2\text{s}^{-1}}{1\,\text{kg}\times100\,\text{ms}^{-1}}$$

$$\Rightarrow 6.62\times10^{-36}\,\text{m}$$

308. Heisenberg uncertainty principle can be explained as

(a) $\Delta x \geq \frac{\Delta P\times h}{4\pi}$
(b) $\Delta x\times\Delta P \geq \frac{h}{4\pi}$
(c) $\Delta x\times\Delta P \geq \frac{h}{\pi}$
(d) $\Delta P \geq \frac{\pi h}{\Delta x}$

JIPMER-2008
JCECE - 2007
BCECE-2005

Ans. (b) : According to Heisenberg's uncertainty principle.

$$\Delta x.\Delta p \geq \frac{h}{4\pi} \quad \text{or} \quad \Delta x.(m.\Delta v) \geq \frac{h}{4\pi}$$

309. A golf-ball weigh 40.0g. If it is moving with a velocity of 20.0 ms^{-1}, it's de-Broglie wave length is

(a) 1.66×10^{-34} nm
(b) 8.28×10^{-32}nm
(c) 8.28×10^{-25} nm
(d) 1.66×10^{-24}nm

JIPMER-2004

Ans. (c) : From de-Broglie equation–

$$\lambda = \frac{h}{mv}$$

Where, h = Planck's constant
m = Mass of Golf-ball
v = Velocity

$$\lambda = \frac{6.626\times10^{-34}\,\text{J.s}}{40\times10^{-3}\,\text{kg}\times200\,\text{ms}^{-1}}$$

$$\Rightarrow 8.28\times10^{-34}\ \text{m}$$

$$\Rightarrow 8.28\times10^{-34}\times10^{9}\text{nm}$$

$$\Rightarrow 8.28\times10^{-25}\ \text{nm}$$

310. The minimum values of uncertainties involved in the determination of both the position and velocity of a particle respectively are 1× 10^{-10} m and 1 × 10^{-10}ms^{-1}. Then, the mass (in kg) of the particle is

(a) 5.270×10^{-15}
(b) 5.270×10^{-20}
(c) 5.270×10^{-16}
(d) 5.270×10^{-10}
(e) 5.270×10^{-14}

Kerala-CEE-2015

Ans. (a) : According to Heisenberg uncertainty principle -

$$\Delta x.\Delta p= \frac{h}{4\pi}$$

$$\Rightarrow \Delta x.m\Delta v = \frac{h}{4\pi} \Rightarrow m = \frac{h}{4\pi\Delta x.\Delta v}$$

Given $\therefore$ $\Delta x=1\times10^{-10}$ m, $\Delta v=1\times10^{-10}\text{ms}^{-1}$

$$m = \frac{6.626\times10^{-34}}{4\times3.14\times10^{-10}\times10^{-10}}$$

$$\Rightarrow 5.270\times10^{-15}\ \text{kg}$$

311. Uncertainty principle is valid for

(a) Proton
(b) Methane
(c) Both (a) and (b)
(d) 1 μm sized platinum particles
(e) 1 μm sized NaCl particles

Kerala-CEE-2017

Ans. (a) : Uncertainty Principle states that the position and momentum for a subatomic particle is uncertain to find simultaneously. Thus, the uncertainty principle is valid for protons (subatomic particle).

312. Maximum number of photons emitted by a bulb capable of producing monochromatic light of wavelength 550 nm is ———, if 100 V and 1A is supplied for one hour.

(a) 1×10^{24}
(b) 5×10^{24}
(c) 1×10^{23}
(d) 5×10^{23}
(e) 5×10^{22}

Kerala-CEE-2019

Ans. (a) : Given that,

$\lambda = 550\ \text{nm} = 550\times10^{-9}\ \text{m}$
$i = 1\text{A},\ V = 100\text{V}$

$$\therefore E = \frac{hc}{\lambda} = \frac{6.626\times10^{-34}\times3.0\times10^{8}}{550\times10^{-9}} = 0.036\times10^{-17}$$

So, each proton carries energy, $E = 0.036\times10^{-17}$

$$\text{No. of photons} = \frac{\text{total energy output in one second}}{\text{energy carried per photon}}$$

$$n = \frac{100\times3600}{0.036\times10^{-17}}$$

$$n = 1\times10^{24}$$

313. The ratio of de-Broglie wavelengths for electrons accelerated through 200 V and 50 V is :

(a) 1 : 2
(b) 2 : 1
(c) 3 : 10
(d) 10 : 3

Manipal-2020

Ans. (a) : As we know,

$$eV = \frac{1}{2}mv^2$$

So, $$v = \sqrt{\frac{2eV}{m}}$$

Ans, $$mv = \sqrt{2meV}$$

According to de Broglie equation–

$$\lambda = \frac{h}{mv}$$

or $$\lambda = \frac{h}{\sqrt{2meV}}$$

When it is accelerated through 200 volt

$$\lambda_1 = \frac{h}{\sqrt{2meV}.\sqrt{200}} \qquad \text{.......(i)}$$

@apna_pdf

When it is accelerated through 50 volt

$$\lambda_2 = \frac{h}{\sqrt{2meV}.\sqrt{50}} \quad ....(ii)$$

On solving equation (i) and (ii), we get

$$\frac{\lambda_1}{\lambda_2} = \frac{\sqrt{50}}{\sqrt{200}} = \frac{1}{2}$$

314. If uncertainty in position and velocity are equal, then uncertainty in momentum will be :

(a) $\frac{1}{2}\sqrt{\frac{mh}{\pi}}$ (b) $\frac{1}{2}\sqrt{\frac{h}{\pi m}}$

(c) $\frac{h}{4\pi m}$ (d) $\frac{mh}{4\pi}$

Manipal-2018

Ans. (a) Given, $\Delta x = \Delta v$

According to Heisenberg Uncertainity Principle–

$$\Delta x \times \Delta p \geq \frac{h}{4\pi}$$

Where, Δx = Change in position

Δp = Change in momentum

$$\Delta x \times m\Delta v = \frac{h}{4\pi} \quad (\because \Delta p = m\Delta v)$$

$$(\Delta v^2) = \frac{h}{4\pi m} \quad [\because \Delta x = \Delta v]$$

$$\Delta p = m\Delta v = m\sqrt{\frac{h}{4\pi m}} \Rightarrow \sqrt{\frac{mh}{4\pi}}$$

$$\Delta p = \frac{1}{2}\sqrt{\frac{mh}{\pi}}$$

315. Uncertainty in the position of an electron (mass = 9.1×10^{-31} kg) moving with a velocity 300 ms^{-1} accurate upon 0.001% will be (h = 6.63×10^{-34} J-s)

(a) 19.2×10^{-2} m (b) 5.76×10^{-2} m

(c) 1.92×10^{-2} m (d) 3.84×10^{-2} m

MHT CET-2011

Ans. (c) : $\Delta v = \frac{0.001}{100} \times 300\,ms^{-1} = 3\times10^{-3}\,ms^{-1}$

$$\Delta x.m\Delta v = \frac{h}{4\pi}$$

$$\Delta x = \frac{h}{4\pi m\Delta v}$$

$$\Rightarrow \frac{6.63\times10^{-34}\,kg\,m^2s^{-1}}{4\times3.14\times9.1\times10^{-31}kg\times3\times10^{-3}ms^{-1}}$$

$= 0.019336$

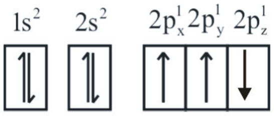
$\Delta x \simeq 1.933\times10^{-2}$ m.

316. Which one is a wrong statement?

(a) Total orbital angular momentum of electron in s-orbital is equal to zero.

(b) An orbital is designated by three quantum numbers while an electron in an atom is designed by four quantum numbers.

(c) The electronic configuration of N atom is



(d) The value of m for d_z^2 is zero.

NEET-2018

Ans. (c) : While filling electron to the orbitals, direction of spin cannot change unless the orbital is half–filled.

317. If uncertainty in position and momentum are equal, then uncertainty in velocity is

(a) $\frac{1}{m}\sqrt{\frac{h}{\pi}}$ (b) $\sqrt{\frac{h}{\pi}}$

(c) $\frac{1}{2m}\sqrt{\frac{h}{\pi}}$ (d) $\sqrt{\frac{h}{2\pi}}$

NEET-2008

Ans. (c) : According to Heisenberg,

Uncertainty Principle - $\Delta x.\Delta p = \frac{h}{4\pi}$

$$(\Delta p)^2 = \frac{h}{4\pi} \quad [\therefore \Delta x = \Delta p]$$

$$(m.\Delta v)^2 = \frac{h}{4\pi}$$

$$m^2.\Delta v^2 = \frac{h}{4\pi}$$

$$\Delta v = \sqrt{\frac{h}{4\pi m^2}} = \frac{1}{2m}\sqrt{\frac{h}{\pi}}$$

318. The measurement of the electron position is associated with uncertainty in momentum, which is equal to 1 × 10^{-18} g cm s^{-1}. The uncertainty in election velocity is (mass of an electron is 9 × 10^{-28}g)

(a) 1 × 10^9 cm s^{-1} (b) 1 × 10^6 cm s^{-1}

(c) 1 × 10^5 cm s^{-1} (d) 1 × 10^{11} cm s^{-1}

NEET-2008

Ans. (a) : Momentum, $\Delta p = m\Delta v$

1×10^{-18} g cm s^{-1} = 9×10^{-28}g $\times\Delta v$

$\therefore \Delta v = 1\times10^9$ cms^{-1}

319. Given : The mass of electron is 9.11 × 10^{-31} kg. Planck constant is 6.626×10^{-34}Js, the uncertainty involved in the measurement of velocity within a distance of 0.1 Å is

(a) 5.79 × 10^5 m s^{-1} (b) 5.79 × 10^6 m s^{-1}

(c) 5.79 × 10^7 m s^{-1} (d) 5.79× 10^8 m s^{-1}

NEET-2006

Ans. (b) : According to Heisenberg's uncertainty principle, $\Delta x\Delta v = \frac{h}{4\pi m}$,

or $\quad \Delta v = \frac{h}{4\pi m\Delta x}$

Where Δx is uncertainty involved in the measurement of position Δv is uncertainty involved in the measurement of velocity h is planck's constant m is mass of the electron

@apna_pdf

∵ Given $\Delta x = 0.1\ \mathring{A}$

$= (0.1\times10^{-10})$

$= 10^{-11}$ m

$m = 9.11 \times10^{-31}$ kg

$h= 6.626 \times10^{-34}$ Js

On substituting the values–

$$\Delta v = \frac{6.626\times10^{-34}}{4\times3.14\times9.11\times10^{-31}\times10^{-11}}$$

$= 0.0579 \times 10^{8}\ ms^{-1} = 5.79 \times 10^{6}\ ms^{-1}$

320. The uncertainty in momentum of an electron is 1×10^{-5} kg m/s. The uncertainty in its position will be ($h = 6.62 \times 10^{-34}$ kg m^2/s)

(a) 5.27×10^{-30} m (b) 1.05×10^{-26} m

(c) 1.05×10^{-28} m (d) 5.25×10^{-28} m

NEET-1998

Ans. (a) : The uncertainty in the position of an electron is : $\Delta x= \frac{h}{4\pi\Delta p}$

Where, Δx = The position of the particle

Δp = The momentum of the particle

h = Planck's constant

$$\Delta x = \frac{6.626\times10^{-34}}{4\times3.146\times10^{-5}}$$

$= 5.27\times10^{-30}$ m

321. The position of both, an electron and a helium atom is known within 1.0 nm. Further the momentum of the electron is known within 5.0×10^{-26} kg m s^{-1}. The minimum uncertainty in the measurement of the momentum of the helium stone is

(a) 8.0×10^{-26} kg m s^{-1} (b) 80 kg m s^{-1}

(c) 50 kg m s^{-1} (d) 5.0×10^{-26} kg m s^{-1}

NEET-1998

Ans. (d) : Uncertainty principle state that the product of uncertainty position and uncertainty in momentum is constant for a particle

$$\Delta x, \Delta p = \frac{h}{4\pi}$$

Here, given Δx = 1.0nm for both electron and helium atom, so Δp charge of momentum is also same for both the particle

Therefore uncertainty in momentum of the helium stone is also 5.0×10^{-26} kg ms^{-1}

322. Uncertainty in position of an electron (mass = 9.1×10^{-28} g) moving with a velocity of 3×10^{4} cm/s accurate upto 0.001% will be

(use $h/(4\pi)$ in uncertainity expression where h = 6.626×10^{-27} erg second)

(a) 5.76 cm (b) 7.68 cm

(c) 1.93 cm (d) 3.84 cm

NEET-1995

Ans. (c) : According to Heisenberg's uncertainty principle $\Delta x \times \Delta v = \frac{h}{4\pi m}$

Where, Δx = Uncertainty in position or change in position

Δv = uncertainty in velocity

h = Planck's constant $(6.626\times10^{-27}\ Js)$

m = mass of electron $(9.1\times10^{-28}\ kg)$

Here, Δv = 0.001% of 3×10^{4}

$= \frac{0.001}{100}\times3\times10^{4} = 0.3$ cm/s

$$\therefore \Delta x = \frac{h}{4\pi m\Delta v}$$

$$= \frac{6.626\times10^{-27}}{4\times3.14\times9.1\times10^{-28}\times0.3} = 1.93\text{cm}$$

323. If E_e, E_α and E_p represent the kinetic energies of an electron, α-particle and a proton respectively each moving with same de-Broglie wavelength then

(a) $E_e = E_\alpha = E_p$ (b) $E_e > E_\alpha > E_p$

(c) $E_\alpha > E_p > E_e$ (d) $E_e > E_p > E_\alpha$

UP CPMT-2011

Ans. (d) : De-Broglie wavelength,

$$\lambda = \frac{h}{mv}$$

$$v = \frac{h}{m.\lambda} \qquad \text{..... (i)}$$

$$K.E = \frac{1}{2}mv^2 \qquad \text{..... (ii)}$$

Now, put the value of *v* in Eq. (ii)

$$K.E = \frac{1}{2}m\left(\frac{h}{m.\lambda}\right)^2$$

$$K.E = \frac{1}{2}\left(\frac{h^2}{m\times\lambda^2}\right)$$

Hence, $K.E \propto \frac{1}{m}$ (If λ and h-constant)

and the order of K.E is as–

$E_e > E_p > E_\alpha$

5. Schrodinger Wave Equation

324. When an electron in an excited hydrogen atom jumps from an energy level for which n = 5 to level for which n = 2, the spectral line is observed in the which series of the hydrogen spectrum?

(a) Lyman (b) Balmer

(c) Paschen (d) pfund

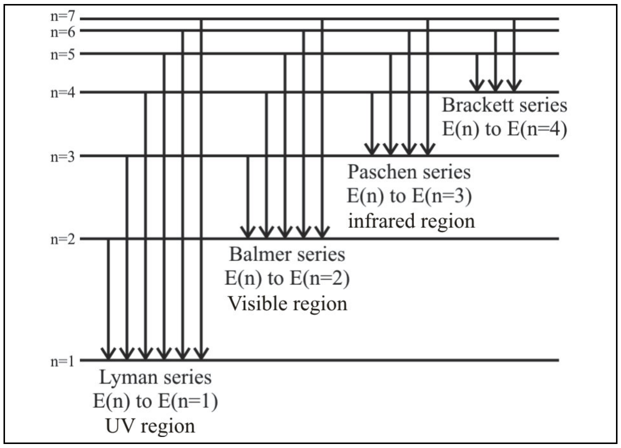
AP-EAMCET-1991

Ans. (b): In Balmer series, hydrogen spectrum $n_1 = 2$ and $n_2 = 3, 4$ .....

- An electron in an excited hydrogen atom (n = 2) jump to n = 5 energy level, then the spectral line is observed is Balmer series.

Electron transitions for the Hydrogen atom

@apna_pdf



325. Which one of the following series of lines is found in the UV region of atomic spectrum of hydrogen?

(a) Balmer (b) Paschen
(c) Brackett (d) Lyman

AP-EAMCET-1991

Ans. (d) : Lyman series of hydrogen spectrum lies in UV region.

- Balmer series lies in visible region.
- Paschen series lies in infrared region.
- Brackett series lies in infrared region.

Hence, Lyman series lies in UV region and Paschen series lies in IR region of spectrum.

326. Among the first lines of Lyman, Balmer, Paschen and Brackett series in hydrogen atomic spectra, which has the highest energy?

(a) Lyman (b) Balmer
(c) Paschen (d) Brackett

AP-EAMCET-1999

Ans. (a) : Energy, $\Delta E = 13.6\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)\text{eV}$

For the first line of Lyman series,

$n_1 = 1, n_2 = 2$

$$\Delta E = 13.6\left(\frac{1}{1^2}-\frac{1}{2^2}\right)\text{eV} = 10.2\,\text{eV}$$

and energy decreases as we move on to the next series.

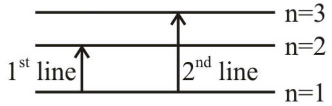
327. What are the values of n_1 and n_2 for the 2nd line in the Lyman series of hydrogen atomic spectrum ?

(a) 3 and 5 (b) 2 and 3
(c) 1 and 3 (d) 2 and 4

AP-EAMCET-2000

Ans. (c) : 2nd line (H_β line) is formed when electron jumps from 3rd orbit to 1st orbit in Lyman series.

$\therefore$ $n_1 = 1, n_2 = 3$



328. The wavelength of spectral line emitted by hydrogen atom in the Lyman series is $\frac{16}{15R}$ cm. What is the value of n_2? (R=Rydberg constant)

(a) 2 (b) 3
(c) 4 (d) 1

AP-EAMCET-2007

Ans. (c) : Given, $\lambda = \frac{16}{15R}\text{cm}, n_2 = ?$

For Lyman series–

$$\frac{1}{\lambda} = R\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right]$$

$$\frac{15R}{16} = R\left[\frac{1}{1^2}-\frac{1}{n_2^2}\right]$$

or $$\frac{15R}{16R} = 1-\frac{1}{n_2^2}$$

or $$\frac{1}{n_2^2} = 1-\frac{15}{16} = \frac{1}{16}$$

or $$\frac{1}{n_2} = \frac{1}{4}$$

or $$\boxed{n_2 = 4}$$

329. An electronic transition in hydrogen atom results in the formation of H_α line of hydrogen in Lyman series, the energies associated with the electron in each of the orbits involved in the transition (in kcal mol^{-1}) are :

(a) –313.6, –34.84 (b) –313.6, –78.4
(c) –78.4, –34.84 (d) –78.4, –19.6

AP-EAMCET-2008

Ans. (b) : Energy of electron in nth orbit–

$$E_n = \frac{2\pi^2 Z^2 e^4}{n^2 h^2} a$$

Putting the value of h, e and π, we get

$$E_n = \frac{-1311.8Z^2}{n^2}\text{kJ/mole}$$

$$E_n = \frac{-313.52Z^2}{n^2}\text{kcal/mole}$$

$$(\because 1\,\text{kcal} = 4.184\,\text{kJ})$$

For H atom, Z = 1 and Lyman series have the value of $n_1 = 1, n_2 = 2$.

$n_1=1, n_2=2$

Since, Energy of electron in n_1 orbit

$$= \frac{-313.52\times(1)^2}{(1)^2}$$

= – 313.6 kcal/mole

and energy of electron in n_2 orbit

$$= \frac{-313.52\times(1)^2}{(2)^2}$$

= – 78.38 kcal/mole

330. The ratio of the highest to the lowest wavelength of Lyman series is

(a) 4 : 3 (b) 9 : 8
(c) 27 : 5 (d) 16 : 5

TS-EAMCET (Engg.), 05.08.2021 Shift-II

@apna_pdf

Ans. (a) : The equation of Lyman series wavelength for hydrogen atom is

$$\frac{1}{\lambda}=R_H\left(1-\frac{1}{n^2}\right)$$

Where, λ = Lyman series wavelength for hydrogen atom

R_H = Rydberg Constant

For lowest wavelength, n = ∞

$$\therefore\ \frac{1}{\lambda_L}=R_H\left(1-\frac{1}{\infty^2}\right)$$

$$\text{or}\qquad \frac{1}{\lambda_L}=R_H \qquad ..... (1)$$

For highest wavelength, n = 2

$$\therefore\ \frac{1}{\lambda_H}=R_H\left(1-\frac{1}{4}\right)=\frac{3R_H}{4} \qquad ..... (2)$$

From equation (1) and (2)

$$\frac{\lambda_H}{\lambda_L}=\frac{4}{3}\Rightarrow 4:3$$

331. Which one of the following is extracted through alloy formation ?

(a) Manganese (b) Silver
(c) Nickel (d) Lead

SCRA - 2009

Ans. (b) : Silver is the metal extracted through alloy formation.

Note-Alloys are made by mixing two or more elements, at least one of which is a metal.

332. Which among the following represents Schrodinger wave equation ?

(a) $\frac{d^2\psi}{dx^2}+\frac{d^2\psi}{dy^2}+\frac{d^2\psi}{dz^2}+\frac{4\pi m}{h}(E-v)\psi=0$

(b) $\hat{H}=\frac{h}{4\pi^2 m}\left(\frac{d^2}{dx^2}+\frac{d^2}{dy^2}+\frac{d^2}{dz^2}\right)+V$

(c) $\hat{H}=\frac{-h^2}{8\pi^2 m}\left(\frac{d^2}{dx^2}+\frac{d^2}{dy^2}+\frac{d^2}{dz^2}\right)+P$

(d) $\frac{d^2\psi}{dx^2}+\frac{d^2\psi}{dy^2}+\frac{d^2\psi}{dz^2}+\frac{8\pi^2 m}{h^2}(E-v)\psi=0$

AP EAMCET (Engg.) 18.9.2020 Shift-I
GUJCET-2008

Ans. (d) : The Schrondinger wave equation is

$$\frac{d^2\psi}{dx^2}+\frac{d^2\psi}{dy^2}+\frac{d^2\psi}{dz^2}+\frac{8\pi^2 m}{h^2}(E-v)\psi=0$$

Where, ψ = Wave function
m = Mass of electron,
h = Planck's constant
E = Total energy of electron
V = Potential energy of electron

333. The spectrum of Helium is expected to be similar to that of——

(a) Li^+ (b) H
(c) Na (d) He^+

AP EAPCET 19-08-2021 Shift-I
NEET-1998

Ans. (a) : The spectrum of any element depends upon the no. of electron in outer shell.

Electronic configuration of He = $_1s^2$

Reason:- Li^+ has the same electronic configuration like as He atom i.e.

$Li^+ = 1s^2, 2s^1$ (Removing of one electron form outer shell)

$Li^+ = 1s^2$

i.e $Li^+ = 2$

334. Which of the following electron transitions in the H-atom will release the largest amount of energy?

(a) n=3 to n=2 (b) n=2 to n=1
(c) n=5 to n=2 (d) n=6 to n=2

COMEDK-2012

Ans. (b) : As we know,

$$E=\frac{hc}{\lambda}\text{ and }\frac{1}{\lambda}=R\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right]$$

So, we can say–

$$E\propto\left\{\frac{1}{n_1^2}-\frac{1}{n_2^2}\right\}$$

Energy released when electron jumps from

(a) For, n= 3 to n=2

$$\left(\frac{1}{2^2}-\frac{1}{3^2}\right)=\left(\frac{1}{4}-\frac{1}{9}\right)=\frac{5}{36}$$

(b) For, n = 2 to n=1

$$\left(\frac{1}{1^2}-\frac{1}{2^2}\right)=\left(\frac{1}{1}-\frac{1}{4}\right)=\frac{3}{4}$$

(c) For, n = 5 to n=2

$$\left(\frac{1}{2^2}-\frac{1}{5^2}\right)=\left(\frac{1}{4}-\frac{1}{2^5}\right)=\frac{21}{100}$$

(d) For, n = 6 to n = 2

$$\left(\frac{1}{2^2}-\frac{1}{6^2}\right)=\left(\frac{1}{4}-\frac{1}{36}\right)=\frac{8}{36}$$

$$\frac{3}{4}>\frac{21}{100}>\frac{8}{36}>\frac{5}{36}$$

Hence, largest amount of energy is released when electron jumps from n=2 to n=1.

335. A body of mass 10 mg is moving with a velocity of 100 m s^{-1}. The wavelength of de Broglie wave associated with it would be ($h=6.63\times10^{-34}$ J s)

(a) 6.63×10^{-35} m (b) 6.63×10^{-34} m
(c) 6.63×10^{-31}m (d) 6.63×10^{-37} m

COMEDK-2019

Ans. (c) Given, Mass, m = 10 mg = 10×10^{-3} g

= 10×10^{-6} kg= 10^{-5} kg

$v=100\,m\,s^{-1}$, de Broglie, λ = ?

h = 6.63×10^{-34} J s

de Broglie relation, $\lambda=\frac{h}{mv}$

$$\lambda=\frac{6.63\times10^{-34}}{10^{-5}\times100}=\frac{6.63\times10^{-34}}{10^{-3}}=6.63\times10^{-31}\text{m}$$

336. The first emission line on hydrogen atomic spectrum in the Balmer series appears at (R = Rydberg constant):

@apna_pdf

(a) $\frac{5R}{36}cm^{-1}$ (b) $\frac{3R}{4}cm^{-1}$

(c) $\frac{7R}{144}cm^{-1}$ (d) $\frac{9R}{400}cm^{-1}$

AP-EAMCET (Medical), 2006
AP EAMCET (Medical) -1998
AP-EAMCET (Engg.) -1998

Ans. (a) : The first emission line on hydrogen atomic spectrum in Balmer series contains the following values-

$n_1 = 2$ and $n_2 = 3$

now, $\bar{\nu} = R\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)Cm^{-1}$

where $- \bar{\nu}$ = wave number

R = Rydberg constant

$\therefore \quad \bar{\nu} = R\left(\frac{1}{4} - \frac{1}{9}\right)$

$\bar{\nu} = R\left(\frac{9-4}{36}\right)Cm^{-1}$

or $\bar{\nu} = \frac{5R}{36}Cm^{-1}$

337. What are the values of n_1 and n_2 respectively for H_β line in the Lyman series of hydrogen atomic spectrum?

(a) 3 and 5 (b) 2 and 3

(c) 1 and 3 (d) 2 and 4

AP-EAMCET (Medical), 2006

Ans. (c) : The Lyman series of lines are the lines in the hydrogen spectrum which appear in the ultraviolet region. The value of n_1 and n_2 is given as follows–

$n_1 = 1$

$n_2 = 2,3….$

338. The radial probability distribution curve obtained for an orbital wave function (ψ) has 3 peaks and 2 radial nodes. The valence electron of which one of the following metals does this wave function (ψ) correspond to ?

(a) Cu (b) Li

(c) K (d) Na

AP- EAMCET(Medical) -2010

Ans. (d): The radial probability distribution curve obtained for an orbital wave function has 3 peaks and 2 radial nodes i.e. n =3 and l= 0 (for radial node =2)

Hence, the valence electron of the metal must present in 3s-orbital. The electronic configuration of the given metal is –

$_{29}Cu = [Ar]3d^{10}, 4s^1$

$_3Li = [He]2s^1$

$_{19}K = [Ar]4s^1$

$_{11}Na = [Ne]3s^1$

Thus, the given wave function corresponds to the valence electrons of the sodium metal.

339. Which one of the following conditions is incorrect for a well behaved wave function (ψ)?

(a) ψ must be finite

(b) ψ must be single valued

(c) ψ must be infinite

(d) ψ must be continuous

AP-EAMCET- (Engg.) - 2010

Ans. (c) : For a well behaved wave function (ψ) is defined as the wave function (ψ) must be finite, single valued and continuous.

340. Assertion (A) : The probability of finding an electron in a small volume around a point (x, y, z) at a distance 'r' from the nucleus is proportional to ψ^2.

Reason (R) : Subatomic particles have both wave and particle nature.

The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)

(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)

(c) Only (A) is true but (R) is not true

(d) (A) is not true but (R) is true

AP - EAMCET(MEDICAL) - 2009

Ans. (b) : The square of the wave function, ψ^2 is called probability density and is always positive. The probability of finding an electron at a distance 'r' from the nucleus is expressed by following relation–

$\text{Probability} = 4\pi r^2 dr \cdot \psi^2$

$\therefore \quad \text{Probability} \propto \psi^2$

The de-Broglie explains any particle shows the both nature i.e. particle and wave nature. Both (A) and (R) are true but (R) is not the correct explanation of (A).

341. Wave number of spectral line for a given transition is x cm^{-1} for He^+, then its value for Be^{3+} (isoelectronic of He^+) for same transition is–

(a) $\frac{x}{4}cm^{-1}$ (b) x cm^{-1}

(c) 4x cm^{-1} (d) 16x cm^{-1}

BCECE-2013

Ans. (c) : The spectral lines of the transitions are directly proportional to square of atomic number i.e. z^2.

$\bar{\nu} \propto z^2$

Given, $\bar{\nu}_1 = x$

Now, $\frac{\bar{\nu}_1}{\bar{\nu}_2} = \frac{z_1^2}{z_2^2}$

For, $He^+, z_1 = 2$

For, $Be^{3+}, z_2 = 4$

$\frac{x}{\bar{\nu}_2} = \frac{(4)^2}{(2)^2}$

$\bar{\nu}_2 = 4x\ cm^{-1}$

342. What is effective nuclear charge and the periphery of nitrogen atom when an extra electron is added in the formation of an anion?

(a) 1.20 (b) 2.45

(c) 3.55 (d) 5.95

BCECE-2013

@apna_pdf

Ans. (c) : As an extra electron is added in nitrogen atom then added electron will be screened by five electrons in second orbit ($2s^22p^3$) and two electrons in first orbit ($1s^2$)

Now screening constant–

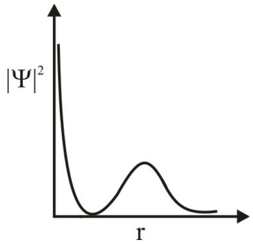
$\sigma = 5\times0.35$ in n^{th} orbit $+ 2\times0.85$ in $(n-1)^{th}$ orbit

$\Rightarrow \quad 1.75 + 1.70 \Rightarrow 3.45$

$\therefore$ Effective nuclear charge

$\Rightarrow \quad 7 - 3.45 = 3.55$

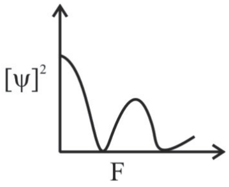
343. The graph between $|\psi|^2$ and r (radial distance) is shown below. This represents.



(a) 1s-orbital
(b) 2p-orbital
(c) 3s-orbital
(d) 2s-orbital

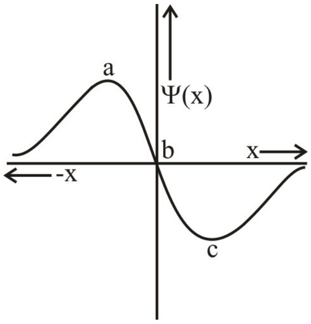
[JEE Main 2019, 10 April Shift-I]

Ans. (d) : The given probability density curve is for 2s orbital because it has only one radial node. Among other given orbitals, 1s and 2p do not have any radial node and 3s has two radial nodes.



2s

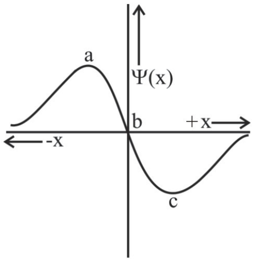
344. The electrons are more likely to be found



(a) in the region a and c
(b) in the region a and b
(c) only in the region a
(d) only in the region c

[JEE Main 2019, 12 April Shift-I]

Ans. (a) : The electrons are more likely to be found in the region a and c as shown in figure. At b, wave function becomes zero and is called radial nodal surface or simple node.



The graph between wave function ψ and distance (r) from the nucleus helps in determining the shape of orbital.

345. The frequency of light emitted for the transition n = 4 to n = 2 of He^+ is equal to the transition in H atom corresponding to which of the following?

(a) n = 3 to n = 1
(b) n = 2 to n = 1
(c) n = 3 to n = 2
(d) n = 4 to n = 3

AIEEE-2011

Ans. (b) : For He^+

$$\bar{v} = \frac{1}{\lambda} = R_H 2^2\left(\frac{1}{2^2}-\frac{1}{4^2}\right)$$

For H

$$\bar{v} = \frac{1}{\lambda} = R_H \times 1^2\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)$$

For same frequency–

$$2^2\left(\frac{1}{2^2}-\frac{1}{4^2}\right) = \left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)$$

$$\Rightarrow \quad \frac{1}{n_1^2}-\frac{1}{n_2^2} = \frac{1}{1^2}-\frac{1}{2^2}$$

$$\Rightarrow \quad n_1 = 1 \text{ and } n_2 = 2$$

346. Energy of an electron is given by E = –2.178 × 10^{-18} J $\left(\frac{Z^2}{n^2}\right)$. Wavelength of light required to excite an electron in an hydrogen atom from level n = 1 to n = 2 will be (h = 6.62 × 10^{-34}) Js and c = 3.0 ×10^8 ms^{-1})

(a) 1.214×10^{-7} m
(b) 2.816×10^{-7} m
(c) 6.500×10^{-7} m
(d) 8.500×10^{-7} m

[JEE Main 2013]

Ans. (a) : Energy change–

$$\Delta E = 2.178\times10^{-18}\left(\frac{1}{1^2}-\frac{1}{2^2}\right) = \frac{hc}{\lambda}$$

$$= 2.178\times10^{-18}\left(\frac{1}{1^2}-\frac{1}{2^2}\right) = \frac{6.62\times10^{-34}\times3.0\times10^8}{\lambda}$$

$$\therefore \lambda = 1.214\times10^{-7} \text{ m}$$

347. For any given series of spectral lines of atomic hydrogen, let $\Delta\bar{v} = \bar{v}_{max} - \bar{v}_{min}$ be the difference in maximum and minimum frequencies in cm^{-1}. The ratio $\Delta\bar{v}_{Lyman}/\Delta\bar{v}_{Balmer}$ is

(a) 27 : 5
(b) 5 : 4
(c) 9 : 4
(d) 4 : 1

[JEE Main 2019, 9 April Shift-I]

@apna_pdf

Ans. (c) : For Lyman series–

$$\Delta\overline{V} = \overline{V}\max - \overline{V}_{\min} = R\left(\frac{1}{1^2} - \frac{1}{\infty^2}\right) - R\left(\frac{1}{1^2} - \frac{1}{2^2}\right)$$

$$\Rightarrow R - \frac{3R}{4} = \frac{R}{4}$$

For Balmer series

$$\Delta\overline{V} = \overline{V}_{\max} - \overline{V}_{\min} = R\left(\frac{1}{2^2} - \frac{1}{\infty^2}\right) - R\left(\frac{1}{2^2} - \frac{1}{3^2}\right)$$

$$\Rightarrow \frac{R}{4} - \frac{5R}{36} = \frac{4R}{36}$$

$$\therefore \frac{\Delta\overline{V}\text{Lyman}}{\Delta\overline{V}\text{Balmer}} = \frac{\frac{R}{4}}{\frac{4R}{36}} = \frac{36}{16} = 9:4$$

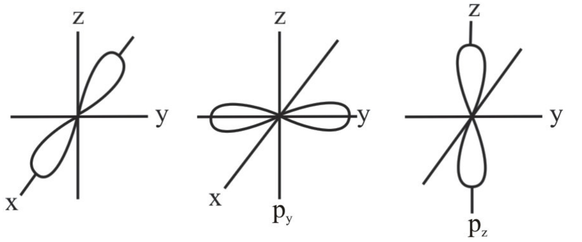
348. Which of the following orbitals will have zero probability of finding the electron in the yz plane?

(a) p_x (b) p_y

(c) p_z (d) d_{yz}

WB-JEE-2010

Ans. (a) : px orbital lies along x–axis. Hence, the probability of finding an electron is zero in the yz plane.



6. Electronic Configuration and Shape of Orbital's.

349. Identity the incorrect statement from the following

(a) All the five 4d orbitals have shapes similar to the respective 3d orbitals.

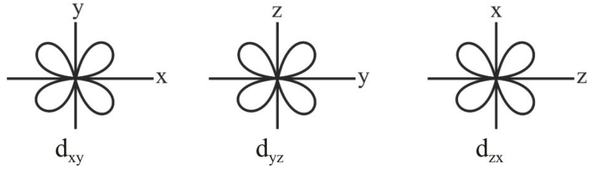
(b) In an atom, all the five 3d orbitals are equal in energy in free state.

(c) The shapes of d_{xy} , d_{yz} and d_{xz} orbitals are similar to each other; and $d_{x^2-y^2}$ and d_{z^2} are similar to each other.

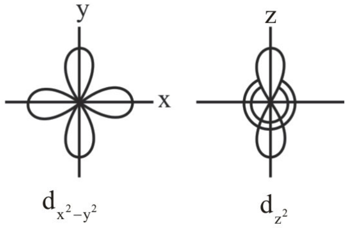
(d) All the five 5d orbitals are different in size when compared to the respective 4d orbitals.

NEET-17.07.2022

Ans. (c) : The size of orbital depends on the principle quantum number and the shape of orbital's depends on the azimuthal quantum number (*l*). In all the five 3d orbital are equal in energy in free state and the shape of d_{xy}, d_{yz} and d_{zx} are similar.



and the shape of $d_{x^2-y^2}$ and d_{z^2} are different



350. The electronic configuration of Pt (atomic number 78) is:

(a) $[Xe]\ 4f^{14}\ 5d^9\ 6s^1$ (b) $[Kr]\ 4f^{14}\ 5d^{10}$

(c) $[Xe]\ 4f^{14}\ 5d^{10}$ (d) $[Xe]\ 4f^{14}\ 5d^8\ 6s^2$

JEE Main-29.06.2022, Shift-I

Ans. (a) : Sub-electronic configuration of Pt (atomic number 78) is–

$_{78}Pt = {}_{54}[Xe]\ 4f^{14}\ 5d^9\ 6s^1$

351. Which of the following statements are correct?

(a) The electronic configuration of Cr is (Ar) $3d^5\ 4s^1$

(b) The magnetic quantum number may have a negative value

(c) In the ground state of an atom, the orbitals are filled in order of their increasing energies

(d) The total number of nodes are given by n–2

Choose the most appropriate answer from the options given below:

(a) (a), (c) and (d) only (b) (a) and (b) only

(c) (a) and (c) only (d) (a), (b) and (c) only

JEE Main-29.06.2022, Shift-I

Ans. (c) : Statements –

(a) Electronic configuration of Cr

$_{24}Cr = [Ar]\ 3d^5\ 4s^1$

(d) Total number of nodes are (n–1)

So, option (c) is correct

352. Element "E" belongs to the period 4 and group 16 of the periodic table. The valence shell electron configuration of the element, which is just above "E" in the group is

(a) $3s^2$, $3p^4$ (b) $3d^{10}$, $4s^2$, $4p^4$

(c) $4d^{10}$, $5s^2$, $5p^4$ (d) $2s^2$, $2p^4$

JEE Main-28.06.2022, Shift-I

Ans. (a) : Element "E" belong to the period 4 and group 16 of the periodic table.

Then, element is $_{34}Se = [Ar]\ 3d^{10}\ 4s^2\ 4p^4$. [4 period, 16 group]

So, "E" is sulphur because "E" is above the 'Se'. Therefore, electronic configuration is $3s^2$, $3p^4$.

353. The number of nodal planes present in *s antibonding orbitals is :

(a) 1 (b) 2

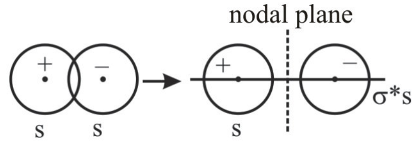
(c) 0 (d) 3

Karnataka-CET, 2008

@apna_pdf

Ans. (a) : In an antibonding molecular orbital, most of the electron density is located away from the space between the nuclei, as a result of which there is a nodal plane between the nuclei.

Note- A plane at which the electron density is zero.



354. Mg^{2+} is isoelectronic with

(a) Cu^{2+} (b) Zn^{2+}
(c) Na^{+} (d) Ca^{2+}

Karnataka-CET-2007

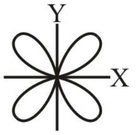
Ans. (c) : Isoelectronic species have same number of electron. Mg^{2+} and Na^{+} both have 10 electrons hence, they are isolectronic species.

355. Which of the following atomic orbitals is not directed along the axis?

(a) p_x (b) $d_{x^2-y^2}$
(c) d_{xy} (d) d_{z^2}

AP-EAMCET (Med.)-1999

Ans. (C) : The lobe of the of three orbital i.e. d_{xy}, d_{y^2}, d_{x^2} exists in between the axis and the lobe of $d_{x^2-y^2}$ and d_{z^2} exist in along the axis.



356. How many electrons are present in the M shell of the atom of an element with atomic number 24?

(a) 5 (b) 6
(c) 12 (d) 13

AP-EAMCET (Med.)-1999

Ans. (d) : The electronic configuration of atomic number 24 is $1s^2$, $2s^2$, $2p^6$, $3s^2$, $3p^6$, $4s^1$, $3d^5$. The name of the element is Chromium.

$$_{24}Cr = 2, 8, 13, 1$$
$$\begin{array}{cccc} K & L & M & N \end{array}$$

So, M shell contains 13 electrons.

357. The symbol of the element 'Tungeston' is:

(a) Ta (b) W
(c) Tl (d) Tc

NDA (II)-2015

Ans : (b) The symbol of the element 'Tungsten' is W and atomic number is 74. It is the rarest and toughest metal found in nature.

- It have 5 stable and 21 unstable isotopes.
- It have highest melting point and tensile strength.

358. Which one of the following orbitals has the highest energy?

(a) 5d (b) 5f
(c) 6s (d) 6p

SCRA-2015

Ans. (b): According to **Aufbau principle** electron are first occupy those orbitals whose energy is lowest.

Hence the electronic configuration is–

1s, 2s, 2p, 3s, 3p, 4s, 3d, 4p, 5s, 4d, 5p, 6s, 4f, 5d, 6p, 7s 5f, 6d, 7p.

359. The correct electronic configuration of potassium is

(a) $1s^2,2s^2,2p^6,3s^1$
(b) $1s^2,2s^2,2p^6,3s^2,3p^6,4s^2$
(c) $1s^2,2s^2,2p^6,3s^2,3p^5,4s^2$
(d) $1s^2,2s^2,2p^6,3s^2,3p^6,4s^1$

AP EAMCET- 1992

Ans. (d) : The electronic configuration of Potassium is-

$_{19}K = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^1$

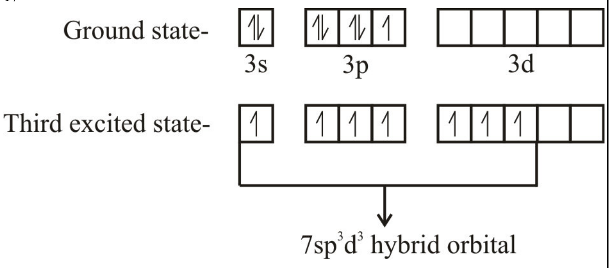
360. Chlorine atom, in its third excited state, reacts with fluorine to form a compound X. The formula and shape of X are

(a) ClF_5, pentagonal
(b) ClF_4, tetrahedral
(c) ClF_4, pentagonal bipyramidal
(d) ClF_7, pentagonal bipyramidal

AP EAMCET- 2003

Ans. (d) : The electronic configuration of $_{17}Cl$ is given below-

$_{17}Cl = 1s^2 2s^2 2p^6 3s^2 3p^5 3d^0$



Hence, it forms the ClF_7 compound and have the pentagonal bipyramidal geometry.

361. The electronic configuration of curium (Z = 96) is

(a) $[Rn]\ 5f^8\ 6d^0\ 7s^2$ (b) $[Rn]\ 5f^7\ 6d^1\ 7s^2$
(c) $[Rn]\ 5f^3\ 6d^5\ 7s^2$ (d) $[Rn]\ 5f^6\ 6d^2\ 7s^2$

JHARKHAND – 2019

Ans. (b) : The electronic configuration of Curium (Z = 96)

$_{96}Cm = [Rn]\ 5f^7\ 6d^1\ 7s^2$

Curium (Cm) is a synthetic chemical element of the actinoid series in the periodic table.

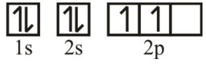
362. The number of unpaired electrons in carbon atom is

(a) one (b) Two
(c) Three (d) Four

MPPET- 2009

Ans. (b) : The electronic configuration of carbon is–

$_6C = 1s^2, 2s^2, 2p^2$



Hence, the number of unpaired electron in carbon atom is 2.

@apna_pdf

363. In the change of NO^+ to NO, the electron is added to a

(a) σ orbital (b) π orbital
(c) σ* orbital (d) π* orbital

SCRA 2010

Ans. (d) : According to molecular orbital diagram–electronic configuration of.

$$NO^+(14e) - \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2,$$
$$\pi^* 2p_x = \pi^* 2p_y$$

$$NO(15e^-) - \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2\ \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y$$

The last electron into $\pi^* 2p_x$ orbital i.e. π^* orbital.

364. For the iso-electronic series, which among the following species requires the least energy to remove an outer electron?

(a) K^+ (b) Ag
(c) Cl^- (d) S^{2-}

SCRA-2014

Ans. (d) : The isoeletronic species are K^+, Cl^- and S^{2-}. The electronic configuration are–

$${}_{19}K^+ = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^0$$
$${}_{17}Cl^- = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^0$$
$${}_{16}S^{2-} = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^0$$

The S^{2-} ion has more in size than K^+ and Cl^- because 16 proton of the nuclear pull on 18 electron. So, the energy required to removing the electron from outer orbital is less in quantity.

365. The maximum number of electrons that can be accommodated in all the orbitals for which *l* = 3, is :

(a) 15 (b) 14
(c) 10 (d) 6

AP-EAMCET-1991

Ans. (b) : For $l = 3$, orbital is f.

f-orbital

Hence, maximum number of electron is 14.

366. The rule that explains the reason for chromium to have [Ar] $3d^5$, $4s^1$ configuration instead of [Ar] $3d^4$, $4s^2$, is :

(a) Pauli's exclusion principle
(b) Aufbau principle
(c) Hund's rule
(d) Heisenberg principle

AP-EAMCET-1996

Ans. (c) : Hund's rule, state that electrons do not pair up in the orbitals unless all the degenerated orbital have got one electron each to get stability.
Hence, to get more stability chromium has [Ar] $3d^5$, $4s^1$ configuration instead of [Ar] $3d^4\ 4s^2$.

367. The electronic configuration of sodium is :

(a) [Ne] $3s^2$ (b) [Ne] $3s^1$
(c) [Ar] $4s^1$ (d) [Ar] $4s^2$

AP-EAMCET-1999

Ans. (b) : Electronic configuration of sodium is

$${}_{11}Na = 1s^2\ 2s^2\ 2p^6\ 3s^1$$
or $${}_{11}Na = [Ne]\ 3s^1.$$

Hence, the correct option is (b).

368. In the ground state, an element has 13 electrons in M shell. The element is :

(a) Copper (b) Chromium
(c) Nickel (d) Iron

AP-EAMCET-2001

Ans. (b) : Given that :
In the ground state an element has 13 electron in M shell is Chromium.

$${}_{24}Cr = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^1\ 3d^5 = \overset{K}{2}\ \overset{L}{8}\ \overset{M}{13}\ \overset{N}{1}$$

No. of electron in M shell = 2 + 6 + 5 = 13.

369. X litre of carbon monoxide is present at STP. It is completely oxidised to CO_2. The volume of CO_2 formed is 11.207 L. What is the value of X in litres ?

(a) 22.414 (b) 11.207
(c) 5.6035 (d) 44.828

AP-EAMCET-2002

Ans. (b) : $$\underset{\substack{22.4L \\ xL}}{CO} + \frac{1}{2}O_2 \rightarrow \underset{\substack{22.4L \\ 11.207L}}{CO_2}$$

For STP,
22.4 L of CO, oxidize to CO_2 = 22.4 L

$$1\text{ L of CO, oxidize to } CO_2 = \frac{22.4}{22.4}L = 1$$

$$11.207\text{ L of CO, oxidize to } CO_2 = \frac{22.4}{22.4} \times 11.207$$
$$= 11.207\text{ L}$$

370. If the electron of a hydrogen atom is present in the first orbit, the total energy of the electron is:

(a) $\frac{-e^2}{r}$ (b) $\frac{-e^2}{r^2}$
(c) $\frac{-e^2}{2r}$ (d) $\frac{-e^2}{2r^2}$

AP-EAMCET-2003

Ans. (c) : We know that :

$$\text{Kinetic energy, K.E.} = \frac{1}{2}mv^2$$

$$\text{Potential energy} = \frac{-e^2}{r}$$

$$\text{or}\quad \text{K.E.} = \frac{1}{2}\frac{e^2}{r}\ \left(\because mv^2 = \frac{e^2}{r}\right)$$

$$\therefore \quad \text{Total energy} = \text{K.E.} + \text{PE}$$
$$= \frac{1}{2}\frac{e^2}{r} - \frac{e^2}{r}$$
$$= \frac{e^2}{r}\left(\frac{1}{2} - 1\right)$$
$$= \frac{e^2}{r}\left(\frac{-1}{2}\right)$$
$$= \frac{-e^2}{2r}$$

@apna_pdf

371. Which of the following elements have least number of electrons in its M shell ?

(a) K (b) Mn
(c) Ni (d) Sc

AP-EAMCET-2004

Ans. (a) : Potassium (K) elements has least number of electrons in it's M shell.

$$_{19}K = \underbrace{1s^2}_{K}\underbrace{2s^2 2p^6}_{L}\underbrace{3s^2 3p^6}_{M}\underbrace{4s^1}_{N}$$

Number of electrons in M shell (n = 3) = 8

Similarly,

		K	L	M	N
$_{25}Mn$	=	2	8	13	2
$_{28}Ni$	=	2	8	16	2
$_{21}Sc$	=	2	8	9	2

Hence, the correct option is (a).

372. The atomic numbers of elements X, Y and Z are 19, 21 and 25 respectively. The number of electrons present in the M shell of these elements follow the order :

(a) Z > X > Y (b) X > Y > Z
(c) Z > Y > X (d) Y > Z > X

AP-EAMCET-2005

Ans. (c) : Given atomic number of element :

Configuration, $_{19}X = \underbrace{1s^2}_{K}\underbrace{2s^2 2p^6}_{L}\underbrace{3s^2 3p^6}_{M}\underbrace{4s^1}_{N}$

$$_{21}Y = \underbrace{1s^2}_{K}\underbrace{2s^2 2p^6}_{L}\underbrace{3s^2 3p^6}_{M}\underbrace{4s^2}_{N}\underbrace{3d^1}_{M}$$

$$_{25}Z = \underbrace{1s^2}_{K}\underbrace{2s^2 2p^6}_{L}\underbrace{3s^2 3p^6}_{M}\underbrace{4s^2}_{N}\underbrace{3d^5}_{M}$$

For the order of number of electrons in M shell is :

Z > Y > X

373. The maximum number of sub-levels, orbitals and electrons in N shell of an atom are respectively :

(a) 4, 12, 32 (b) 4, 16, 30
(c) 4, 16, 32 (d) 4, 32, 64

AP-EAMCET-2007

Ans. (c) : For N shell :

(i) Number of shell (n) = 4
(ii) The number of sub-shell (l) = 4
(iii) Number of orbital = $n^2 = 4^2 = 16$
(iv) Number of electron = $2n^2$
$= 2 \times 4^2$
$= 32$

374. Which orbital among the following has zero radial nodes and 2 angular nodes?

(a) 4s (b) 3d
(c) 2p (d) 5s

AP EAPCET 23-08-2021 Shift-I

Ans. (b) : Radial node = $n - \ell - 1$

Where, n = Principle quantum number
ℓ = Azimuthal quantum number

Angular node = ℓ

ℓ value for s = 0 , p = 1, d = 2, f = 3

(i) 4s $\begin{cases}\text{Radial node} = 4-0-1 = 3\\ \text{Angular node} = 0\end{cases}$

(ii) 3d $\begin{cases}\text{Radial node} = 3-2-1 = 0\\ \text{Angular node} = 2\end{cases}$

(iii) 2p $\begin{cases}\text{Radial node} = 2-1-1 = 0\\ \text{Angular node} = 1\end{cases}$

(iv) 5s $\begin{cases}\text{Radial node} = 5-0-1 = 4\\ \text{Angular node} = 0\end{cases}$

So, the option (b) is correct.

375. In which of the following pair are the ions isoelectronic ?

(a) Mg^{2+}, Ar (b) Na^-, O^{2-}
(c) Al^{3+}, Cl^- (d) K^+, Ne

NDA (I)-2019

Ans : (b) Isoelectronic species have the same number of electrons but different in atomic number. In the given option, Na^+ and O^{2-} are isoelectronic species having 10 electron.

Electronic configuration of Na^+ and O^{2-};

$Na^+ = 1s^2\ 2s^2\ 2p^6$
$O^{2-} = 1s^2\ 2s^2\ 2p^6$

376. Assertion (A) : Atoms with completely filled and half-filled subshells are stable.

Reason (R) : Completely filled and half-filled subshells have symmetrical distribution of electrons and have maximum exchange energy.

The correct answer is

(a) (A) and (R) are correct, (R) is the correct explanation of (A)
(b) (A) and (R) are correct, (R) is not the correct explanation of (A)
(c) (A) is correct, but (R) is not correct
(d) (A) is not correct, but (R) is correct

TS-EAMCET-2016

Ans. (a) : Atoms with completely filled and half filled subshells have symmetrical distribution of electrons and have maximum exchange energy and the electrons are more stable in the atom.

377. The element with the electronic configuration $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^1$ is

(a) Cu (b) Ca
(c) Cr (d) Co

TS-EAMCET-2016

Ans. (a) : The element with electronic configuration $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^1$ is Copper and Copper has atomic number is 29.

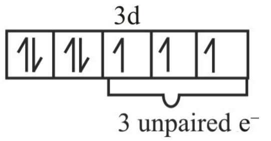
378. The number of unpaired electrons in Co^{2+}, is

(a) 2 (b) 3
(c) 4 (d) 5

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (b) : The electronic configuration of Co^{2+} is $1s^2\ 2s^2\ 2p^6\ 3p^6\ 3d^7$.

or $Co^{2+} = [Ar]3d^7$



@apna_pdf

379. [Ar]$3d^{10}4s^1$ electronic configuration belongs to

(a) Ti (b) Tl

(c) Cu (d) V

MPPET-2008

Ans. (c) : The electronic configuration of [Ar] $3d^{10}$ 45^1 is belong to Cu.

It is in 4th period and IB group.

380. The electronic configuration of Cs is

(a) $[Kr]5s^1$ (b) $[Xe]6s^1$

(c) $[Rn]7s^1$ (d) $[Ar]4s^1$

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (b) : Caesium atomic number is 55.

Thus, electron configuration of Caesium is $1s^22s^22p^63s^2$ $3p^64s^23d^{10}4p^65s^24d^{10}5p^66s^1$ or [Xe] $6s^1$.

Hence, correct option is (b).

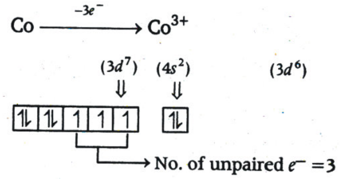
381. How many unpaired electrons will be present in the ground state of an atom which has valence electronic configuration $3d^6$ in its +3 oxidation state ?

(a) 1 (b) 3

(c) 4 (d) 7

AP EAMCET (Engg.) 18.9.2020 Shift-I

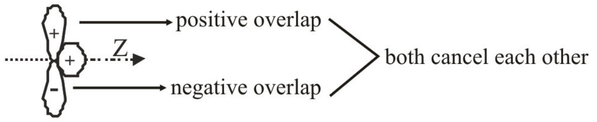
Ans. (b) : Ground state electronic configuration of the element (Co, z = 27) will be [Ar] $3d^7$ $4s^2$.



382. Which among the following represents zero overlap ?

(a) 
(b) 
(c) 
(d) 
AP EAPCET 24.08.2021 Shift-II

Ans. (c): Both orbitals p and s are aligned to different axis so their total overlap become zero.



383. To which orbital among the following may an electron having zero angular momentum belong?

(a) 3s (b) 3p

(c) 3d (d) 4f

AP EAPCET 24.08.2021 Shift-II

Ans. (a) Angular momentum, $\mu = \sqrt{l(l+1)}\frac{h}{2\pi}$

Where l = Azimuthal quantum number for orbital

Azimuthal quantum no. (l)

s	0
p	1
d	2
f	3

So, for 3s orbital an electron having zero angular momentum.

384. To which group of the periodic table does an element having electronic configuration [Ar] $3d^54s^2$ belong?

(a) Second (b) Fourth

(c) Seventh (d) Third

AP EAPCET 19-08-2021 Shift-I

Ans. (c) : The given electronic configuration–

${}_{18}$[Ar], $3d^5$, $4s^2$

Which is the electronic configuration of Mn and Mn element belongs to the 7th group of periodic table.

385. The element with atomic number 12 belongs to .... group and .... period

(a) IA, third (b) III A, third

(c) II A, third (d) II A, second

AP EAMCET (Engg.) 2001

Ans. (c): The element with atomic number 12 is magnesium.

The electronic configuration for Mg = $1s^2$, $2s^2$, $2p^6$ $3s^2$. There are 2 electron in the outermost shell so it belongs to the II A group. Mg has an outermost shell, n=3 therefore, the third period.

386. The maximum number of sub-level, orbitals and electrons in N shell of an atom are respectively

(a) 4, 12, 32 (b) 4, 16, 30

(c) 4, 16, 32 (d) 4, 32, 64

AP EAMCET (Engg.) -2007

Ans. (c) : For 'N' shell

$\because$ The number of shell (n) = 4

$\therefore$ The number of sublevels or subshell (l) = 4

The number of orbitals = $n^2 = 4^2 = 16$

and the number of electrons = $2n^2 = 2\times4^2 = 32$

387. Electronic configuration of X is $1s^2$ $2s^2$ $2p^6$ $3s^2$ $3p^1$. It belongs to

(a) third group and third period

(b) thirteenth group and third period

(c) first group and third period

(d) third group and first period.

COMEDK-2017

Ans. (b) : $1s^2$ $2s^2$ $2p^6$ $3s^2$ $3p^1$

i.e., n=3, third period

And group number for p-block elements = 10+number of electrons in s and p orbitals = 10+2+1=13

388. Elements A, B, C, D and E have the following electronic configuration:

(a) $1s^2$ $2s^2$ $2p^2$ **(b) $1s^2$ $2s^2$ $2p^6$ $3s^2$**

(c) $1s^2$ $2s^2$ $2p^5$ **(d) $1s^2$ $2s^2$ $2p^6$ $3s^2$ $3p^2$**

(e) $1s^2$ $2s^2$ $2p^6$ $3s^2$ $3p^6$

@apna_pdf

Which of these will belong to the same group in the periodic table?

(a) A and B (b) A and C
(c) A and D (d) A and E

COMEDK-2018

Ans. (c) : A and D belongs to same group because in same group. Number of valence electrons is same.
A: $1s^2\ 2s^2\ 2p^2$
D: $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^2$

389. An orbital with n=3, l=1 is designated as

(a) 1s (b) 3s
(c) 3p (d) 3d

COMEDK-2014

Ans. (c) : For 3p-orbital, n=3 and l =1.

390. The total number of orbitals in the fifth energy …….is:

(a) 5 (b) 10
(c) 18 (d) 25

AP-EAMCET (Medical), 2006

Ans. (d) : Given:- n = 5
Total number of orbital's in the fifth energy level
$= n^2$
$= 5^2$
$= 25.$

391. The atomic number of an element is 35. What is the total number of electrons present in all the p-orbitals of the ground state atom of that element?

(a) 6 (b) 11
(c) 17 (d) 23

AP-EAMCET (Medical), 2003

Ans. (c) : The atomic number of element is 35. The name of the element is bromine. The electronic configuration of Br is $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^{10}, 4p^5$.
Electrons present in p- orbital is 17.

392. The total number of electrons present in all the 's' orbitals, all the 'p' orbitals and all the 'd' orbitals of cesium ion are respectively:

(a) 8, 26, 10 (b) 10, 24, 20
(c) 8, 22, 24 (d) 12, 20, 22

AP-EAMCET (Medical), 2003

Ans. (b) : According to the Aufbau Principle-the electronic configuration of Cs^+ is $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^{10}, 4p^6, 5s^2, 4d^{10}, 5p^6$
Total electron in s-orbital = 10
Total electron in p-orbital = 24
Total electron in d- orbital = 20

393. The electronic configuration of four different elements is given below, identify the group XIV element among these:

(a) $[He]2s^1$ (b) $[Ne]3s^2$
(c) $[Ne]3s^2 3p^2$ (d) $[Ne]3s^2 3p5$

AP-EAMCET (Medical), 2001

Ans. (c) : The element of group XIV belongs to the p-block elements. As we know, outer configuration of p-block goes to the $ns^2\ np^2$. The XIV group elements contains the four electron in outer shell. Hence, the correct option is C.

394. Which of the following is correct for number of electron, number of orbitals and type of orbitals respectively in N orbit?

(a) 4, 4 and 8 (b) 4, 8 and 16
(c) 32, 16 and 4 (d) 4, 16 and 32

GUJCET-2011

Ans. (c):

Orbits	K	L	M	N
No of electrons	2	8	18	32
No. of orbitals	s	s,p	s,p,d,	s,p,d,f
	2	4	9	16

∴ For N orbit, No. of e^- = 32, No. of orbital = 16 and type of orbital = 4

395. In which of the following pairs, the outer most electronic configuration will be the same?

(a) Fe^{2+} and Co^+ (b) Cr^+ and Mn^{2+}
(c) Ni^{2+} and Cu^+ (d) V^{2+} and Cr^+

JEE Main 25-02-2021, Shift-I

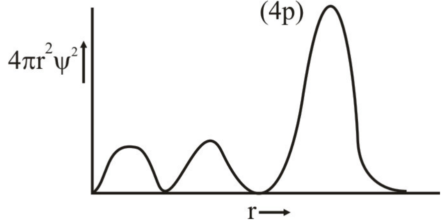
Ans. (b) :
(a) Fe^{2+} : $[Ar]\ 3d^6$ Co^+ : $[Ar]\ 3d^7\ 4s^1$
(b) Cr^+ : $[Ar]\ 3d^5$ Mn^{2+} : $[Ar]\ 3d^5$
(c) Ni^{2+} : $[Ar]3d^8$ Cu^{2+} : $[Ar]\ 3d^9$
(d) V^{2+} : $[Ar]\ 3d^3$ Cr^+ : $[Ar]\ 3d^5$
So, (b) option is correct.

396. An orbital with one angular node shows three maxima in its radial probability distribution curve, the orbital?

(a) 3s (b) 4p
(c) 5d (d) 3p

TS EAMCET 05.08.2021, Shift-I

Ans. (b) : The atomic orbital with one angular node shows 3 maxima, the number of radial nodes must be 2. The 3s, 5d and 4p orbital's have two radial nodes. However, only the 4p orbital's have one angular node.



397. Assertion: Yb^{+2} is more stable in comparison to Gd^{+2}
Reason: The electronic configuration of Gd is $[Xe]\ 4f^7\ 5d^2\ 6s^2$.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Morning)

Ans. (c): The electronic configuration of Yb^{2+} and Gd^{2+} are:
Yb^{2+}: $[Xe]\ 4f^{14}\ 5d^0\ 6s^0$
Gd^{2+}: $[Xe]\ 4f^7\ 5d^1\ 6s^0$
Thus, the given electronic configuration of Gd^{2+} is not correct.

@apna_pdf

398. Assertion: Helium and beryllium having similar outer electronic configuration of types ns^2. Reason: Both are chemically inert.

(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion.
(c) If Assertion is true but the Reason is false
(d) If both Assertion ad Reason are false

AIIMS-1994

Ans. (c): Although He and Be have similar outer electronic configuration of the type ns^2, only He (s^2) has inert gas configuration and hence is chemically inert but Be ($1s^2$, $2s^2$) close not have inert gas configuration and hence is not chemically inert.

399. Assertion: d^5 configuration is more stable than d^4
Reason: d^5 has more exchange energy as compared to d^4 because 10 & 6 exchanges are possible in d^5 & d^4 respectively.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Morning)

Ans.(a): d^5 configuration has exactly haif–filled configuration so has more exchange energy. While d^4 has only four such (unpaired) electron these has less exchange energy. Maximum exchange energy leads to the stabilization of the atoms.
Therefore, d^5 configuration is more stable them that of d^4 configuration.

400. Spectrum of Li^{2+} is similar to that of

(a) H (b) Be
(c) He (d) Ne

AIIMS-2002

Ans. (a): Electronic configuration of Li is $1s^2$ $2s^1$ and of Li^{2+} is $1s^1$. That is similar to the electronic configuration of H ($1s^1$) Which has only one electronic in its valance shell, thus it has spectrum similar to that of H.

401. Which of the following element is represented by electronic configuration

$1s^2 2s^2 2p_x^1 2p_y^1 2p_z^1$

(a) Nitrogen (b) oxygen
(c) fluorine (d) sulphur

AIIMS-2001

Ans. (a): 7^N– $1s^2$, $2s^2$ $2px^1$ $2py^1$ $2pz^1$
This element contains 7 electrons

402. The outermost configuration of most electronegative element is

(a) ns^2 np^5 (b) ns^2 np^6
(c) ns^2 np^4 (d) ns^2 np^3

AIIMS-2000

Ans. (a): The outermost electronic configuration of the most electronegative element is ns^2 np^5. It represents a halogen atom. In a period, halogens have the highest electro negativity due to the small size and high effective number charge.

403. The configuration $1s^2, 2s^2 2p^5, 3s^1$ shows:

(a) excited state of O_2^-
(b) excited state of neon atom
(c) excited state of fluorine atom
(d) ground state of fluorine atom

AIIMS-1997

Ans. (b): The ground state of neon is $1s^2$ $2s^2$ $2p^6$ on excitation an electron from 2p jumps to 3s orbital. The excited neon configuration is $1s^2$ $2s^2$ $2p^5$ $3s^1$.

404. The element with outer electronic configuration $(n – 1)d^2ns^2$. where n = 4. would belong to ___.

(a) 2nd period. 2nd group (b) 4th period. 4th group
(c) 4th period. 2nd group (d) 2nd period. 4th group

AP EAPCET 19-08-2021, Shift-II

Ans. (b) : Given,
Outer electronic configuration = $(n - 1)d^2$ ns^2 where n = 4
$\therefore$ $= (4 – 1)d^2, 4s^2$
$= 3d^2, 4s^2$
This is the outer electronic configuration of titanium which is belongs to the 4th period and 4th group.

405. Transition metal elements exhibit general electronic configuration ________

(a) ns^{1-2} nd^{1-10} (b) ns^{1-2} $(n – 1)$ d^{1-10}
(c) $ns^2(n –1)d^{10}$ (d) ns^2 $(n – 1)d^0$

AP- EAPCET- 07-09-2021, Shift-I

Ans. (b) : Transition metal element exibit general electronic configuration is $ns^{1-2}(n – 1)$ d^{1-10}.

406. If an element with atomic number Z = 115 has been discovered today in which of the following family would it had been placed and identify its electronic configuration.

(a) Boron Family : [Ar] $4f^{14}5d^{10}6s^2 6p^3$
(b) Carbon Family : [Kr] $5f^{14}6d^{10}7s^2 7p^3$
(c) Nitrogen Family : [Rn] $5f^{14}$ $6d^{10}$ $7s^2 7p^3$
(d) Oxygen Family : [Xe] $4f^{14}5d^{10}6s^2 6p^3$

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c) : Atomic number Z = 115 is Moscovium (Mc) is a synthetic chemical element and an extremely radioactive element. It belongs to nitrogen family and electronic configuration is
115^{Mc} =[Rn] $5f^{14}$ $6d^{10}$ 75^2 $7p^3$

407. The atomic number of an element 'M' is 26. How many electrons are present in the M-shell of the element in its M^{3+} state?

(a) 11 (b) 15
(c) 14 (d) 13

AP - EAMCET (Medical) - 2007

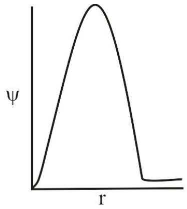
Ans. (d) : The atomic number of element (M) is 26.
According to **Aufbau principle**, the electronic configuration of $_{26}M$ will be $1s^2$, $2s^2$, $2p^6$, $3s^2$, $3p^6$, $3d^6$, $4s^2$.

@apna_pdf

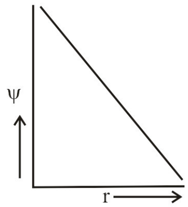
For $_{26}M^{3+} = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^5$
or $_{26}M^{3+} = 2, 8, 13$
K L M
Hence, the electrons are present in M shell is 13.

408. Which of the following graph represents variation of 2p-orbital wave function with distance from the nucleus?

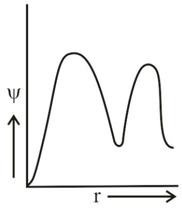
(a)



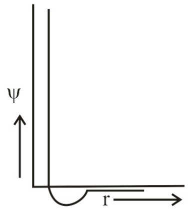
(b)



(c)



(d)



VITEEE-2016

Ans. (a) : In option (a) show the variation of 2p–orbitals wave function with distance from the nucleus. It has one maxima and passes through origin.

409. The orbital angular momentum of an electron in 2p orbital is
(a) h/4 π
(b) zero
(c) h/2 π
(d) $\sqrt{2}$ h/2 π

Assam CEE-2019

Ans. (d) : Angular momentum in an orbital

$$= \frac{h}{2\pi}\sqrt{\ell(\ell+1)}, \quad (\ell = 1)$$

$$= \left(\frac{\sqrt{2}h}{2\pi}\right)$$

410. The orbital angular momentum of a p-electron given as
(a) $\frac{h}{\sqrt{2}\pi}$
(b) $\sqrt{3}\frac{h}{\sqrt{2}\pi}$
(c) $\sqrt{\frac{3}{2}}\frac{h}{\pi}$
(d) $\sqrt{6}\frac{h}{2\pi}$

NEET-Mains 2012

Ans. (a) : Orbital angular momentum (m)

$$= \sqrt{\ell(\ell+1)}\frac{h}{2\pi}$$

For P electrons; ℓ=1

$$\text{Thus, } m = \sqrt{\ell(\ell+1)}\frac{h}{2\pi} = \frac{\sqrt{2}h}{2\pi} = \frac{h}{\sqrt{2}\pi}$$

411. Orbital having 3 angular nodes and 3 total nodes to
(a) 5p
(b) 3d
(c) 4f
(d) 6d

Odisha NEET-2019

Ans. (c) : Give that,
Angular node (ℓ) = 3
Total node = 3
Total node = Radial node + Angular node
$3 = n - \ell - 1 + \ell$
$3 = n - 1$
$n = 4$
Subshell nl = 4f

412. The number of radial nodes of 3s and 2p orbitals are respectively
(a) 2, 0
(b) 0, 2
(c) 1, 2
(d) 2, 2

BITSAT-2017

Ans. (a) : For a given orbital with principal quantum number (n) and azimuthal quantum number (l)
number of radial nodes = $(n - l - 1)$
for 3s orbital: n = 3 and l = 0
therefore, number of radial nodes
$= 3 - 0 - 1 = 2$
for 2p orbital; n = 2 and l = 1
therefore, number of radial nodes
$= 2 - 1 - 1 = 0$

413. According to Bohr's theory, the angular momentum for an electron in 5th orbit is
(a) 2.5 h / π
(b) 5 h / π
(c) 25 h / π
(d) 5 π / 2h

UPTU/UPSEE-2010

Ans. (a) : The angular momentum (ℓ) of an electron in a Bohr's orbit is given as $L = \frac{nh}{2\pi}$

It is an integral multiple of $\frac{h}{2\pi}$

In the fifth Bohr orbit, the angular momentum of electron is $(L) = \frac{5h}{2\pi}$

$$L = \frac{2.5h}{\pi}$$

$= 2.5$ h\π

414. Which one of the following decides the shapes of orbitals in an energy shell?
(a) Magnetic quantum number
(b) Principle quantum number
(c) Azimuthal quantum number
(d) Spin quantum number

AMU-2013

Ans. (c) : Principal quantum number tells the principal energy level or shell to which the electron belongs or the average distance of the electron from the nucleus.
Azimuthal quantum number tells, the shape of the various subshells present within the same principal shell.
Magnetic quantum number determines the number of preferred orientations of the electrons present in subshell. Spin quantum number helps to explain state of each electron in an orbital.

@apna_pdf

415. The electrons indentified by quantum numbers n and *l* (i) n = 4, *l* = 1; (ii) n = 4, *l* =0; (iii) n = 3, *l* = 2; (iv) n = 3, *l* = 1 can be placed in order of increasing energy from the lowest to highest as

(a) (iv) < (ii) < (iii) < (i)
(b) (ii) < (iv) < (i) < (iii)
(c) (i) < (iii) < (ii) < (iv)
(d) (iii) < (i) < (iv) < (ii)

AMU-2011

Ans. (a) : The greater is the value of (n+1), the greater si the energy of orbitals.
(i) n=4, l=1 = 4p orbital
(ii) n=4, l=0 = 4s orbital
(iii) n=3, l=2 = 3d orbital
(iv) n=3, l=1 = 3p orbital
According to the Aufbau principle, energies of above–mentioned orbitals are in the order of –
The increasing order of energy
(iv) 3p < (ii) 4s< (iii) 3s< (i) 4p

416. The element whose electronic configuration is $1s^2\ 2s^2\ 2p^6\ 3s^2$ is a

(a) metoalloid (b) metal
(c) noble gas (d) non-metal

AMU-2004

Ans. (b) : $1s^2\ 2s^2\ 2p^6\ 3s^2$ is electronic configuration of alkaline earth metal.

417. The electronic configuration of P in $H_3\ PO_4$

(a) $1s^2 2s^2, 2p^6, 3s^2 3p^6$ (b) $1s^2, 2s^2, 2p^6, 3s^2$
(c) $1s^2 2s^2 2p^6$ (d) $1s^2, 2s^2, 2p^6, 3s^2 3p^6, 4s^1$

CG PET- 2011

Ans. (a) : The electronic configuration of pin H_3PO_4 is $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6$
P atom has 5 valance electron it shares 3 with 3–OH groups to form 3P–OH bonds it shares 2 with one O atom to form p=O bond.

418. The pair having the similar shape is

(a) BF_3 and NF_3 (b) BF_4^- and NH_4^+
(c) $SiC1_4$ and $SC1_4$ (d) CH_3^+ and N_3O^+

CG PET- 2011

Ans. (b) : Both BF_4^- and NH_4^+ ion are tetrahedral.

419. Quantum numbers ℓ = 2and m = 0 represent the orbital

(a) d_{xy} (b) $d_{x^2-y^2}$
(c) d_{z^2} (d) d_{xz}

CG PET- 2016

Ans. (c) : Quantum number ℓ= 2 and m=0

Respresent dz^2 orbital.

Note– For s, p, d and f orbitals, the value of the azmithual quantum number 'ℓ' is 0, 1, 2, 3.

When ℓ=2, m can have values

–2, –1, 0, +1 +2.

A d–subshell can be have five different orientations and orbitals
Corresponding to these orientations are

d_{xy}, d_{xz}, d_{yz}, $d_{x^2-y^2}, d_{z^2}$.

420. The electronic configuration of an element is
$1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^3$
Its properties would be similar to which of the following elements?

(a) Boron (b) Oxygen
(c) Nitrogen (d) Chlorine

CG PET -2004

Ans. (c) : The valence shell electronic configuration is $4s^2\ 4p^3$ similar to nitrogen $2s^2, 2p^3$.

421. Out of the following electronic configurations the one of a transition element is

(a) $1s^2, 2s^2 2p^2, 3s^2 3p^6 3d^{10}, 4s^2 4p^6$
(b) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^2, 4s^2$
(c) $1s^2, 2s^2 2p^6, 3s^2 p^6, 4s^2$
(d) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^{10}, 4s^2 4p^1$

CG PET -2004

Ans. (b) : $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 3d^2\ 4s^2$ is a transition element the last electron here enters the 3d sub shell.

422. Aufbau principle is not satisfied by

(a) Cr and Cl (b) Cu and Ag
(c) Cr and Mg (d) Cu and Na

CG PET -2004

Ans. (b) : The correct option is Cu and Ag. Cu as we know should have the configuration $3d^9\ 4s^2$ But it does not obey the Aufbau Principal and has a configuration of $3d^{10}\ 4s^1$.
Similarly Ag lies below Cu in the periodic table [same group] and thus disobeys.
aufbau principal.

423. Which of the following can be represented by the configuration $[Kr]5s^2$?

(a) Ca (b) Sr
(c) Ba (d) Ra

CG PET -2004

Ans. (b) : Electronic configuration of strontium is $[Kr]5s^2$

424. Which of the following describes the shape of orbital?

(a) Principal quantum number
(b) Azimuthal quantum number
(c) Magnetic quantum number
(d) Spin quantum number

CG PET -2006

Ans. (b) : Principal quantum number represents the principal energy shell where the electron is revolving
Azimuthal quantum describe the slope of an orbital
Magnetic quantum number describes the orientation of the orbital in space.

425. Electronic configuration of H^+ is

(a) $1s^0$ (b) $1s^1$
(c) $1s^2$ (d) $1s^1, 2s^1$

CG PET- 2010

Ans. (a) : Electronic configuration
$H^+ = 1s^0$
$H^- = 1s^2$
$He^+ = 1s^1$

@apna_pdf

426. The ion which does not have configuration of argon (Ar) is:

(a) I^- (b) K^+
(c) Cl^- (d) Ca^{2+}

HP CET-2018

Ans. (a) : Argon has 18 electrons Cl^-, K^+, Ca^{2+} have 18 electrons I^- have 54 electron so I^- does not have electronic configuration with Ar.

427. Match List-I with List-II.

List-I (Electronic configuration of elements)		List-II (Δ_i in kJ mol^{-1})	
A.	**$1s^22s^2$**	**(i)**	**801**
B.	**$1s^22s^22p^4$**	**(ii)**	**899**
C.	**$1s^22s^22p^3$**	**(iii)**	**1314**
D.	**$1s^22s^22p^1$**	**(iv)**	**1402**

Choose the most appropriate answer from the options given below.

Codes

	A	B	C	D
(a)	(ii)	(iii)	(iv)	(i)
(b)	(i)	(iv)	(iii)	(ii)
(c)	(i)	(iii)	(iv)	(ii)
(d)	(iv)	(i)	(ii)	(iii)

(JEE Main 2021, 26 Feb Shift-I)

Ans. (a) : The correct option is A (a) -(ii), (b) -(iii), C(iv), d-(i)

$1s^2\ 2s^2 \rightarrow Be$
$1s^2\ 2s^22p^4 \rightarrow O$
$1s^2\ 2s^22p^3 \rightarrow N$
$1s^2\ 2s^22p^1 \rightarrow B$

The ionization enthalpy order is B < Be < O < N. Be has more I.E compared to B due to extra state fully filled 2s orbital N has more I.E Compared to O due to extra stable half filled 2p orbital.

Hence,

N→1402 kJ /mol
O→1314 kJ/mol
B→801 kJ/mol
Be→899 kJ /mol

428. The electronic configuration of bivalent europium and trivalent cerium are (atomic number : Xe = 54, Ce = 58, Eu = 63)

(a) $[Xe]4f^7$ and $[Xe]4f^1$
(b) $[Xe]4f^7\ 6s^2$ and $[Xe]4f^26s^2$
(c) $[Xe]4f^2$ and $[Xe]4f^7$
(d) $[Xe]4f^4$ and $[Xe]4f^9$

(JEE Main 2020, 9 Jan Shift-I)

Ans. (a) : The electronic configuration of europium and cerium in the ground state is–

$Eu(63) \Rightarrow [Xe]4f^76s^2$
$Ce(58) \Rightarrow [Xe]4f^15d^16s^2$

Bivalent means it lost two electrons and trivalent means it lost three electrons

$Eu^{2+} \Rightarrow [Xe]4f^7$
$Ce^{3+} \Rightarrow [Xe]4f^1$

429. The correct electronic configuration and spin-only magnetic moment (BM) of Gd^{3+} (Z=64), respectively, are

(a) $[Xe]4f^7$ and 7.9 (b) $[Xe]5f^7$ and 7.9
(c) $[Xe]5f^7$ and 8.9 (d) $[Xe]4f^7$ and 8.9

(JEE Main 2020, 5 Sep Shift-I)

Ans. (a) : Given, $[Gd]^{3+}$

To find electronic configuration and magnetic moment of $[Gd]^{3+}$ -

Electronic configuration of $[Gd]^{3+}$:$[Xe]4f^7\ 5d^06s^0$

Hence number of unpaired electron n=7

Hence magnetic moment $\sqrt{n(n+2)} = \sqrt{63} = 7.9\ BM$

Hence electronic configuration is $[Xe]4f^7$

Magnetic moment is 7.9 BM

430. In the sixth period, the orbitals that are filled are

(a) 6s, 5f, 6d, 6p (b) 6s, 4f, 5d, 6p
(c) 6s, 5d, 5f, 6p (d) 6s, 6p, 6d, 6f

(JEE Main 2020, 5 Sep Shift-I)

Ans. (b) : As per (n+*l*) rule in 6th period, order of orbital filling is 6s, 4f, 5d, 6p.

431. Outermost electronic configuration of a group-13 element E is $4s^2\ 4p^1$. The electronic configuration of an element of p-block period-five placed diagonally to element, E is

(a) $[Kr]3d^{10}4s^24p^2$ (b) $[Ar]3d^{10}4s^24p^2$
(c) $[Xe]5d^{10}6s^26p^2$ (d) $[Kr]4d^{10}5s^25p^2$

(JEE Main 2021, 20 July Shift-II)

Ans. (d) : $[Kr]4d^{10}\ 5s^2\ 5p^2$

The element E is Ga and the digonal element of 5th period is $_{50}Sn$ having outer electronic configuration will be $[Kr]4d^{10}\ 5s^2\ 5p^2$.

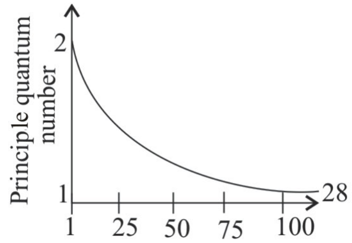
432. Among the following, the energy of 2s-orbital is lowest in

(a) K (b) H
(c) Li (d) Na

[JEE Main 2019, 12 April Shift-II]

Ans. (a) : The energy of 2s-orbital is lowest in K (potassium). An orbital gets larger as the principle quantum number n increases.

Correspondingly the energy of the electron in such an orbital become less negative, meaning that the electron is less strongly bound and has less energy. The graph of principle quantum number with atomic number is



433. Ge (Z = 32) in its ground state electronic configuration has x completely filled orbitals with $m_\ell = 0$. The value of x is

[JEE Main 2021, 31 Aug Shift-I]

@apna_pdf

Ans. (7) : $_{32}Ge : 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 3d^{10}\ 4s^2\ 4p^2$

7 orbitals are fully filled with $m_\ell = 0$.

The value of x is 7.

434. A certain orbital has n = 4 and m_ℓ = –3. The number of radial nodes in this orbital is........(Round off to the nearest integer).

[JEE Main 2021, 17 March Shift-I]

Ans. (0) : n = 4, m_ℓ = –3 so ℓ = 3

Number of radial nodes = n – ℓ – 1

= 4 – 3 – 1

= 0

435. The number of orbitals with n = 5, m_1 = +2 is ....(Round off to the nearest integer).

[JEE Main 2021, 16 March Shift-II]

Ans. (3) : For, n = 5

ℓ = 0, 1, 2, 3, 4

For, ℓ = 2, m = –2, –1, 0, 1, 2

For, ℓ = 3, m = –3, –2, –1, 0, 1, 2, 3

For, ℓ = 4, m = –4, –3, –2, –1, 0, 1, 2, 3, 4

Hence, the number of orbitals with n = 5, m_ℓ = +2 is 3.

436. Which of the following atoms in its ground state has the highest number of unpaired electrons?

(a) Chromium (24)
(b) Iron (26)
(c) Manganese (25)
(d) Vanadium (23)

J & K CET-(2016)

Ans. (a) : The electronic configuration of the give element is–

Chromium (24): $(3d^5 4s^1)$ – 6 unpaired electron.
Iron (26) : $(3d^6 4s^2)$ – 4 unpaired electron.
Manganese (25) : $(3d^5 4s^2)$ – 5 unpaired electron.
Vanadium (23) : $(3d^3 3s^2)$ – 3 unpaired electron.
So, $_{24}$Cr has the highest number of unpaired electrons.

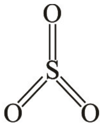
437. The sulphur compound in which the sulphur atom has octet configuration in its valence shell among the following is

(a) Sulphur trioxide
(b) Sulphur hexafluoride
(c) Slphur dichloride
(d) Sulphur dioxide

J & K CET-(2016)

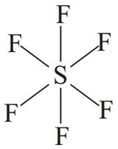
Ans. (c) : Octet rule dictates that atoms are most stable when their valence shells are filled with eight electrons. The moleculer of the halogens, oxygen, nitrogen and carbon are known to obey the octet rule.

SO_3:



(Extended octet)

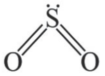
SF_6 :



(Extended octet)

SCl_2 : Cl – S – Cl (complete octet)

SO_2:



(Extended octet)

438. Which electronic configuration will show the highest first ionization potential?

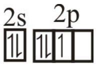
(a) $1s^2 2s^2 2p^1$
(b) $1s^2 2s^2 2p^5$
(c) $1s^2 2s^2 2p^3$
(d) $1s^2 2s^2$

J & K CET-(2018)

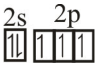
Ans. (b) : $1s^2 2s^2 2p^1$=B
$1s^2 2s^2 2p^5$=F
$1s^2 2s^2 2p^3$=N
$1s^2 2s^2$=Be
The order of first ionization potential is F > N > Be > B.

439. The orbital diagram in which Aufbau principle is violated is

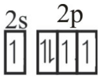
(a)



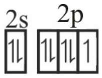
(b)



(c)



(d)



J & K CET-(2013)

Ans. (c) : According to Aufbau principle in the ground state of the atoms the electron fill subshells of the lowest available energy, then they fill subshells of higher energy. So, in option (c) 2s subshell should filled before the 2p subshell is occupied while in (a) Hund's rule is violated.

440. What is the total number of electrons that can have the values n = 2, *l* = 1, s = ½ in the electronic configuration $1s^2 2s^2 2p^3$?

(a) 1
(b) 3
(c) 5
(d) 7

J & K CET-(2013)

Ans. (b) The given electronic configuration is $1s^2 2s^2 2p^3$

2p

Then, n=2, *l*=1 i.e. 2p
Hence, the total number of electron is 3.

441. According to Aufbau principle, the correct order of energy of 3d, 4s and 4p orbitals is

(a) 4p < 3d < 4s
(b) 4s < 4p < 3d
(c) 4s < 3d < 4p
(d) 3d < 4s < 4p

J & K CET-(2006)

Ans. (c) : According to Aufbau principle the increasing order of the energies of the orbital's is
1s < 2s < 2p < 3s < 3p < 4s < 3d < 4p < 5s…..

442. Electronic configuration of deuterium atom is

(a) $1s^1$
(b) $2s^2$
(c) $2\ s^1$
(d) $1s^2$

J & K CET-(2005)

Ans. (a) : Deuterium is an isotope of hydrogen its atomic number is one
Hence, its electronic configuration is as $_1D^2$: $1s^1$

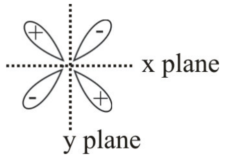
443. Two nodal planes are present in

(a) $\pi^* 2p_x$
(b) $\sigma\ 2p_z$
(c) $\pi\ 2p_x$
(d) $\pi\ 2p_y$

J & K CET-(2004)

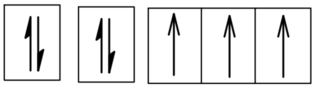
@apna_pdf

Ans. (a) : π^*2p_x has two nodal planes perpendicular to each other

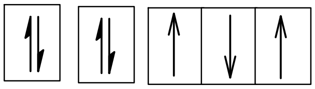


444. Ground state electronic configuration of nitrogen atom can be represented as

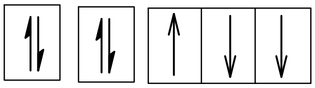
(a)



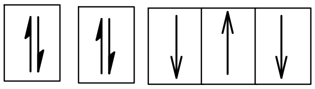
(b)



(c)

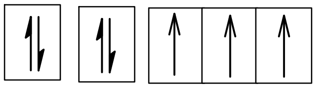


(d)



J & K CET-(2003)

Ans. (a) : Nitrogen (N) atomic number = 7
Electronic configuration ($_7$N) = $1s^2$, $2s^2$, $2p^3$
Hence,



445. A 3p-orbital has
(a) two non-spherical nodes
(b) two spherical nodes
(c) one spherical and one non-spherical node
(d) one spherical and two non-spherical nodes

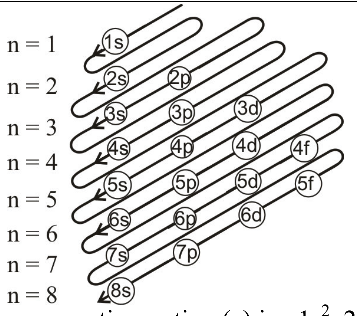
J & K CET-(1998)

Ans. (c) : Given 3p orbital
In 3p orbital, n = 3 and l =1
We know,
Spherical Node = $n - l - 1 = 3 - 1 - 1 = 1$
Non spherical Node = $l = 1$
Hence, one spherical Node and one non spherical Node.

446. Impossible configuration is:
(a) $1s^2$, $2s^2$, $2p^2$, 3 s^2
(b) $1s^2$, $2s^2$
(c) $1s^2$, $2s^2$, $2p^6$
(d) none of these

JCECE - 2003

Ans. (a): Aufbau Principal: it state that electron are filled in the atomic orbitals in the increasing order of orbital energy level It means the available atomic orbitals with the lowest energy levels are occupied before those with higher energy levels.



From the above equation option (a) i.e. $1s^2$, $2s^2$ $2p^{2,}$ $3s^2$ does not follow Aufbau Rule.

447. The element with the electronic configuration as [Ar] $3d^{10}4s^24p^3$ represents a
(a) metal
(b) non-metal
(c) metalloid
(d) transition element

JCECE - 2010

Ans. (c) : Electronic configuration shows that the p-orbital of the element is not complete. That is why, it is a p-block element. Moreover, the atomic number of the element is 33(As). Therefore, it is a metalloid.

448. The electronic configuration of element with atomic number 24 is
(a) $1s^2$, $2s^22p^6$, $3s^23p^63d^4$, $4s^2$
(b) $1s^2$, $2s^22p^6$, $3s^23p^63d^{10}$
(c) $1s^2$, $2s^22p^6$, $3s^23p^63d^6$
(d) $1s^2$, $2s^22p^6$, $3s^23p^63d^5$, $4s^1$

JCECE - 2010

Ans. (d) : The electronic configuration of element with atomic number 24 is
$1s^2$, $2s^2$, $2p^6$, $3s^2$, $3p^6$, $4s^1$, $3d^5$
($\because$ Exactly half-filled orbitals are more stable than nearly half-filled orbitals.)

449. Which of the following is correct for number of electrons, number of orbitals and type of orbitals respectively in N-orbit?
(a) 4, 4 and 8
(b) 4, 8 and 16
(c) 32, 16 and 4
(d) 4, 16 and 32

JCECE - 2013

Ans. (c) : For N shell, types of orbitals = 4s, 4p, 4d, 4f
Number of orbitals = 1+ 3 + 5 + 7 = 16
number of electrons = 32

450. The outermost electronic configuration of the most electronegative element is
(a) ns^2np^3
(b) ns^2np^4
(c) ns^2np^5
(d) ns^2np^6

JCECE - 2014

Ans. (c) : ns^2np^5 configuration shows the most electronegative element as after gaining one electron it becomes more stable (inert gas configuration) [electronegativity is the tendency of attracting electron].

451. If n=6, the correct sequence for filling of electrons will be.
(a) ns →(n-1) d→(n-2) f→np
(b) ns →(n-2) f→np→(n-1)d
(c) ns → np→(n-1) d→(n-2)f
(d) ns →(n-2) f→(n-1)d→np

JIPMER-2014

@apna_pdf

Ans. (d) : If n=6, then the correct sequence for filling of electrons will be
ns→(n–2)f→ (n–1)d→np.
It will be
6s→4f→ 5d→6p.
The energy of 4f and 5d orbitals are in between the energies of 4s and 6p orbitals.
Note:– Higher is the (n+ ℓ), higher will be the energy of the orbital.
For n=6
6s= 6+0=6
6p=6+1=7
5d=5+2=7
4f=4+3=7
Hence, the correct order is:
ns→(n–2)f→(n–1)d→np

452. The total number of orbitals in the fifth energy level is

(a) 5 (b) 10
(c) 18 (d) 25

JIPMER-2009
UP CPMT-2008

Ans. (d) : For fifth energy level
The value of n will be 5
Therefore, the total number of orbitals is given by $n^2 = 5^2 = 25$

453. The last element of the p-block in 6th period is represented by the outer most electronic configuration

(a) $7s^2, 7p^6$ (b) $5f^{14}, 6d^{10}, 7s^2, 7p^5$
(c) $4f^{14}, 5d^{10}, 6s^2, 6p^4$ (d) $4f^{14}, 5d^{10}, 6s^2, 6p^6$

Karnataka-CET-2020

Ans. (d) : As we know form periodic table, the last element of the p-block in 6th period is Radon ($_{86}$Rn).
The electronic configuration of $_{86}$Rn
$_{86}Rn = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 3d^{10}, 4s^2, 4p^6, 4d^{10}, 5s^2, 4f^{14}, 5d^{10}, 6s^2, 6p^6$
Or it can be also written as $[Xe]\ 4f^{14}, 5d^{10}, 6s^2, 6p^6$

454. The orbital nearest to the nucleus is

(a) 4f (b) 5d
(c) 4s (d) 7p

Karnataka-CET-2018

Ans. (c) : In general orbitals with lower energy are present near to the nucleus. This can be calculate by (n+1) rule.
(i) Lower be the sum of (n+1) value, nearest the orbital to the nucleus.
(ii) And for the same sum, if the value of n will be lower, then its energy will also be low and it will be nearest to the nucleus.
Therefore, from the given options-

(a) 4f→ (ℓ =3) ∴ n+ ℓ = 4+3=7
(b) 5d→ (ℓ =2) ∴ n+ ℓ = 5+2=7
(c) 4s→ (ℓ =0) ∴ n+ ℓ = 4+0=4
(d) 7p→ (ℓ =1) ∴ n+ ℓ = 7+1=8

455. Among the elements form atomic number 1 to 36, the number of elements which have an unpaired electron in their s subshell is

(a) 2 (b) 7
(c) 6 (d) 9

Karnataka-CET-2014

Ans. (c) : Key elements among 1 to 36 atomic number which have one-unpaired electron in their s-subshell-
∵ The alkali metals have 1 electron in s-subshell-
$H = 1 \rightarrow 1s^1$
$Li = 3 \rightarrow 1s^2\ 2s^2$
$Na = 11 \rightarrow 1s^2\ 2s^2\ 2p^6\ 3s^1$
$K = 19 \rightarrow [Ar]\ 4s^1$
$Cr = 24 \rightarrow [Ar]\ 4s^1\ 3d^5$
$Cu = 29 \rightarrow [Ar]\ 4s^1\ 3d^{10}$
Therefore, there are total 6 elements between atomic number 1 to 36 which have one electron in their outer most s-subshell.

456. Impossible orbital among the following is

(a) 3f (b) 2p
(c) 4d (d) 2s

Karnataka-CET-2012

Ans. (a) : According to Bohr Bury's scheme maximum number of e^- in 3rd orbital $2n^2=2(3)^2=18$
Maximum number of e^- in s-subshell =2, p-subshell =6, d-subshell =10 and f-subshell =14 therefore, 18 e^- present in 3rd orbital enter in s, p and d subshell.
There after there is no e^- available for f-subshell that is why 3f subshell is not possible.
Thus, the value of magnetic quantum number is $-l$ to $+l$, then –2 to +2, i.e –2–1, 0,+1, +2

457. The number of naturally occurring p-block elements that are diamagnetic is

(a) 18 (b) 6
(c) 5 (d) 7

Karnataka-CET-2011

Ans. (a) : The group 18 elements have completely filled subshells, therefore, they are diamagnetic. They are He, Ne, Ar, Kr and Xe.

458. Which one of the following is not correct in respect of hybridization of orbitals?

(a) The orbitals present in the valence shell only are hybridized
(b) The orbitals undergoing hybridization have almost equal energy
(c) Promotion of electron is not essential condition for hybridization
(d) It is not always that only partially filled orbitals participate in hybridization in some cases even filled orbitals in valence shell take part
(e) Pure atomic orbitals are more effective in forming stable bonds than hybrid orbitals

Kerala-CEE-2013

Ans. (e) : Pure atomic orbitals are less effective in forming stable bonds than hybrid orbitals.

@apna_pdf

459. Which of the following are isoelectronic species?

(i) NH_3 **(ii)** CH_3^+

(iii) NH_2^- **(iv)** NH_4^+

Choose the correct answer from the codes given below.

(a) (i), (ii), (iii) (b) (ii), (iii), (iv)
(c) (i), (ii), (iv) (d) (i), (iii), (iv)
(e) (ii), (iii)

Kerala-CEE-2014

Ans. (d) :

Species	Number of electrons
(1) NH_3	$7+1\times3=10$
(2) CH_3^+	$6+1\times3-1=8$
(3) NH_2^-	$7+1\times2+1=10$
(4) NH_4^+	$7+1\times4-1=10$

Since,
(i) (iii) and (iv) have the equal number of electrons therefore these are called as isoelectronic species.

460. Electronic configuration of only one p-block element is exceptional. One molecule of that element consists of how many atoms of it?

(a) One (b) Two
(c) Three (d) Four

MHT CET-2015

Ans. (a) : Helium is the element with exceptional configuration in p-block with only 2 electrons in outermost shell Helium is monoatomic hence it consists of only 1 atom.
Electronic configuration of helium (He) = $1s^2$

461. The number of spherical nodes in 3p orbitals are/is

(a) one (b) three
(c) none (d) two

NEET-1988

Ans. (a) : Given, 3p orbital
In 3p orbital, n = 3 and l = 1
We know,
Spherical Node = $n-l-1=1$

462. The orientation of an atomic orbital is governed by

(a) principle quantum number
(b) azimuthal quantum number
(c) spin quantum number
(d) magnetic quantum number

NEET-2006

Ans. (d) : Magnetic Quantum number represents the orientation of an orbital around the nucleus. It is represented by m_l.

463. The total number of atomic orbitals in fourth energy level of an atom is

(a) 8 (b) 16
(c) 32 (d) 4

NEET-2011
UPTU/UPSEE-2004

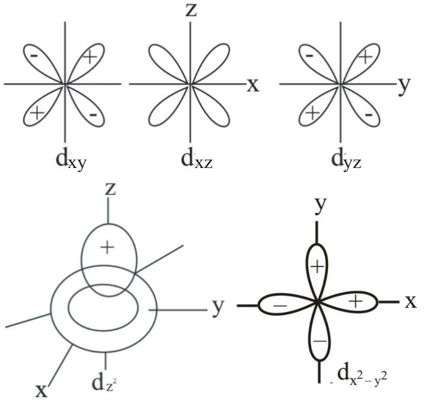
Ans. (b) : According to question.
n=4
Now,
Number of atomic orbital in particular energy level is given by formula $=n^2$
Number of orbital's in fourth energy level $\Rightarrow 4^2 \Rightarrow 16$ orbital's.

464. Which of the following pairs of d-orbital's will have electron density along the axes?

(a) d_{z^2}, d_{xy} (b) d_{xy}, d_{yz}
(c) $d_{z^2}, d_{x^2-y^2}$ (d) $d_{xy}, d_{x^2-y^2}$

NEET-II 2016

Ans. (c) : The shapes of various d-orbitals are as follow



So, the pairs of d-orbitals having electron density along the axis are dz^2 and dx^2-y^2.

465. 4d, 5p, 5f and 6p orbital's are arranged in the order of decreasing energy. The correct option is

(a) 5f > 6p> 4d > 5p (b) 5f > 6p > 5p > 4d
(c) 6p > 5f > 5P > 4d (d) 6p > 5f > 4d > 5p

NEET-2009

Ans. (b) : As we know, Greater the (n+1) values greater is the energy (n+1) values for,
4d=4+2=6
5p=5+1=6
5f=5+3=8
6p=6+1=7
Order of energy would be 5f > 6p > 5p > 4d

466. The stable electronic configuration of chromium is

(a) $3d^6\ 4S^1$ (b) $3d^5\ 4S^2$
(c) $3d^5\ 4S^1$ (d) $3d^6\ 4S^o$

J & K CET-(2007)

Ans. (c) : The electronic configuration of ${}_{24}Cr$ is $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 3d^5\ 4s^1$

467. Which one of the following electronic arrangements is absurd?

(a) n=3,l=1,m= –1 (b) n=3, l =0, m= 0
(c) n=2, l =0, m= –1 (d) n=2, l =1, m= 0

WB-JEE-2019

Ans. (c) : The value of magnetic quantum number m depends upon aziamuthal quantum number l m varies form $-l$ to $+l$
So, if the value of l. is O then value of m will also be O.

@apna_pdf

468. The ground state term symbol for an electronic state is governed by:
(a) Heisenberg's principle
(b) Hund's rule
(c) Aufbau principle
(d) Pauli exclusion principle

UPTU/UPSEE-2004

Ans. (b) : The ground state term symbol for an electronic state is governed by Hund's Rule.

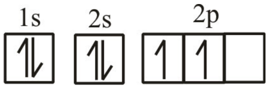
469. The compound in which cation is isoelectronic with anion is:
(a) NaC*l* (b) CsF
(c) NaI (d) K_2S

UPTU/UPSEE-2004

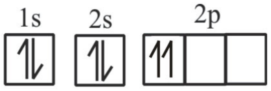
Ans. (d) : NaCl: No of e^- in Na^+ = 11–1=10
No of e^- in Cl^- = 17+1=18
CsF No of e^- in Cs^+ = 55–1=54
No of e^- in F^- = 9+1=10
NaI No of e^- in Na^+ ⇒11–1=10
No of e^- in I^- ⇒53+1=54
K_2S No of e^- in K^+ =19–1=18
No of e^- in S^{2-} =16+2=18
So, K_2S anion has isoelectronic with cation

470. Which of the following will violate Pauli's exclusion principle?

(a)



(b)



(c) Both (a) and (b)
(d) None of the above

UPTU/UPSEE-2014

Ans. (b) : Pauli's exclusion principle states that in a single atom no two electrons will have an identical set or the same quantum numbers. It means orbital must have opposite spins or it should be anti parallel.

471. The electronic configuration of the oxide ion is much most similar to the electron configuration of the
(a) sulphide ion (b) nitride ion
(c) oxygen atom (d) nitrogen atom

UPTU/UPSEE-2009

Ans. (b) : Sulphide ion (S^{2-})=No of electrons =16+2=18
Nitride ion (N^{3-})=No of electrons =7+3=10
Oxide ion (O^{2-})=No of electrons =8+2=10
No of electros in oxygen atom =8
No of electrons in nitrogen atom=7
Electronic configuration of O^{2-} or N^{3-} (10)
$1s^2\ 2s^2\ 2p^6$

472. The electronic configuration $1s^22s^22p^63s^23p^63d^9$ represents a
(a) Metal atom (b) Non metal atom
(c) Non metallic anion (d) Metallic cation

WB-JEE-2008

Ans. (d) : The given configuration represents the electron configuration of Cu^{2+} i.e a metallic cation.

473. An element belongs to group 15 and third period of the periodic table, Its electronic configuration will be
(a) $1s^2\ 2s^2\ 2p^3$ (b) $1s^2\ 2s^2\ 2p^4$
(c) $1s^2\ 2s^22p^6\ 3s^2\ 3p^3$ (d) $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3P^2$

WB-JEE-2011

Ans. (c) : The element belongs to group 15 and third period is phosphorus ($_{15}P$).
Electronic configuration of phosphorus.
$_{15}P = 1s^2, 2s^2, 2p^6, 3s^2, 3p^3$

474. The representation of the ground state electronic configuration of He by box-diagram as $\boxed{\uparrow\uparrow}$ is wrong because it violates
(a) Heisenberg's uncertainty principle
(b) Bohr's quantization theory of angular momenta
(c) Pauli's exclusion principle
(d) Hund's rule

WB-JEE-2011

Ans. (c) : According to Pauli Exclusion principle, in any orbital, maximum two electrons can exist, having opposite spin.

475. Which of the following electronic configuration is not possible?
(a) n=3, *l* = 0, m=0 (b) n=3, *l* = 1, m= –1
(c) n=2, *l* = 0, m= –1 (d) n=2, *l* = 1, m= 0

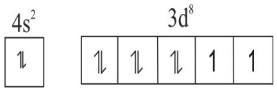
WB-JEE-2018

Ans. (c) : When l=0, m will also be zero.
Hence electronic configuration is not possible.

476. The number of unpaired electrons in Ni (atomic number = 28) are
(a) 0 (b) 2
(c) 4 (d) 8

WB-JEE-2018

Ans. (b) $_{28}Ni$ has electronic configuration = $[Ar]3d^8,4s^2$



∴ No of unpaired electron =2

7. Quantum Number

477. Consider the following pairs of electrons

(A) (a) n=3, *l*=1, m_l=1, $m_s = +\frac{1}{2}$
(b) n=3, *l* =2, m_l=1, $m_s = +\frac{1}{2}$
(B) (a) n=3, *l* =2, m_l= –2, $m_s = -\frac{1}{2}$
(b) n=3, *l* =2, m_l= –1, $m_s = -\frac{1}{2}$
(C) (a) n=4, *l* =2, m_l= 2, $m_s = +\frac{1}{2}$
(b) n=3, *l* =2, m_l= 2, $m_s = +\frac{1}{2}$

@apna_pdf

The pairs of electrons present in degenerate orbitals is/are:

(a) Only (A)   (b) Only (B)
(c) Only (C)   (d) (B) and (C)

JEE Main-24.06.2022, Shift-I

Ans. (b) :
(A) (a) n = 3, $l = 1$ ⇒ 3p
(b) n = 3, $l = 2$ ⇒ 3d
(B) (a) n = 3, $l = 2$ ⇒ 3d
(b) n = 3, $l = 2$ ⇒ 3d
(C) (a) n = 4, $l = 2$ ⇒ 4d
(b) n = 3, $l = 2$ ⇒ 3d

478. The number of radial and angular nodes in 4d orbital are, respectively

(a) 1 and 2   (b) 3 and 2
(c) 1 and 0   (d) 2 and 1

JEE Main-26.06.2022, Shift-II

Ans. (a) : We know that,
Radial nodes = $n-l-1$
Angular node = l
Where, n = Principle quantum number
l = Azimuthal quantum number
For 4d, n = 4, $l = 2$
∴ Radial node = 4–2–1 = 1
And angular node = 2

479. Consider the following set of quantum numbers.
The number of correct sets of quantum numbers is _____.

	n	l	m_l		n	l	m_l
(a)	3	3	–3	(b)	3	2	–2
(c)	2	1	+1	(d)	2	2	+2

JEE Main-27.06.2022, Shift-II

Ans. (2) : The value of azimuthal quantum number
s = 0, p = 1, d = 2, f = 3.
For n = 2, l = 0, 1, m_l = +1, 0, –1
For n = 3, l = 0, 1, 2, m_l = +2, +1, 0, –1, –2
Therefore, the correct set of quantum number in option (b) and (c).
Hence, The number of correct sets of quantum number is 2.

480. Consider the following statement :

(A) The principle quantum number 'n' is a positive integer with values of 'n' = 1, 2, 3,....
(B) The azimuthal quantum number 'I' For a given 'n' (principle quantum number) can have values as 'l' = 0, 1, 2, …n
(C) Magnetic orbital quantum number 'm_l' for a particular 'l' (azimuthal quantum number) has (2I+1) values.
(D) ±1/2 are the two possible orientations of electron spin.
(E) For l =5, there will be a total of 9 orbital Which of the above statement are correct?

(a) (A), (B) and (C)
(b) (A), (C), (D) and (E)
(c) (A), (C) and (D)
(d) (A), (B), (C) and (D)

JEE Main-28.06.2022, Shift-II

Ans. (c) : Here, statements (A), (C) and (D) are correct.
And statements (B) and (E) are incorrect.
The correct form of statements (B) and (E)–
(B) The azimuthal quantum number 'l' for a given 'n' (principle quantum number) can have values as 'l' = 0, 1, 2 ……..(n – 1)
(E) for l = 5, the total number of orbital
$= (2l + 1) = 11$

481. For n=3 energy level the number of possible orbitals (all kinds) are

(a) 1   (b) 3
(c) 4   (d) 9

CG PET -2005

Ans. (d) : Given, n = 3
and we know,
Number of orbitals $= n^2$
$= (3)^2 = 9$

482. The number of radial nodes for 4p is

(a) 4   (b) 3
(c) 2   (d) 1

SCRA-2015

Ans. (c): Radial node = $n - l - 1$
Where, n = principle quantum number
l = Azimuthal quantum number
For 4p orbital
n = 4, $l = 1$
∴ Radial node = 4–1–1 = 2

483. Which of the following sets of quantum numbers is restricted:

(a) n = 3, 1 = 1, m = + 2
(b) n = 3, 1 = 2, m = –2
(c) n = 3, 1 = 1, m = + 1
(d) n = 3, l = 1, m = –1

MPPET - 2012

Ans. (a) : If n = 3
Where, n = Principle Quantum No.
Then, l (Azimuthal Quantum No.)

$$\begin{array}{lccc} & l = 0, & 1, & 2 \\ & \downarrow & \downarrow & \downarrow \\ \text{and} & m = 0. & \overbrace{-1, 0, +1}, & \overbrace{-2, -1, 0, +1, +2} \end{array}$$

484. The magnetic quantum number m for the outermost electron in the Na atom, is :

(a) 1   (b) 2
(c) 3   (d) 0

AP-EAMCET-1991

Ans. (d) : The electronic configuration of sodium atom is :

$${}_{11}\text{Na} = \underbrace{1s^2}_{K}\,\underbrace{2s^2\,2p^6}_{L}\,\underbrace{3s^1}_{M}$$

@apna_pdf

For $3s^1$
Principle quantum number (n) = 3
Azimuthal quantum number (l) = 0
Magnetic quantum number (m) = 0

485. Which one of the following sets of the quantum numbers is not possible for a 4p electron ?

(a) $n = 4, l = 1, m = +1, s = +\frac{1}{2}$

(b) $n = 4, l = 1, m = 0, s = +\frac{1}{2}$

(c) $n = 4, l = 1, m = 2, s = +\frac{1}{2}$

(d) $n = 4, l = 1, m = -1, s = -\frac{1}{2}$

AP-EAMCET-1998

Ans. (c) : For 4p electron,

$$n = 4, l = 1, m = +1, 0, -1,\ S = \pm\frac{1}{2}$$

Hence the option (c) is not correct.

486. Based on the Bohr's theory of hydrogen atom, the speed of the electron, energy of the electron, and the radius of its orbit varies with the principal quantum number, respectively as

(a) n, n^2, n^2
(b) $\frac{1}{n^2}, \frac{1}{n}, n$
(c) $\frac{1}{n}, \frac{1}{n}, n^2$
(d) $\frac{1}{n}, \frac{1}{n^2}, n^2$

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (d) :

Speed of electron (V) = $\frac{Z}{n} \times 2.188 \times 10^8\ \text{cm/sec}$

or $V \propto \frac{1}{n}$ [Where n is energy level]

Energy of e^- (E) = $-13.6\ \frac{Z^2}{n^2}$ eV [Z is atomic number]

or $E \propto \frac{1}{n^2}$

Radius of orbital (r_n)= $0.529 \times \frac{n^2}{Z}$ Å

or $r_n \propto n^2$

Hence, $V : E : r_n = \frac{1}{n} : \frac{1}{n^2} : n^2$

487. Find the exact orbital from the following for which n = 4 and l = 1.

(a) 4s
(b) 3d
(c) 4d
(d) 4p

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (d) : For, n (principal quantum number) = 4 an ℓ (azimuthal quantum number) = 1
The orbital is 4p.
For, $4s \rightarrow n = 4, \ell = 0$

$3d \rightarrow n = 3, \ell = 2$

$4d \rightarrow n = 4, \ell = 2$

488. Choose the correct option regarding:
Assertiion : Energy of the orbital decreases with increase of 'n'.
Reason : Energy is required in shifting away the negatively charged electron from positively charged nucleus

(a) Assertion and Reasoning are correct statements and Reason is the correct explanation for Assertion
(b) Assertion and Reasoning are correct statements and Reason is not the explanation for Assertion
(c) Assertion is correct, Reason is wrong
(d) Assertion is wrong, Reason is correct

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (d) : As we move away from the nucleus, in atom the potential energy of electron increases, as the distance for nucleus increases, the value of n increases. Consequently the kinetic energy of the electron decreases, but total energy as a whole increases. Thus, the Assertion is incorrect but Reason is correct. Hence, the correct option is (d).

489. The four quantum numbers of the valence electron of potassium are:

	n	l	m	s
1	4	0	0	1/2
2	4	1	0	1/2
3	4	0	1	1/2
4	4	1	1	1/2

(a) $4, 0, 1, \frac{1}{2}$
(b) $4, 1, 0, \frac{1}{2}$
(c) $4, 0, 0, \frac{1}{2}$
(d) $4, 1, 1, \frac{1}{2}$

AP EAMCET (Medical) -1998

Ans. (c): The electronic configuration of potassium is $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^1$. We find the four quantum of 4s– shell–
Principal quantum number (n) = 4
Azimuthal quantum number (ℓ) = 0
Magnetic quantum number (m) = 0
Spin quantum numbers (s) $= +\frac{1}{2}$

490. "No two electrons in an atom can have the same set of all four quantum numbers". This principle of called

(a) Zeeman effect
(b) Pauli's exclusion principle
(c) Stark effect
(d) Heisenberg principle

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (b) : Pauli's exclusion principle is, "No two electrons in an atom can have the same set of all four quantum numbers".
e.g. for $4s^2$ configuration, its

	n	ℓ	m	s
1st e^- =	4	0	0	+1/2
2nd e^- =	4	0	0	–1/2

@apna_pdf

491. How many emission spectral lines are possible when hydrogen atom is excited to nth energy level ?

(a) $\frac{n(n+1)}{2}$ (b) $\frac{(n+1)}{2}$

(c) $\frac{(n-1)n}{2}$ (d) $\frac{n^2}{4}$

TS EAMCET-2017

Ans. (c) : Number of spectral lines $=\frac{n(n-1)}{2}$

Where, n is the orbital of electron.

492. A subshell n = 3, *l* = 2 can accommodate maximum of______

(a) 10 electrons (b) 6 electrons

(c) 18 electrons (d) 16 electrons

AP EAPCET 20.08.2021 Shift-II

Ans. (a): Given that subshell n = 3, *l* = 2

So,

l = 0 (s = subshell)
l = 1 (p = subshell)
l = 2 (d = subshell)
l = 3 (f = subshell)

In n = 3 and *l* = 2 maximum no. of electron is 10.

493. The quantum number which explains the line spectra observed as doublets in case hydrogen and alkali metals and doublets are triplets in case of alkaline earth metals is

(a) spin (b) azimuthal

(c) magnetic (d) principal

AP EAMCET (Engg.) 2012

Ans. (a) : Spin quantum number explains the line spectra observed as doublets in case of hydrogen and alkali metals and doublets and triplets in case of alkaline earth metal.

494. The number of angular and radial nodes of 4d orbital respectively are

(a) 3, 1 (b) 1, 2

(c) 3, 0 (d) 2, 1

AP EAMCET (Engg.) -2014

Ans. (d) : For 4d subshell, n=4, *l* = 2

No. of angular nodes =*l* = 2

Number of radial nodes = n–*l* – 1⇒ 4–2–1=1

496. An electron having spin quantum number, s = –1/2 and magnetic quantum number, m=+3 can be present in

(a) both s-orbital and p-orbital

(b) p-orbital only

(c) f-orbital only

(d) both d-orbital and f-orbital

COMEDK-2012

Ans. (c) : For f-orbital, *l*=3; m= –*l* to +*l*

i.e., –3 to +3

497. Which one of the following sets of quantum numbers represents the highest energy level in an atom?

(a) n=4, *l*=0, m=0, $s=+\frac{1}{2}$

(b) n=3, *l*=1, m=1, $s=+\frac{1}{2}$

(c) n=3, *l*=2, m= –2, $s=+\frac{1}{2}$

(d) n=3, *l*=0, m=0, $s=+\frac{1}{2}$

COMEDK 2018, Assam CEE-2018
JIPMER-2012
Karnataka-CET-2011
NEET-1994

Ans. (c) : The orbital with highest (n+*l*) value will have the highest energy. In the given sets n=3, l=2, m =–2, s =+1/2 have n+*l* =5 i.e., 3d-orbital has the highest energy.

498. Four different sets of quantum numbers for four electrons are given below:

$e_1 = 4, 0, 0, -\frac{1}{2}; e_2 = 3, 1, 1, -\frac{1}{2}$

$e_3 = 3, 2, 2, +\frac{1}{2}; e_4 = 3, 0, 0, +\frac{1}{2}$

The order of energy of e_1, e_2, e_3 and e_4 is

(a) $e_1 > e_2 > e_3 > e_4$ (b) $e_4 > e_3 > e_2 > e_1$

(c) $e_3 > e_1 > e_2 > e_4$ (d) $e_2 > e_3 > e_4 > e_1$

COMEDK-2018

Ans. (c) : Higher (n+l) value, higher is the energy and for same (n+l) value higher n, higher will be the energy.

Thus, $e_3 > e_1 > e_2 > e_4$

499. Which one of the following expressions represent the electron probability function (D)?

(a) $4\,\pi r\,dr\,\psi^2$ (b) $4\,\pi r^2\,dr\,\psi$

(c) $4\,\pi r^2\,dr\,\psi^2$ (d) $4\,\pi r\,dr\,\psi$

AP-EAMCET (Medical), 2003

Ans. (c) : According to the quantum mechanics, the plot of ψ^2 versus distance from the nucleus (r) indicates the probability of an electron in a certain volume of space is the plot of the probability density. It explains a method for estimating an electrons probability at a certain location. This amputation generates a quantity called an electron may be found in a certain region at a certain place. Hence, the electron probability function is $4\,\pi r^2\,dr\,\psi^2$.

500. The number of radial nodes in 3s and 2p orbitals, respectively are

(a) 2 ; 2 (b) 2 ; 0

(c) 0 ; 0 (d) 3 ; 2

TS-EAMCET (Engg.), 06.08.2021

Ans. (b): No. of radial node = n – *l* – 1

n = Principle quantum number
l = Azimuthal quantum number

The value of *l* are–

$l = \underset{s}{0}\ \underset{p}{1}\ \underset{d}{2}\ \underset{f}{3}$

For 3s, No. of radial node = 3 – 0 – 1
= 2

For 2p, No. of radial node = 2 – 1 – 1
= 0

@apna_pdf

501. The orbital with 4 radial and 1 angular nodes is

(a) $5p_y$ (b) $6p_z$
(c) $4d_{xy}$ (d) $5d_{yz}$

TS EAMCET 05.08.2021, Shift-I

Ans. (b) : Radial nodes = n – l – 1
Angular node = l
where, n = Principle quantum number.
l = Azimuthal quantum number.
For $5p_y$, n = 5, l = 1
Radial node = 5 – 1 – 1 = 3
Angular node = 1
For $6p_z$, n = 6, l = 1
Radial node = 6 – 1 – 1 = 4
Angular node = 1
For $4d_{xy}$, n = 4, l = 2
Radial node = 4 – 2 – 1 = 1
Angular node = 2
For $5d_{yz}$, n = 5, l = 2
Radial node = 5 – 2 – 1 = 2
Angular node = 2
Hence, the orbital node 4 radial and 1 angular nodes is $6p_z$.

502. The orbital having two radial as well as two angular nodes is:

(a) 3p (b) 4d
(c) 4f (d) 5d

JEE Main 26.02.2021, Shift-I

Ans. (d) : Angular node = l
Where, l = azimuthal quantum number

Orbital	Angular node(l)	Radial node(n - l - 1)
5d	2	2
4f	3	0
3f	1	1
4d	2	1

503. Which of the following elements outermost orbit's last electron has magnetic quantum number m = 0?

(a) Na (b) O
(c) Cl (d) N

AIIMS 25 May 2019 (Evening)

Ans. (a) : Na $_{11}Na = 1s^2\ 2s^2\ 2p^6\ 3s^1$
For last electron, l=0, m=0

504. Which one of the following set of quantum numbers is not possible for 4p electron?

(a) $n = 4, l = 1, m = -1, m_s = +\frac{1}{2}$

(b) $n = 4, l = 1, m = 0, m_s = +\frac{1}{2}$

(c) $n = 4, l = 1, m = 2, m_s = +\frac{1}{2}$

(d) $n = 4, l = 1, m = -1, m_s = -\frac{1}{2}$

AIIMS 25 May 2019 (Evening)

Ans. (c): For 4p electron n=4, l=1, m=1, 0+1
ms $= \pm\frac{1}{2}$ As l = 1, m cannot be equal to 2.
Therefore set of quantum number is not possible.

505. In the electronic configuration of which of the given elements, 'Aufbau principle' or (n+l) rule is violated ?

(a) Mn (b) Ga
(c) La (d) Pu

AP EAPCET 24.08.2021 Shift-II

Ans. (c) : Aufbau principle states that the electrons are filled into an atomic orbital in the increasing order of orbital energy level.
Therefore La electronic configuration of the elements violated the Aufbau principle rule because La is lanthanoid element.

506. With increasing Principal Quantum number, the energy difference between adjacent energy levels in H-atom______

(a) Decreases
(b) Increases
(c) remain constant
(d) decreases at low level of 'n' & increases for higher value of 'n'

AP EAPCET 20.08.2021 Shift-II

Ans. (a): With increasing principle Quantum number, the energy difference between adjacent energy levels in H-atom is decreases.

507. The maximum number of electrons, present in an orbit that is represented by azimuthal quantum number (l) = 3, will be

(a) 8 (b) 2
(c) 14 (d) 6

AIIMS-1996

Ans. (c): l=3 corresponds to f-orbitals. Since there are seven f-orbitals and each orbital accommodates 2 electrons, So maximum number of electrons is 14.

508. What is maximum wavelength of line of Balmer series of hydrogen spectrum? ($R = 1.09 \times 10^7 m^{-1}$)

(a) 400 nm (b) 654 nm
(c) 486 nm (d) 434 nm

AIIMS-26 May, 2018

Ans. (b): For maximum wavelength in the Balmer series energy difference is lowest.

Thus, $\bar{v} = R \times Z2 \left(\frac{1}{n^2} - \frac{1}{n_2^2}\right), n_2 = 3 \text{ and } n_1 = 2$

$\therefore \frac{1}{\lambda} = 1.09 \times 10^7 \times 1^2 \left(\frac{1}{2^2} - \frac{1}{3^2}\right)$

$\Rightarrow \frac{1}{\lambda} = 1.09 \times 10^7 \times 1 \left(\frac{1}{4} - \frac{1}{9}\right)$

$\Rightarrow 1.09 \times 10^7 \times 1 \left(\frac{5}{36}\right)$

$\Rightarrow \lambda = \frac{36}{5 \times 1.09 \times 10^{7m}}$

$\Rightarrow 6.60 \times 10^{-7}$ m $\Rightarrow$ 660 nm

@apna_pdf

509. Which transition in the hydrogen atomic spectrum will have the same wavelength as the transition, n=4 to n=2 of He$^+$ spectrum?

(a) n=4 to n= 3 (b) n=3 to n= 2

(c) n=4 to n= 2 (d) n=2 to n= 1

AIIMS-2016

Ans. (d): $\because \frac{1}{\lambda} = z^2.R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$

$\therefore$ For He$^+$ ion, z=2

$$\frac{1}{\lambda} = 2^2 R\left[\frac{1}{2^2} - \frac{1}{4^2}\right]$$

$$\frac{1}{\lambda} = 4 \times R \times \frac{3}{16} = \frac{3}{4}R$$

The same value for H-atom is possible when electron jumps from n=2 to n=1 i.e.

$$\frac{1}{\lambda} = 1 \times R\left[\frac{1}{1} - \frac{1}{4}\right] \Rightarrow \frac{3}{4}R$$

510. In Bohr series of lines of hydrogen spectrum, the third line from the red end corresponds to which one of the following inter- orbit jumps of the electron for Bohr orbits in an atom of hydrogen

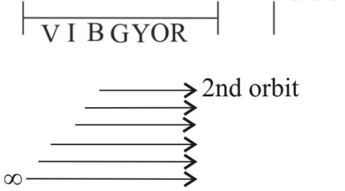
(a) 5→2 (b) 4→1

(c) 2→5 (d) 3→2

AIIMS-2017

Ans. (a): In hydrogen spectrum coloured radiaton means visible radiation corresponds to Balmer series.

(n_1=2, n_2=3, 4…….)



2nd line from the red end, it means 5→2

511. Which of the following combinations of quantum numbers is allowed?

(a) n l m m$_s$ — 3 2 1 0 (b) 2 0 0 $-\frac{1}{2}$

(c) 3 –3 –2 $+\frac{1}{2}$ (d) 1 0 1 $+\frac{1}{2}$

AIIMS-2013

Ans. (b): (a) is allowed as s cannot be zero

(c) is not allowed as *l* cannot be –3 because *l* can be any whole number from 0 to n–1 and it cannot be n.

(d) is not allowed as for l=o and m cannot be =1

512. The electrons identified by quantum numbers n and *l* for (i) n=4, *l*=1(ii) n=4, *l*=0(iii) n=3,*l*=2(iv)n=3,*l*=1 can be placed in order of increasing energy, from the lowest to highest, as

(a) (iv)<(ii)<(iii)<(i) (b) (ii)<(iv)<(i)<(iii)

(c) (i)<(iii)<(ii)<(iv) (d) (iii)<(i)<(iv)<(ii)

AIIMS-2014

Ans. (a): According to Aufbau's principle, the filling of electrons in various subshells of an atom takes place in the increasing order of energy, starting with the lowermost.

According to the Bohr–Bury rule i.e. (n+*l*) sum rule, the sub shell with the lower value of (n+*l*) is filled first if the values for (n+*l*) are equal, the one with the smaller value of n is filled first.

	n	*l*	(n+*l*)
(i)	4	1	5
(ii)	4	0	4
(iii)	3	2	5
(iv)	3	1	4

So, the correct order is iv < ii < iii < i.

513. Azimuthal quantum number defines

(a) e/m ratio of electron

(b) angular momentum of electron

(c) spin of electron

(d) magnetic momentum of electron

AIIMS-2002

Ans. (b): Generally azimuthal quantum number defines angular momentum.

514. The quantum number 'm' of a free gaseous atom is associated with:

(a) the effective volume of the orbital

(b) the shape of the orbital

(c) the spatial orientation of the orbital

(d) the energy of the orbital in the absence of a magnetic field

AIIMS-1998

Ans. (c): Magnetic quantum number m is associated with spatial orientation of the orbital. It is also called orientation quantum number because it gives the orientation or distribution of the electron clouds.

515. For principle quantum number n=4, the total number of orbitals having *l*=3 is:

(a) 3 (b) 7

(c) 5 (d) 9

AIIMS-2004

Ans. (b): For n=4, *l* =3 (f–subshell), number of values of m=2*l*+1=7 values

⇒ Number of orbitals in f-subshell is 7

516. Quantum numbers of an atom can be defined on the basis of

(a) Hund's rule

(b) Pauli's exclusion principle

(c) Aufbau's principle

(d) Heisenberg's uncertainty principle

AIIMS-2002

Ans. (b): Each electron in an atom is designated by a set of four quantum numbers. According to pauli's exclusion principle, no two electron in an atom have same values of all the four quantum numbers. Therefore consequently, an orbital accommodates two electron with opposite spins, these two electron have the same value of quantum number 'n' , '*l*' , and 'm' but value of 's' will be different.

@apna_pdf

517. The total number of orbitals in a shell with principal quantum number 'n' is:

(a) n^2 (b) n+1

(c) 2n (d) $2n^2$

AIIMS-1997

Ans. (a): No. of orbital in a shell $=n^2$.

518. In an atom the order of increasing energy of electrons with quantum numbers

(i) n = 4, l = 1 (ii) n = 4, l = 0

(iii) n = 3, l = 2 and (iv) n = 3, l = 1 is

(a) iii < (i) < iv < ii (b) ii < iv < i < iii

(c) i < iii < ii < iv (d) iv < ii < iii < i

AP-EAMCET (Engg.) - 2014

Ans. (d) : The order of increase of energy can be calculated from $(n + l)$ rule. If two orbitals have same value of $(n + l)$, the orbital with lover value of n will be filled first.

(i) For n = 4, l = 1, $(n + l) = 4+1 = 5$

(ii) For n = 4, l = 0, $(n + l) = 4+0 = 4$

(iii) For n = 3, l = 2, $(n + l) = 3+2 = 5$

(iv) For n = 3, l = 1, $(n + l) = 3+1 = 4$

So, the order is (iv) < (ii) < (iii) < (i)

519. The number of angular and radial nodes of 4d orbital respectively are

(a) 3, 1 (b) 1, 2

(c) 3, 0 (d) 2, 1

AP-EAMCET (Engg.) - 2014

Ans. (d) : Number of radial node $= n - l - 1$

Where, n = Principle quantum number

l = Azimuthal quantum number

∴ For 4d

$n = 4, l = 2$

Radial node $= 4 - 2 - 1 = 1$

Angular node $= l = 2$

Thus, the number of angular and radial node of 4d orbital is 2, 1 respectively.

520. Which of the following sets of quantum numbers is correct for an electron in 3d-orbital?

(a) $n = 3, l = 2, m = -3, s = +\frac{1}{2}$

(b) $n = 3, l = 3, m = +3, s = -\frac{1}{2}$

(c) $n = 3, l = 2, m = -2, s = +\frac{1}{2}$

(d) $n = 3, l = 2, m = -3, s = -\frac{1}{2}$

AP-EAMCET (Engg.) 2015

Ans. (c) : An electron for 3d-orbitals–

$n = 3, l = 2, m = -2, s = +\frac{1}{2}$

Note : Azimuthal quantum number of s, p, d and f orbital is 0, 1, 2 and 3 respectively.

521. The values of four quantum numbers of valence electron of an element are n = 4, l = 0, m = 0 and $s = +\frac{1}{2}$. The element is :

(a) K (b) Ti

(c) Na (d) Sc

AP-EAMCET (Engg.)-2004

Ans. (a) : The four quantum number are given as –

$n = 4$

$l = 0$

$m = 0$

and $s = +\frac{1}{2}$

The value of principle quantum number is 4, it means that elements belongs to the fourth period. The value of azimuthal quantum number is 0 that means electron present at s-orbital. m = 0 indicates that the valence electron is present in orbital of s-subshell. The value of s denote the orientation of electron. Hence, from the above data, it is clear that atom belongs to s-block and the name of metal is K.

522. The number of radial nodes of 3s and 2p orbitals respectively are

(a) 0, 2 (b) 2, 0

(c) 1, 2 (d) 2, 1

AP-EAMCET (Engg.) 2013

Ans. (b) Number of radial nodes $= n - \ell - 1$

Where n = no. of principle quantum number.

ℓ = Azimuthal quantum number.

For 3s	For 2p
$n = 3, \ell = 0$	$n = 2, \ell = 1$
Radial nodes = 3–0–1 = 2	Radial nodes = 2–1–1 = 0

The number of radial nodes for 3s and 2p are 2, 0 respectively.

523. With increase in principal quantum number n, the energy difference between adjacent energy levels in hydrogen atom

(a) increases

(b) decreases

(c) remains constant

(d) decreases for lower values of n and increases for higher values of n

AP - EAMCET(MEDICAL) - 2009

Ans. (b) : As we know, the energy difference between adjacent energy levels is inversely proportional to the principal quantum number, n. Therefore, with increase in n, the energy difference will decrease.

$$\Delta E \propto \left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$$

524. The correct set of quantum numbers for Rb (atomic no. 37) is

(a) $5,0,0,-\frac{1}{2}$ (b) $5,1,0,\frac{1}{2}$

(c) $6,0,1,\frac{1}{2}$ (d) $5,1,1,\frac{1}{2}$

JEE Main-2013

@apna_pdf

Ans. (a) : The electronic configuration for Rb (37) is
Rb (37)
$= 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^2\ 3d^{10}\ 4p^6\ 5s^1$
For $5s^1$, $n = 5.\ l = 0,\ m = 0,\ s = \frac{1}{2}$

525. How many electrons in $_{19}$K have n = 3; l = 0 ?
(a) 1 (b) 2
(c) 4 (d) 3
JCECE - 2011

Ans. (b) : n = 3 and l = 0 means 3s-orbitals and s-orbital occupy 2 electrons.

526. The Balmer series in atomic hydrogen is observed in the following spectral region
(a) infrared (b) ultraviolet
(c) visible (d) far IR
AMU-2014

Ans. (c) : Balmer series in atomic hydrogen is observed in visible region.
Note:– Lyman series lies in UV region and paschen series lies in IR region and bracket and other lies in for IR region.

527. For the 19th electron of K the values of quantum number will be
(a) $4, 1, 0, +\frac{1}{2}$ (b) $4, 0, 0, +\frac{1}{2}$
(c) $3, 2, 0, +\frac{1}{2}$ (d) $3, 0, 0, +\frac{1}{2}$
AMU-2010

Ans. (b) : $_{19}K \rightarrow 1S^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^1$
Values of quantum number -
$n=4,\ I = 0,\ m = 0$ and $s = +\frac{1}{2}$

528. An electron with values 4,1,0 and +1/2 for the set of four quantum numbers n, l, m_l and m_s respectively, belongs to
(a) 4s - orbital (b) 4p - orbital
(c) 4d- orbital (d) 4f- orbital
AMU-2006

Ans. (b) : n = 4, l = 1 indicates 4p orbital.

529. An electron with values 4, 2,–2 and +1/2 for the set of four quantum numbers n, l, m_l and m_s, respectively, belongs to
(a) 4s-orbital (b) 4p-orbital
(c) 4d-orbital (d) 4f-orbital
AMU-2005

Ans. (c) : The value of 'n' and 'ℓ' equal to 4 and 3 respectively, corresponds to 4f–orbital, hence the electron will belong to 4f–orbital.

530. For l = 1, the correct set of values of m are
(a) 1, 2, 3 (b) 0, 1, 2
(c) 0 (d) -1, 0, +1
AMU-2004

Ans. (d) : For l =1
$m = -1, 0, +1\ [\ m = -l, \ldots\ldots.0, \ldots.. +l\ ]$

531. Which of the following represents correct set of the four quantum numbers (n, l, m and s, respectively) of a 4d electron?
(a) 4,3,2,+1/2 (b) 4,2,1,0
(c) 4,3,-2,+1/2 (d) 4,2,1,–1/2
AMU-2003

Ans. (d) : For 4d electron.
n=4, l=2
$m = -2, -1, 0+1, +2;\ s = \pm\frac{1}{2}$

532. The nineteenth electron of chromium has which of the following set of quantum number?

	n	l	m	s
(a)	3	0	0	±1/2
(b)	3	2	–2	±1/2
(c)	4	0	0	±1/2
(d)	4	1	–1	±1/2

AMU EXPLORER-2002

Ans. (c) : Atomic number of chromium is 24. The electronic configuration of chromium is $1s^2$, $2s^2$, $2p^6$, $3s^2$, $3p^6$, $4s^4$, $3d^5$. The nineteenth electron goes to the 4s orbital. The quantum number is illustrated below for 4s orbital.

$\boxed{\uparrow}$
4s

Principle quantum number (n) = 4
Azimuthal quantum number (l) = 0
Magnetic quantum number (m) = 0
Spin quantum number (s) = $\pm\frac{1}{2}$
Hence, the correct option of set of quantum number is 0.

533. The ion that is isoelectronic with CO is
(a) O_2^- (b) N_2^+
(c) CN^- (d) O_2^+
Assam CEE-2018
UP CPMT-2012
JCECE - 2006
J & K CET-(1998)
NEET-1997

Ans. (c) : Number of electrons in
$CO = 6+8=14$
$CN^- = 6+7+1=14$
$N_2^+ = 7+7-1=13$
$N_2^{2-} = 7+7+2=16$
$NO = 7+8+1=16$
CO is isoelectronic with CN^- because both species have same number of electrons.
Isoelcetronic species refers to the species which have same number of electrons.
CN^{-1} is isoelectronic with CO, both loose 14 electron.

534. Which of the following is not possible?
(a) $n = 2, l = 1, m = 0$ (b) $n = 2, l = 0, m = -1$
(c) $n = 3, l = 0, m = 0$ (d) $n = 3, l = 1, m = -1$
BCECE-2007

Ans. (b) : (a) n=2, ℓ=1, m=0, it is possible
(b) n=2, ℓ=0, m=–1, it is not possible because, if ℓ=0, m must be 0. The value of m totally depends on upon the value of ℓ (m= – ℓ to ℓ)
(c) n=3, ℓ=0, m= –0, it is possible
(d) n=3, ℓ=1, m= –1, it is possible

@apna_pdf

535. In n = 3, l = 0 and m = 0, then atomic number is :

(a) 12 or 13 (b) 13 or 14

(c) 10 or 11 (d) 11 or 12

BCECE-2004

Ans. (d) : n=3, ℓ=0, m=0 indicates last shell is 3s so, electronic configuration will be $1s^2 2s^2 2p^6 3s^{1-2}$
So atomic number is 11 or 12.

536. The correct set of four quantum number for the valence electron of rubidium (Z = 37) is :

(a) n = 5, l = 0, m = 0, s = + 1/2

(b) n = 5, l = 1, m = 1, s = + 1/2

(c) n = 5, l = 1, m = 1, s = + 1/2

(d) n = 6, l = 0, m = 0, s = + 1/2

BCECE-2003

Ans. (a) : Electronic configuration of rubidium (z=37) is $[Kr]^{36}\ 5s^1$

$\therefore$ for valence electron ($5s^1$)

n=5, l =0, m=0, $s = \frac{1}{2}$

537. Azimuthal quantum number determines the

(a) size

(b) spin

(c) orientation

(d) angular momentum of orbitals

BCECE-2011

Ans. (d) : Angular momentum of orbital $= \sqrt{\ell(\ell+1)}\frac{h}{2\pi}$

538. What is the correct orbital designation of an electron with the quantum number,

$$\mathbf{n = 4, l = 3, m = -2, s = \frac{1}{2}?}$$

(a) 3s (b) 4f

(c) 5p (d) 6s

BCECE-2010

Ans. (b) : n=4 represent 4th orbit
l =3 represent f subshell
m= –2 represent orientation of f–orbital
$s = \frac{1}{2}$ represents direction of spin of electron
$\therefore$ the orbital is 4f.

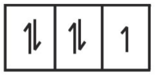
539. The correct set of quantum numbers for an element (Z = 17) for the unpaired electron will be –

(a) $3, 1, 1, \pm 1/2$ (b) $2, 0, 0, \pm 1/2$

(c) $3, 0, 0, \pm 1/2$ (d) $2, 1, 1, 0$

BCECE-2017

Ans. (a): Electronic configuration of (Z=17) $1s^2$, $2s^2$, $2p^6$, $3s^2$, $3p^5$ unpaired electron is present in 3p–orbital that can be shown as



Thus, for 3p, n=3, l=1, m= ± 1, $s = \pm\frac{1}{2}$

540. An e^- has magnetic quantum number as –3, what is its principal quantum number?

(a) 1 (b) 2

(c) 3 (d) 4

BITSAT 2016

Ans. (d) : When m = –3, l = 3, $\therefore$ n = 4.

541. Which of the following sequences of the energy levels of the subshells related to principal quantum number four (n=4)?

(a) s < p < d < f (b) s < d < p < f

(c) s < f < p < d (d) p < s < d < f

CG PET -2008

Ans. (a): The sequence of energies of the sub shells is compassed of using m + l rule where 'n' is principle quantum and 'l' is azimuthal quantum no. for same value of 'n' higher value of l have higher energy.
So,
s < p < d < f

542. Four different sets of quantum numbers for 4 electrons are given below

$e_1 = 4, 0, 0, -\frac{1}{2}$ $e_2 = 3, 1, 1, -\frac{1}{2}$

$e_3 = 3, 2, 2, +\frac{1}{2}$ $e_4 = 3, 0, 0, +\frac{1}{2}$

The order of energy of e_1, e_2, e_3, e_4 is

(a) $e_1 > e_2 > e_3 > e_4$ (b) $e_4 > e_3 > e_2 > e_1$

(c) $e_3 > e_1 > e_2 > e_4$ (d) $e_2 > e_3 > e_4 > e_1$

CG PET- 2013

Ans. (c) : Higher (n+l) value higher is the energy and for same (n+l) value higher n, higher will the energy.
Thus, $e_3 > e_1 > e_2 > e_4$

543. 2p orbitals have

(a) $n = 1, l = 2$ (b) $n = 1, l = 0$

(c) $n = 2, l = 1$ (d) $n = 2, l = 0$

CG PET -2004

Ans. (c) : In 2 p-orbital , 2 denotes principle quantum number (n=2) and p denotes azimuthal quantum number (l=1).

544. Which of the ions having following electronic structure would have maximum magnetic moment?

(a) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^3$

(b) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^5$

(c) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^7$

(d) $1s^2, 2s^2 2p^6, 3s^2 3p^6 3d^9$

CG PET -2005

Ans. (b) : Magnetic moment $= \sqrt{n(n+2)}$, where n is no. of unpaired electrons.
Higher the number of unpaired electrons, higher is the magnetic moment.
Number of unpaired electrons are maximum in option b (5 unpaired electrons).
Option a and c :3 unpaired electrons
Option d : 1 unpaired electrons.

@apna_pdf

545. A particle of mass nearly equal to proton is moving with a velocity nearly equal to the velocity of light. The wavelength of wave associated with it is

(a) directly proportional to its velocity
(b) inversely proportional to its energy
(c) (a) is wrong while (b) is correct
(d) Both (a) and (b) are correct

CG PET -2018

Ans. (a) :

$$\frac{\lambda_1}{\lambda_2}=\frac{m_2v_2}{m_1v_1}=\frac{\frac{1}{2}m_2v_2^2}{\frac{1}{2}m_1v_1^2}\frac{v_1}{v_2}=\frac{K.E._1}{K.E_2}=\frac{v_1}{v_2}$$

As $K.E_1 = K.E_2$

$$\therefore \frac{\lambda_1}{\lambda_2}=\frac{v_1}{v_2} \text{ or } \lambda \times v$$

546. A particle moving with a velocity 10^6 m/s will have de-Broglie wavelength nearly [Given, m = 6.62×10^{-27} kg, h = 6.62×10^{-34} J-s]

(a) 10^{-9} m
(b) 10^{-13} m
(c) 10^{-19} m
(d) 1 Å

CG PET -2009

Ans. (b): Given,
Velocity of particle $=10^6$ m/s
mass $=6.62\times10^{-27}$ kg
Plancks constant (h)$=6.62\times10^{-34}$ JS^{-1}

According to de-broglie wavelength $\lambda=\frac{h}{p}$

$$\text{or } =\frac{h}{mv} \quad [\therefore p = mv]$$

$$\lambda=\frac{6.62\times10^{-34}}{6.62\times10^{-27}\times10^{6}}=10^{-13}\text{m}$$

547. From the given sets of quantum numbers, the one that is inconsistent with the theory is

(a) $n = 3, l = 2, m = -3, s = +\frac{1}{2}$
(b) $n = 4, l = 3, m = 3, s = +\frac{1}{2}$
(c) $n = 2, l = 1, m = 0, s = -\frac{1}{2}$
(d) $n = 4, l = 3, m = 2, s = +\frac{1}{2}$

CG PET- 2010

Ans. (a) : When l=2, m≠–3

548. The correct set of four quantum number for the valence electrons of rubidium atom (Z = 37) is

(a) $5,0,0,+\frac{1}{2}$
(b) $5,1,0,+\frac{1}{2}$
(c) $5,1,1,+\frac{1}{2}$
(d) $5,0,1,+\frac{1}{2}$

[JEE Main 2014]

Ans. (a):
Electronic configuration of Rubidium is (Z = 37)
$= 1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^{10} 4p^6 5s^1$
The valence electron is in 5s orbital
Its 4 quantum number are- n = 5, l = 0, m = 0, s = $+\frac{1}{2}$

549. The number of orbitals associated with quantum number n = 5, $m_s = +\frac{1}{2}$ is

(a) 25
(b) 50
(c) 15
(d) 11

[JEE Main 2020, 7 Jan Shift-I]

Ans. (a) : Total no. of electrons in n=5 are $2n^2$ i.e 2×5^2 =50

Thus electrons having, $m_s = \frac{+1}{2} = \frac{50}{2} = 25$ which is equal to no. of orbitals.

550. The quantum number of four electrons are given below:

I. n = 4, l = 2, m_l = –2, $m_s = -\frac{1}{2}$
II. n = 3, l = 2, m_l = 1, $m_s = +\frac{1}{2}$
III. n = 4, l = 1, m_l = 0, $m_s = +\frac{1}{2}$
IV. n = 3, l = 1, m_l = 1, $m_s = -\frac{1}{2}$

The correct order of their increasing energies will be

(a) IV < III < II < I
(b) I < II < III < IV
(c) IV < II < III < I
(d) I < III < II < IV

[JEE Main 2019, 8 April Shift-I]

Ans. (c) : Smaller the value of (n+l), smaller the energy if two or more sub-orbits have same values of (n+ l) suborbits with lower values of n has lower energy. The (n+ l) value of the given option are as follows:
(I) n=4, l =2; n + l =6
(II) n=3, l =2; n + l =5
(III) n=4, l =1; n + l =5
(IV) n=3, l =1; n + l =4
Among (II) and (III) n=3 has lower energy. Thus the correct order of their increasing energies will be IV < II < III < I

551. The number of subshells associated with n = 4 and m = –2 quantum number is

(a) 8
(b) 2
(c) 16
(d) 4

[JEE Main 2020, 2 Sep Shift-II]

Ans. (b) : For m=-2, it represent 2 subs hells.

552. The value of magnetic quantum number of the outermost electron of Zn^+ ion is

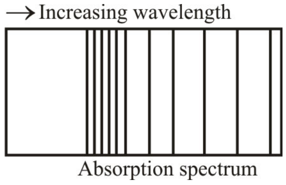
[JEE Main 2021, 31 Aug Shift-II]

Ans. (0) : $Zn^+ \rightarrow 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 3d^{10}\ 4s^1$
outermost electron is in 4s subshell m=0.

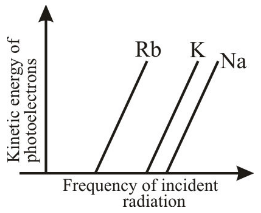
@apna_pdf

553. The figure that is not a direct manifestation of the quantum nature of atoms is

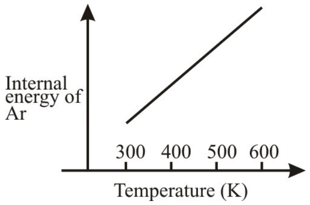
(a)



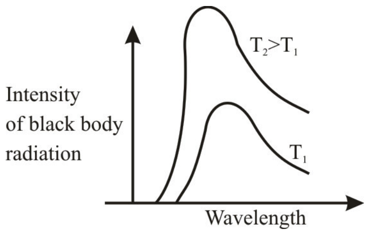
(b)



(c)

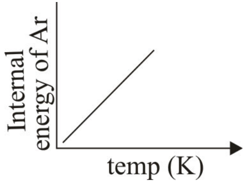


(d)



[JEE Main 2020, 2 Sep Shift-I]

Ans. (c) : The internal energy of 'Ar' or any gas has nothing to do with quantum nature of atom hence,



554. Maximum number of electrons in a shell principle quantum number n is given by

(a) n	(b) 2n
(c) n^2	(d) $2n^2$

J & K CET-(2012)

Ans. (d) : The maximum number of electrons that can be present in a shell is $2n^2$. Where n corresponds to a shell this was stated by Pauli exclusion principle.

555. The correct set of four quantum numbers for the electron in the outermost subshell of Cu atom (atomic number 29) in its ground state, is

	n	l	m_l	m_s
(a)	4	0	0	+1/2
(b)	3	0	0	+1/2
(c)	4	1	0	+1/2
(d)	3	1	+1	+1/2

J & K CET-(2016)

Ans. (a) : The electronic configuration of Cu in ground state [Ar] $3d^{10}\ 4s^1$

Hence, for outermost subshell, n=4 , l=0

m_l=0 and $m_s = +\frac{1}{2}$

556. The total number of orbitals associated with the principal quantum number n = 3, is

(a) 9	(b) 8
(c) 5	(d) 7

J & K CET-(2014)

Ans. (a) : by using the relation, no of orbital's $=n^2=(3)^2=9$.

557. How many quantum numbers are required to define the electron in an atom?

(a) 2	(b) 3
(c) 1	(d) 4

J & K CET-(2019)

Ans. (d) : Four quantum numbers (principal quantum number, azimuthal quantum number, magnetic quantum number and spin quantum number) are required to define or electron in an atom.

558. The electrons identified by quantum numbers n and l, (i) n = 4, l = 1 (ii) n = 4, l = 0 (iii) n = 3, l = 2 and (iv) n = 3, l = 1 can be placed in order of increasing energy as

(a) (i) < (ii) < (iii) < (iv)
(b) (iv) < (iii) < (ii) < (i)
(c) (iv) < (ii) < (iii) < (i)
(d) (iv) < (i) < (ii) < (iii)

J & K CET-(2011)

Ans. (c) : j

n	l	nl sub orbit	n + l
4	1	4p	5
4	0	4s	4
3	2	3d	5
3	1	3p	4

Higher the value of (n + l), higher the energy if (n + l) are same, sub orbit with lower value of n has lower energy.

Thus, 3p < 4s < 3d < 4p

Hence, correct order is (iv) < (ii) < (iii) < (i)

559. Out of the following which is the correct set of quantum numbers for outermost electron of potassium (Z= 19)?

	n	l	m	s
(a)	4	3	2	–1/2
(b)	4	2	0	–1/2
(c)	4	1	0	+1/2
(d)	4	0	0	–1/2

J & K CET-(2010)

Ans. (d) : Ans. (d) : K (z=19):$[Ar]^{18}\ 4s^1$

Outermost electron :$4s^1$

n=4, l =0, m=0, $s = +\frac{1}{2}$ or $\frac{-1}{2}$.

@apna_pdf

560. The number electrons accommodated in an orbit with principal quantum number 2 is

(a) 2 (b) 6
(c) 10 (d) 8

J & K CET-(2007)

Ans. (d) : The number of electrons $=2n^2$
Where n = principal quantum number. For n =2
Number of electrons $= 2(2)^2 = 8$

561. The correct set of the four quantum numbers of a 4d electron is

(a) 4, 2, 1, –1/2 (b) 4, 2, 1, 0
(c) 4, 3, 2, +1/2 (d) 4, 3, –2, +1/2

J & K CET-(2005)

Ans. (a) : For 4d arbitral
Principal quantum Number (n) = 4
Azimuthal quantum number (l) –2 (For d-subshell l=2)
Magnetic quantum number (m) can have values ranging from $-l$ to $+l$ i.e –2 to +2
Spin quantum number (s) has only two values $+\frac{1}{2}$ and $-\frac{1}{2}$

562. The total number of orbital's possible for principal quantum number n is

(a) n (b) n^2
(c) 2n (d) $2n^2$

J & K CET-(2004)

Ans. (b) : The total number of orbital is a shell is n^2 the principal quantum number (symbolized) is one of four quantum number assigned to each electron in an atom to describe that electron is state. The total number of orbital possible for principal quantum n is n^2.

563. The electrons identified by quantum numbers

(i) n = 4, l = 1 (ii) n = 4, l = 0
(iii) n = 3, l = 2 (iv) n = 2, l = 1

Can be placed in order of increasing energy from the lowest to highest as

(a) (iv) < (ii) < (iii) < (i)
(b) (ii) < (iv) < (i) < (iii)
(c) (i) < (iii) < (ii) < (iv)
(d) (iii) < (i) < (iv) < (ii)

J & K CET-(2003)

Ans. (a) : According to Aufbau's principle the filling of electrons in Various subshells of an atom takes place in the increasing under of energy starting with lowest most.
According to the Bohr Bury rule i.e (n + l)Sum rule, the sub-shell with the lowest value of (n + l) if filled first. If the values for (n + l) are equal, the one with the smaller value of n is filled first.

	N	l	$(n + l)$
i.	4	1	5
ii.	4	0	4
iii.	3	2	5
iv.	3	1	4

The correct order is iv < ii < iii < i

564. n = 4 and l = 3 is designated as

(a) 4s (b) 4p
(c) 4d (d) 4f

J & K CET-(1999)

Ans. (d) : n = 4, l = 3
l = 0 for s sub-shell
l = 1 for p sub- shell
l = 2 for d sub- shell
l = 3 for f sub- shell
∴ 4f

565. Which of the following quantum numbers distinguishes the two electrons present in an orbital from each other?

(a) principal quantum number
(b) azimuthal quantum number
(c) spin quantum number
(d) none of these

J & K CET-(1999)

Ans. (c) : Spin quantum of any two electrons in an orbital cannot be same. If one has a value +1/2 other have –1/2.

$\frac{+1}{2}, \frac{1}{2}$

e.g. for $1s^2$

566. The correct set of quantum numbers for the unpaired electron of chlorine atom is (Atomic No. of Cl = 17 i.e. $3s^2$, $3p^5$)

	N	l	m
(a)	3	1	0
(b)	3	0	1
(c)	3	1	1
(d)	3	0	0

J & K CET-(1999)

Ans. (c) : The correct set of quantum number for the unpaired electron of chlorine atom is
n = 3, l = 1 and m = 0.1
For chlorine atom (Z = 17) the last
Electron enters into 3p orbital for which
n = 3, l = 1, m = –1, 0 or + 1 and $s = \pm\frac{1}{2}$

567. The maximum number of electrons in all those orbitals for which principal quantum number is 3 and azimuthal quantum number 2, is

(a) 2 (b) 8
(c) 10 (d) 18

J & K CET-(1997)

Ans. (c) : Principal quantum number, n = 3, azimuthal quantum ; l = 2,
Hence, for l = 2, it is d – subshell.
d – Subshell has 5 degenrate orbitals and 1 orbital contain maximum 2 electron
Hence, 5 orbital contain maximum 2 × 5 = 10 electron.

568. Which of the following has highest energy?

(a) n = 2, l = 1 (b) n = 3, l = 2
(c) n = 3, l = 1 (d) n = 2, l = 0

JCECE - 2006

Ans. (b) : Energy is highest in the outermost shell
n = 2, l = 1 = 2p
n = 3, l = 2 = 3d
n = 3, l = 1 = 3p
n = 2, l = 0 =2s
According to Dufbaus principle 3d has highest energy.

@apna_pdf

569. The shape of the orbital with the value of l =2 and m = 0 is

(a) spherical (b) dumb-bell
(c) trigonal planar (d) square-planar

JCECE - 2009

Ans. (b) : s p d f
l = 0, 1 2 3d – Orbital is double dumb-bell shaped.

570. The electron, identified by quantum numbers n and l, (i) n = 4, l = 1 (ii) n = 4, l = 0 (iii) n = 3, l = 2 (iv) n = 3, l = 1 can be placed in order of increasing energy, from the lowest to highest, as

(a) (iv) < (ii) < (iii) < (i)
(b) (ii) < (iv) < (i) < (iii)
(c) (i) < (iii) < (ii) < (iii)
(d) (iii) < (i) < (iv) < (ii)

JCECE - 2014

Ans. (a) : (i) 4p (ii) 4s (iii) 3d (iv) 3p.
According to Aufbau rule, order of increasing energy is 3p < 4s < 3d < 4p.

571. The orbital angular momentum of an electron is 2s orbital is

(a) $+\frac{1}{2}\cdot\frac{h}{2\pi}$ (b) zero
(c) $\frac{h}{2\pi}$ (d) $\sqrt{2}\cdot\frac{h}{2\pi}$

JCECE - 2015

Ans. (b) : Orbital angular momentum

$$=\sqrt{l(l+1)}\frac{h}{2\pi}=0 \quad (\because \text{ for 2s-electron, } l=0)$$

572. The electrons identified by quantum numbers n and l, are as follows

I. n = 4, l = 1 II. n = 4, l = 0
III. n = 3, l = 2 IV. n = 3, l = 1

If we arrange them in order of increasing energy, i.e. from lowest to highest, the correct order is

(a) IV < II < III < I (b) II < IV < I < III
(c) I < III < II < IV (d) III < I < IV < II

JIPMER-2017

Ans. (a) : (i) More be the sum of n + 1 → more be the energy
(ii) Same sum, the more value of n have higher energy.
∴ n + 1 for →
(i) 4 + 1 = 5 (ii) 4 + 0 = 4
(iii) 3 + 2 = 5 (iv) 3 + 1 = 4
Order is (iv) < (ii) < (iii) < (i).

573. Among the following set of quantum numbers, the impossible set is

	n	**l**	**m**	**s**
(a)	3	2	–3	$-\frac{1}{2}$
(b)	4	0	0	$\frac{1}{2}$
(c)	5	3	0	$-\frac{1}{2}$
(d)	3	2	–2	$\frac{1}{2}$

JIPMER-2017

Ans. (a) : For each value of n, l = n –1 (max) and for each value of 1.
m = 1 to + 1
Thus, for 1 = 2, m = –2, –1, 0, 1, 2 and m = –3

574. Maximum number of electrons in a subshell of an atom determined by the following?

(a) $4l + 2$ (b) $2n^2$
(c) $4l – 2$ (d) $2l + 1$

JIPMER-2013

Ans. (a) : For a given shell, l the number of subshells, m_l = ($2l$ + 1) since each subshell can accommodate 2 electrons of opposite spin,
So, maximum number of electrons in a subshell = 2 ($2l$ + 1) = $4l + 2$.

575. If magnetic quantum number of a given atom represented by 3, then what will be its principal quantum number?

(a) 2 (b) 3
(c) 4 (d) 5

JIPMER-2006

Ans. (c) : If the magnetic quantum number of a given atom is represented by –3, then its principal quantum number will be 4.
For a given value of l,
m = –l, ……..0 …… + l when
m = –3, l = 3
For given value of n , l
Can have values from 0 to n –1 when
l = 3, n = 4, So that
n = –1, –4 –1 = 3

576. Number of orbitals in L energy level

(a) 1 (b) 2
(c) 3 (d) 4

JIPMER-2005

Ans. (d) : It is second energy level. Second energy level contains one s-orbital and three P orbitals. Therefore total number of orbital in L level is four.

577. The shape of an orbital is determined by

(a) n (b) l
(c) m (d) s

JIPMER-2004

Ans. (b) : The azimuthal quantum number (l) determines the shape of an orbital.
For l = 0 (spherical, s)
l = l (dumb-shape)

578. Azimuthal quantum number (l) defined

(a) shape of orbitals
(b) orientation of orbitals
(c) energy of orbitals
(d) size of orbitals

JIPMER-2019

@apna_pdf

Ans.(a) : The azimuthal quantum number (l) determines the shape of an orbital

$l = 0$ (sperical, s)

$l = 1$ (dumb – bell, p) etc.

579. The correct set of quantum number for the unpaired electrons of chlorine atom is

(a) $2, 1, -1, +\frac{1}{2}$ (b) $2, 0, 0, +\frac{1}{2}$

(c) $3, 1, 1, \pm\frac{1}{2}$ (d) $3, 0, 0, \pm\frac{1}{2}$

Karnataka-CET-2017

Ans. (c) : The correct set of quantum number of the unpaired electron of chlorine atom is

$3, 1, 1, \pm\frac{1}{2}$

For chlorine atom (Z = 17) the last electron enters into 3p orbital for

Which n = 3, $l = 1$, m = –1, 0

or + 1 and. $s = \frac{+1}{2}$.

580. Consider the following sets of quantum numbers. Which of the following setting in not permissible arrangement of electrons in an atom?

	n	l	m	s
(a)	4	0	0	$-\frac{1}{2}$
(b)	5	3	0	$+\frac{1}{2}$
(c)	3	2	–2	$-\frac{1}{2}$
(d)	3	2	– 3	$+\frac{1}{2}$

Karnataka-CET-2016

Ans. (d) : For a given value of '*l*' the permission permissible value of 'm' are $-l, -(l-1) \ldots. 0 \ldots.. (l-1)\ l$

Thus for $l = 2$, m cannot have a value of –3.

581. The two electrons have the following set of quantum number, P = 3, 2, –2 + 1/2, Q = 3, 0, 0 + 1/2

Which of the following statement is true?

(a) P and Q have same energy

(b) P has greater energy than Q

(c) P has lesser energy than Q

(d) P and Q represent same electron

Karnataka-CET-2015

Ans. (b) : P has greater energy than Q as the *l* value P is greater than Q and the energy is give by (n + *l*) value.

582. The correct set of four quantum numbers for the outermost electron of sodium (Z = 11) is

(a) $3, 1, 1, \frac{1}{2}$ (b) $3, 2, 1, \frac{1}{2}$

(c) $3, 0, 0, \frac{1}{2}$ (d) $3, 1, 0, \frac{1}{2}$

Karnataka-CET-2012

Ans. (c) : As the electronic configuration of Na is : $Is^2\ 2s^2\ 2p^6\ 3s^1$

So, the outermost electron is $3s^1$ therefore quantum numbers for 3s':3,0, 0, $\frac{1}{2}$.

583. The set of quantum numbers for the outermost electron for copper in its ground state is

(a) $4, 1, 1, +\frac{1}{2}$ (b) $3, 2, 2, +\frac{1}{2}$

(c) $4, 0, 0, +\frac{1}{2}$ (d) $4, 2, 2, +\frac{1}{2}$

Karnataka-CET, 2010

Ans. (c) : The electronic configuration of the Cu atom is

$_{29}Cu = [Ar]\ 3d^{10}\ 4s^1$

Since, the outermost shell is 4s, thus outermost electron is in it.

For $4s^1$,

$n = 4, \quad l = 0, \quad m = 0, \quad s = +\frac{1}{2}$

584. The correct set of four quantum number for outermost electron of potassium (Z = 19) is

(a) $4, 1, 0, \frac{1}{2}$ (b) $3, 1, 0, \frac{1}{2}$

(c) $4, 0, 0, \frac{1}{2}$ (d) $3, 0, 0, \frac{1}{2}$

Karnataka-CET, 2009

Ans. (c) : K (19) : $1s^2, 2s^2 2p^6, 3s^2 3p^6, 4s^1$

$4s^1$ is the valence electron is potassium, hence the correct set of four quantum numbers for outermost electron is 4, 0, 0, $\frac{1}{2}$.

585. When the azimuthal quantum number has the value of 2, the number of orbitals possible are

(a) 7 (b) 5

(c) 3 (d) 0

Karnataka-CET, 2008

Ans. (b) : Given, azimuthal quantum number (l) = 2

Number of orbitals = $(2l + 1)$

$= (2 \times 2 + 1) = 4 + 1 = 5$

586. The number of angular and radial nodes in 3p orbital respectively are

(a) 3, 1 (b) 1, 1

(c) 2, 1 (d) 2, 3

Kerala-CEE-29.08.2021
Karnataka-CET-2021

Ans. (b) : For angular node = ℓ

and Radial node = $n - \ell - 1$

Where, n = Principle quantum no.

ℓ = Azimuthal quantum no.

For 3p orbitals the value of ℓ for p-orbital is 1

$\therefore$ No. of angular node (ℓ) = 1

and No. of radial nodes = $n - \ell - 1 = 3 - 1 - 1 = 1$

@apna_pdf

587. The electrons, identified by quantum number n and *l*,
(I) n = 3; *l* = 2 n =5; *l* = 0 (III) n = 4; *l* =1 (IV) n = 4; *l* = 2 (V) n = 4; *l* = 0
can be placed in order of increasing energy, as
(a) I < V < III < IV < II
(b) I < V < III < II < IV
(c) V < I < III < II < IV
(d) V < I < II < IIII < IV
(e) V < I < IV < III < II

Kerala-CEE-2009

Ans. (d) (i) n = 3, $l = 2 \Rightarrow$ 3d
(ii) n = 5, $l = 0 \Rightarrow$ 5s
(iii) n = 4, $l = 1 \Rightarrow$ 4p
(iv) n = 4, $l = 2 \Rightarrow$ 4d
(v) n = 4, $l = 0 \Rightarrow$ 4s
According to Aufbau principle, An electron enters the orbital with lowest energy in order to increasing energies.
4s < 3d < 4p < 5s < ud

588. Which one of the following set of quantum numbers is not possible for electron in the ground state of an atom with atomic number 19?
(a) n = 2, *l* = 0, m = 0
(b) n = 2, *l* = 1, m = 0
(c) n = 3, *l* = 1, m = -1
(d) n = 3, *l* = 2, m = +2
(e) n = 4, *l* = 0, m = 0

Kerala-CEE-2006

Ans. (d) : $_{19}K = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6 4s^1$, *l* = 2 means d – subshell which is not present in K.

589. The correct set of quantum numbers (n, l and m respectively) for the unpaired electron of chlorine atom is:
(a) 2, 1, 0
(b) 2, 1, 1
(c) 3, 1, 1
(d) 3, 2, 1
(e) 3, 2, –1

Kerala-CEE-2004

Ans. (c) Cl (Z = 17) : $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^2x\ 3py^2\ 3pz^1$
$1s^2 2s^2\ 2p_x^2\ 2p_y^1\ 2p_z^1$
For the unpaired electron
n = 3, *l* = 1, m = –1, 0 or + 1

590. The number of electrons with azimuthal quantum number *l* = 1 and *l* = 2 for Cr in ground state respectively are
(a) 16, 5
(b) 16, 4
(c) 12, 4
(d) 16, 3
(e) 12, 5

Kerala-CEE-2015

Ans. (e) : Electrons configuration of
$_{24}Cr = 1s^2\ 2s^2\ sp^6\ 3s^2\ 3p^6\ 4s^1\ 3d^5$
Given,
azimuthal quantum number (*l*) = 1= p orbital
azimuthal quantum number (l) = 2 = d orbital
So, number of electrons in p– orbital
⇒ 12 and number of electrons in d–orbital = 5.

591. The magnetic quantum number for d-orbital is given by :
(a) 2
(b) 0, ±1, ±2
(c) 0, 1, 2
(d) 5

Manipal-2019

Ans. (b) :

n = 1	l = 0	m = 0	s
n = 2	l = 0,1	m = 0, ±1	s and p
n = 3	l = 0.1, 2	m = 0, ±1, ±2	s, p and d

592. Which of the following sets of quantum numbers is impossible arrangement?
(a) $n = 3,\ m = -2,\ s = +\frac{1}{2}$
(b) $n = 4,\ m = 3,\ s = +\frac{1}{2}$
(c) $n = 5,\ m = 2,\ s = -\frac{1}{2}$
(d) $n = 3,\ m = -3\ \ s = -\frac{1}{2}$

Manipal-2018

Ans. (d) :
n = 1, 2, 3, …..
l = 0, 1, 2, …. (n – 1) ex if
n = 3, l = 0, 1, 2
m = -l to l
$s = +\frac{1}{2}, \frac{-1}{2}$
n ≠ m so the following configuration is not possible.
$n = 3,\ m = -3,\ s = -\frac{1}{2}$

593. For *f*-orbital the values of m are :
(a) –2, –1, 0, +1, +2
(b) –3, –2, –1, 0, +1, +2, +3
(c) –1, 0, +1
(d) 0, +1, +2, +3

Manipal-2017

Ans. (b) : For f-orbital , *l* = 3 thus m lies from -3 to +3
Hence m, = -3, -2, -1, 0, +1, +2 , +3

594. What is the orbital angular momentum of an electron in 'f' orbital?
(a) $\frac{1.5h}{\pi}$
(b) $\frac{\sqrt{6}h}{\pi}$
(c) $\frac{\sqrt{3}h}{\pi}$
(d) $\frac{\sqrt{3}h}{2\pi}$

MHT CET-2014

Ans. (c) : Orbital angular momentum
$$mvr = \frac{h}{2\pi}\sqrt{l(l+1)} \quad \text{for f-orbital}$$
$l = 3$
∴ Orbital angular momentum
$$mvr = \frac{h}{2\pi}\sqrt{3(3+1)} = \frac{\sqrt{3}h}{\pi}$$
$$= \frac{\sqrt{3}h}{\pi}$$

@apna_pdf

595. The maximum number of electrons in a subshell is given by the expression

(a) $4l - 2$ (b) $4l + 2$
(c) $2l + 2$ (d) $2n^2$

NEET-1989

Ans. (b) : For an azimuthal quantum number l there are $2l + 1$ orbitals in a subshell since, each orbital can accommodate two electrons of opposite spin, the maximum number of electrons in a subshell is given by $2 \times (2l + 1) = 4l + 2$

596. The total number of electrons that can be accommodated in all the orbitals having principal quantum number 2 and azimuthal quantum number 1 are

(a) 2 (b) 4
(c) 6 (d) 8

NEET-1990

Ans. (c) : When n = 2 and l = 1 then subshell is 2p the number of orbital's in p-subshell.

$\Rightarrow (2l + 1) = (2 \times 1 + 1)$
$= 3$

Total (maximum) number of electrons

2 × number of orbital's
$\Rightarrow 2 \times 3$
$\Rightarrow 6$
(as each orbital contains 2 electrons)

597. For azimuthal quantum number l = 3, the maximum number of electrons will be

(a) 2 (b) 6
(c) 0 (d) 14

NEET-1991

Ans. (d) : As we known azimuthal quantum number l =3 denotes f – subshell and f-subshell contain seven orbitals. Each orbital can contain maximum of two electrons with opposite spin. Thus f-subshell contain total 14 electrons.

598. The following quantum numbers are possible for how many orbitals?

n = 3, l = 2, m = +2

(a) 1 (b) 2
(c) 3 (d) 4

NEET-2001

Ans. (a) : The three quantum number n, l, and m_l enable us to label completely an orbital. It is one of the d-orbital's present in 3d subshell.

599. If n = 6, the correct sequence for filling of electrons will be

(a) ns → (n-2)f → (n-1)d → np
(b) ns → (n-1)d → (n-2)f → np
(c) ns → (n-2)f → np → (n–1)d
(d) ns → np → (n–1)d → (n–2)f

NEET-2011

Ans. (a) : For n = 6 electron are filled as
$6s \rightarrow 4f \rightarrow 5d \rightarrow 6p$

This is because electron first enters in that orbital's for which (n + 1) is lower. In case, if (n + 1) is same it goes first in that orbital for which n is lowest.

600. Maximum number of electrons in a subshell of an atom is determined by the following

(a) $2l+1$ (b) $4l - 2$
(c) $2n^2$ (d) $4l + 2$

NEET-2009

Ans. (d) : For a given shell l,
the number of subshells. $m_l = (2l + 1)$
Since each subshell can accommodate 2 electrons of opposite spin, so maximum number of electrons in a subshell
$\Rightarrow 2(2l + 1) = 4l + 2$.

601. Which of the following is not permissible arrangement of electrons in an atom?

(a) n = 5, l = 2, m = 0, s + 1/2
(b) n = 5, l = 3, m = 0, s + 1/2
(c) n = 3, l = 3, m = 0, s + 1/2
(d) n = 4, l = 0, m = 0, s = -1/2

NEET-2009

Ans. (c) : If n = 3
l = 0 to (3 – 1) = 0, 1, 2
m = - l to + l = -2, -1, 0 +1, +2
$S = \pm\frac{1}{2}$
Is not a permissible set of quantum number

602. The correct set of four quantum numbers for the valence electron of rubidium atom (Z= 37) is

(a) 5, 1, 1, + 1/2 (b) 6, 0, 0 +1/2
(c) $5, 0, 0, +\frac{1}{2}$ (d) $5, 1, 0, +\frac{1}{2}$

NEET-2012

Ans. (c) : Electronic configuration of rubidium $(z = 37) \text{is} [\text{Kr}]^{36} 5S^1$
For valence electron ($5s^1$)
n = 5, l = 0, m = 0, s = $\frac{1}{2}$

603. The angular momentum of electron in 'd' orbital is equal to

(a) $2\sqrt{3}\frac{h}{2\pi}$ (b) 0 h
(c) $\sqrt{6}\frac{h}{2\pi}$ (d) $\sqrt{2}\frac{h}{2\pi}$

NEET-2015, cancelled

Ans. (c) : Angular momentum = $\sqrt{l(l+1)}\frac{h}{2\pi}$
For d orbital, l = 2
Angular momentum = $\sqrt{2(2+1)}\frac{h}{2\pi}$
$= \sqrt{6}\frac{h}{2\pi}$

604. What is the maximum number of orbital's that can be identified with the following quantum numbers?

n= 3, l =1, m_1 = 0

@apna_pdf

(a) 1 (b) 2
(c) 3 (d) 4

NEET-2014

Ans.(a): Only one orbital $3p_z$ has following set of quantum number, n = 3, l = 1 and $m_l = 0$

605. What is the maximum numbers of electrons that can be associated with the following set of quantum numbers?
n = 3, *l* = 1 and m = –1
(a) 4 (b) 2
(c) 10 (d) 8

NEET-2013

Ans. (b) : The orbital associated with n = 3, *l* = 1 is 3p. One orbital (with m = –1 of Subshell Can accommodate maximum 2 electrons.

606. Two electrons occupying the same orbital are distinguished by
(a) azimuthal quantum number
(b) spin quantum number
(c) principal quantum number
(d) magnetic quantum number

NEET-I 2016

Ans. (b) : If two electrons in an atom are in the same atomic orbital, then they must have the same n, *l* and m values. Thus in order to satisfy pauli's exclusion principal, they must have opposite spins.

607. How many electrons can fit in the orbital for which n = 3 and *l* = 1?
(a) 2 (b) 6
(c) 10 (d) 14

NEET-II 2016

Ans. (a) : An orbital can always have a maximum no. of two electrons only.

608. Which set of quantum numbers is not possible?
(a) $3,2,-2,\frac{1}{2}$ (b) $3,2,-3,\frac{1}{2}$
(c) $4,0,0\frac{1}{2}$ (d) $5,3,0,\frac{1}{2}$

Tripura JEE-2022

Ans. (b) : When *l* = n, m, cannot be -3 value of m_l cannot numerically greater than the value of l.

609. Maximum number of electrons in a subshell with *l* = 3 and n = 4 is
(a) 14 (b) 16
(c) 10 (d) 12

NEET-2012

Ans. (a) : *l* = 3 and n = 4 represents 4f so total number of electrons in a subshell
2 (2*l* + 1)
⇒2(2 × 3 + 1) = 14 electrons. Hence
f-subshell can contain maximum 14 electrons.

610. The set of quantum number for 19th electron of chromium (Z = 24) is
(a) $4, 0, 0, +\frac{1}{2}$ (b) $4, 1, -1, +\frac{1}{2}$
(c) $3, 2, 2, +\frac{1}{2}$ (d) $3, 2, -2, +\frac{1}{2}$

UP CPMT-2011

Ans. (a) : Cr (Z = 24) : $1s^2, 2s^2, 2p^6, 3s^2, 3p^2 4s^1, 3d^5$

For 19th electron $\boxed{\uparrow}$ 4s'

$n = 4, l = 0, m = 0, s = +\frac{1}{2}$

611. No two electron can have the same values of …..quantum numbers.
(a) One (b) Two
(c) Three (d) Four

UPTU/UPSEE-2004

Ans. (d) : According to pauli principle 2 elelctron does not have the same value of all four quantum number. They have maximum same value are 3.

612. Which of the following electron has minimum energy?
(a) $n=4, l=0. m = 0.s=+\frac{1}{2}$
(b) $n=4, l=1. m = \pm 1.s=+\frac{1}{2}$
(c) $n=5, l=0. m = 0.s=+\frac{1}{2}$
(d) $n=3, l=2. m = -2.s=+\frac{1}{2}$

UPTU/UPSEE-2017

Ans. (a) : (i) Energy of electron depends on sum of n + 1 values.
(ii) For the same sum of n + 1, the orbital with lower value of n is filled first. Lower be the sum, lower the energy of electron.
(iii) Electrons are filled in increasing order of energy. Thus among the given options, n + 1 for :
(a) 4 + 0 = 4 (b) 5 + 0 = 5
(c) 4 + 1 = 5 (d) 3 + 2 = 5
4 + 0 = 4 is the

613. Which of the following set of quantum numbers represents the highest energy of an atom?
(a) $n = 3, l = 2, m = 1, s = +\frac{1}{2}$
(b) $n = 4, l = 0, m=0, s = -\frac{1}{2}$
(c) $n = 3, l = 0, m = 4, s = +\frac{1}{2}$
(d) $n = 3, l = 0, m = 1, s = +\frac{1}{2}$

UPTU/UPSEE-2016

Ans. (a): n = 3 , *l* = 0 represents 3s – orbital
n = 3, *l* = 01 represents 3p – orbital
n = 3, *l* = 2 represents 3d – orbital
n = 4, *l* = 0 represents 4s – orbital
The order of increasing energy of the orbitals is
3s < 3p < 4s < 3d

@apna_pdf

614. Consider the ground state of Cr atom (Z = 24). The number of electrons with the azimuthal quantum number, *l* = 1 and 2 are respectively

(a) 12 and 4 (b) 12 and 5
(c) 16 and 4 (d) 16 and 5

UPTU/UPSEE-2012

Ans. (b) : Electronic configuration of 24^{Cr}

$1s^2 2s^2 2p^6 3s^2 3p^6 3d^5 4s^1$

No. of electrons in *l* = 1(p-orbital) is

$6 + 6 = 12.$

No of electrons in *l* = 2 (d-orbital) is 5 the number of electrons with the azimuthal quantum number *l* = 1 and 2 respectively are 12 and 5

615. 'No two electrons in an atom can have the same set of quantum numbers.' This principle is known by which one of the following?

(a) Zeeman's exclusion principle
(b) Stark's exclusion principle
(c) Pauli's exclusion principle
(d) Hersbach's exclusion principle

UPTU/UPSEE-2011

Ans. (c) : the Pauli's exclusion principle states that in an atom or molecule, no two electrons can have the same set of all four electronic quantum numbers.

As an orbital can contain a maximum no. of only two electrons, the two electrons must have opposing spins, this means if one electron is assigned as a spin up $\left(+\frac{1}{2}\right)$ electron, the other electron must be spin-down $\left(-\frac{1}{2}\right)$ electron.

When n = 5, *l* = 0, 1, 2, 3, or 4 and m = -4 to +4 n = 5, *l* = 4, m = 0, s = $+\frac{1}{2}$ is a correct set of quantum number.

616. Identity the correct statement.

(a) Quantum numbers (n, *l*, m, s) are arbitratily
(b) All the quantum numbers (n, *l*, m, s) for any pair of electron in an atom can be identical under special circumstance
(c) All the quantum numbers (n, *l*, m, s)may not be required to describe an electron of an atom completely
(d) All the quantum numbers (n, *l*, m, s) are required to describe an electron of an atom completely)

WB-JEE-2013

Ans. (d) : All the quantum numbers (n, l, m, s) are required to describe an electron of an atom completely.

n describes the position and energy of the electron in an orbit or shell. *l* is used to describe subshell and the space of the orbital occupied by the electron.

m describes the preferred orientation of orbital's in space. s describes the spinning of an electron on its axis.

617. If the given four electronic configurations.

(i) n = 4, *l* = 1 (ii) n = 4, *l* = 0
(iii) n = 3, *l* = 2 (iv) n = 3, *l* = 1

are arranged in order of increasing energy, then the order will be

(a) (iv) < (ii) < (iii) < (i)
(b) (ii) < (iv) < (i) < (iii)
(c) (i) < (iii) < (ii) < (iv)
(d) (iii) < (i) < (iv) < (ii)

WB-JEE-2017

Ans. (a): $n = 4,\ l = 1$ 4P orbital
$n = 4,\ l = 0$ 4s orbital
$n = 3,\ l = 2$ 3d orbital
$n = 3,\ l = 1$ 3p orbital

According to (n + *l*) rule,

increasing order of energy

(iv) < (ii) < (iii) < (i)

618. Which of the following sets of quantum number represents the 19th electron of Cr (Z = 24)?

(a) $\left(4, 1, -1, +\frac{1}{2}\right)$ (b) $\left(4, 0, 0, +\frac{1}{2}\right)$
(c) $\left(3, 2, 0, -\frac{1}{2}\right)$ (d) $\left(3, 2, -2, +\frac{1}{2}\right)$

WB-JEE-2017

Ans. (b) : ${}_{24}Cr = [Ar]^{18}\, 4s^1 3d^5$

19th electron enters in $4s^1$ subshell

For $4s^1$

n = 4, *l* = 0, m = 0, s = $\frac{+1}{2}$

619. The difference between orbital angular momentum of an electron in a 4*f*-orbital and another electron in a 4s-orbital is

(a) $2\sqrt{3}$ (b) $3\sqrt{2}$
(c) $\sqrt{3}$ (d) 2

WB-JEE-2020

Ans. (a) : Orbital angular momentum is given by the formula,

$$\sqrt{l(l+1)} \times \frac{h}{2\pi}$$

∴ For 4f, l = 3

→ orbital angular momentum = $\sqrt{12} \times \frac{h}{2\pi}$

For 4s, l = 0,

orbital angular momentum = 0

∴ Difference = $\sqrt{12} - 0 = \sqrt{12} = 2\sqrt{3}$.

8. Bohr's Model for Hydrogen Atom

620. If radius of second Bohr orbit of the He^+ ion is 105.8 pm, what is the radius of third Bohr orbit of Li^{2+} ion?

(a) 158.7 $\overset{0}{A}$ (b) 158.7 pm
(c) 15.87 pm (d) 1.587 pm

NEET-17.07.2022

@apna_pdf

Ans. (b) : $r = \frac{n^2}{Z}\times a_0$

For He$^+$, n = 2

Z = 2

$$r_{He^+} = 105.8\,\text{pm}$$

$$r_{He^+} = \frac{(2)^2}{2}\times a_0$$

$$105.8 = \frac{4\times a_0}{2}$$

$$a_0 = \frac{105.8\times 2}{4} = 52.9$$

For Li^{2+}, n = 3, Z = 3

$$r_{Li^{2+}} = \frac{3^2}{3}\times a_0$$

= 3 × 52.9 = 158.7 pm

621. If the radius of the 3rd Bohr's orbit of hydrogen atom is r_3 and the radius of 4th Bohr's orbit is r_4. Then:

(a) $r_4 = \frac{9}{16}r_3$ (b) $r_4 = \frac{16}{9}r_3$

(c) $r_4 = \frac{3}{4}r_3$ (d) $r_4 = \frac{4}{3}r_3$

JEE Main-26.06.2022, Shift-I

Ans. (b) : $r = \frac{n^2}{z}$

For H– atom, we know = 1

So, $r \propto n^2$

$r_3 \propto 9$

$r_4 \propto 16$

From ratio $= \frac{r_3}{r_4} = \frac{9}{16}$

$$r_4 = \frac{16}{9}r_3$$

622. The hydrogen line spectrum provides evidence for the

(a) Heisenberg Uncertainty principle

(b) Wave like properties of light

(c) Diatomic nature of hydrogen

(d) Quantized nature of atomic energy states

SCRA-2012

Ans. (d) : The hydrogen like spectrum is an important piece of evidence to show the quantized electronic structure of an atom.

Atomic orbits have fixed energies.

623. The energy of an electrons in the 3rd orbit of an atom is –E.

The energy of an electron in the first orbit will be

(a) –3E (b) $-\frac{E}{3}$

(c) $-\frac{E}{9}$ (d) –9E

MPPET- 2009

Ans. (d) : Given that,

$$E_n = -\frac{13.6\,z^2}{n^2}\ \text{eV atom}^{-1}$$

For 3rd Oribit

$$E_3 = -E = \frac{-13.6(z)^2}{3^2} \qquad .....(i)$$

$$E_1 = \frac{-13.6(z)^2}{(1)^2} \qquad .....(ii)$$

Divided equation (i) and (ii) we get

$$\frac{-E}{E_1} = \frac{-13.6}{3^2}\times\frac{1^2}{-13.6}$$

$E_1 = -9E$

624. If the radius of 1s electron orbit of a hydrogen atom is 53 pm, then the radius of the 3p electron orbit would be

(a) 0.477 nm (b) 477 nm

(c) 159 pm (d) 17.66 nm

SCRA-2014

Ans. (a) : Given that,

$n = 1, r_1 = 53$ pm, $n = 3, r_3 = ?$

Now, from the radii expression-

$$r_n = \frac{52.9n^2}{z}\ \text{pm}$$

Where, n = no. of orbit.

z = atomic number

$$\therefore\quad r_3 = \frac{52.9\times 9}{1}\ \text{pm}$$

$r_3 = 476.1$ pm

or $r_3 = 0.476$ nm

625. The velocity of an electron in the first Bohr orbit is v_1. What is its velocity in the third Bohr's orbit?

(a) $v_1/9$ (b) $v_1/3$

(c) v_1 (d) $3v_1$

SCRA-2010

Ans. (b) : The velocity of an electron in the nth stationary orbit for H- like species is expressed as,

$$V_n = 2.18\times 10^6\ \frac{Z}{n}\ \text{m sec}^{-1}$$

Here, z = 1 and n= 3

So, Velocity in the third { ∵ velocity of e$^-$ in first Bohr orbit = V_1}

Bohr's orbit = $\frac{v_1}{3}$

626. The energy of the electron in the hydrogen atom is given by the expression :

(a) $\frac{-e^2}{r^2}$ (b) $\frac{-n^2h^2}{2\pi 2Z^2e^4m}$

(c) $\frac{-2\pi^2Z^2e^4}{n^2h^2}$ (d) $\frac{nh}{2\pi}$

AP-EAMCET-1991

@apna_pdf

Ans. (c) : The energy of the electron in the hydrogen atom is given as :

$$E_n = \frac{-2\pi^2 Z^2 e^4}{n^2 h^2}$$

627. The basic assumption of Bohr's model of hydrogen atom is that :

(a) the energy of the electron is quantised
(b) the angular momentum of the electron is quantised
(c) the radial distance of the electron is quantised
(d) the orbital velocity of the electron is quantized

AP-EAMCET-1994

Ans. (b) : Bohr's Model–

(1) Electrons are revolving around nucleus K, L, M, N in specific energy level with centripetal force given by nucleus.

$$\boxed{\frac{mu^2}{r} = \frac{ZKe^2}{r^2}}$$

(2) Only those orbits are allowed whose angular momentum (p) is integral multiple of $\frac{h}{2\pi}$.

$$\boxed{p = mvr = \frac{nh}{2\pi}}$$

628. The radius of the second Bohr's orbit is :

(a) 0.053 nm
(b) 0.106 nm
(c) 0.212 nm
(d) 0.0265 nm

AP-EAMCET-1995

Ans. (c) : Bohr radius $(r_n) = \in_0 n^2 h^2$

$$r_n = \frac{n^2 h^2}{4\pi^2 m e^2 kZ}$$

$$k = \frac{1}{4\pi \in_0}$$

$$\therefore \quad r_n = \frac{n^2 h^2 \in_0}{\pi m e^2 Z} = n^2 \frac{a_0}{Z}$$

Where, m = mass of electron
e = charge of electron
h = Planck's constant
k = Coulomb constant

$$\boxed{r_n = \frac{n^2 \times 0.53}{Z} \text{Å}}$$

Radius of n^{th} Bohr orbit for H-atom

$= 0.53\ n^2$ Å [Z = 1 for H-atom]

∴ Radius of 2^{nd} Bohr orbit for H-atom

$= 0.53 \times (2)^2 = 2.12$ Å

$= 0.212$ nm [1Å = 0.1 nm]

629. In the Bohr hydrogen atom, the electronic transition emiting light of longest wavelength is:

(a) n = 2 to n = 3
(b) n = 4 to n = 3
(c) n = 3 to n = 2
(d) n = 2 to n = 1

AP-EAMCET-1997

Ans. (b) : We know that $\Delta E = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

Thus the decreasing order of energy transition is–

$\boxed{\text{n=2 to n=3} > \text{n=2 to n=1} > \text{n=3 to n=2} > \text{n=4 to n=3}}$

Also, $E = \frac{hc}{\lambda}$

Emitting light of longest wavelength will have low energy and if the principle quantum number increases, the difference between the energy of two orbits decreases. Therefore, n = 4 to n=3 refers the lower energy.

Thus that should be the increasing order of wavelength.

630. The energy of an electron present in Bohr's second orbit of hydrogen atom is :

(a) – 1312 J atom^{-1}
(b) – 328 kJ mol^{-1}
(c) – 328 J mol^{-1}
(d) – 164 kJ mol^{-1}

AP EAMCET (Engg.) 2001

Ans. (b) : For Bohr's second orbit

$$E_A = \frac{-1312}{n^2} \text{kJ. mol}^{-1}$$

$$E_2 = \frac{-1312}{2^2} = -328 \text{ kJ/mol.}$$

631. Which one of the following statements is not correct?

(a) Rydberg's constant and wave number have same units
(b) Lyman series of hydrogen spectrum occurs in the ultraviolet region
(c) The angular momentum of the electron in the ground state of hydrogen atom is equal to $\frac{h}{2\pi}$
(d) The radius of first Bohr orbit of hydrogen atom is 2.116×10^{-8} cm

AP-EAMCET-2002

Ans. (d) : The radius of first Bohr orbit of hydrogen atom is 0.53 Å or 0.53×10^{-8} cm. Hence, statement is false.

- The unit of Rydberg constant as well as wave number $(\overline{v})$ is cm^{-1}. Hence, statement is true.
- The Lyman series of hydrogen spectrum occurs at the ultra violet region. Hence, the given statement is true.
- According to Bohr's theory, Angular momentum, $mvr = \frac{nh}{2\pi}$.

So, in ground state, angular momentum $= \frac{h}{2\pi}$.

632. An electron is moving in Bohr's fourth orbit. Its de-Broglie wavelength is λ. What is the circumference of the fourth orbit?

(a) $\frac{2}{\lambda}$
(b) 2λ
(c) 4λ
(d) $\frac{4}{\lambda}$

VITEEE-2014

Ans. (c) : According to Bohr's concept, an electron always move in the orbit with angular momentum (mvr) equal to $\frac{nh}{2\pi}$.

$$\therefore \quad mvr = \frac{nh}{2\pi}$$

@apna_pdf

$$r = \frac{n}{2\pi}\cdot\left(\frac{h}{mv}\right)$$

$$\left(\because \lambda = \frac{h}{mv}\ \text{de - Broglie equation}\right)$$

$$r = \frac{n\lambda}{2\pi}$$

For 4th orbit–

$$r = \frac{4\lambda}{2\pi} = \frac{2\lambda}{\pi}$$

$$\therefore\ \text{Circumference} = 2\pi r\ = 2\pi\times\frac{2\lambda}{\pi}$$

$$= 4\lambda$$

633. The energy (in ev) associated with the electron in the 1^{st} orbit of Li^{2+} is

(a) – 122.4 (b) – 61.15

(c) – 30.5 (d) – 244.6

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (a) : Given that,

$n = 1, Z = 3$ (for Li^{3+})

$$\because \text{Energy of electron } (E_n) = -13.6\frac{Z^2}{n^2}\text{ev}$$

For 1^{st} orbit–

$$E_1 = -13.6\frac{(3)^2}{(1)^2}\text{ev}$$

or $E_1 = -122.4$ ev

634. Which energy level transition among the following will have the least wavelength?

(a) $n_4 \rightarrow n_3$ (b) $n_4 \rightarrow n_2$

(c) $n_4 \rightarrow n_1$ (d) $n_2 \rightarrow n_1$

AP EAPCET 25.08.2021, Shift-II

Ans. (c) : $n_4 \rightarrow n_1$ transition will have the least wavelength. The option (c) is correct. Energy is inversely proportional to wavelength. For an electron to undergo electronic transition from higher to lower energy level wavelength is least.

635. Calculate the de Broglie's wavelength of an electron residing in the 2^{nd} Bohr's orbit of a Hydrogen atom. (Bohr's radius, $a_0 = 0.529$Å)

(a) 0.2116 nm (b) 2.116 πÅ

(c) 21.16 m (d) 20116 μm

AP EAPCET 25.08.2021, Shift-II

Ans. (b) :

$$\lambda = \frac{h}{p} = \frac{h}{mv} \text{ ———— (1)}$$

$$\therefore\ \Delta V\,\Delta n = \frac{h}{4\pi m}$$

$$m\Delta V = \frac{h}{4\pi\Delta n} \text{ ———— (2)}$$

putting the vale in eq^n (1) we get

$$\lambda = \frac{h}{h}4\pi.\Delta n$$

$$\lambda = 4\pi\Delta n$$

$$\lambda = 4\pi\times 0.529\ \text{Å}\quad (\therefore\ \text{given } \Delta n = 0.529\ \text{Å})$$

$$\lambda = 2.116\ \text{Å}$$

636. If the wavelength of the first line of Balmer series is 656 nm, then the wavelengths of its second line and limiting line respectively are ———

(a) 485.9 nm & 434 nm

(b) 485.9 nm & 364.4 nm

(c) 715 nm & 434 nm

(d) 608 nm & 415.2 nm

AP EAPCET 25.08.2021, Shift-II

Ans. (b) : Given that $\lambda_1 = 656$ mm and $n_1 = n_2$ and $n_2 = 3$.

We know that or fist wavelength

$$\bar{v} = \frac{1}{\lambda_1} = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

$$\frac{1}{656} = R_H\left(\frac{1}{2^2} - \frac{1}{3^2}\right)$$

$$\frac{1}{656\ \text{nm}} = R_H\left(\frac{1}{4} - \frac{1}{9}\right)$$

$$\frac{1}{656\ \text{nm}} = R_H\frac{5}{36} \text{ ———— (1)}$$

For second line, $n_1 = 2, n_2 = 4$

$$\frac{1}{\lambda_2} = R_H\left(\frac{1}{2^2} - \frac{1}{4^2}\right)$$

$$\frac{1}{\lambda_2} = R_H\left(\frac{1}{4} - \frac{1}{16}\right)$$

$$\frac{1}{\lambda_2} = R_H\frac{3}{16} \text{ ———— (2)}$$

Dividing equation (1) and (2) we get

$$\frac{\lambda_2}{656} = \frac{5}{36}\times\frac{16}{3}$$

$$\boxed{\lambda_2 = 485.9\ \text{nm}}$$

Wavelength of limiting line –

$n_1 = 2, n_2 = \infty$

So,

$$\frac{1}{\lambda} = R_H\left(\frac{1}{2^2} - \frac{1}{\infty^2}\right) = R_H\times\frac{1}{4}$$

Dividing (1) and (2) we get

$$\frac{\lambda}{656} = \frac{5}{36}\times 4$$

$$\lambda = \frac{20}{36}\times 656\ \text{nm} = 364.4\ \text{nm}$$

$$\boxed{\lambda_{nm} = 364.4\ \text{nm}}$$

@apna_pdf

637. Which of the following corresponds to the energy of the possible excited state of hydrogen?

(a) –13.6 eV (b) 13.6 eV

(c) –3.4 eV (d) 3.4 eV

TS EAMCET-2017
BCECE-2012
NEET-2002

Ans. (c) : Energy level of an atoms are

$E_n = -13.6Z^2/n^2$ eV

Where Z = atomic number

Energy level (n) = 1, 2, 3, …..

For hydrogen atom, Z = 1

And first excited state, n = 2

$$\therefore E = \frac{-13.6\times1^2}{2^2}$$

E = –3.4 eV

638. The electron in the hydrogen jump on absorbing 12.75 eV of energy would jump to ____orbit

(a) 3 (b) 2

(c) 5 (d) 4

AP EAPCET 24.08.2021 Shift-II

Ans. (d) : We know that

$$E_n = \frac{-21.8\times10^{-19}}{n^2}\text{ Joule}$$

$$E_1 = \frac{-21.8\times10^{-19}}{1^2}$$

$E_1 = -21.8\times10^{-19}$J (n = 1 for ground state at H-atom)

After absorbing 12.75eV of energy the energy of electron will be -

$-21.8\times10^{-19} + 12.75\times1.6\times10^{-19}$

$-21.8\times10^{-19} + 20.4\times10^{-19}$

-1.4×10^{-19} J

Thus $\dfrac{-21.8\times10^{-19}}{n^2} = -1.4\times10^{-19}$

$$n^2 = \frac{21.8\times10^{-19}}{1.4\times10^{-19}}$$

$n^2 = 15.57$

$\boxed{n = 4}$

Thus the e^- will jump to the 4th orbit.

639. On the basis of Bohr's model. The radius of the 3rd orbit is——

(a) Equal to the radius of 1st orbit

(b) 3times the radius of 1st orbit

(c) 5 times the radius of 1st orbit

(d) 9 times the radius of 1st orbit

AP EAPCET 19-08-2021 Shift-I

Ans. (d) : From the equation of Bohr's model-

$$r_n = \frac{52.9(n^2)}{2}\text{ pm}$$

Where - r_n = radius of nth orbital

n = no of orbit

2 = atomic number

Given- n = 3

$$\therefore R_3 = \frac{52.9(3)^2}{2}\text{pm}$$

$$r_3 = \frac{9\times52.9}{2}\text{ pm …….(i)}$$

For the 1st orbit i.e. n = 1

$$r_1 = \frac{52.9\times(1)^2}{2}\text{ pm}$$

$$r_1 = \frac{52.9}{2}\text{ pm …….(ii)}$$

From (i) and (ii)

$r_3 = 9r_1$

Hence, the radius of the 3rd orbit is 9 times the radius of 1st orbit

640. Energy associated with the first orbit of He^+ is

(a) 8.72×10^{-18} joules (b) 0.872×10^{-18} joules

(c) -0.872×10^{-18} joules (d) -8.72×10^{-18} joules

COMEDK-2015
AMU-2015

Ans. (d) : For H-like particles,

$$E_n = \frac{-21.78\times10^{-19}}{n^2}Z^2\text{J}$$

For He^+, Z = 2, n = 1

$$= \frac{-21.78\times10^{-19}}{1^2}\times(2)^2 = -8.712\times10^{-18}\text{J}$$

641. Assuming Rydberg constants are equal, the ground state energy of the electron in hydrogen atom is equal to

(a) the ground state energy of the electron in He^+

(b) the first excited state energy of the electronic He^+

(c) the first excited state energy of the electron in Li^{2+}

(d) the ground state energy of the electron in Be^{3+}

COMEDK-2020

Ans. (b) : $E_n = -R_H.\dfrac{Z^2}{n^2}$

For ground state hydrogen atom : Z=1, n=1

$$\therefore E_1 = -13.6\times\frac{1}{1} = -13.6\text{eV}$$

For the ground state in He^+; Z=2, n=1

$$E_1 = -13.6\times\frac{4}{1} = -54.4\text{eV}$$

For the first excited state in He^+; Z=2, n=2;

$$E_2 = -13.6\times\frac{4}{4} = -13.6\text{eV}$$

For the first excited state in Li^{2+}; Z=3, n=2;

$$E_1 = -13.6\times\frac{9}{4} = -30.6\text{eV}$$

For the ground state energy of the electron in Be^{3+}; Z=4, n=1;

$= -13.6\times16 = -217.6$eV

@apna_pdf

642. Match the following

List-I	List-II
(A) $mvr = \frac{nh}{2\pi}$	(i) Paschen series
(B) Infra-red	(ii) Electron total energy
(C) $\lambda = \frac{h}{p}$	(iii) de-Broglie equation
(D) $\frac{-e^2}{2\pi}$	(iv) Schrodinger equation
	(v) Bohr's equation

The correct answer is

	A	B	C	D
(a)	(v)	(ii)	(iii)	(i)
(b)	(iii)	(ii)	(v)	(iv)
(c)	(v)	(i)	(iii)	(ii)
(d)	(iv)	(i)	(ii)	(iii)

AP-EAMCET (Medical), 2008

Ans. (c) :

List-I	List-II
(A) $mvr = \frac{nh}{2\pi}$	Bohr's equation
(B) Infra-red	Paschen series
(C) $\lambda = \frac{h}{p}$	de-Broglie equation
(D) $\frac{-e^2}{2\pi}$	Electron total energy

643. The wavelength (in Å) of an emission line obtained for Li^{2+} during an electronic transition from $n_2 = 2$ to $n_1 = 1$ is (R = Rydberg constant)

(a) $\frac{3R}{4}$ (b) $\frac{3R}{4}$

(c) $\frac{4}{3R}$ (d) $\frac{4}{27R}$

AP-EAMCET (Medical), 2008

Ans. (d) : Given data:

$n_1 = 1$

$n_2 = 2$

$Z = 3$ (for Li^{2+})

$\lambda = ?$

Now, from Rydberg equation-

$$\overline{\upsilon} = RZ^2\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

Or $$\frac{1}{\lambda} = R(3)^2\left(\frac{1}{1} - \frac{1}{4}\right)$$

$$\frac{1}{\lambda} = 9R \times \frac{3}{4}$$

Or $$\lambda = \frac{4}{27R}$$

644. The ratio of potential energy (PE) and total energy of an electron in a Bohr orbit of the hydrogen atom is

(a) 1 (b) 2

(c) −1 (d) $\frac{1}{2}$

TS-EAMCET 09.08.2021, Shift-I

Ans. (b) : Potential energy $(P.E.) = -\frac{Ke^2}{r_n}$ .....(i)

And, Total energy $(T.E.) = -\frac{1Ke^2}{2r_n}$ .....(ii)

$\therefore$ $\frac{P.E.}{T.E.} = \frac{-Ke^2/r_n}{-1Ke^2/2r_n}$

or $\frac{P.E.}{T.E.} = 2$

$\therefore$ P.E. : T.E. = 2 : 1

645. Electromagnetic radiation of wavelength 663 nm is just sufficient to ionise the atom of metal A. The ionization energy of metal A in kJ mol^{-1} is ——. (Rounded-off to the nearest integer) [$h = 6.63\times10^{-34}$ Js, $c = 3.00\times10^8$ ms^{-1}, $N_A = 6.02\times10^{23}$ mol^{-1}]

JEE Main 25.02.2021, Shift-II

Ans. : Given, wavelength (λ) = 663 nm {1nm = 10^{-9}m}

$= 663\times10^{-9}$m

We know that, $E = \frac{hc}{\lambda}$

For 1 mole of atom, total energy is given by,

$$\Rightarrow E = N_A \times \frac{hc}{\lambda}$$

$$\Rightarrow E = \frac{6.023\times10^{23}\times6.63\times10^{-34}\times3\times10^8}{663\times10^{-9}\times1000}$$

$= 3\times10^{-19}$ J

Ionisation energy per mol

$= 3 \times 10^{-19} \times 10^{-3} \times 6.02 \times 10^{23}$

$= 180.6$ KJ mol^{-1}

$= 181$ kJ mol^{-1}

646. **Assertion:** A spectral line will be seen for a $2P_x \rightarrow 2p_y$ transition.

Reason: Energy is released in the form of waves of light when the electron drops from $2p_x$ to $2p_y$ orbital.

(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion

(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion

(c) If Assertion is true but the Reason is false

(d) If both Assertion and Reason are false

AIIMS-1996

Ans. (d): In this case both assertion and reason are false. Both $2p_x$ and $2p_y$ orbitals have equal energy (2p orbitals are degenerate), there is no possibility of electron transition and hence, no energy is released and thus, no spectral line will be observed.

@apna_pdf

647. The maximum energy is possessed by an electron, when it is present

(a) in first excited state
(b) in nucleus
(c) at infinite distance from the nucleus
(d) in ground energy state

AIIMS-1996

Ans. (c): When electron is placed at an infinite distance from the nucleus the energy increases sharply.

The potential energy of the electron is minimum at equilibrium distance from the nucleus.

648. Assertion: Angular momentum of an electron in any orbit is given by angular momentum $= \frac{nh}{2\pi}$, where n is the principal quantum number

Reason: The principal quantum number n can have any integral values.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2012-13

Ans. (b): Both assertion and reason are correct. Reason is not the correct explanation of assertion.

649. What is the energy (kJ/mol) associated with the de-excitation of an electron from n=6 to n=2 in He^+ ion?

(a) 1.36×10^6 (b) 1.36×10^3
(c) 1.16×10^3 (d) 1.78×10^3

AIIMS-27 May, 2018

Ans. (c): Given that,

n = 6 to n = 2

$$E = 13.6\times Z_1^2\left(\frac{1}{4}-\frac{1}{36}\right)$$

$$= 13.6\times4\left(\frac{9-1}{36}\right)$$

$$= 13.6\times4\times\frac{8}{36}$$

= 12.08 eV × 96 kJ/mol

= 1.16 × 10^3 KJ/mol

650. In Second orbit of H atom the velocity of e^- is:

(a) 2.18×10^6 m/sec (b) 3.27×10^6 m/sec
(c) 10.9×10^5 m/sec (d) 21.8×10^6 m/sec

AIIMS-27 May, 2018
AIIMS-2001

Ans. (c): $V = 2.18 \times 10^6 \times \frac{z}{n}$

$$V = 2.18\times10^6\times\frac{1}{2} = 10.9\times10^5 \text{ m/sec.}$$

Hence, $V = 10.9\times10^5$ m/sec

651. In hydrogen atomic spectrum, a series limit is found at 12186.3 cm^{-1}. Then, it belongs to

(a) Lyman Series (b) Balmer series
(c) Paschen series (d) Brackett series

AIIMS-2014

Ans. (c): Series limit is the last line of the series

i.e. $n_2 = \infty$

$$\therefore \quad \bar{v} = \frac{1}{\lambda} = R\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right] = R\left[\frac{1}{n_1^2}-\frac{1}{\infty^2}\right]$$

$$\bar{v} = \frac{R}{n_1^2}$$

$$12186.3 = \frac{109677.76}{n_1^2}$$

$$n_1^2 = \frac{109677.76}{12186.3} = 9, \ n_1 = 3$$

The line belongs to Paschen series.

652. Based on equation, $E = -2.178\times10^{-18}\,J\left(\frac{Z^2}{n^2}\right)$, certain conclusions are written. Which of them is not correct?

(a) Larger the value of n, the larger is the orbit radius.
(b) Equation can be used to calculate the change in energy when the electron changes orbit.
(c) For n=1, the electron has a more negative energy than it does for n=6 which means that the electron is more loosely bound in the smallest allowed orbit.
(d) The negative sign in equation simply means that the energy of electron bound to the nucleus is lower than it would be if the electrons were at the infinite distance from the nucleus.

AIIMS-2015

Ans. (c): For n=1, the electron has a more negative energy than it does for n=6 which means that the electron is more loosely bound in the smallest allowed orbit.

653. The energy of electron in first energy level is -21.79×10^{-12} erg per atom. The energy of electron in second energy level is:

(a) -54.47×10^{-12} erg atom^{-1}
(b) -5.447×10^{-12} erg atom^{-1}
(c) -0.447×10^{-12} erg atom^{-1}
(d) -0.05447×10^{-12} erg atom^{-1}

AIIMS-2000

Ans. (b): Assume that atom to be hydrogen like,

Energy of n^{th} energy level

$E_n = \frac{-E_1}{x^2}$, where E_1 is energy of first energy level

$$E_2 = \frac{-E_1}{2^2} = \frac{-E_1}{4} = \frac{-21.79\times10^{-12}}{4}$$

$= -5.447\times10^{-12}$ erg per atom

@apna_pdf

654. If velocity of an electron in the first Bohr orbit of H is v_1 then velocity in second orbit will be

(a) v_1 (b) $2v_1$

(c) $\frac{v_1}{2}$ (d) $\frac{v_1}{4}$

SRMJEEE – 2007

Ans. (c) : The velocity of an electron of the n^{th} stationary state for hydrogen like species is expressed as–

$$V_n = 2.18 \times 10^6 \times \frac{z}{n} m/s$$

Where z = atomic number and n = orbit

Now, $V_1 = 2.18 \times 10^6 \times \frac{(1)}{(1)} m/s$

The velocity in second orbit is–

$$V_2 = 2.18 \times 10^6 \times \frac{(1)}{(2)}$$

or $V_2 = \frac{V_1}{2}$

$V \propto \frac{Z}{n}$ since, Z and n both have become twice, velocity of electron in second orbit of H^+ will be v.

655. If the energy of an electron in the second Bohr orbit of H-atom is –E, what is the energy of the electron in the Bohr's first orbit?

(a) 2E (b) –4E

(c) –2E (d) 4E

SRMJEEE – 2010

Ans. (b) : The expression of energy of hydrogen atom is :

$$E_n = -2.18 \times 10^{-18} \left(\frac{z^2}{n^2}\right) J$$

Given– $E_2 = -E$

$E_1 = ?$

$\therefore \quad E_2 = -2.18 \times 10^{-18} \times \frac{(1)^2}{(2)^2} J = -E \quad ...(i)$

and $E_1 = -2.18 \times 10^{-18} \times \frac{(1)^2}{(1)^2} J$ (from equation i)

or $E_1 = -4E$

656. According to Bohr's theory which one of the following values of angular momentum of hydrogen atom is not permitted?

(a) $\frac{1.25h}{\pi}$ (b) $\frac{h}{\pi}$

(c) $\frac{1.5h}{\pi}$ (d) $\frac{0.5h}{\pi}$

AP-EAMCET- (Engg.)-2011

Ans. (a): According to Bohr's theory.

$$mvr = \frac{nh}{2\pi}$$

Where, m = mass of atom

v = velocity

r = radius of n^{th} orbit

Therefore, the angular momentum is an integral multiple of $\frac{h}{2\pi}$.

Hence option (a) is not permitted for angular momentum of hydrogen atom.

657. In a hydrogen atom, the electron is at a distance of 4.768 Å from the nucleus. The angular momentum of the electron is

(a) $\frac{3h}{2\pi}$ (b) $\frac{h}{2\pi}$

(c) $\frac{h}{\pi}$ (d) $\frac{3h}{\pi}$

AP- EAMCET(Medical) -2010

Ans. (a): Given data:-

$$r_n = 4.768 Å$$

As we know the radius of first Bohr's orbit is –

$$r_n = 0.529 \frac{n^2}{Z} Å$$

$$4.768 = 0.529 \times n^2$$

$$n^2 = \frac{4.768}{0.529}$$

or $n^2 = 9$

$n = 3$

$\therefore$ Angular momentum of the electron is $(mvr) = \frac{nh}{2\pi} = \frac{3h}{2\pi}$

658. In the Bohr hydrogen atom, the electronic transition emitting light of longest wave length is:

(a) n = 2 to n =3 (b) n = 4 to n = 3

(c) n = 3 to n =2 (d) n = 2 to n = 1

AP – EAMCET - (Medical)-1997

Ans. (b) : The spectrum of hydrogen atom obey the following formula–

$$\bar{v} = R_H \left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

Where R_H = Rydberg constant

In the Paschen series of hydrogen atom spectrum, the minimum energy difference found in n =4 to n = 3 due to which they have longest wavelength.

659. What is the lowest energy of the spectral line emitted by the hydrogen atom in the Lyman series?
(h = Planck's constant, c = Velocity of light, R=Rydberg's constant).

(a) $\frac{5hcR}{36}$ (b) $\frac{4hcR}{3}$

(c) $\frac{3hcR}{4}$ (d) $\frac{7hcR}{144}$

AP-EAMCET (Engg.)-2005

@apna_pdf

Ans. (c): Given data:- For the Lyman series-

$n_1 = 1, \quad n_2 = 2$

From the Rydberg equation-

$$\bar{\nu} = R\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

where- $\bar{\nu}$ = wave number

R = Rydberg constant

$$\bar{\nu} = R\left(\frac{1}{1} - \frac{1}{4}\right)$$

or $\bar{\nu} = \frac{3R}{4}$

$\because \quad \lambda = \frac{1}{\bar{\upsilon}}$

$\therefore \quad \lambda = \frac{4}{3R}$

Now,

$$E = \frac{hc}{\lambda}$$

$$E = \frac{hc \times 3R}{4}$$

or $E = \frac{3hcR}{4}$

For lowest energy of the spectral line in Lyman series $n_1 = 1$, $n_2 = 2$.

660. According to Bohr's theory, the angular momentum for an electron of 3rd orbit is

(a) $3\hbar$ (b) $1.5\hbar$

(c) $9\hbar$ (d) $2\frac{\hbar}{\pi}$

VITEEE 2014

Ans. (a) : According to Bohr's theory, the angular momentum of e^- in n^{th} orbit is equal to

$$mvr = \frac{nh}{2\pi}$$

For 3rd orbit,

$$mvr = \frac{3h}{2\pi}$$

$$\text{So, } mvr = 3.\hbar \Rightarrow \left(\because \hbar = \frac{h}{2\pi}\right)$$

661. What transition in the hydrogen spectrum would have the same wavelength as the Balmer transition, n = 4 to n = 2 of He⁺ spectrum?

(a) n = 4 to n = 2 (b) n = 3 to n = 2

(c) n = 2 to n = 1 (d) n = 4 to n = 3

VITEEE-2013

Ans. (c): According to the question

$$\lambda_H = \lambda_{He^+}$$

$$R_H Z_H^2\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right] = R_H Z_{He^+}^2\left[\frac{1}{2^2} - \frac{1}{4^2}\right]$$

$$R_H \times 1\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right] = R_H \times 4\left[\frac{1}{4} - \frac{1}{16}\right]$$

$$\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right] = 4 \times \frac{4-1}{16} = 4 \times \frac{3}{16} = \frac{3}{4}$$

for first line $n_2 = 2$, $n_1 = 1$

$$\left[\frac{1}{1^2} - \frac{1}{2^2}\right] = \left[\frac{1}{1} - \frac{1}{4}\right] = \frac{3}{4}$$

Hence $n_1 = 1, \quad n_2 = 2$

So, transition $n_2 = 2$ to $n_1 = 1$ will give spectrum of the same wavelength as that of Balmer transition $n_2 = 4$ to $n_1 = 2$ in He^+.

662. What is the degeneracy of the level of H-atom that has energy $\left(-\frac{R_H}{9}\right)$?

(a) 16 (b) 9

(c) 4 (d) 1

VITEEE 2013

Ans. (b): Energy of electron form n^{th} terms is

$$E_n = -\frac{R_H Z^2}{n^2}$$

For H–atom,

$$\frac{-R_H}{9} = \frac{-R_H \times 1^2}{n^2}, \qquad n^2 = 9$$

663. The ground state energy of hydrogen atom is –13.6 eV. The energy of second excited state of He⁺ ion in eV is

(a) –54.4 (b) –3.4

(c) –6.04 (d) –27.2

[JEE Main 2019, 10 Jan Shift-II]

Ans. (c) : Given that,

energy of hydrogen atom = 13.6 eV.

Second excited state is 3rd orbit–

$$E = -13.6\,\frac{z^2}{n^2}\text{eV} = -13.6 \times \frac{4}{9}\text{eV}$$

$$= -6.04 \text{ eV.}$$

664. The energy of electron in the first Bohr orbit of H atom is - 13.6 eV. The possible energy value of the excited state (s) for electrons in Bohr orbits of hydrogen is

(a) -3.4 eV (b) -4.2 eV

(c) -6.8 eV (d) +6.8 eV

AMU-2011

Ans. (a): The energy of electron on Bohr orbits of hydrogen atoms is given by the expression

$$E_n = \frac{-13.6 \times Z^2}{n^2}\text{eV}$$

For first excited state, n = 2

$$\therefore \quad E_2 = \frac{-13.6 \times (1)^2}{2^2} = \frac{-13.6}{4} = -3.4\text{eV}$$

665. The energy of electron in n^{th} orbit of hydrogen atom is

(a) $\frac{13.6}{n}$eV (b) $\frac{13.6}{n^2}$eV

(c) $\frac{13.6}{n^3}$eV (d) $\frac{13.6}{n^4}$eV

AMU EXPLORER-2002

Karnataka-CET-2016

@apna_pdf

Ans. (b) : The energy of electron in nth orbit of hydrogen atom is given below-

or $E_n = \frac{13.6}{n^2} eV$

666. The spectrum of H^+ is expected to be similar to that of

(a) Be^{2+} (b) Li^+

(c) Na (d) He^+

AMU EXPLORER-2002

Ans. (d) : Helium ion (He^+) and hydrogen has one electron in their outermost shell so both show the same spectrum having similar spectral lines of transitions.

667. For which of the following species, Bohr's theory is not applicable?

(a) 0^{7+} (b) Be^{3+}

(c) Li^{2+} (d) He^{2+}

Assam CEE-2014

Ans. (d) : Bohr's theory is applicable to the species containing only one electron. He^{2+} contain no electron.

668. The ratio of energy of the electron in ground state of hydrogen to the electron in first excited state of Be^{3+} is

(a) 1 : 4 (b) 1 : 8

(c) 1 : 16 (d) 16 : 1

Assam CEE-2014

Ans. (a) : $E_x = -13.6\left(\frac{z^2}{n^2}\right)eV$

$E_1(H)$ = -13.6 eV in ground state n = 1, for H atom z = 1

$E_2(Be^{3+}) = \left[\frac{-13.6\times(4)^2}{(2)^2}\right]$ in first excited state

n = 2 for Be^{3+}, z = 4

$\therefore\ E_1 : E_2 = 1:4$.

669. The Bohr's orbit radius for the hydrogen atom (n = 1) is approximately 0.53 Å. The radius for the first excited state (n = 2) orbit is :

(a) 0.27 Å (b) 1.27 Å

(c) 2.12 Å (d) 3.12 Å

BITSAT-2013

BCECE-2004

Ans. (c) : Radius of nth orbit hydrogen atom = 0.530Å

Number of excited state = (n) = 2

Atomic number of hydrogen atom (z) = 1

We know that the Bohr radius

$$r = \frac{n^2}{z}\times \text{Radius of atom} = \frac{(2)^2}{1}\times 0.530$$

$$= 4 \times 0.530$$

$$= 2.12 \text{ Å}$$

670. The energy of an electron in second Bohr orbit of hydrogen atom is–

(a) -5.44×10^{-19} eV (b) -5.44×10^{-19} cal

(c) -5.44×10^{-19} kJ (d) -5.44×10^{-19} J

AIIMS 26 May 2019 (Evening)

BITSAT 2017

BCECE-2010

Ans. (d) : For H atom, $E_X = \frac{-13.6z^2}{n^2}eV$

For second orbit, n = 2

z = 1 (for hydrogen)

$\therefore\ E_2 = \frac{-13.6\times(1)^2}{(2)^2} = -\frac{13.6}{4}eV$

$= \frac{-13.6\times1.6\times10^{-19}}{4}$ J

$= -5.44\times10^{-19}$ J

671. The wave number of the spectral line in the emission spectrum of hydrogen will be equal to 8/9 times the Rydberg's constant if the electron jumps from–

(a) n = 3 to n = 1 (b) n = 10 to n = 1

(c) n = 9 to n = 1 (d) n = 2 to n = 1

BCECE-2014

Ans. (a) : wave number, $\bar{\nu} = \frac{1}{\lambda} = R_H\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)$,

where R_H is Rydberg's constant $\frac{8}{9}R_H = R_H\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)$

When, transition is from n_2 = 3 to n_1 = 1 then,

$\bar{\nu} = \frac{1}{\lambda} = R_H\left(\frac{1}{1^2}-\frac{1}{3^2}\right) = \frac{8}{9}.R_H$

672. In hydrogen atom, if energy of an electron in ground state is 13.6 eV, then that in the 2nd excited state is –

(a) –1.51 eV (b) –34 eV

(c) –6.04 eV (d) +13.6 eV

BCECE-2018

Ans. (a) : 2nd excited state means third energy level

$E_3 = \frac{E_1}{3^2} = -\frac{13.6}{9} = -1.51eV$

673. The wave number of the limiting line in Lyman series of hydrogen is 109678 cm^{-1}. The wave number of the limiting line in Balmer series of He^+ would be :

(a) 54839 cm^{-1} (b) 109678 cm^{-1}

(c) 219356 cm^{-1} (d) 438712 cm^{-1}

BITSAT-2014

Ans. (b) : Given that,

R_H = 109678 cm^{-1}

Wave number of the limiting line in Balmer series of He^+

$\bar{\nu} = R_H.Z^2\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right]$

$\bar{\nu} = 109678\times(2)^2\left[\frac{1}{(2)^2}-\frac{1}{\infty}\right]$

$\bar{\nu}$ = 109678 cm^{-1}

674. If the radius of H is 0.53 Å, then what will be the radius of $_3Li^{2+}$?

(a) 0.17 Å (b) 0.36 Å

(c) 0.53 Å (d) 0.59 Å

BITSAT-2012

@apna_pdf

Ans. (a) : We know that,

$$(\text{H-like}) = \frac{r_n(\text{H - atom})\times n^2}{Z}$$

For ground state, n = 1

$$\therefore \quad r_n\left({}_3Li^{2+}\right) = \frac{0.53\times1}{3}$$
$$= 0.17\text{Å}$$

675. The first emission line in the atomic spectrum of hydrogen in the Balmer series appears at

(a) $\frac{9R}{400}cm^{-1}$ (b) $\frac{7R}{144}cm^{-1}$

(c) $\frac{3R}{4}cm^{-1}$ (d) $\frac{5R}{36}cm^{-1}$

BITSAT-2016

Ans. (d) : For Balmer $n_1 = 2$ and $n_2 = 3$;

$$v = R\left(\frac{1}{2^2}-\frac{1}{3^2}\right) = \frac{5R}{36}cm^{-1}$$

The first emission line in the atomic spectrum of hydrogen in the Balmer series appears at $\frac{5R}{36}cm^{-1}$.

676. The wavelength of an electron having kinetic energy equal to 4.55×10^{-25}J is (h=6.6 $\times10^{-34}kgm^2s^{-1}$mass of electron =$9.1\times10^{-31}$kg)

(a) 7.25×10^{-7}nm (b) 725m

(c) 7.25×10^{-7}m (d) 7.25×10^{7}m

CG PET-2011

Ans. (c) : Applying de Broglie wavelength

$$(\lambda) = \frac{h}{\sqrt{2me}}$$

Where, m = mass of electron = 9.1×10^{-31} kg, h = 6.6×10^{-34} kg m^2 s^{-1}

E = K.E. =4.55×10^{-25} J

$$\lambda = \frac{6.6\times10^{-34}}{\sqrt{2\times9.1\times10^{-31}\times4.55\times10^{-25}}}$$

$$= \frac{6.6\times10^{-34}}{9.1\times10^{-28}} = 7.25\times10^{-7}\text{ m.}$$

677. For which of the following species, Bohr theory does not apply?

(a) H (b) He^+

(c) H^+ (d) Li^{2+}

CG PET -2005, AIIMS-2000

Ans. (c) : One of the limitations of Bohr's atomic model is that it does not explain the spectra of multi-electron atoms all these species like H, He^+ and Li^{2+} are iso electronic and have only one electron. Their electronic configurations are same and so their spectra is explained by Bohr's atomic model But H^- has 2 electron.

678. Bohr's radius of 2nd orbit of Be^{3+} is equal to that of

(a) 4th orbit of hydrogen

(b) 2nd orbit of He^+

(c) 3rd orbit of Li^{2+}

(d) first orbit of hydrogen

CG PET -2009

Ans. (d) : Bohr radius for nth orbit = $0.53A\times\frac{n^2}{z}$

Where, z = atomic number

$\therefore$ Bohr radius of 2nd orbit of Be^{3+} =

$$\frac{0.53\times(2)^2}{4} = 0.53\overset{0}{A}$$

(d) Bohr radius of 1st orbit of H = $\frac{0.53\times(1)^2}{1} = 0.53\overset{0}{A}$

Hence, Bohr's radius of 2nd orbit of Be^{3+} is equal to that of first orbit of hydrogen.

679. The IE of hydrogen atom is 13.6 eV. The energy required to remove a electron in the n=2 state of the hydrogen atom is

(a) 27.2eV (b) 13.26eV

(c) 6.8eV (d) 3.4eV

J & K CET-2015

CG PET-2010

Ans. (d) : The ionization energy of hydrogen atom is 13.6 eV energy required to move to second state is,

The change in energy involve in removing the electron from n = 2

$$\Delta E = E_\infty - E(2)$$

$$\Delta E = 0 - \left(\frac{-13.6}{2^2}\right)$$

$$\Delta E = \frac{+13.6}{4}$$

$$\Delta E = 3.4\text{ eV}$$

680. Which one of the following about an electron occupying the 1s-orbital in a hydrogen atoms is incorrect? (The Bohr radius is represented by a_0)

(a) The electron can be found at a distance $2a_0$ from the nucleus.

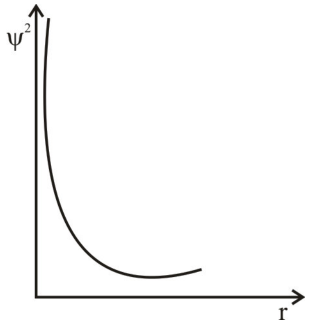
(b) The magnitude of the potential energy is double that of its kinetic energy on an average.

(c) The probability density of finding the electron is maximum at the nucleus.

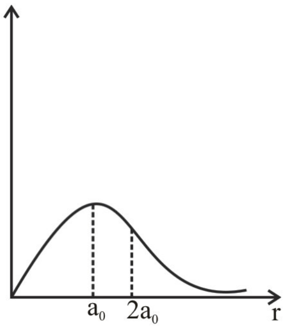
(d) The total energy of the electron is maximum when it is at a distance a_0 from the nucleus.

[JEE Main 2019, 9 April Shift-II]

Ans. (d) : Explanation of point a :



@apna_pdf



The radial propability graph shows that electron in is can be formed at $2a_0$

Explanation of point b, c, d

$E_n = -13.6$

$$E_n = -13.6 \times \frac{z^2}{n^2} e^v \text{ ....(i)}$$

$$K.E. = 13.6 \times \frac{z^2}{n^2} e^v \text{ ....(ii)}$$

$$P.E. = -27.2 \times \frac{z^2}{n^2} e^v \text{ ....(iii)}$$

From (ii) and (iii) equalion, |PEl = l K. E.| and P. E. = $2E_n$

From eq. (i), if n increases; en becomes less negative and vice versa.

So, if n = 1

i.e. when e^- is at distance a_0 from nucleolus En has maximum value.

681. The radius of the second Bohr orbit for hydrogen atom is (Planck's constant (h) = 6.6262×10^{-34} Js; mass of electron = 9.1091×10^{-31} kg; charge of electron (e) = 1.60210×10^{-19} C; permittivity of vacuum ($\in_0$) = 8.854185×10^{-12} $kg^{-1}m^{-3}A_2$)

(a) 1.65Å (b) 4.76Å

(c) 0.529Å (d) 2.12Å

[JEE Main 2017]

Ans. (d) : Radius of n^{th} orbit is–

$$r_n = \frac{0.529n^2}{Z} Å$$

n = 2, Z = 1

$r_2 = 0.53 \times 4$ Å = 2.12 Å

682. Which of the following is the energy of a possible excited state of hydrogen?

(a) +13.6 eV (b) –6.8 eV

(c) –3.4 eV (d) +6.8 eV

[JEE Main-2015]

Ans. (c) : E_1 for H - atom = 13.6 eV

$$E_2 \text{ for H - atom } = -\frac{13.6 \text{ eV}}{2^2} = -3.4 \text{ eV}$$

$$E_3 \text{ for H - atom } = -\frac{13.6}{3^2} \text{eV} = -1.5 \text{ eV}$$

Hence, energy of possible excited state of hydrogen is –3.4 eV.

683. The radius of the second Bohr orbit in terms of the Bohr radius, a_0, in Li^{2+} is

(a) $\frac{2a_0}{3}$ (b) $\frac{4a_0}{3}$

(c) $\frac{4a_0}{9}$ (d) $\frac{2a_0}{9}$

[JEE Main 2020, 8 Jan Shift-II]

Ans. (b) : For 2^{nd} Bohr orbit of Li^{2+},

z = 3, n = 2

$$r = \frac{a_0.n^2}{z}$$

$$= \frac{a_0.(2)^2}{3}$$

$$= \frac{4a_0}{3}$$

684. According to Bohr's atomic theory,

I. kinetic energy of electron is $\propto \frac{Z^2}{n^2}$

II. the product of velocity (v) of electron and principal quantum number (n), 'vn' $\propto Z^2$.

III. frequency of revolution of electron in an orbit is $\propto \frac{Z^3}{n^3}$

IV. coulombic force of attraction on the electron is $\propto \frac{Z^3}{n^4}$

Choose the most appropriate answer from the options given below.

(a) Only III (b) Only I

(c) I, III and IV (d) I and IV

[JEE Main 2021, 24 Feb Shift-II]

Ans. (d) : According to Bohr's theory :

(A) $K.E. = 13.6 \frac{z^2}{n^2} \frac{eV}{atom} \Rightarrow K.E. \propto \frac{z^2}{n^2}$

(B) speed of $e^- \propto \frac{z}{n}$

$\therefore v \times n \propto z$

(C) Frequency of revolution of $e^- = \frac{v}{2\pi r}$

$\therefore$ Frequency $\propto \frac{z^2}{n^3}$

(D) $F \propto \frac{z}{\left(\frac{n^2}{z}\right)^2}$

$F \propto \frac{z^3}{n^4}$

@apna_pdf

685. The kinetic energy of an electron in the second Bohr orbit of a hydrogen atom is equal to $\frac{h^2}{xma_0^2}$. The value of 10× x is ....(a_0 is radius of Bohr's orbit)
(Nearest integer) (Given, $\pi = 3.14$)
[JEE Main 2021, 27 Aug Shift-I]

We know that,

$$K.E. = \frac{1}{2}mv^2 \qquad .....(i)$$

$$mvr = \frac{nh}{2\pi} \rightarrow (\text{Bohr's model})$$

$$(mv)^2 = \frac{n^2h^2}{4\pi^2r^2}$$

$$mv^2 = \frac{1}{m} \times \frac{n^2h^2}{4\pi^2r^2} \qquad .....(ii)$$

Put (ii) in (i)–

$$K.E. = \frac{1}{2} \times \frac{1}{m} \times \frac{n^2h^2}{4\pi^2r^2}$$

Now, $n_0 = 2$, $r_1 = a_0$, $r_2 = a_0 \times (2)^2 = 4a_0$

$$K.E. = \frac{1}{2} \times \frac{2^2h^2}{4\pi^2(4a_0)^2m}$$

$$\Rightarrow \qquad \frac{h^2}{32\pi^2a_0^2m}$$

from question–

$$\frac{h^2}{xma_0^2} = \frac{h^2}{32\pi^2ma_0^2}$$

$$\frac{1}{x} = \frac{1}{32\pi^2}$$

$$x = 32\pi^2$$

$$x = 315.5$$

$$10x = 315.5 \times 10$$

$$= 3155$$

686. Given below are two statements.
Statement-I According to Bohr's model of an atom, qualitatively the magnitude of velocity of electron increases with decrease in positive charges on the nucleus as there is no strong hold on the electron by the nucleus.
Statement-II According to Bohr's model of an atoms, qualitatively the magnitude of velocity of electron increases with decrease in principal quantum number. In the light of the above statements, choose the most appropriate answer from the options given below.
(a) Both statement I and statement II are false.
(b) Both statement I and statement II are true.
(c) Statement I is false but statement II are true.
(d) Statement I is true but statement II is false.
[JEE Main 2021, 26 Aug Shift-I]

Ans. (c) : According to Bohr's model of an atom,

$$V \propto \frac{Z}{n}$$

Z = atomic number of atom, corresponds to the +ve charge so as Z increases velocity increases so statement I is worng.
and as 'n' decreases velocity increases so, statement-II is correct.

687. Given below are two statements.
Statement-I Bohr's theory accounts for the stability and line spectrum of Li^+ ion.
Statement-II Bohr's theory was unable to explain the splitting of spectral lines in the presence of a magnetic field. In the light of the above statements, choose the most appropriate answer from the options given below:
(a) Both statement I and II are true.
(b) Statement I is false but statement II is true.
(c) Both statements I and II are false.
(d) Statement is true but statement II is false.
[JEE Main 2021, 18 March Shift-II]

Ans. (b) : Statement -1 is false since, Bohr's theory accounts for the stability and spectrum of single electronic species (e.g. H_e^+, Li^{2+} etc)
statement – II is true since, Bohr's theory was unable to explain the splitting of spectral lines in the presence of a magnetic field.

688. Bohr model of hydrogen atom was unable to explain
(a) Rydberg's formula of atomic spectra
(b) Heisenberg's uncertainty principle
(c) Planck's law of energy quantization
(d) Rutherford' model of atomic structure
J & K CET-(2012)

Ans. (b) : Bohr model of hydrogen atom could not explain :
(i) de Broglie concept of dual nature of matter and Heisenberg's uncertainty principle.
(ii) the splitting of lines in magnetic and electric field.

689. Energy of one mole of photons of radiation whose frequency is 5×10^{14} Hz is
(a) 199.51 kJ mol^{-1} (b) 189.51 kJ mol^{-1}
(c) 198.51 kJ mol^{-1} (d) 188.51 kJ mol^{-1}
J & K CET-(2014)

Ans. (a) : Given, Frequency $\nu = 5\times10^{14}$ $\because$ Energy of 1 photon, $E = h\upsilon$

$$\therefore \text{ Energy of 1 mole of photon, } E' = N_Ah\upsilon$$

$$= 6.022\times10^{23}\times6.626\times10^{-34}\times5\times10^{14}$$

$$= 199.508\times10^3 J\ mol^{-J} = 199.51\ kJmol^{-1}$$

690. Let the energy of an n^{th} orbit of H atom be $-21.76 \times 10^{-19} / n^2$J. What will be the longest wavelength of energy required to remove an electron from the third orbit?
(a) 0.628 nm (b) 1.326×10^{-7} m
(c) 0.798 pm (d) 0.821 μm
J & K CET-(2017)

@apna_pdf

Ans. (d) : Given, energy of an nth orbit of H atom

$$E = \frac{-21.76\times10^{-19}}{n^2} J$$

We know that,

$$E = \frac{hc}{\lambda} \Rightarrow \lambda = \frac{hc}{E}$$

Where, c = speed of light = 3×10^8m/s

h = Plank's constant = 6.6×10^{-34}

$$\lambda = \frac{6.6\times10^{-34}\times10^8\times n^2}{-21.76\times10^{-19}}$$

For n = 3

$$\lambda = \frac{6.6\times10^{-34}\times3\times10^8\times(3)^2}{-21.76\times10^{-19}}$$

$\lambda = 8.2\times10^{-7} = 0.82\times10^{-6}$ m = 0.82μm

691. With respect to atomic spectrum, each line is the Lyman series is due to electrons returning

(a) from a particular higher energy level to n=3
(b) from a particular higher energy level to n=2
(c) from a particular higher energy level to n=1
(d) from a particular higher energy level to n=4

J & K CET-(2018)

Ans. (c): Lyman series : n = 2, 3, 4, 5 to n = 1

692. What is the maximum no of emission lines obtained when the excited electrons of a hydrogen atom in n=5 drop to ground state?

(a) 10 (b) 5
(c) 12 (d) 15

J & K CET-(2010)

Ans. (a) : Number of emission lines in the spectrum be equal to (n_2–n_1) (n_2–n_1+1) where n_2=5 and n_1=1

$$\therefore \frac{(5-1)(5-1+1)}{2} = \frac{20}{2} = 10 \text{ lines}$$

693. The value of Rydberg constant is

(a) 109678 cm^{-1} (b) 109876 cm^{-1}
(c) 108769 cm^{-1} (d) 108976 cm^{-1}

J & K CET-(2007)

Ans. (a) : Rydberg constant is a physical constant relating to atomic spectra. Denoted by R_∞ for heavy atoms and R_H for hydrogen. value of Rydberg constant is 109678 cm^{-1}.

694. The wavelength of a spectral line in Lyman series, when electron jumping back to 2nd orbit, is

(a) 1162 (b) 1216
(c) 1362 (d) 1176

J & K CET-(2007)

Ans. (b) : $\frac{1}{\lambda} = R_H\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$

For Lyman Series n_1=1, n_2=2

$$\bar{v} = 109\,677 \text{ cm}^{-1}\left(\frac{1}{1^2} - \frac{1}{2^2}\right) = 109677\times\frac{3}{4}\text{ cm}^{-1}$$

$$= 82258 \text{ cm}^{-1}$$

$$\lambda = \frac{1}{\bar{v}} = \frac{1}{82258}\text{cm}^{-1} = 1.216\times10^{-5}\text{cm}$$

$$= 1216\times10^{-8} = 1216\,\text{Å}$$

695. What is the energy (in eV) required to excite the electron from n = 1 to n = 2 state in hydrogen atom? (n = principal quantum number).

(a) 13.6 (b) 3.4
(c) 17.0 (d) 10.2

VITEEE-2012

Ans. (d) : Energy required to excite the electron from n = 1 to n = 2

$$\Delta E = 13.6z^2\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right) = 13.6\times(1)^2\left(\frac{1}{1^2} - \frac{1}{2^2}\right)$$

$$13.6\left(1 - \frac{1}{4}\right) = 13.6\times\frac{3}{4}$$

= 10.2 eV

696. The first emission line in the electronic spectrum of hydrogen in the Balmer series appears at cm^{-1}

(a) 9R/400 cm^{-1} (b) 7R/144 cm^{-1}
(c) 3R/4 cm^{-1} (d) 5R/36 cm^{-1}

J & K CET-(2003)

Ans. (d) :

For Balmer series n_1= 2 and n_2 = 3

For the first line

$$\bar{v} = R\left(\frac{1}{2^2} - \frac{1}{3^2}\right) = R\left(\frac{1}{4} - \frac{1}{9}\right) = \frac{5R}{36}\text{cm}^{-1}$$

697. Which of the following atomic models involve the concept of stationary orbitals?

(a) Bohr's model (b) Thomson model
(c) Rutherford model (d) wave model

J & K CET-(2002)

Ans. (a) : According to Bohr's concept electrons revolve only is those orbits which have a fixed value of energy these orbital are called stationary orbitals.

698. Which of the following value of n_1 in the relationship is $\frac{1}{\lambda} = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$ is correct when $n_2 > n_1$ corresponds to Paschen lines in the Hydrogen spectrum?

(a) 1 (b) 2
(c) 3 (d) 4

J & K CET-(2001)

Ans. (c): The paschen line all lie in the infrared band. This series overlaps with the next (Brackett) series, i.e. the shortest line in the bracket series has a wavelength that falls among the paschen series. For paschen lines in the hydrogen spectrum the value of n is 3.

699. Transition from n=4, 5, 6 to n = 3 in hydrogen spectrum gives

(a) Lyman series (b) Balmer series
(c) Paschen series (d) Pfund series

J & K CET-(2000)

@apna_pdf

Ans. (c) : For Paschen series,

$n_1 = 3,\ n_2 > n_1$, i.e. $n_2 = 4, 5, 6, \ldots\ldots\ldots\infty$

700. According to Bohr's theory of hydrogen atom, which of the following is quantized for an electron?

(a) acceleration (b) velocity
(c) angular momentum (d) angular acceleration

J & K CET-(1997)

Ans. (c) : According to Bohr's theory, electron can move in that circular path around the nucleous, in which the angular momentum of an electron is either $\frac{h}{2\pi}$ or $\frac{nh}{2\pi}$, n=1 ,2 ,3 ……...
So, angular momentum is quantized for the electron.

701. The ionization energy of hydrogen atom in its ground state is -13.12×10^5 J mol^{-1}. The energy of the electron corresponding to the first excited state will be

(a) -42.48×10^5 J mol^{-1}
(b) -26.24×10^5 J mol^{-1}
(c) -6.56×10^5 J mol^{-1}
(d) -3.28×10^5 J mol^{-1}

J & K CET-(1997)

Ans. (d) : First excited state means, n= 2

$$E_2 = \frac{-13.12\times10^5}{2^2}\ \text{J mol}^{-1}$$
$$= -3.28\times10^5\ \text{J mol}^{-1}$$

702. The expression of angular momentum of an electron in a Bohr's orbit is:

(a) $\frac{nh}{3\pi}$ (b) $\frac{nh}{2\pi}$
(c) $\frac{h}{4\pi}$ (d) $\sqrt{l(l+1)}.\frac{h}{2\pi}$

JCECE - 2003

Ans. (b): The expression of angular momentum of an electron in a Bohr's orbit is $\frac{nh}{2\pi}$.

703. Ratio of kinetic energy of hydrogen and helium gas at 300 K is :

(a) 2 : 1 (b) 4 : 5
(c) 1 : 1 (d) 1 : 2

JCECE - 2006

Ans. (c) : We know that,

$$\text{K.E.} = \frac{3}{2}nRT$$

Therefore,

$$\text{K.E.} \propto n$$

or $$\text{K.E.} \propto \frac{w}{M}$$

$$\frac{\text{K.E.}_{H_2}}{\text{K.E.}_{He}} = \frac{M_{He}}{M_{H_2}}$$
$$= \frac{2}{2} = \frac{1}{1}$$

$\text{K.E.}_{H2} : \text{K.E.}_{He} = 1:1$

704. The wavelength of the radiation emitted, when in a hydrogen atom electron falls from infinity to stationary state one, would be (Rydberg constant = 1.097×10^7 m^{-1})

(a) 91 nm (b) 192 nm
(c) 406 nm (d) 9.1×10^{-8} nm

JCECE - 2008

Ans. (a) : $\frac{1}{\lambda} = R_H z^2\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

$$\frac{1}{\lambda} = 1.097\times10^7\times(1)^2\text{m}^{-1}\left(\frac{1}{1^2} - \frac{1}{\infty}\right)$$

Therefore, $\lambda = 91\times10^{-9}$ m

$\lambda = 91$ nm

705. The energy of second Bohr orbit of the hydrogen atom is –328 kJ mol^{-1}; hence the energy of fourth Bohr orbit would be

(a) – 41 kJ mol^{-1} (b) – 1312 kJ mol^{-1}
(c) – 164 kJ mol^{-1} (d) – 82 kJ mol^{-1}

JCECE - 2008, 2012

Ans. (d) : The energy of second Bohr orbit of hydrogen atom (E_2) is –328 kJ mol^{-1} therefore

$$-328 = \frac{E}{2^2} \Rightarrow E_n = -328\times4 = -1312\text{kJ mol}^{-1}$$

$\therefore$ $E_n = \frac{-1312}{n^2}$kJ mol^{-1}

If n = 4,

$\therefore$ $E_4 = -\frac{1312}{4^2}\text{kJ mol}^{-1} = -82\,\text{kJ mol}^{-1}$

706. When an electron in hydrogen spectrum jumps from n = 7 to n = 2, the total number of spectral lines possible are

(a) 21 (b) 15
(c) 5 (d) 9

JCECE - 2016

Ans. (b) : Total number of spectral lines for the transition from n (Higher) → n(lower) will be = $\frac{\Delta n.(\Delta n+1)}{2}$

Where,

Δn = Difference of $n_H - n_L = 7 - 2 = 5$

$\therefore$ Total number of lines $= \frac{5\times6}{2} = 15$

707. An electron is moving in Bohr's fourth orbit. Its de-Broglie wave length is λ. What is the circumference of the fourth orbits?

(a) $\frac{2}{\lambda}$ (b) 2λ
(c) 4λ (d) $\frac{4}{\lambda}$

JIPMER-2014

Ans. (c) : According to Bohr's concept an electron always move in the orbit with angular momentum (mvr) equal to nh/2π

$$mvr = \frac{nh}{2\pi}$$

@apna_pdf

$$r = \frac{n}{2\pi}\left(\frac{h}{mv}\right)$$

$$r = \frac{n\lambda}{2\pi}$$

(From de–Broglie equation, $\lambda = \frac{h}{mv}$)

For fourth orbit (n=4)

$$r = \frac{2\lambda}{\pi}$$

$\therefore$ circumference= $2\pi r = 2\pi \times \frac{2\lambda}{\pi} = 4\lambda$

708. The ratio of the difference in energy between the first and the second Bohr orbit to that between the second and the third Bohr orbit is

(a) 1/2 (b) 1/3

(c) 4/9 (d) 27/5

JIPMER-2012

Ans. (d) : $\Delta E = E_2 - E_1 = \frac{1312}{1^2} - \frac{1312}{2^2} = 1312\left(\frac{3}{4}\right)$

$$= E_3 - E_2 = \frac{1312}{2^2} - \frac{1312}{3^2} = 1312\left(\frac{5}{36}\right)$$

$\therefore E_2 - E_1 : E_3 - E_2 = \frac{3}{4} : \frac{5}{36} = 27:5$

709. Ratio of radii of second and first Bohr orbits of H atom is

(a) 2 (b) 4

(c) 3 (d) 5

JIPMER-2005

Ans. (b) : According to Bohr's rule, $r \propto n^2$

Where r is radii and n is the number of orbit

So, $\frac{r_1}{r_2} = \frac{(2)^2}{(1)^2} = 4$

Hence, ratio of radii is 4.

710. What will be the number of waves formed by a Bohr electron in one complete revolution in its second orbit?

(a) Three (b) Two

(c) One (d) Zero

JIPMER-2016

Ans. (b) : $\text{Number of waves} = \frac{\text{circumference of orbit}}{\text{de – Broglie wavelength of electron}}$

$$\lambda = \frac{h}{mv}$$

$$\mu = \frac{2\pi r}{\frac{h}{mv}} = \frac{2\pi}{h} \times mvr$$

$$mvr = \frac{nh}{2\pi}, \mu = \frac{2\pi}{h} \times \frac{nh}{2\pi}$$

μ= n

For second orbit, n =2

$\therefore$ number of waves,μ = 2

711. If the energies of the two photons in the ratio of 3 : 2, their wavelength will be in the ratio of

(a) 2 : 3 (b) 9 : 4

(c) 3 : 2 (d) 1 : 2

Karnataka-CET-2011

Ans. (a) : $E = \frac{hc}{\lambda}$

$$E \propto \frac{1}{\lambda}$$

$$\frac{E_1}{E_2} = \frac{\lambda_2}{\lambda_1}$$

$$\frac{3}{2} = \frac{\lambda_2}{\lambda_1}$$

$\therefore \lambda_1 : \lambda_2 = 2 : 3$

712. The radius of the first Bohr orbit of hydrogen atom is 0.529Å. The radius of the third orbit of H^+ will be

(a) 8.46Å (b) 0.705Å

(c) 1.59Å (d) 4.29Å

(e) 2.98Å

Kerala-CEE-2007

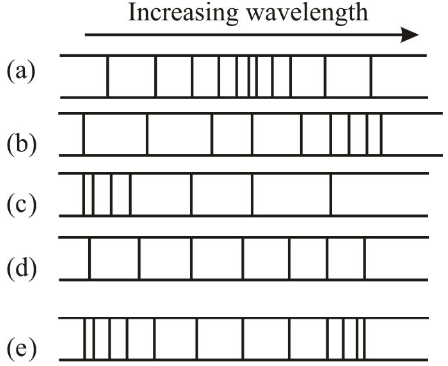
Ans. (d) : According to Bohr model,

Radius of hydrogen atom $(r_n) = \frac{0.529 \times n^2}{z}$ Å

$$r_3 = \frac{0.529 \times (3)^2}{1}$$

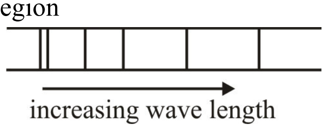
=4.79Å

713. Which diagram best represents the appearance of the line spectrum of atomic hydrogen in the visible region?



Kerala-CEE-2007

Ans. (c) : Line spectrum of atomic hydrogen in the visible region



714. Which transition in the hydrogen atomic spectrum will have the same wavelength as the transition, n = 4 to n = 2 of He^+ spectrum?

(a) n = 4 to n = 3 (b) n = 3 to n = 2

(c) n = 4 to n = 2 (d) n = 3 to n = 1

(e) n = 2 to n = 1

Kerala-CEE-2011

@apna_pdf

Ans. (e) : $\frac{1}{\lambda}=z^2R_H\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right]$

For He^2, $\frac{1}{\lambda}=z^2R_H\left[\frac{1}{2^2}-\frac{1}{4^2}\right]=4\times\frac{3}{16}=\frac{3}{4}$

For H, $\frac{1}{\lambda}=1^2R_H\left[\frac{1}{1^2}-\frac{1}{2^2}\right]=\frac{3}{4}$

Hence, for hydrogen n=2, n=1

715. The ratio of frequency corresponding to the third line in Lyman series of hydrogen atomic spectrum to that of the first line in Balmer series of Li^{2+} spectrum is

(a) $\frac{4}{5}$ (b) $\frac{5}{4}$

(c) $\frac{4}{3}$ (d) $\frac{3}{4}$

(e) $\frac{3}{8}$

Kerala-CEE-2012

Ans. (d) : Lyman series $n_1=1$

For third line of Lyman series, $n_2 = 4$

For hydrogen, z = 1

$$v_H=\frac{c}{\lambda}=c.R_HZ^2\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)$$

$$=cR_H(1)^2\left(\frac{1}{1}-\frac{1}{(4)^2}\right)=\frac{15}{16}R_H\cdot c$$

For lithium, Z = 3

For first line of Balmer series, $n_1 = 2$, $n_2=3$

$$v_{Li^{2+}}=c.R_H(3)^2\left(\frac{1}{(2)^2}-\frac{1}{(3)^2}\right)=c.R_H\times9\times\frac{5}{36}$$

$$=\frac{5}{4}c.R_H$$

$$\frac{v_H}{v_{Li^{2+}}}=\frac{\left(\frac{15}{16}\right)cR_H}{\left(\frac{5}{4}\right)cR_H}=\frac{15}{16}\times\frac{4}{5}=\frac{3}{4}$$

716. The shortest wavelength of the line in hydrogen atomic spectrum of Lyman series when R_H = 109678 cm^{-1} is

(a) 1002.7Å (b) 1215.67 Å

(c) 1127.30 Å (d) 911.7 Å

(e) 1234.7 Å

Kerala-CEE-2014

Ans. (d) : For Lyman series, $n_1=1$ and for shortest wavelength, $n_2=\infty$

$$\therefore \bar{v}=\frac{1}{\lambda}=R_H\left(\frac{1}{1^2}-\frac{1}{\infty^2}\right)=109678\ cm^{-1}$$

$$\lambda=\frac{1}{109678}cm=911.7\times10^{-8}cm=911.7Å$$

717. In the hydrogen atom spectrum, the emission of the least energetic photon taken place during the transition from n= 6 energy level to n = ...energy level.

(a) 1 (b) 3

(c) 5 (d) 4

(e) 2

Kerala-CEE-2016

Ans. (c) : As we move towards outer shell the energy increases but the difference between the successive shalls decreases

$E_2–E_1>E_3–E_2>E_4–E_3$---------

Hence, the emission of least energetic photon takes place during the transition from n=6 energy level to n=5 energy level.

718. The energy of an electron is the 3S orbital (excited state) of H – atom is

(a) – 1.5eV (b) – 13.6eV

(c) – 3.4eV (d) 4.53eV

(e) 4.53eV

Kerala-CEE-2017

Ans. (a) : $E_n=\frac{-13.6}{n^2}eV$

$$E_1=-\frac{13.6\times1}{n^2}eV$$

$$E_n=-\frac{13.6}{(3)^2}eV=-\frac{13.6}{9}=-1.5eV$$

= – 1.51ev (n=3, for 3s–orbital)

719. The shortest wavelength of Paschen series in hydrogen spectrum is 8182 Å. The first member of the Paschen series is nearly.

(a) 15400 Å (b) 12200 Å

(c) 13400 Å (d) 18700 Å

(e) 16700 Å

Kerala-CEE-2020

Ans. (d) : For the calculation of wavelength of spectral lines Rydberg gave a formula,

$$\frac{1}{\lambda}=R_HZ^2\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right]$$

Where, λ = Wavelength

R_H = Rydberg's constant

Z = Atomic number of atom

n_1 and n_2 = integers

$R_H = 1.0973 \times 10^7\ m^{-1}$

$$\frac{1}{\lambda}=1.0973\times10^7\left(\frac{1}{(3)^2}-\frac{1}{(4)^2}\right)$$

$$\frac{1}{\lambda}=1.0973\times10^7\times\frac{7}{16\times9}$$

$$\frac{1}{\lambda}=\frac{16\times9}{7\times1.0973\times107}$$

$$\lambda=\frac{144}{7.6811}\times10^{-7}$$

$\lambda = 18.747 \times 10^{-7}$

$\lambda = 18747 \times10^{-10}$ (∵ $1m = 10^{-10}$ Å)

$\lambda \approx$ 18,800 Å

@apna_pdf

720. In the atomic spectrum of hydrogen, the spectral lines pertaining to electronic transition of n = 4 to n = 2 refers to :

(a) Lyman series (b) Balmer series
(c) Paschen series (d) Brackett series

Manipal-2018

Ans. (b) : In Balmer series, electrons transfer from higher orbits to 2nd orbit.

721. Which of the following statement do not form a part of Bohr's model of hydrogen atom?

(a) Energy of the electrons in the orbits are quantized.
(b) The electron in the orbit nearest the nucleus has the lower energy.
(c) Electrons revolve in different orbits around the nucleus
(d) The position and velocity of the electrons in the orbit cannot be determined simultaneously

NEET-1989

Ans. (d) : According is the Heisenberg uncertainty principle, the position and velocity of the electrons in the orbit cannot be determined simultaneously. This statement is not correct according to Bohr's model because according to Bohr's model it was possible to determine both position and velocity simultaneously.

722. If r is the radius of the first orbit, the radius of nth orbit of H-atom is given by

(a) rn^2 (b) rn
(c) r/n (d) r^2n^2

NEET-1988

Ans. (a) : Radius of nth orbit= r_1n^2 (for H–atom).

723. The energy of an electron in the nth Bohr orbit of hydrogen atom is

(a) $-\frac{13.6}{n^4}eV$ (b) $-\frac{13.6}{n^3}eV$
(c) $-\frac{13.6}{n^2}eV$ (d) $-\frac{13.6}{n}eV$

NEET-1992

Ans.(c): Energy of an electron in n^{th} Bohr orbit of hydrogen atom $(E) = -\frac{13.6}{n^2}eV \quad (Z = 1)$

724. Who modified Bohr's theory by introductin elliptical orbits for electrons path?

(a) Rutherford (b) Thomson
(c) Hund (d) Sommerfeld

NEET-1999

Ans. (d) : Sommerfeld modified Bohr's theory. According to him electrons move in elliptical orbits in addition to circular orbits.

725. The Bohr orbit radius for the hydrogen atom (n =1) is approximately 0.530Å. The radius for the first excited state (n=2) orbit is (in Å)

(a) 4.77 (b) 1.06
(c) 0.13 (d) 2.12

NEET-1998

Ans. (d) : Radius of hydrogen atom = 0.53Å
Number of excited state (n) = 2
Atomic number of hydrogen atom (Z)=1
We know that the Bohr radius.

$$r = \frac{n^2}{Z} \times r_n = \frac{(2)^2}{1} \times 0.530$$
$$= 4 \times 0.530$$
$$= 2.12Å$$

726. In a Bohr's model of an atom, when an electron jumps from n = 1 to n = 3, how much energy will be emitted or absorbed?

(a) 2.389×10^{-12} ergs (b) 0.239×10^{-10} ergs
(c) 2.15×10^{-11} ergs (d) 0.1936×10^{-12} ergs

NEET-1996

Ans. (d) : According to Bohr's model of atom

$$\Delta E = 2.18 \times 10^{-18}\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)J$$
$$= 2.18 \times 10^{-18}\left(\frac{1}{2} - \frac{1}{9}\right)J$$
$$= 1.9 \times 10^{-18} J$$
$$= 1.9 \times 10^{-18} \times 10^7 \text{ erg}$$
$$= 0.19 \times 10^{-10} \text{ erg}$$

727. According to the Bohr theory, which of the following transitions in the hydrogen stom will give the ratio the least energic photon?

(a) n = 6 to n = 1 (b) n = 5 to n = 4
(c) n = 6 to n = 5 (d) n = 5 to n = 3

NEET-Mains 2011

Ans. (c) : We know that

$$\Delta E \propto \left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right], \text{ where } n_2 > n_1$$

∴ n=6 to n=5 will give least energetic photon

728. The energy of second Bohr orbit of the hydrogen atom is –328 kJ mol^{-1}. hence the energy of fourth Bohr orbit would be

(a) –41 kj mol^{-1} (b) –82 kj mol^{-1}
(c) –164 kj mol^{-1} (d) –1312 kj mol^{-1}

NEET-2005

Ans. (b) : Energy of electron in n^{th} orbit of hydrogen

$$E_n = -\frac{E}{n^2}$$

Where E is a constant

$$E_2 = \frac{E}{2^2} = -328 \text{kJ mol}^{-1}$$

E= 4×328 kJ mol^{-1}

$$E_4 = \frac{-E}{4^2} = \frac{-4 \times 328}{16} \text{kJ mol}^{-1}$$
$$= -82 \text{ kJ mol}^{-1}$$

729. The radius of which of the following orbit is same as that of the first Bohr's orbit of hydrogen atom

(a) He^+ (n = 2) (b) Li^{2+} (n = 2)
(c) Li^{2+} (n = 3) (d) Be^{4+} (n = 2)

UP CPMT-2013

@apna_pdf

Ans. (d) : For H-like particles, the radii of the first stationary states are given by the expression

$$r_n = \frac{a_0 n^2}{Z}$$

For H-atom, n = 1 and Z = 1

∴ $r_n = a_0$ = Bohr radius = 52.9 pm.

(a) For He^+ ion, n = 2 and Z = 2

$$\therefore \quad r_n = \frac{a_0(2)^2}{2} = 2a_0$$

(b) For Li^{2+} ion, n = 2 and Z = 3

$$\therefore \quad r_n = \frac{a_0(2)^2}{3} = \frac{4a_0}{3}$$

(c) For Li^{2+} ion, n = 3 and Z = 3

$$\therefore \quad r_n = \frac{a_0(3)^2}{3} = 3a_0$$

(d) For Be^{4+} ion, n = 2 and Z = 4

$$\therefore r_n = \frac{a_0(2)^2}{4} = a_0 \;\; = \text{Bohr radius} = 52.9 \text{ pm}$$

730. Number of spectral lines of Lyman series of electron when it jumps from 6 to first level (in Lyman series), is

(a) 9
(b) 12
(c) 15
(d) 18

UP CPMT-2009

Ans. (c): Number of spectral lines $= \frac{n(n-1)}{2}$

$$= \frac{6(6-1)}{2}$$

$$= 15$$

731. What is the wave number of 4th line in Balmer series of hydrogen spectrum? (R = 1,09,677 cm^{-1})

(a) 24,630 cm^{-1}
(b) 24,360 cm^{-1}
(c) 24,730 cm^{-1}
(d) 24,372 cm^{-1}

UP CPMT-2008

Ans. (d): $\bar{v} = R\left(\frac{1}{n^2_1} - \frac{1}{n^2_2}\right)$

For Balmer series n_1 = 2 and for 4th line in Balmer series $n_2 = 6$

R = 109677 cm^{-1}

$$\bar{v} = 109677\left(\frac{1}{2^2} - \frac{1}{6^2}\right)$$

$$= 109677\left(\frac{1}{4} - \frac{1}{36}\right)$$

$$\bar{v} = 24{,}372 \text{ cm}^{-1}$$

732. What are the values of n_1 and n_2 respectively for H_β line in the Lyman series of hydrogen atomic spectrum?

(a) 3 and 5
(b) 2 and 3
(c) 1 and 3
(d) 2 and 3

UP CPMT-2008

Ans. (c): H_β line is formed when electron jumps from 3rd orbit in Lyman series.

$$n_1 = 1, n_2 = 3$$

733. The energy of second Bohr orbit of the hydrogen atom is – 328 kJ mol^{-1}; hence the energy of fourth Bohr orbit would be

(a) –41kJ mol^{-1}
(b) –1312 kJ mol^{-1}
(c) –164kJ mol^{-1}
(d) –82 kJ mol^{-1}

UPTU/UPSEE-2007

Ans. (d) : Energy of 2nd orbit= –328 kJ/mol

Now, energy of 4th orbit will be $= -\frac{328}{4} = -82 \text{ kJ mol}^{-1}$

734. The wavelength of the radiation emitted, when in a hydrogen atom electron falls from infinity to stationary state, would be (Rydberg constant = 1.097 × 10^7 m^{-1})

(a) 91 nm
(b) 192 nm
(c) 406 nm
(d) 9.1 × 10^{-8} nm

UPTU/UPSEE-2007

Ans. (a) : $\frac{1}{\lambda} = v_H = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

$$= 1.097 \times 10^7\left(\frac{1}{1^2} - \frac{1}{\infty^2}\right)$$

$$= \frac{1}{1.097 \times 10^7} \text{ m} = 9.11 \times 10^{-8} \text{ m}$$

$$= 91.1 \times 10^{-9} \text{ m}$$

$$= 91.1 \text{ nm}$$

735. The radius of hydrogen atom in the ground state is 0.53Å.The radius of Li^{2+} ion (atomic number = 3) in a similar state is:

(a) 0.176Å
(b) 0.30Å
(c) 0.53Å
(d) 1.23Å

UPTU/UPSEE-2014, 2005

Ans. (a) :

Radius of Li^{2+} ion $= r_1 \times \frac{n^2}{z} = 0.53 \times \frac{1^2}{3} = 0.17$ Å

736. For a Bohr atom angular momentum M of the electron is : (n=0,1,2,....)

(a) $\frac{nh^2}{4\pi}$
(b) $\frac{n^2h^2}{4\pi}$
(c) $\frac{\sqrt{nh^2}}{4\pi}$
(d) $\frac{nh}{2\pi}$

UPTU/UPSEE-2005

Ans. (d) : For a Bohr atom, angular momentum m of the electron (mvr) $= \frac{nh}{2\pi}$

737. If an e^- is revolving in the first bohr orbit of a H-atom with a velocity of 2.19 × 10^8 cms^{-1}, what will be the velocity of the e^- in the third orbit of H-atom ?

(a) 2.19 × 10^8 cms^{-1}
(b) 7.3 × 10^7 cms^{-1}
(c) 6.57 × 10^8 cms^{-1}
(d) 1.09 × 10^8 cms^{-1}

UPTU/UPSEE-2018

@apna_pdf

Ans. (b) : The velocity of electron in different orbits is given by the following expression,

$$V_n = V_o \times \frac{z}{n}$$

Given, for first Bohr orbital of H–atom

$V_o = 2.19\times10^8$ cm s^{-1}

∴ the velocity of e– in third orbit of H–atom is (∵ n=3)

$$V_n = 2.19\times10^8\times\ \frac{1}{3}$$

$= 0.73\times10^8$ cm s^{-1}

$= 7.3\times10^7$ cm s^{-1}

738. The radius of which of the following orbit is same as that of the first Bohr's orbit of hydrogen atom?

(a) Li^{2+} (n = 2) (b) Li^{2+} (n = 3)

(c) Be^{3+} (n = 2) (d) He^+ (n = 2)

UPTU/UPSEE-2015

Ans. (c) : $r_n = r_H \times \frac{n^2}{z}$

For Li^{2+} (n=2)

$$r_{Li^{2+}} = r_H \times \frac{(2)^2}{3} = \frac{r_H \times 4}{9}$$

For Li^{2+} (n=3)

$$r_{Li^{2+}} = r_H \times \frac{(3)^2}{3} = 3r_H$$

For Be^{3+} (n=2)

$$r_{Be^{3+}} = r_H \times \frac{(2)^2}{4} = r_H$$

For He^+ (n=2)

$$r_{He^+} = \frac{r_H \times (2)^2}{4} = 2r_H$$

Thus, Be^{3+} (n=2) has same radius as that of the first Bohr's orbit of H–atom.

739. The ratio of the difference in energy between the first and second Bohr orbit to that between the second and third Bohr orbit is

(a) $\frac{1}{2}$ (b) $\frac{1}{27}$

(c) $\frac{4}{9}$ (d) $\frac{27}{5}$

UPTU/UPSEE-2013

Ans. (d) : : $E_1 - E_2 = -13.6 \times Z^2 \left(\frac{1}{1^2} - \frac{1}{2^2}\right)$

$$E_1 - E_2 = -13.6\ \times Z^2 \left(\frac{3}{4}\right) \qquad \text{——— (i)}$$

$$E_2 - E_3 = -13.6\ \times Z^2 \left(\frac{1}{2^2} - \frac{1}{3^2}\right)$$

$$E_2 - E_3 = -13.6\ \times Z^2 \left(\frac{5}{36}\right) \qquad \text{——— (ii)}$$

From eq^n. (i) and (ii)

$$\left(\frac{E_1 - E_2}{E_2 - E_3}\right) = \frac{3\times36}{4\times5} = \frac{27}{5}$$

740. Which one of the following represents the correct ratio of the energy of electron in ground state of H atom to that of the electron in the first excited state of Li^+?

(a) 4:9 (b) 9:4

(c) 1:4 (d) 4:1

UPTU/UPSEE-2011

Ans. (a) : $E_n \propto \frac{Z^2}{n^2}$

For H atom, $E_1 \propto \frac{1^2}{1^2}$ [∵ Z = 1 for hydrogen]

$E_1 = 1$

For Li^+ ion, $E_2 \propto \frac{3^2}{2^2}$ [∵ Z = 3 for Li^+ ion]

$E_2 = \frac{9}{4}$

Thus, E1/E2 = 1 / $\frac{9}{4}$ or 4 : 9

741. What is the energy required to move the electron from ground state of H atom to the first excited state? Given that the ground state energy of H atom is 13.6 eV and that the energy E_n of an electron in nth orbital of an atom or ion of atomic number Z is given by the equation

$E_n = -(13.6Z^2/n^2)$.

(a) 13.6 eV (b) 3.4 eV

(c) 10.2 eV (d) –10.2 eV

UPTU/UPSEE-2011

Ans. (c) : $E_n = \frac{-13.6}{n^2} \times Z^2$

The energy required to move from ground state (n = 1) of H to first excited state (n = 2) is

$$\Delta E = E_2 - E_1 = -13.6\left(\frac{1}{2^2} - \frac{1}{1^2}\right) = 13.6 \times \frac{3}{4} = 10.2 \text{ eV}$$

742. An electron from one Bohr stationary orbit can go to next higher orbit

(a) by emission of electromagnetic radiation

(b) by absorption of any electromagnetic radiation

(c) by absorption of electromagnetic radiation of particular frequency

(d) without emission or absorption of electromagnetic radiation

UPTU/UPSEE-2008

Ans. (c) : According to Bohr's atomic model, if energy is supplied to an electron it may jump from a lower energy level to higher energy level. Energy is absorbed in the form of quanta (or photon)

$$\Delta E = h\nu$$

Where, ν is the frequency.

According to above postulate an electron from one Bohr stationary orbit can go to next higher orbit by the absorption of electromagnetic radiation of particular frequency.

@apna_pdf

743. For the Paschen series the values of n_1 and n_2 in the expression

$$\Delta E = R_H c\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)$$

(a) $n_1=1, n_2=2,3,4,\ldots$ (b) $n_1=2, n_2=3,4,5,\ldots$

(c) $n_1=3, n_2=4,5,6,\ldots$ (d) $n_1=4, n_2=5,6,7,\ldots$

WB-JEE-2009

Ans. (c) : Paschen series is the third series of hydrogen spectrum and lies in the infrared region, therefore for this series, $n_1 = 3$ and $n_2 > n_1$, i.e. 4, 5, 6, ...

744. In Sommerfeld's modification of Bohr's theory, the trajectory of an electron in a hydrogen atom is

(a) a perfect ellipse

(b) a closed ellipse like curve, narrower at the perihelion position and flatter at the aphelion position

(c) a closed loop on a spherical surface

(d) a rosette.

WB-JEE-2010

Ans. (a) : According to Sommerfeld's modification, the trajectory of an electron in a hydrogen atom is a closed ellipse like curve in addition to circular orbits.

745. The electronic transitions from n = 2 to n = 1 will produce shortest wavelength in (Where n = principal quantum state)

(a) Li^{2+} (b) He^+

(c) H (d) H^+

WB-JEE-2011

Ans. (a) : $\frac{1}{\lambda} = Z^2 R_H\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right]$

$n_1 = 1, n_2 = 2$

$$\frac{1}{\lambda} = Z^2 R_H\left[\frac{1}{1}-\frac{1}{4}\right] = \frac{1}{\lambda} = \frac{3}{4}R_H Z^2$$

$$\therefore \lambda \propto \frac{1}{Z^2}$$

Hence, elements having high atomic number will produce shortest wavelength.

746. The energy of an electron in first Bohr orbit of H-atoms is 13.6 eV. the possible energy value of electron in the excited state of Li^{2+} is

(a) -122.4 eV (b) 30.6 eV

(c) -30.6 eV (d) 13.6 eV

WB-JEE-2011

Ans. (c) : $E_n = E_1 \times \frac{Z^2}{n^2}$

E_1 = energy of hydrogen in first orbit

$n = 2, Z = 3$

$$E_n = -13.6 \times \frac{(3)^2}{(2)^2} = -30.6 \text{ eV}$$

747. The emission spectrum of hydrogen discovered first and the region of the electromagnetic spectrum in which it belongs, respectively are

(a) Lyman, ultraviolet (b) Lyman, visible

(c) Balmer, ultraviolet (d) Balmer, visible

WB-JEE-2014

Ans. (d) : Balmar spectrum of hydrogen was discovered first and it lies in the visible region.

748. The time taken for an electrin to complete one revolution in Bohr orbit of hydrogen atom is

(a) $\frac{4m^2\pi r^2}{n^2h^2}$ (b) $\frac{n^2h^2}{4mr^2}$

(c) $\frac{4\pi^2 mr^2}{nh}$ (d) $\frac{nh}{4\pi^2 mr^2}$

WB-JEE-2016

Ans. (c) : We know according to Bohr's theory

$$mvr = \frac{nh}{2\pi}$$

$$V = \frac{nh}{2\pi mr}$$

∴ Time required for one complete revolution

$$T = \frac{2\pi r}{V} = \frac{2\pi r}{nh}\times 2\pi mr = \frac{4\pi^2 mr^2}{nh}$$

749. The energy required to break one mole of hydrogen-hydrogen bonds in H_2 is 436 KJ. What is the longest wavelength of light required to break a single hydrogen- hydrogen bond?

(a) 68.5 nm (b) 137 nm

(c) 274 nm (d) 548 nm

WB-JEE-2016

Ans. (c) : Amount of energy required to break one H-H bond is $\frac{436\times10^3}{6.023\times10^{23}} = \frac{436}{6.023\times10^{20}}$ J mol^{-1}

Now,

$$E = \frac{hc}{\lambda}$$

$$\lambda = \frac{6.626\times10^{-34}\times3\times10^8}{436}\times6.023\times10^{20}$$

$$= \frac{6.626\times6.023\times3}{436}\times10^{-6} = 274 \text{ nm}$$

750. The radius of the first Bohr orbit of a hydrogen atom is 0.53×10^{-8} cm. The velocity of the electron in the first Bohr orbit is

(a) 2.188×10^8 cm s^{-1} (b) 4.376×10^8 cm s^{-1}

(c) 1.094×10^8 cm s^{-1} (d) 2.188×10^9 cm s^{-1}

WB-JEE-2020

Ans. (a) : The formula used for the velocity of electron in Bohr orbit of a hydrogen atom is:

$$V = \frac{nh}{2\pi mr}$$

$$V = \frac{1\times6.6\times10^{-34}}{2\times3.14\times9.1\times10^{-31}\times0.53\times10^{-10}}$$

$$= 2.18\times10^6 \text{ ms}^{-1}$$

@apna_pdf

9. Isobars and Isotopes

751. $\left({}_{32}Ge^{76}, {}_{34}Se^{76}\right)$ **and** $\left({}_{14}Si^{30}, {}_{16}S^{32}\right)$ **are examples of**
(a) isotopes and isobars
(b) isobars and isotones
(c) isotones and isotopes
(d) isobars and isotopes

WB-JEE-2014

Ans. (b) : ${}_{32}Ge^{76}$ and ${}_{34}Se^{76}$ have the same mass number but different atomic number, so they are isobars.
Number of neutrons in ${}_{14}Si^{30} = 30 - 14 = 16$
Number of neutrons in ${}_{16}S^{32} = 32 - 16 = 16$
Because of the presence of some number of neutrons, ${}_{14}Si^{30}$ and ${}_{16}S^{32}$ are called isotones.

752. ${}_{19}K^{40}$ **and** ${}_{20}Ca^{40}$ **are known as**
(a) isotopes (b) isobars
(c) isotones (d) isodiaphers

UP CPMT-2002

Ans.(b): ${}_{19}K^{40}$ and ${}_{20}Ca^{40}$ both have same mass no but different atomic number, are called isobars.

753. Isotopic pair is
(a) ${}_{20}X^{40}$, ${}_{21}Y^{40}$ (b) ${}_{20}X^{40}$, ${}_{20}Y^{41}$
(c) ${}_{40}X^{20}$, ${}_{41}Y^{20}$ (d) None of these

UP CPMT-2005

Ans. (b) : Key Idea: Isotopes are the atoms of same element which have different atomic masses (due to different number of neutrons). They had same atomic numbers.
∴ choice (b) is the correct answer because both (${}_{20}X^{40}$, ${}_{20}X^{41}$) have same atomic number but different atomic mass.

754. O_2 and O_3 are
(a) allotropes (b) isotopes
(c) isomorphs (d) polymorphs

UP CPMT-2010

Ans. (a) : Since, in O_2 and O_3 different numbers of same element i.e. oxygen are present, these are allotropes.
Note. Different crystalline structures, different number of atoms and different nuclear spins all result in allotropy.

755. An isobar of ${}_{20}Ca^{40}$ is
(a) ${}_{18}Ar^{40}$ (b) ${}_{20}Ca^{38}$
(c) ${}_{20}Ca^{42}$ (d) ${}_{18}Ar^{38}$

MHT CET-2008

Ans. (a) : Isobars have same atomic mass but different atomic numbers. Therefore, the isobars of ${}_{20}Ca^{40}$ is ${}_{18}Ar^{40}$.

756. Isotones have
(a) same number of protons
(b) same number of electrons
(c) same number of neutrons
(d) same isotopic mass

UP CPMT-2010

Ans. (c): Species having the same number of neutron but different atomic number as well as atomic mass are called isotones. E.g. ${}^{39}_{18}Ar, {}^{40}_{19}K$.

10. Line Spectrum of Hydrogen

757. The ratio of the shortest wavelength of two spectral series of hydrogen spectrum is found to be about 9. The spectral series are
(a) Lyman and Paschen
(b) Brackett and Pfund
(c) Paschen and Pfund
(d) Balmer and Brackett

[JEE Main 2019, 10 April Shift-II]

Ans. (a) :
$$\frac{\dfrac{1}{\lambda_2} = R_H\left(\dfrac{1}{n_1^2}-\dfrac{1}{n_2^2}\right)Z^2}{\dfrac{1}{\lambda_1} = R_H\left(\dfrac{1}{m_1^2}-\dfrac{1}{m_2^2}\right)Z^2}$$
As for shortest wavelengths both n_2 and m_2 are ∞ and z for H is 1
$$\therefore\ \frac{\lambda_1}{\lambda_2} = 9(\text{given})$$
$$\therefore\ 9 = \left(\frac{m_1}{n_1}\right)^2$$
$$\text{or } \left(\frac{3}{1}\right)^2 = \left(\frac{m_1}{n_1}\right)^2$$
$m_1 = 3$ (lyman)
$n_1 = 1$ (paschen)

758. The shortest wavelength of H atom in the Lyman series is λ_1. The longest wavelength in the Balmer series of He^+ is
(a) $\frac{36\lambda_1}{5}$ (b) $\frac{5\lambda_1}{9}$
(c) $\frac{9\lambda_1}{5}$ (d) $\frac{27\lambda_1}{5}$

[JEE Main 2020, Sep Shift-II]

Ans. (c) : As we know
$$\Delta E = \frac{hc}{\lambda}$$
So, $\lambda = \frac{hc}{\Delta E}$ for λ minimum i.e. shortest; ΔE = maximum For Lyman series n = 1 & for ΔE max.
Transition must be form n = ∝ to n = 1
So,
$$\frac{1}{\lambda} = R_H Z^2 \left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right)$$
$$\frac{1}{\lambda} = R_H Z^2 \ (1-0)$$
$$\frac{1}{\lambda} = R \times (1)^2 \Rightarrow \lambda_1 = \frac{1}{R}$$
For longest wavelength ΔE = minimum for Balmer Series n = 3 to n = 2 will have ΔE = minimum.
for He^+ (Z) = 2

@apna_pdf

So,

$$\frac{1}{\lambda_2} = R_H \times Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

$$\frac{1}{\lambda_2} = R_H \times 4 \left(\frac{1}{4} - \frac{1}{9}\right)$$

$$\frac{1}{\lambda_2} = R_H \times \frac{5}{9}$$

$$\boxed{\lambda_2 = \lambda_1 \times 5/9}$$

759. Match the type of series given in Column I with the wavelength range given in Column II and choose the correct option.

Column I	Column II
A. Lyman	1. Ultraviolet
B. Paschen	2. Near infrared
C. Balmer	3. Far infrared
D. Pfund	4. Visible

Codes

(a) 1 2 4 3 (b) 4 3 1 2

(c) 3 1 2 4 (d) 4 3 2 1

JIPMER-2017

Ans. (a) : The correct match is

(A) → Lyman → (1) Ultraviolet

(B) → Paschen → (2) Near infrared

(C) → Balmer → (4) Visible

(D) → Pfund → (3) Far infrared

760. What is the wave number of 4th line in Balmer series of hydrogen spectrum? (R = 1, 09, 677 cm^{-1})

(a) 24,630 cm^{-1} (b) 24,360 cm^{-1}

(c) 24,730 cm^{-1} (d) 24,372 cm^{-1}

JIPMER-2009

Ans. (d) : $\bar{V} = R\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

For Balmer series n_1= 2 and for 4th line in Balmer series $n_2 = 6$

$$R = 109677\ cm^{-1}$$

$$\bar{V} = 109677\left(\frac{1}{2^2} - \frac{1}{6^2}\right)$$

$$= 109677\left(\frac{1}{4} - \frac{1}{36}\right)$$

$$\bar{V} = 24,372\ cm^{-1}$$

761. What are the values of n_1 and n_2 respectively for H_β line in the Lyman series of hydrogen atomic spectrum 44?

(a) 3 and 5 (b) 2 and 3

(c) 1 and 3 (d) 2 and 4

JIPMER-2009

Ans. (c) : H_β line is formed when electron jumps from 3rd orbit to 1st orbit in Lyman Series

$\therefore n_1 = 1, n_2 = 3$

762. Which is the shortest wavelength line in the Lyman series of the hydrogen spectrum? ($R=1.097\times10^{-2}nm^{-1}$)

(a) 94.21 nm (b) 91.16 nm

(c) 911.6 nm (d) 933.6 nm

JIPMER-2004

Ans. (b) : : For Lyman Series $\frac{1}{\lambda} = R\left(\frac{1}{(1)^2} - \frac{1}{n^2}\right)$

Hence for λ to be smallest n should be greatest

$$\frac{1}{\lambda_{min}} = 1.097\times10^{-2}\left(1 - \frac{1}{\infty 2}\right)$$

$\Rightarrow 1.097 \times 10^{-2}$

or

$$\lambda_{min} = \frac{1}{1.097\times10^{-2}} = 91.16\,nm$$

763. The wave number of the spectral line in the emission spectrum of hydrogen will be equal to $\frac{8}{9}$ times the Radberg's constant if the electron jumps from

(a) n = 3 to n = 1 (b) n = 10 to n = 1

(c) n = 9 to n = 1 (d) n = 2 to n = 1

Karnataka-CET, 2010

Ans. (a) : Wave number of spectral line in emission spectrum of hydrogen,

$$\bar{v} = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right) \quad \ldots (i)$$

Given $\bar{v} = \frac{8}{9}R_H$

On putting the value of $\bar{v}$ in Eq. (i), we get

$$\frac{8}{9}R_H = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

$$\frac{8}{9} = \frac{1}{(1)^2} - \frac{1}{n_2^2}$$

$$\frac{8}{9} - 1 = -\frac{1}{n_2^2}$$

$$\frac{1}{3} = \frac{1}{n_2}$$

$\therefore \quad n_2 = 3$

Hence, electron jumps from $n_2 = 3$ to $n_1 = 1$

764. X-rays are electromagnetic radiation whose wavelengths are the order of:

(a) 1 metre (b) 10^{-1} metre

(c) 10^{-5} metre (d) 10^{-10} metre

NDA (II)-2015

Ans : (d) X-ray are electromagnetic radiation whose wavelength are the order of 10^{-10} meter.

- X-ray are produces when high velocity electron collide with metal plates
- It have shorter wavelength of the electromagnetic spectrum.
- It have capability to travel in vaccum.

@apna_pdf

765. The shortest wavelength in hydrogen spectrum of Lyman series when $R_H = 109678\ cm^{-1}$, is

(a) 1002.7Å (b) 1215.67Å

(c) 1127.30Å (d) 911.7Å

(e) 1234.7Å

Kerala-CEE-2010

Ans. (d) : For Lyman Series, $n_1 = 1$

$$\bar{V} = \frac{1}{\lambda} = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right) = R_H\left(\frac{1}{1^2} - \frac{1}{\infty^2}\right)$$

Or

$$\lambda = \frac{1}{R_H} = \frac{1}{109678 cm^{-1}}$$

$= 911.7 \times 10^{-8}$

$= 911.7Å$

766. What will be the longest wavelength line in Balmer series of spectrum?

(a) 546 nm (b) 656 nm

(c) 566 nm (d) 356 nm

NEET-1996

Ans. (b) : The longest wavelength means that lowest energy. We known that relation for wavelength

$$\frac{1}{\lambda} = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

Here $n_1 = n_2$ $n_2 = 3$

RH is Rydberg constant = 109677 cm^{-1}

$$\frac{1}{\lambda} = 109677\left(\frac{1}{(2)^2} - \frac{1}{(3)^2}\right) = 15233$$

Or

$$\lambda = \frac{1}{15233} = 6.56 \times 10^{-5}\ cm$$

$\Rightarrow 6.56 \times 10^{-7}\ \lambda \Rightarrow 656$ nm

767. The wave number of hydrogen atom in Lymen series is 82200 cm^{-1}. The electron goes from

(a) $n_3 \to n_2$ (b) $n_2 \to n_1$

(c) $n_4 \to n_3$ (d) None of these

UPTU/UPSEE-2013

Ans. (b) : According to Rydberg formula

$$\bar{V} = R\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

Here, R = 109677 = 109678 cm^{-1}

$\bar{V} = 82200\ cm^{-1}$

$$\text{Thus, } \frac{82200}{109678} = \left(\frac{1}{12} - \frac{1}{n_2^2}\right)$$

Or

$$\frac{3}{4} = \left(1 - \frac{1}{n_2^2}\right)$$

$$\frac{1}{n_2^2} = 1 - \frac{3}{4} = \frac{1}{4}$$

Or

$n_2 = 2$

∴ The electron jumps from second orbit (n_2) to ground state (n_1)

768. Splitting of spectrum lines in magnetic field is

(a) Stark effect (b) Raman effect

(c) Zeeman effect (d) Rutherford effect

UPTU/UPSEE-2008

Ans. (c) : Stark effect ⇒ The splitting of spectral lines under the influences of electric field is called stark effect.

Zeeman effect ⇒ The splitting of spectral lines under the influences of magnetic field is called Zeeman effect.

769. Heat treatment of muscular pain involves radiation of wavelength of about 900 nm. Which spectral line of H-atoms is suitable for this purpose? [$R_H = 1\times10^5 cm^{-1}$, $h = 6.6 \times 10^{-34}$ Js, $c = 3 \times 10^8\ ms^{-1}$]

(a) Paschen, 5→3 (b) Paschen, ∞→3

(c) Lyman, ∞→1 (d) Balmer, ∞→2

[JEE Main 2019, 11 Jan Shift-I]

Ans. (b) : $\frac{1}{\lambda} = R_H\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right) = 10^7\left(\frac{1}{3^2} - \frac{1}{\infty}\right)$

$\lambda = 9 \times 10^{-7}$ m

∴ $\lambda = 900$ nm

770. In hydrogen spectrum, the series of lines appearing in ultra violet region of electromagnetic spectrum are called :

(a) Balmer lines (b) Lyman lines

(c) Pfund lines (d) Brackett lines

Manipal-2017

Ans. (b) : Lyman series was found out in the ultraviolet region by Lyman.

Balmer series was found out in the visible region by Balmer.

Bracket series was found out in the infrared region by Brackett.

P fund series was found out in the infrared region by P fund.

11. Filling of Orbital's in atom

771. In a given atom no two electrons can have the same values for all the four quantum numbers. This is called

(a) Hund's Rule

(b) Aufbau principle

(c) Uncertainty principle

(d) Pauli's Exclusion principle

NEET-1991

Ans. (d) : In a given atom no two electrons can have the same values for all the four quantum numbers. This is called Pauli's Exclusion principle.

@apna_pdf

772. Wave nature of electrons was demonstrated by

(a) Schrodinger
(b) de-Broglie
(c) Davisson and Germer
(d) Heisenberg

UP CPMT-2004
J & K CET-(1999)

Ans. (c) : (a) **Schrodinger** He put forward new model of atom by taking into account the de-Broglie concept of dual nature matter and Heisenberg's uncertainly principle. He described the motion of electron in threo dimensional space in the form of mathematical equation known as Schrödinger wave equation.

(b) **de-Broglie** According to him, all the material particles possess wave character as well as particle character.

$$\lambda = \frac{h}{mv} \text{(de - Broglie equation)}$$

Water, λ = Wavelength
h = Planck's constant
m = mass of particle
v = Velocity of particle

(c) **Davisson and Germer** They carried out experiment to show the wave character of electrons. They observed when a beam of electrons is allowed to fall on the surface of nickel crystal are received on photographic plate, a diffraction pattern similar to that of X-rays is obtained. Since, X-rays are electromagnetic rays, it means electrons have wave character also.

(d) **Heisenberg's uncertainty principle** It states that position and momentum of an electron cannot be measured accurately and simultaneously.

$\therefore$ Correct answer is (c) because wave nature of electron is demonstrated by Davission and Germer.

773. The observation that the ground state of nitrogen atom has 3 unpaired electrons in its electronic configuration and not otherwise is associated with:

(a) Pauli's exclusion principle
(b) Hund's rule of maximum multiplicity
(c) Heisenberg's uncertainty principle
(d) Ritz combination principle

JCECE - 2005

Ans. (b) : According to Hund's rule while filling orbital's of a Subshell pairing of electrons does not take place until all the orbitals of the subshell are singly occupied.

774. Hund's rule state that

(a) Number of two e^- can be in two separate orbitals
(b) Number of two e^- can be present with similar spin in a orbital
(c) No e^- can exist in d orbital
(d) None of the above

JIPMER-2019

Ans. (d) : Hund's rule of maximum multiplicity states that, the pairing of electrons in the orbital's of a particular subshell (p, d or f) does not take place until all the orbital of as subshell are singly occupied. Thus all he given statements are not related to Hund's rule.

775. The scientist who proposed the atomic model based one the quantization of energy for the first time was

(a) Max Planck
(b) Neils Bohr
(c) de-Broglie
(d) Heisenberg

J & K CET-(2008)

Ans. (b) : Neils Bohr utilized the concept of quantization of energy (Proposed by max Planck) first time to give a new model of atom.

776. Who used the quantum theory for the first time to explain the structure of atom?

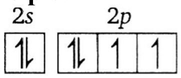
(a) de Broglie
(b) Bohr
(c) Heisenberg
(d) Einstein

J & K CET-(2005)

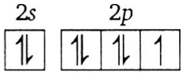
Ans. (b) : To overcome the objections of Rutherford's model and to explain the hydrogen spectrum, Bohr proposed a quantum mechanical model of the atom, which is based on the quantum theory of radiation and the classical laws of physics.

777. Which is not in accordance to aufbau principle?

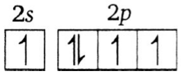
(a)



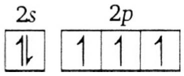
(b)



(c)



(d)



BCECE-2008

Ans. (c) : Aufball principle states that in the ground state of an atom, the orbital with lower energy is filled up first before the filling of the orbital's with a higher energy commences, increasing order of energy of various orbital's is

1s, 2s, 2p, 3s, 4s, 3d, 3p, 5s etc.

778. The Pauli exclusion principle applies to the following option.

(a) H
(b) H^+
(c) H^-
(d) He^+

Manipal-2016

Ans. (c) : Since H has one electron and $H^{\oplus}$ has no electron the Pauli exclusion principle does not apply to them however $H^{\ominus}$ has two electrons; hence this principle applies on it.

779. Select the correct options according to Hund's rule and Pauli exclusion principle.

I.

II.

III.

IV.

Codes :

(a) Both I and II
(b) Both II and III
(c) Both I and III
(d) Both III and IV

Manipal-2016

Ans. (d) : Figure given in option (d) follow the Hund's rule and Pauli exclusion principle.

@apna_pdf

03.

Classification of Elements and Periodicity in Properties

1. Valency and Oxidation State

1. Identify the incorrect statement from the following

(a) Lithium is the strongest reducing agent among the alkali metals.
(b) Alkali metals react with water to form their hydroxides.
(c) The oxidation number of K in KO2 is +4.
(d) Ionisation enthalpy of alkali metals decreases from top to bottom in the group

NEET-17.07.2022

Ans. (c) : The group first is known as alkali metal and show only +1 oxidation state in all of their compound. KO_2 is a superoxide.

The oxidation state of K in KO_2 is –

$x + 2(-1/2) = 0$

$x - 1 = 0$

$x = +1$

So, the oxidation state of K is + 1.

2. The average oxidation number of bromine in Br_3O_8 is

(a) $\frac{16}{3}$ (b) $\frac{4}{3}$
(c) $\frac{3}{4}$ (d) $\frac{5}{2}$
(e) $\frac{8}{3}$

Kerala CEE -03.07.2022

Ans. (a) : Given, Br_3O_8

Let oxidation number of Br is x and we know oxidation number of O is (–2). Then

$3(x) + 8(-2) = 0$

$3x - 16 = 0$

$3x = 16$

$x = \frac{16}{3}$

So, the average oxidation number Br in Br_3O_8 is $\frac{16}{3}$.

3. Given below are statements:

Statement I : The pentavalent oxide of group -15 element, E_2O_5, is less acidic than trivalent oxide, E_2O_3 of the same element.

Statement II : The acidic character of trivalent oxide of group 15 elements, E_2O_3 , decreases down the group.

In light **of** the above statements, choose **most appropriate** answer from the options given below:

(a) Both Statement I and Statement II are true
(b) Both Statement I and Statement II are false
(c) Statement I. true, but Statement II is false
(d) Statement I. false, but Statement II is true

JEE Main-28.06.2022, Shift-I

Ans. (d) : As oxidation no. decreases, Acidic behaviour decreases.

∴ $E_2O_5 : 2x - 10 = 0$
$x = +5$
$E_2O_3 : 2x - 6 = 0$
$x = +3.$

∴ E_2O_5 is more acidic than E_2O_3.

4. Choose the correct stability order of group 13 element in their +1 oxidation state.

(a) Al < Ga < In < Tl (b) Tl < In < Ga < Al
(c) Al < Ga < Tl< In (d) Al < Tl < Ga < In

JEE Main-26.06.2022, Shift-I

Ans. (a) : The correct stability order of group 13 element in their +1 oxidation state is –

Al < Ga < In < Tl

Because, inert pair effect as you moving down the group, the stability of oxidation state the increases while the stability of +3 oxidation state decreases.

5. In which of the following compounds an element exhibits two different oxidation states?

(a) N_2H_4 (b) N_3H
(c) NH_2CONH_2 (d) NH_4NO_3

Karnataka CET-17.06.2022, Shift-II

Ans. (d) : Oxidation States of –

(a) In N_2H_4, the oxidation state of N is (– 2)

$2(x) + 4 = 0$ (oxidation state of H = +1)
$x = -2$

(b) In N_3H, the oxidation state of N is $\left(\frac{-1}{3}\right)$

$3(x) + 1 = 0$ (oxidation state of H = +1)
$x = \frac{-1}{3}$

(c) In NH_2CONH_2, the oxidation state of N is (–3)

$x + 2 + 4 - 2 + x + 2 = 0$
$2x = -6$
$x = -3$

(d) In NH_4NO_3 is breaks into $NH_4^+ \ NO_3^-$.

So, it has two different oxidation states.

In NH_4^+ , the oxidation state of N is –

@apna_pdf

$x + 4 = 1$
$x = -3$

In NO_3^-, the oxidation state of N is –

$x + (-6) = -1$
$x = +5$

Thus the oxidation state of N in NH_4^+, is –3 while in NO_3^-, is +5.

6. Which of the following does not have valence electron in 3d- subshell?

(a) Fe (III) (b) Cr(I)
(c) Mn (II) (d) P(0)

BITSAT-2012
AIIMS-2002

Ans. (d): Phosphorous is not a d-block element. It is an element of P-block of group 15.
Thus cannot have any valence electron in d-subshell.
All other element are d-block elements therefore has valence electron in 3d-subshell
Electronic configuration of these are
Fe(III)= $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 3d^5$
Cr(I)= $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 3d^5$
Mn(II)= $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 3d^5$

7. Identify the element for which electronic configuration in +3 oxidation state is [Ar]$3d^5$.

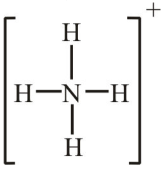
(a) Ru (b) Mn
(c) Co (d) Fe

(JEE Main 2021, 1 Sep Shift-II)

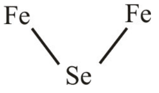
Ans. (d) : The atomic number of Ar is 18 due to presence of electrons in d-orbital's and add 5 electron in the d-orbital. Total number of electrons in X^{3+} is 23. Oxidation means loss of electrons, so +3 charges implies 3 electrons loss by X to form X^{3+}.
Hence, the number of electrons in X = 23 + 3 = 26
Therefore the element is Fe.

8. Which among the following structures does not correctly represent the bonding capacities (valancies) of the atoms involved?

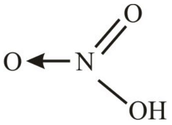
(a)



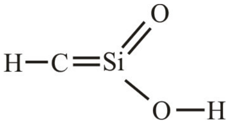
(b)



(c)

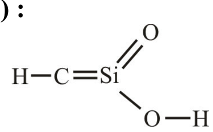


(d)



AP EAPCET-6 Sep. 2021, Shift-II

Ans. (d) :



This structure not correctly represent the bonding capacities i.e. valencies in the atoms involved. because valency of carbon is 4 but one carbon has three bonds and other five.

9. 1 mole of metal 'M' reacts completely with alcohol to give 1.5 moles of H_2. Then what will be the valency of metal 'M'?

(a) 4 (b) 3
(c) 2 (d) 1

GUJCET-2020

Ans. (b) : On the reaction of metal and the alcohol, the metal replace the hydrogen ion of the alcohol, and liberates hydrogen gas.
The reaction can be written as–
$M^{nt} + R - OH \rightarrow (R - O)n\ M + 1/2\ H_2$
If one mole of metal gives 3/2 moles of hydrogen, it can be written as– $M \rightarrow m^{3+} + 3e^-$
Therefore, the valency of metal is 3.

10. Assertion: I_2O_5 is used to detect CO.
Reason: In I_2O_5 the oxidation number of I is 5.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Morning)

Ans. (b): $I_2O_5 + 5CO \rightarrow I_2 + 5CO_2$
Solid iodine pentoxide with gaseous carbon monoxide in the presence of air gives carbon dioxide and solid iodine.
Oxidation state of I in I_2O_5

$2x + 5 \times (-2) = 0$
$2x - 10 = 0$
$x = 5$

11. Which one of the following represents the correct order of electron releasing tendency of metals?

(a) Zn > Cu > Ag (b) Ag > Cu > Zn
(c) Cu > Zn > Ag (d) Cu > Ag > Zn

NDA (II)-2019

Ans : (b) The correct order of electron releasing tendency of metals are–
Ag>Cu>Zn
The tendency of metals to lose electron is determine by their position in electrochemical series.

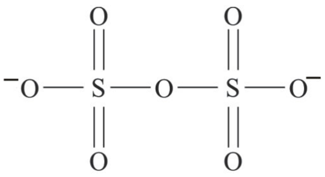
12. Assertion: $S_2O_7^{2-}$ & $Cr_2O_7^{2-}$ both exist.
Reason: Both have same valence electrons.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

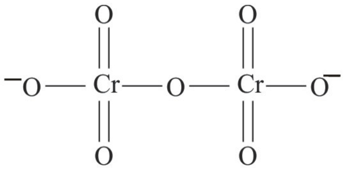
AIIMS 26 May 2019 (Morning)

@apna_pdf

Ans. (a): The structure of $S_2O_7^{2-}$ is–



and the structure of $Cr_2O_7^{2-}$ is–



Both having the same structure and same valence electrons.

13. The element that forms stable compounds in low oxidation state is

(a) Mg (b) Al
(c) Ga (d) Tl

TS EAMCET-2017

Ans. (d) : The element that forms stable compound in low oxidation state is Thallium (Tl) due to inert pair effect, and poor shielding. Increased effective nuclear charge holds the 6s electron tightly.

14. The valency of an element depends upon the

(a) total number of protons in an atom
(b) mass number of an atom
(c) total number of neutrons in an atom
(d) total number of electrons in the outer most shell of an atom

NDA (I)-2017

Ans : (d) The valency of an element depends upon the total number of electrons in the outer most shell of an atoms.

15. Match List-I with List-II and select the correct answer using the code given below the Lists:

List-I (Element)	List-II (Highest Valency)
A. Sulphur	**1. Five**
B. Phosphorous	**2. Six**
C. Lead	**3. Two**
D. Silver	**4. Four**

Code:

	A	B	C	D
(a)	2	4	1	3
(b)	2	1	4	3
(c)	3	1	4	2
(d)	3	4	1	2

NDA (II)-2016

Ans. (b) :

List-I (Element)	List–II (Highest volume)
A. Sulphur	Six
B. Phosphorous	Five
C. Lead	Four
D. Silver	Two

16. Which oxidation state for nitrogen is correctly given ?

	Compound	Oxidation
(a)	NH_3	+ 3
(b)	$[Co(NH_3)_5Cl]$	+ 1
(c)	Mg_3N_2	– 3
(d)	NH_2OH	+ 1

BCECE-2016

Ans. (c) : The oxidation state of nitrogen is

(i) In NH_3
$x + 3(+1) = 0$
$x + 3 = 0$
$x = -3$

(ii) In $[CO(NH_3)_5Cl]$
$+1 + 5[x+3(+1)]-1 = 0$
$5[x+3] = 0$
$x + 3 = 0$
$x = -3$

(iii) In Mg_3N_2
$3(+2) + 2x = 0$
$6 + 2x = 0$
$x = -3$

(iv) In NH_2OH
$x + 2(+1) + (-2) + 1 = 0$
$x + 2 - 2 + 1 = 0$
$x = -1$

17. The number of electrons is the valence shell of the central atom of a molecules is 8. The molecule is

(a) BCl_3 (b) BeH_2
(c) SCl_2 (d) SF_6

AP EAMCET (Engg.) -2014

Ans. (c) : The number of electrons is the valence shell of the central atom of a molecules is 8. The molecule is SCl_2. The central S atom has 2 bond pairs of electrons and 2 lone pairs of electrons.

18. The valency shell of element A contains 3 electrons while the valency shell of element B contains 6 electrons. If A combines with B, the probable formula of the compound formed will be

(a) AB_2 (b) A_2B
(c) A_2B_3 (d) A_3B_2

BITSAT-2014

Ans. (c) : The element A is ns^2np^1 and B is ns^2np^4. They can form compound of the type A_2B_3.

19. Variable valency is a general feature of :

(a) s-block elements (b) p-block elements
(c) d-block elements (d) (b) and (c) both

MPPET-2013

Ans. (c) : Variable valency is the feature of d-block element. Variation in valency is due to participation of (n – 1)d electron in bond formation. d-block elements have empty inner orbitals, the electrons are added to incomplete inner shells.

20. One mole of N_2H_4 loses 10 moles of electrons to form a new compound Z. Assuming that all the nitrogens appear in the new compound, what is the oxidation state of nitrogen in Z? (There is no change in the oxidation state of hydrogen.)

(a) –1 (b) –3
(c) +3 (d) +5

AP EAMCET (Engg.) 2012

Ans. (c) : Given,

$$N_2H_4 - 10e^- \longrightarrow Z^{10+} \ (\text{with two N atoms})$$

Since, total oxidation number of two N atoms in N_2H_4

$$2x + 4 = 0$$
$$2x = -4$$

@apna_pdf

$\therefore$ N_2H_4 Losses 10 e^- so total oxidation number of two N-atoms increases by 10, i.e. the total oxidation number of two N-atoms is

$$Y = -4 + 10 = +6$$

$\therefore$ Oxidation number of each N atom in $Z^{10+} = +3$

21. Which of the following is non-existent?

(a) AlF_6^{3-} (b) CoF_6^{3-}
(c) BF_6^{3-} (d) SiF_6^{2-}

AMU – 2010

Ans. (c) : BF_6^{3-} does not exist because boron does not have d-orbital maximum covalency of B is only 4 as it does not have d-orbital.

AlF_6^{3-}, SiF_6^{2-}, CoF_6^{3-} exist because they have d- orbital in valence shell to expand their valency.

22. The valency of the element having atomic number 9 is

(a) 1 (b) 2
(c) 3 (d) 4

MPPET- 2009

Ans. (a) : The atomic number 9 the atom is fluorine. The electronic configuration of an element of atomic number 9 is 2, 7. It requires one electron to get stable noble gas configuration. Hence, its valency is 1.

23. The oxidation number of O in OF_2 is

(a) –2 (b) +1
(c) +2 (d) –1

BCECE-2009

Ans. (c) : Let the oxidation number of O is x.
In OF_2

$$x + 2(-1) = 0$$
$$x - 2 = 0$$
$$x = +2$$

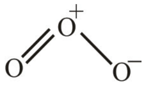
Thus, the oxidation number of O in OF_2 is +2.

24. The oxidation state of oxygen is zero in

(a) CO (b) O_3
(c) SO_2 (d) H_2O_2

CG PET -2007

Ans. (b) : For carbon monoxide, the sum of the individual oxidation number of the constituent atoms must equal the charge on the ion,
Hence, the oxidation number oxygen – 2.
The oxidation number of an oxygen atom in the ozone is zero.



Average oxidation state $= \dfrac{-1+1+0}{3} = 0$

25. The number of electrons in the valence shell of sulphur in SF_6 is:

(a) 12 (b) 10
(c) 8 (d) 11

UPTU/UPSEE-2005

Ans. (a) : The number of electrons in the valence shell of sulphur in SF_6 is 12 because the valency of sulphur is +6 and six fluoxine atoms each having combine to sulphur.

26. Xenon hexafluoride reacts with silica to form a xenon compound X. The oxidation state of xenon in X is :

(a) +2 (b) +4
(c) +6 (d) 0

AP-EAMCET (Engg.)-2004

Ans. (c) : When xenon hexafluoride reacts with silica to form xenon oxytetrafluoride.

$$\underset{\text{Xenonhexafluroide}}{2XeF_6} + \underset{\text{Silica}}{SiO_2} \longrightarrow \underset{\text{Xenonoxytetrafluoride}}{2XeOF_4} + SiF_4$$

$XeOF_4$

Let Oxidation state of Xe in x is.

$$\therefore \quad x - 2 - 4 = 0$$
$$x = +6$$

27. Which of the following element shows maximum valency?

(a) Carbon (b) Barium
(c) Nitrogen (d) Sulphur

UP CPMT-2003

Ans. (d) : Use the number of electrons in valence shell to find the maximum valence shown by the element.

(a) C, atomic number=6, $1s^2, 2s^2, 2p^2$
$\because$ it has 4 electrons in valence shell
$\therefore$ its maximum valency is 4
(b) Barium belongs to group 2 (at. no=56)
$\because$ it has 2 electrons in valence shell
$\therefore$ its maximum valency is 2.
(c) Nitrogen (at. no. 7) = $1s^2, 2s^2, 2p^3$
$\because$ valence shell has 5 electrons
$\therefore$ it can have maximum valency of 5.
(d) Sulphur (at. no. 16) $1s^2, 2s^2, 2p^6, 3s^2, 3p^4$
$\because$ valence shell has 6 electrons
$\therefore$ it can have maximum valency of 6.
$\therefore$ sulphur shows maximum valency among given choices.

28. Which one of the following elements show different oxidation states?

(a) Sodium (b) Fluorine
(c) Chlorine (d) Potassium

AP-EAMCET (Medical), 2001

Ans. (c) : The elements having d-orbital shows different oxidation states. In the given elements only chlorine has vacant d-orbital. So, it can show –1, +1, +3, +5 and +7 oxidation state.

29. Metals having ns^1 as the valence electronic configuration:

(a) are strong oxidizing agents
(b) are highly electronegative
(c) are highly electropositive
(d) have a first ionization potential of more than 10 eV/atom

AP-EAMCET (Med.)-1999

Ans. (c) : If the outer electronic configuration goes to ns^1 valence shell then the metal is belongs to the alkali metal. As we know, alkali metals are more electropositive with low ionization energies in the periodic table. Electropositivity increases down the group in the alkali metal.

@apna_pdf

30. **Which of the following covalent molecules is an exception of octet rule?**
(a) $BeCl_2$ (b) CO_2
(c) H_2O (d) CH_4

AP-EAMCET/1999

Ans. (a): $BeCl_2$ has a covalent molecule. In Beryllium, there are 4 electron in $BeCl_2$. Hence, octet rule is not obeyed in $BeCl_2$.

31. **Which of the following sequence is correct with reference to the oxidation number of iodine?**
(a) $I_2 > ICl < HI < HIO_4$ (b) $HIO_4 < ICl < I_2 < HI$
(c) $I_2 < HI < ICl < HIO_4$ (d) $HI < I_2 < ICl < HIO_4$

AP EAMCET- 1997

Ans. (d) : Let the oxidation number of iodine is x.

(i) In HI	(ii) In I_2
$+1+x = 0$	$x=0$
$x = -1$	
(iii) In ICl	(iv) In HIO_4
$x + (-1) = 0$	$+1 + x + 4(-2) = 0$
$x + 1= 0$	$1 + x - 8 = 0$
$x = +1$	$x - 7 = 0$
	$x = +7$

Hence, According to the increasing oxidation number iodine are -
$HI < I_2 < ICl < HIO_4$

32. **The oxidation state of sodium in sodium amalgam is**
(a) +1 (b) -1
(c) zero (d) +2

AP EAMCET- 1996

Ans. (c) : The formula of sodium amalgam is Na–Hg Sodium amalgam's are mixture not a compound. The oxidation state of metal in sodium. Amalgam is always zero. Hence, the oxidation number of sodium in sodium amalgam is zero.

33. **The oxidation state of iodine in ICl_2^- is**
(a) +1 (b) –1
(c) +2 (d) –3

AP EAMCET- 1995

Ans. (a) : Given the molecule is ICl_2^-.
Let, oxidation state of I is x.
In ICl_2^-
$x + 2(-1) = -1$
$x - 2 = -1$
$x = -1 + 2$
$x = +1$
Hence, the oxidation state of iodine is +1.

34. **The Oxidation number of chlorine in $KClO_3$ is**
(a) +5 (b) -5
(c) +1 (d) -1

AP EAMCET- 1993

Ans. (a) : Given that , $KClO_3$
Let the oxidation number of Cl is x.
We know that, the oxidation state of K is +1, and oxygen is –2.
$\therefore$ In $KClO_3$
$1+X + 3(-2) = 0$
$X - 5=0$
$X = +5$

35. **In which of the following sulphur has the lowest oxidation state?**
(a) H_2SO_4 (b) SO_2
(c) H_2SO_3 (d) H_2S

AP EAMCET- 1993

Ans. (d) :

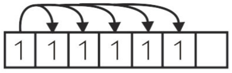
(i) In H_2SO_4	(ii) In SO_2
$2 \times (+1) + x + 4(-2) = 0$	$x + 2(-2) = 0$
$2 + x - 8 = 0$	$-4 + x =0$
$x = + 6$	$x = +4$
(iii) In H_2SO_3	(iv) In H_2S
$2(+1) +x + 3(-2) = 0$	$2(+1) + x = 0$
$+2 + x - 6 = 0$	$2 + x =0$
$x - 4 = 0$	$x= -2$
$x = + 4$	

Hence, In H_2S has the lowest oxidation state of sulphur.

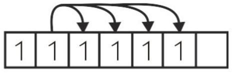
36. **An f-shell containing 6 unpaired electrons can exchange**
(a) 6 electrons (b) 9 electrons
(c) 12 electrons (d) 15 electrons

VITEEE, 2014

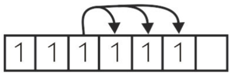
Ans. (d) : The electron with same spin present in the degenerate orbitals tends to exchange their position
The possible exchange of f^6 – configuration



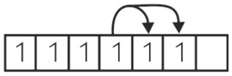
5 exchange by e^-1



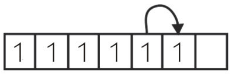
4 exchange by e^-2



3 exchange by e^-3



2 exchange by e^-4



1 exchange by e^-5

Thus, the total exchange of f^6 – configuration is $= 5 + 4 + 3 + 2 + 1 = 15$ electrons.

2. Periodic Laws

37. **The long form of periodic Table is based on**
(a) mass of the atom (b) atomic number
(c) shapes of the atom (d) electronegegativity

CGPET-2012
J&K CET-1998, AIIMS-1994

Ans. (b): The long form (modern periodic table) periodic table is based on the increasing atomic number. The atomic number is the number of protons in the nucleus of an atom. The number of protons define the identity of an element.

38. **Given below are two statements:**
One is labelled as Assertion (A) and the other is labelled as Reason (R).
Assertion (A) Metallic character decreases and non-metallic character increases on moving from left to right in a period.

@apna_pdf

Reason (R) It is due to increase in ionisation enthalpy and decrease in electron gain enthalpy, when one moves from left to right in a period.

In the light of the above statements, choose the most appropriate answer from the options given below.

(a) (A) is false but (R) is true
(b) (A) is true but (R) is false
(c) Both (A) and (R) are correct and (R) is the correct explanation of (A)
(d) Both (A) and (R) are correct but (R) is not the correct explanation of (A)

(JEE Main 2021, 31 Aug Shift-I)

Ans. (b) : Metallic character decreases and non-metallic character increases on moving from left to right in a period due to decrease ionization enthalpy and increase in electron gain enthalpy from left to right in a period.

39. The interaction energy of London forces between two particles is proportional to r^x, where r is the distance between the particles. The value of x is

(a) 3
(b) –3
(c) –6
(d) 6

(JEE Main 2021, 26 Aug. Shift-II)

Ans. (c) : According to London forces, "Greater than Polorisability of the interacting particles greater is the magnitude of interaction energy."

The energy of interaction force $\propto \frac{1}{r^6}$ where, r = distance between particles. The interaction energy of London forces is inversely proportional to sixth power of the distance between two interacting particles.

40. In the modern periodic table the acidic nature of oxides_______.

(a) Increases from left to right and decreases from top to bottom
(b) Decreases from right to left and increases from top to bottom
(c) Remains same across a period and increases from top to bottom
(d) Decreases from left to right and remains the same down the group

AP-EAMCET 25-08-2021 Shift - I

Ans. (a) : Acidic nature increases from left to right and decreases top to bottom in modern periodic table because the electronegativity decreases down the group. Electronegativity is the property of the element to attract electron pairs. When the metal is more electropositive, it has more basic oxide in nature and less in acidic character.

41. The plot of square root of frequency of X-ray emitted against atomic number led to suggestion of which law/rule?

(a) Periodic law
(b) Modern periodic law
(c) Hund's rule
(d) Newland's law

MHT CET-2014

Ans. (b) : Moseley gave the modern periodic law. He showed the atomic number is more fundamental property of an element than its atomic mass.

The square root of the frequency of a line (x-ray spectrum) is related to the atomic number Z.

$\sqrt{\nu} = a\,(z - b)$

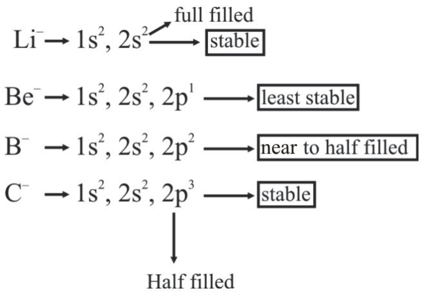
Where, Z = Atomic number
a = Proportionality constant
b = Another constant

42. Identify the least stable ion amongst the following :

(a) Be^-
(b) Li^-
(c) B^-
(d) C^-

MPPET-2013

Ans. (a) :



full filled
$Li^- \rightarrow 1s^2, 2s^2 \rightarrow$ stable
$Be^- \rightarrow 1s^2, 2s^2, 2p^1 \rightarrow$ least stable
$B^- \rightarrow 1s^2, 2s^2, 2p^2 \rightarrow$ near to half filled
$C^- \rightarrow 1s^2, 2s^2, 2p^3 \rightarrow$ stable
Half filled

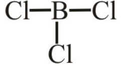
- Be^- is least stable.

43. Which one of the following has incomplete octet?

(a) NH_3
(b) BCl_3
(c) CCl_4
(d) PCl_3

UP CPMT-2012

Ans. (b) : ${}_5B$=2, 3
${}_{17}Cl$=2, 8, 7



In BCl_3, B has 6 electrons.
Therefore, it has incomplete octet.

44. Atomic numbers of elements X,Y and Z are 50, 78 and 60 respectively. these elements are placed in modern long from of Periodic Table respectively in

(a) p- block, d-block and f-block
(b) p-block, d- block and s- block
(c) s- block, p-block and d-block
(d) s-block, d-block and f- block

CG PET- 2011

Ans. (a) : Atomic number x=50 is tin(Sn).
It is an P-block element.
The electronic configuration of tin (Sn) is $[Kr]4d^{10}5s^2sp^2$.
Atomic number y = 78 is platinum (Pt).
It is an d-block element.
The electronic configuration of Platinum (Pt) is $[Xe]4f^{14}5d^96s^1$.
Atomic number z = 60 is neodymium (Nd).
It is an f-block element.
The electronic configuration of Nd is $[Xe]4f^46s^2$.
Therefore, In modern periodic table x, y and z are p-block, d-block and f-block element.

@apna_pdf

45. Which of the following is a wrong statement? In a given period of the Periodic Table, the s-block element has, in general, a higher value of

(a) electronegativity (b) atomic radius
(c) ionisation energy (d) electron affinity

JIPMER-2010

Ans. (b): Atomic radius decrease along the period so, s-block element will have high atomic radius.

- Electron affinity increases along the period so, s-block element will have less electron affinity.
- Electronegativity increases along the period so, s-block element will have less electro-negativity.
- Ionization energy increase along the period so, s-block element will have less Ionization energy.

46. Ortho and para- hydrogen have

(a) Identical chemical properties but different physical properties
(b) identical physical and chemical properties
(c) Identical physical properties but different chemical properties
(d) different physical and chemical properties.

WB-JEE-2010

Ans. (a) : Ortho and para hydrogen are similar in chemical properties but differ in some of the physical properties.

- Melting point of para hydrogen is 13.83k while that of ordinary hydrogen is 13.95k
- Boiling point of para hydrogen is 20.26k while that of ordinary hydrogen is 20.39k.
- The vapour pressure of liquid para hydrogen is higher than that of ordinary liquid hydrogen.

47. In a periodic table the basic character of oxides

(a) increases from left to right and decreases from top to bottom
(b) decreases from right to left and increases from top to bottom
(c) decreases from left to right and increases from top to bottom
(d) decreases from left to right and increases from bottom to top.

WB-JEE-2010

Ans. (c) : In the periodic table, on moving along a period, the tendency to lose electrons decreases and thus, the metallic character decrease since the oxides of non-metal are acidic. Thus, on moving along a period from left to right basic character decrease. While on moving down top to bottom in a group basic character increases due to increase in metallic character.

48. In which one of the following pairs the radius of the second species is greater than that of the first?

(a) Na, Mg (b) O^{2-}, N^{3-}
(c) Li^{+}, Be^{2+} (d) Ba^{2+}, Sr^{2+}
(e) Al, Be

Kerala-CEE-2007

Ans. (b) : O^{2-} and N^{3-} both are isoelectronic but differ in the charge possessed by them as the negative charge increases, the electrons are held less tightly by the nucleus, therefore O^{2-}, N^{3-} have greater the electrons more the repulsion and hence the larger size.

49. Which of the following does not exhibit the periodicity in properties of the elements?

(a) s- block (b) d- block
(c) p- block (d) f- block

CG PET -2005

Ans. (c) : All the periodic properties exhibit regular trends while moving across the period as well as moving down the group but in exactly opposite manner. The n/p ratio does not behave in this manner and hence p-block element not show the periodicity in properties of the element.

50. Which of the following does not exhibit the periodicity in properties of the elements?

(a) Ionisation energy (b) n/p ratio
(c) Electro negativity (d) Atomic radius

CG PET -2005

Ans. (b) : Electron affinity, Electronegativity and atomic radius follow the periodicity in properties of the element but n/p ratio does not behave in this manner. Hence, the n/p ratio does not exhibit the periodicity in properties of the element.

51. The first artificial disintegration of an atomic nucleus was achieved by:

(a) Geiger (b) Wilson
(c) Madam Curie (d) Rutherford

JCECE - 2005

Ans. (d) : The first artificial disintegration is the term coined by Ernest Rutherford, for the process by which an atomic nucleus is broken by bombarding it with high speed alpha particle's either from a particle accelerator or a naturally decaying radioactive substance such as radium.

52. As per the modern periodic law, "the physical and chemical properties of elements are periodic functions of their

(a) Atomic number"
(b) Electronic configuration"
(c) Atomic weight"
(d) Atomic size"

A.P.EAMCET 1998

Ans. (a) : According to modern periodic law, "The physical and chemical properties of the elements are periodic function of their atomic numbers.
Atomic weight is defined as the number of protons and neutrons in an atom. Atomic size is define as the distance between an atom's nucleus and its outermost shell is measured in atomic size.

53. In the long form of Periodic Table, the elements having lowest ionization potential are present in

(a) I group (b) IV group
(c) VII group (d) zero group

A.P.EAMCET 1992

Ans. (a) : The group I of the periodic table, the element is loosely attached to the nucleus, it easily to remove the electron from atom. Hence, the group-I has lowest ionization potential.

54. The law of triads is applicable to a group of

(a) Cl, Br, l (b) C,N,O
(c) Na, K, Rb (d) H,O,N

JEE Main, 24.09.2019

@apna_pdf

Ans. (a): According to the law of triads, in a group of three elements, the average atomic masses of the first and last element would be approximately equal to the atomic mass of middle elements.
Do bereiner also suggested that the law of triads can also be extended for other quantifiable properties such as density of elements.
Bromine must be approximately equal to the average of atomic masses of chlorine and Iodine.
Hence, Cl, Br, I are follow the law of triads.

(3.c) Periodic Classification, Periodic Trends

55. Which of the following electronic configurations corresponds to an inert gas?

(a) $1s^2, 2s^2, 2p^5$ (b) $1s^2, 2s^2, 2p^6$
(c) $1s^2, 2s^1$ (d) $1s^2, 2s^2, 2p^6, 3s^1$

BITSAT-2010
A.P.EAMCET 1993
NEET-1989

Ans. (b) : Inert gas configuration has outermost shell has completely filled. So the option (b) is correct for inert gas configuration.

56. Which of the following pairs has both members from the same period of periodic table :

(a) Na, Ca (b) Na, Cl
(c) Ca, Cl (d) Cl, Br

BITSAT 2010
BCECE-2006

Ans. (b) : $_{11}$Na 2, 8, 1; $_{17}$Cl 2, 8, 7
These have same number of shells. Hence, they are the elements of the same period.

57. Identify the correct order of the size of the following.

(a) $Ca^{2+} < K^+ < Ar < Cl^- < S^{2-}$
(b) $Ar < Ca^{2+} < K^+ < Cl^- < S^{2-}$
(c) $Ca^{2+} < Ar < K^+ < Cl^- < S^2$
(d) $Ca^{2+} < K^+ < Ar < S^{2-} < Cl^-$

NEET-2010, 2007

Ans. (a) : The isoelectronic ions ionic radii of anions is more than that of cations further the size of anion increases with increases in negative charge 4th size of the cation decrease with increases in positive charge.
The increasing of the size of ions are:-
$Ca^{2+} < K^+ < Ar < Cl^- < S^{2-}$

58. Which of the following represents the correct order of increasing electron gain enthalpy with negative sign for the elements O, S, F and Cl?

(a) Cl < F < O < S (b) O < S < F < Cl
(c) F < S < O < Cl (d) S < O < Cl < F

NEET-2010, 2005

Ans. (b) : Electron gain enthalpy generally increases in a period from left to right and decrease from top to bottom in a group of periodic table.
Cl and F are belong to 17 group and O and S are belong to 16 group. Cl has higher electron gain enthalpy than F because the incoming electron experience a greater force of repulsion because of small size of F atom. Similarly, in case of O and S. Thus, the correct order of electron gain enthalpy is-
O < S < F < Cl

59. The set of elements that differ in mutual relationship from those of the other sets is

(a) Li-Mg (b) B-Si
(c) Be-Al (d) Li-Na

(JEE Main 2021, 17 March Shift-II)

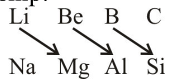
Ans. (d) : Li-Mg, Be-Al and B-Si show as diagonal relationship but Li and Na do not show diagonal relationship as both belongs to some group and not placed diagonally.

60. The set of elements that differ in mutual relationship from those of the other sets is:

(a) Be–Al (b) B-Si
(c) Li-Na (d) Li-Mg

JEE Main 17.03.2021, Shift-II

Ans. (c) : Be-Al, B-Si, Li-Mg have the diagonal relationship whereas Li-Na are of the same group element and have the other properties than diagonal relationship sets. So, Li and Na does not have diagonal relationship.

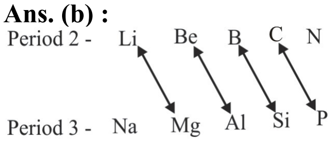


61. From the given pairs of elements, the correct set of elements that does not possess

(a) B – Si, Nb – Ta (b) Li – Al, C – P
(c) Mo – W, B – Si (d) Zr – Hf, Be – Al

TS EAMCET 10.08.2021, Shift-II

Ans. (b) :



62. In general, the properties that decrease and increase down a group in the periodic table, respectively are

(a) electronegativity and atomic radius
(b) electronegativity and electron gain enthalpy
(c) electron gain enthalpy and electronegativity
(d) atomic radius and electronegativity

(JEE Main 2019, 9 Jan Shift-I)

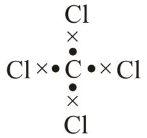
Ans. (a) : Electro negativity is a measure of the tendency of an atom to attract a bonding pair of electron.
On moving to down the group electronegativity decrease and increase down the group atomic radius respectively.
Electron gain enthalpy becomes more negative from left to right in a period.

63. Which of the following has octet around central atom?

(a) PF_5 (b) SF_6
(c) CCl_4 (d) BF_3

JIPMER-2019

Ans. (c) : The molecules that refers to the tendency of an atom to have 8 electrons in the valence shell.



Thus, CCl_4 Molecule has complete the octet around the central atom of chlorine.

@apna_pdf

64. Which statement (s) is (are) false for the periodic classification of elements?

(a) The properties of the elements are the periodic functions of their atomic numbers

(b) Non-metallic elements are lesser in number than the metallic elements

(c) The first ionisation energies of the elements along a period do not vary in a regular manner with increase in atomic number

(d) For transition elements, the d-electrons are filled monotonically with increase in atomic number

(e) Both (c) and (d)

Kerala-CEE-2018

Ans. (d) : For transition elements, the d-electrons are not filled monotonically with increase in atomic number.

The first ionization energy of the element along a period vary in a regular manner with increase in atomic number.

65. An element has [Ar]$3d^1$ configuration in its +2 oxidation state. Its position in the periodic table is

(a) period-3, group - 3 (b) period-3, group - 7

(c) period-4, group - 3 (d) period-3, group – 9

AP-EAMCET – 2016

Ans. (c) : Given that an element with electronic configuration [Ar]$3d^1$ in its + 2 oxidation state.

$\therefore$ The atomic number of element

$= Ar + 1 + 2 = 21$

Thus, the element is Scandium. It belong to 4th period and group - 3

66. Identify the most acidic oxide among the following oxides based on their reaction.

(a) SO_3 (b) P_4O_{10}

(c) Cl_2O_7 (d) N_2O_5

AP-EAMCET (Engg.) 2015

Ans. (c) : On going from left to right in a period, the ionisation energy of element generally increases. Hence, their oxides basic to amphoteric to acidic character.

Oxide of more electronegative atom is more acidic in nature.

The oxidation state of oxygen is –2. Let x be the oxidation state of non metal.

For, SO_3 molecule, $x + (-2)3 = 0$ or $x = +6$

For P_4O_{10} molecule, $4(x) + 10(-2) = 0, x = +5$

For, Cl_2O_7 molecule, $2(x) + 7(-2) = 0$ or $x = +7$

For, N_2O_5 molecule, $2(x) + 5(-2) = 0$ or $x = +5$

67. Assertion: Both Be and Al can form complexes such as BeF_4^{2-} and AlF_6^{3-} respectively, BeF_6^{3-} is not formed.

Reason: In case of Be, no vacant d-orbital's are present in its outermost shell.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS-2015

Ans. (a): Be and Al can form complexes such as BeF_4^{2-} and AlF_6^{3-} respectively, BeF_6^{3-} is not formed due to the absence of vacant d-orbital is not enough orbitals to accommodate extra electrons.

Hence, both asseration and reasons are correct and reason is the correct explanation of the assertion.

68. The element, with atomic number 118, will be

(a) alkali (b) noble gas

(c) lanthanide (d) transition element

BITSAT-2015

Ans. (b) : Electronic configuration of element with atomic number 118 will be [Rn]$5f^{14}6d^{10}$ $7s^27p^6$. Since its electronic configuration in the outermost orbit (ns^2np^6) resemble with that of inert or noble gases, therefore it will be noble gas element.

69. The element with atomic number 117 has not been discovered yet. In which family would you place this element if discovered?

(a) Alkali metals (b) Alkaline earth metals

(c) Halogens (d) Noble gases

AIIMS-2014

Ans. (c): The electronic configuration of the element with atomic number 117 (Rn) $5f^{14}$, $6d^{10}$, $7s^2$, $7p^5$.

This element contains 7 electrons in its outermost shell. So, it belong to VII A (17) group of periodic table. It is a halogen family.

70. The number of elements present in the fourth period is

(a) 32 (b) 8

(c) 18 (d) 2

AP-EAMCET (Engg.) 2013

Ans. (c) : For 4th period

$\therefore$ The orbital in 4th period is = 4s, 3d, 4p

And the no. of electron in the orbit is 2, 10, 6

The number of electron present in the fourth period is 18.

71. The screening effect of d-electrons is

(a) Equal to p-electrons

(b) Much more than p-electrons

(c) Same as f-electrons

(d) Less than p-electrons

BITSAT-2013

Ans. (d) : The screening effect of inner electron of the nucleus is due to decrease in ionization potential, therefore the order of the screening effect is

$f < d < p < s$

Hence, the screening effect of d-election is less than p-electron.

72. Identify the wrong statement in the following.

(a) Amongst isoelectronic species, smaller the positive charge on the cation, smaller is the ionic radius

(b) Amongst isoelectronic species, greater the negative charge on the anion, larger is the ionic radius

@apna_pdf

(c) Atomic radius of the elements increases as on moves down the first group of the periodic table.
(d) Atomic radius of the elements decreases as on moves across from left to right in the 2nd period of the periodic table.

NEET-2012

Ans. (a) : The positive charge on the cation increases, the effective nuclear charge increases. Thus, the atomic size decreases. Since the number of the shell increases, So atomic radius increases. Against isoelectronic species, ionic radius increases with increases in negative charge or decrease in positive charge.

73. Properties of elements are periodic function of number of_______ present in the nucleus.
(a) protons (b) electrons
(c) neutrons (d) mesons.

J & K CET-(2012)

Ans. (a) : Properties of elements are periodic function of number of protons present in the nucleus. Number of protons = number of electrons.

- Physical and chemical properties of elements depend on the number of electrons and their arrangement.

Thus, properties of elements are periodic function of number of protons present in the nucleus.

74. As we move from left to right in the 3d-series elements
(a) electropositive character decreases
(b) electropositive character increases
(c) electropositive character decreases and electronegative character increases
(d) electropositive character increases and electronegative character decreases.

COMEDK-2011

Ans. (c) : As we move in the row from left to right, electrons are added to the 3d subshell to neutralize the increase in the positive charge of the nucleus as the atomic number increase so, we move from left to right in 3d series element electropositive character decrease and electronegative character increases.

75. Beryllium and aluminium exhibit many properties which are similar. But, the two elements differ in
(a) forming covalent halides
(b) forming polymeric hydrides
(c) exhibiting maximum covalency in compounds
(d) exhibiting amphoteric nature in their oxides

BITSAT-2011

Ans. (c) : Beryllium and aluminium are S-block element and P-block element respectively.
Exhibiting maximum covalency in compoundly due to diagonal relationship, Be and Al have many similar properties. However they differ in exhibiting maximum covalency.
Maximum covalency of Be = 4
Maximum covalency of Al = 6
This is due to absence of d-orbital in Be.

76. Number of elements presents in the fifth period of Periodic Table is
(a) 32 (b) 10
(c) 18 (d) 8

JCECE - 2010

Ans. (c) : The fifth period is from rubidium (37) to xenon (54). The last electron enters in 5s, 4d or 5p orbitals. Therefore, the fifth period has (2 + 10 + 6) 18 elements.

77. The effective nuclear charge is equal to
(a) Z – S (b) Z + S
(c) A – Z (d) Z + A

SRMJEEE – 2009

Ans. (a) : The effective nuclear charge is the net positive charge experienced by valence electrons.
Z = atomic number
S = Number of shielding electrons

$$\boxed{Z_{eff} = Z - S}$$

78. Lattice energy of an ionic compound depends upon
(a) charge on the ion only
(b) size of the ion only
(c) charge on the ion and size of the ion
(d) packing of its ions only

AP - EAMCET(MEDICAL) - 2009

Ans. (c) : From the Born-Lande equation–

$$U = \frac{N_A M z^+ z^- e^2}{4\pi \in_0 r}\left(1 - \frac{1}{n}\right)$$

Where, U = Lattice energy of crystal
N_A = Avogadro's number
M = Molecular weight
z^+, z^- = Charge of cation and anion
r = Radius of the atom
n = Exponent

From the above equation it is clear that lattice energy depends upon charge on the ion and size of the ion.

79. Beryllium resembles much with :
(a) Zn (b) Al
(c) Li (d) Ra

BITSAT 2009

Ans. (b) : Beryllium resembles with aluminium due to similarity in the size of ions and similarity in electropositive character. This type of resemblance between first elements of a group in second period with second element of the next group is termed as diagonal relationship.

80. Which of the following properties of lithium does not show diagonal relationship with magnesium?
(a) Formation of Li^+ ion
(b) Formation of Li_3N
(c) Solubility of $LiHCO_3$
(d) Thermal decomposition of Li_2CO_3

CG PET -2009

Ans. (a) : Molecular radius of Li is 60 and Mg^{+2} ion is 65.

- Does not solubility of bicarbonates.
- Format with ion and heat to made Li_2CO^3
- Both Li and Mg combine directly with N_2 to give nitride Li_3N_2 and Mg_3N_2
- Bicarbonates of Li and Mg are more soluble in water than carbonates. Whereas carbonates of alkali metals are more soluble.

@apna_pdf

81. Increase in atomic size down the group is due to–

(a) increase in number of electrons
(b) increase in number of protons and neutrons
(c) increase in number of protons
(d) increase in number of protons, neutrons and electrons

BCECE-2008

Ans. (a) : Increase in atomic size down the group is due to increase in number of electrons.
To accommodate these electrons new shells are added to the atom. These new shells take the outermost electrons farther from the nucleus causing atomic size to increase as we go down the group.

82. On moving from left to right in the second period along the periodic table the gram atomic volume of the element

(a) increases with constant velocity
(b) remains unchanged
(c) first increases and then decreases
(d) decreases

CG PET-2007

Ans. (d) : On moving from left to right in the second period of the periodic table the gram atomic valence of the element decreases.
The atomic valence of noble gases is comparatively larger as they have large Van der Waals radii due to completed valence shell, with all electrons paired which causes greater repulsion.

83. Which of the following elements represents highly electropositive as well as highly electronegative character in its period?

(a) Hydrogen
(b) Nitrogen
(c) Fluorine
(d) None

BITSAT-2007

Ans. (a) : First period has H and He only, out of which He is inert, hence H behaves as a highly electropositive as well as electronegative element.

84. The group of elements in which the differentiating electron enters the antepenultimate shell of atoms are called

(a) *f*-block elements
(b) p-block elements
(c) s-block elements
(d) d-block elements

J & K CET-(2007)

Ans. (a) : The group of elements in which the differentiating electron enters the antepenult-s timate shell of atoms are called f-block elements.
Incase of inner transition elements i.e. f-block elements, the last three shell are namely valence, penultimate and penultimate and penultimate shell are incomplete. The inner transition elements the last shell contains two electrons and the penultimate shell may contain electron more than eight or nine and penultimate shell contains more than 18 upto 32 electrons.

85. Pick out the statement(s) which is (are) not true about the diagonal relationship of Li and Mg:

(i) polarizing powers of Li^+ and Mg^{2+} are almost same
(ii) like Li, Mg decomposes water very fast
(iii) LiCl and $MgCl_2$ are deliquescent
(iv) like Li, Mg do not form solid bicarbonates

(a) (i) and (ii)
(b) (ii) and (iii)
(c) only (ii)
(d) only (i)
(e) (ii) and (iv)

Kerala-CEE-2006

Ans. (c) : The diagonal relationship of Li and Mg of the properties are:-
(i) Polarizing powers of Li^+ and Mg^{2+} are almost same
(ii) Li,Mg decomposes water very fast
(iii) LiCl and $MgCl_2$ are deliquescent
(iv) Li,Mg dose not form solid bicarbonates

86. The cause of diagonal relationship is

(a) Similar electronegativities
(b) Similar ionic or atomic radii
(c) Similar polarizing power of ions
(d) All the three

BITSAT-2006

Ans. (d) : Diagonal relationship is formed due to the identical size of ions, we move forward right across a period in the periodic table then the size of the atom reduces and when we move downward across a group then the size of the atom gradually increases.
- Similar electronegativities
- Similar ionic or atomic radii
- Similar polarizing power of ions

87. Which is responsible for the diagonal relation of lithium with magnesium?

(a) Less ionic radii
(b) High polarising power
(c) Approximately equal electronegativity and affinity
(d) All of the above

CG PET -2006

Ans. (d) : The diagonal relationship of lithium with magnesium are–
- Both have almost similar electro negativity
- Both Li and Mg are quite hard They are harder and lighter than other elements in their receptive group.
- Both Lithium and magnesium have small size and high charge density.
- They are low and almost same. Their ionic radii are similar.

88. Diagonal relationship is for:

(a) Li – Na
(b) Be – Mg
(c) Si – C
(d) B – Si

UPTU/UPSEE-2006

Ans. (d) : Diagonal relationships occur because of the direction in the trends of various properties as you move across or down the Periodic table. Many of the chemical properties of an element are related to the size of the atom.
Diagonal relationship is–
Li and Mg, Be and Al, B and Si etc.

89. The stability of ferric ion is due to :

(a) half filled f - orbitals
(b) half filled d- orbitals
(c) completely filled f- orbitals
(d) completely filled d- orbitals

BCECE-2006

@apna_pdf

Ans. (b) : Ferric ion Fe^{3+} has half filled d-orbital.
The electronic configuration of irons is (Ar) $3d^6\ 4s^2$. So, when we say ferric it mean iron loses three electrons, that is it loses two electron from 2s–orbitals and one electron from 3d orbitals. Therefore, ferric ion has d-orbital is filled by 5 electrons that is half filled and half filled orbitals are stable.

90. Following statements regarding the periodic trends of chemical reactivity of the alkali metals and the halogens are given. Which of these statements give the correct picture?
(a) The reactivity decreases in the alkali metals but increases in the halogens with increase in atomic number down the group
(b) In both the alkali metals and the halogens the chemical reactivity decreases with increase in atomic number down the group
(c) Chemical reactivity increases with increase in atomic number down the group in both the alkali metals and halogens
(d) In alkali metals, the reactivity increases but in the halogens it decreases with increase in atomic number down the group

(AIEEE-2006)

Ans. (d) : In alkali metal, we move top to bottom in a group size increases thus, reactivity increases. But in halogen, the reactivity decrease due to decrease in electronegativity and decrease oxidizing ability due to the inert pair effect atomic radius increases from top to bottom in a group which less the attraction of valence electron of other atoms thus, decreasing reactivity.

91. p-orbital in a given shell can accommodate upto–
(a) four electrons
(b) two electrons with parallel spin
(c) six electrons
(d) two electrons with opposite spin

BCECE-2005

Ans. (c) : Any orbital of any subshell can accommodate a maximum of two electrons with opposite spins. 'P' subshell have 3 orbitals (Px, Py, Pz). Each orbital can accommodate two electrons with opposite spin.

Therefore, P-orbitals in a given shell can accommodate upto six electrons.

92. In the periodic table metallic character of elements shows one of the following trend:
(a) Decreases down the group and increases across the period
(b) Increases down the group and decreases across the period
(c) Increases across the period and also down the group
(d) Decreases across the period and also down the group

JCECE - 2005

Ans. (b) : The effective nuclear charge acting on the valence shell electrons increases across a period, the tendency to lose electrons will decreases. Down the group, the effective nuclear charge experienced by valence electrons decrease because the outer most electrons move further away from the nucleus. Therefore, these can be lost easily.
Hence, metallic character decreases across a period and increase down a group.

93. Which of the following is correct?
(a) The number of electrons present in the valence shell of S in SF_6 is 12
(b) The rates of ionic reactions are very slow
(c) According to VSEPR theory, $SnCl_2$ is a linear molecule
(d) The correct order of ability to form ionic compounds among Na^+, Mg^{2+} and Al^{3+} is $Al^{3+} > Mg^{2+} > Na^+$

AP-EAMCET/2005

Ans. (a)
- The number of electrons present in the valence shell of S in SF_6 is 12. Statement is true.
- The rates of ionic reactions are very fast. Statement is false.
- According, to VSEPR theory, $SnCl_2$ is a bent or V-shaped molecule. Statement is false.
- The correct order of ability to form ionic compounds among Na^+, Mg^{2+} and Al^{3+} is $Na^+ > Mg^{2+} > Al^{3+}$. Statement is false.

94. What is the correct relationship between the pH of isomolar solutions of sodium oxide, Na_2O (pH_1), sodium sulphide, Na_2S (pH_2), sodium selenide, Na_2Se (pH_3) and sodium telluride Na_2Te(pH_4)?
(a) $pH_1 > pH_2 > pH_3 > pH_4$
(b) $pH_1 > pH_2 = pH_3 > pH_4$
(c) $pH_1 > pH_2 < pH_3 < pH_4$
(d) $pH_1 > pH_2 < pH_3 \approx pH_4$

NEET-2005

Ans. (a) : The basicity of these oxides decreases, when placed in water, the basicity of solution also decreases.

$Na_2O + 2H_2O \longrightarrow 2NaOH + H_2O$
$Na_2S + 2H_2O \longrightarrow 2NaOH + H_2S$
$Na_2Se + 2H_2O \longrightarrow 2NaOH + H_2Se$
$Na_2Te + 2H_2O \longrightarrow 2NaOH + H_2Te$

Hence, the order of neutralisation of NaOH is $H_2Te > H_2Se > H_2S > H_2O$.
Their aqueous solution have the following order of basic character due to neutralization of NaOH with–
$Na_2O > Na_2S > Na_2Se > Na_2Te$
or $(pH_1) > (pH_2) > (pH_3) > (PH_4)$

95. Which one shows most pronounced inert pair effect?
(a) Si (b) Sn
(c) Pb (d) C

J & K CET-(2004)

Ans. (c) : Inert pair effect is observed in the elements of group 13 up to group 17. It can be defined as the inability of S electron inheavier P-block elements to participate in bonding. The stability of oxidation states two units less than the maximum oxidation of a group increases down the group.
Inert pair effect is a result at poor shielding of d and f-orbital and filling of electron in Al does not involve any d or f-orbital.
Thus, the Pd is most likely to show innert pair effect.

@apna_pdf

96. The element with atomic number 12 belongs to --- group and --- period.

(a) IA, third
(b) III A, third
(c) II A, third
(d) II A, second

A.P.EAMCET 2001

Ans. (c) : Given $_{12}Z = 1s^2\ 2s^2\ 2p^6\ 3s^2$
The element is Mg, it belongs to the IIA group and third period.

97. The electronic configuration of group XIII elements is

(a) ns^1np^2
(b) ns^2np^3
(c) ns^2np^2
(d) ns^2np^1

A.P.EAMCET 2000

Ans. (d) : The electronic configuration of group III element is $ns^2\ np^1$
e.g- $_{5}B$, $_{13}Al$, $_{31}Ga$, $_{49}In$, $_{81}Tl$, $_{113}Nh$

98. Which of the following is the atomic number of metal?

(a) 32
(b) 34
(c) 36
(d) 38

AIIMS-2000

Ans. (d): The atomic number 38 is metal and name is Strontium, which is s-block element. All elements of s-block are metals.
On moving down the group, the size of the atom increases due to the increase in the number of shells. Because of that the attraction between the nucleus and the valence electrons decreases.

99. Which group of periodic table contains no metal?

(a) IA
(b) IIIA
(c) VIIA
(d) VIII

AIIMS-1999

Ans. (c): The group VII A of halogens such as fluorine, chlorine, bromine, iodine etc.
The word halogen means salt producing so halogen react with metal to form salt and halogen family has no-metals.
Group IA and III A contain mostly metals and group VIII contains transition elements which are metals.

100. Among the following elements that has the lowest first ionization potential is

(a) nitrogen
(b) oxygen
(c) fluorine
(d) neon

A.P.EAMCET 1994

Ans. (b) : $_7N = 1s^2\ 2s^2\ 2p^3$

$_8O = 1s^2\ 2s^2\ 2p^4$

$_9F = 1s^2\ 2s^2\ 2p^5$

$_{10}Ne = 1s^2\ 2s^2\ 2p^6$

Nitrogen has half-filled orbital and Ne has filled orbital it show stable configuration but Oxygen has less stable configuration and less nuclear charge.

101. Which of the following has the smallest size?

(a) Al^{3+}
(b) F^-
(c) Na^+
(d) Mg^{2+}

NEET-1994

Ans. (a) : The size of cation is small then their neutral atom because it has less electrons while its nuclear charge remains the same. So, the nucleus attracts the electron more towards itself and leads to the decrease in size. Al^{3+} ion has smallest size.

- When an atom losses electrons, it results in the formation of positive ion known as cation.
- When an atom gains electrons, it results in the formation of negative ion known as anion.

102. One of the characteristic properties of non-metals is that they

(a) are reducing agents
(b) form basic oxides
(c) form cations by electron gain
(d) an electronegative

NEET-1993

Ans. (d) : Elements with a high electronegativity are generally non-metals and electrical insulators and tend to behave as oxidation in chemical reactions.
Conversely, elements with a low electronegativity are generally metals and good electrical conductor and tend to behave as reductants in chemical reactions.

103. Which one of the following has minimum value of cation/anion ratio?

(a) NaCl
(b) KCl
(c) $MgCl_2$
(d) CaF_2

NEET-1993

Ans. (c) : The given species potassium (K) has the biggest size. The order of the ionic size is $K^+ > Ca^{2+} > Na^+ > Mg^{2+}$.
Hence, the ratio of cation and anion is Mg^{2+}/Cl^- has minimum value of cation/anion ratio.

104. Which of the following sets has strongest tendency to form anions?

(a) Ga, Ni, Tl
(b) Na, Mg, Al
(c) N, O, F
(d) V, Cr, Mn

NEET-1993

Ans. (c) : Non-metal have very strong tendency to form anion whereas metals have tendency to form cation in group of nitrogen, fluorine and oxygen. All elements are non-metals but in other options metal are present. N, O and F are more electronegative element, so they accept electrons more easily and form negative ions.

105. Which of the following has largest size?

(a) Na
(b) Na^+
(c) Na^-
(d) Can't be predicted.

NEET-1993

Ans. (c) : Na^- is the largest because one extra electron is present which is not attracted strongly by the nucleus and no one electron is remove then the cation are always smaller in size.
Hence, the decreasing order of the size of $Na^- > Na > Na^+$.

106. Na^+, Mg^{2+}, Al^{3+} and Si^{4+} are isoelectronic. The order of their ionic size is

(a) $Na^+ > Mg^{2+} < Al^{3+} < Si^{4+}$
(b) $Na^+ < Mg^{2+} > Al^{3+} > Si^{4+}$
(c) $Na^+ > Mg^{2+} > Al^{3+} > Si^{4+}$
(d) $Na^+ < Mg^{2+} > Al^{3+} < Si^{4+}$

NEET-1993

@apna_pdf

Ans. (c) : Atomic radii and atomic size decrease across a period, cations are smaller size. Among isoelectronic ions, the one with the larger positive nuclear charge will have a smaller radius. Hence, the largest species is Na^+ and the smallest one Si^{+4}.
Therefore, the order of their ionic size are–
$Na^+ > Mg^{2+} > Al^{3+} > Si^{4+}$.

107. In the periodic table from left to right in a period, the atomic volume
(a) decrease
(b) increase
(c) remains same
(d) first decrease then increase

NEET-1993

Ans. (d) : In the periodic table the atomic size first decrease from left to right in period, so the atomic volume first decreases and then increase because atomic size in last of any period increases.
The atomic volume of noble gases is comparatively larger as they have large Van der Waals radii due to completed valence shell, with all electrons paired which causes greater repulsion.

3. Atomic and Ionic Radii

108. The correct order of increasing ionic radii is
(a) $Mg^{2+} < Na^+ < F^- < O^{2-} < N^{3-}$
(b) $N^{3-} < O^{2-} < F^- < Na^+ < Mg^{2+}$
(c) $F^- < Na^+ < O^{2-} < Mg^{2+} < N^{3-}$
(d) $Na^+ < F^- < Mg^{2+} < O^{2-} < N^{3-}$

JEE Main-27.06.2022, Shift-II

Ans. (a) : Ionic radii is the distance from the nucleus up to which it has influence on its electron bond.
The ionic radii of isoelectronic species increases with a decreases in the magnitudes of nuclear charge.
So, The correct order of increasing ionic radii is $Mg^{2+} < Na^+ < F^- < O^{2-} < N^{3-}$.

109. Decreasing size of ions is :
(a) $I > I^- > I^+$
(b) $I^- > I > I^+$
(c) $I^+ > I^- > I$
(d) $I > I^+ > I^-$

CG PET -2007, BCECE-2005
MPPET-2000, NEET-1996
PBCET-1986

Ans. (b) : When an atom added electron then the subshell are added and size is increases. When an atom are remove electron then subshell are removed and size is decrease.
So, the decreasing order of size are –
$I^- > I > I^+$

110. The correct sequence which shows decreasing order of the ionic radii of the elements is
(a) $Al^{3+} > Mg^{2+} > Na^+ > F^- > O^{2-}$
(b) $Na^+ > Mg^{2+} > Al^{3+} > O^{2-} > F^-$
(c) $Na^+ > F^- > Mg^{2+} > O^{2-} > Al^{3+}$
(d) $O^{2-} > F^- > Na^+ > Mg^{2+} > Al^{3+}$

JEE Main-04.09.2020, Shift-I
JEE Main-05.09.2020, Shift-II
AIEEE 2010, J&K CET-1997

Ans. (d) :
$$\frac{Z}{e} = \frac{\text{nuclear charge}}{\text{no. of electrons}}$$
When Z/e ratio decrease the size increase for
O^{2-}, $\frac{Z}{e} = \frac{8}{10} = 0.8$
F^-, $\frac{Z}{e} = \frac{9}{10} = 0.9$
Na^+, $\frac{Z}{e} = \frac{11}{10} = 1.1$
Mg^{2+}, $\frac{Z}{e} = \frac{12}{10} = 1.2$
Al^{3+}, $\frac{Z}{e} = \frac{13}{10} = 1.3$
Hence, the decreasing order of ionic radii of the element are–
$$O^{2-} > F^- > Na^+ > Mg^{2+} > Al^{3+}$$

111. The ionic radii (in Å) of N^{3-}, O^{2-}, and F^- respectively are
(a) 1.36, 1.40 and 1.71
(b) 1.36, 1.71 and 1.40
(c) 1.71, 1.40, and 1.36
(d) 1.71, 1.36 and 1.40

CG PET -2018
(JEE Main 2015)
J & K CET-(2003)

Ans. (c) : Z/e increase then the atomic radii decreases. Hence, the ionic radii of N^{3-}, O^{2-} and F^- are 1.71, 1.40 and 1.36 Å respectively.

112. Ionic radii are
(a) inversely proportional to effective number charge
(b) inversely proportional to square of effective nuclear charge
(c) directly proportional to effective nuclear charge
(d) directly proportional to square of effective nuclear charge

JCECE – 2008, NEET-2004
UPTU/UPSEE-2007

Ans. (a) : Ionic radii varies with effective nuclear charge (Z_{eff}) and screening effects.
Ionic radii is inversely proportional to the effective nuclear charge as if the radii increases nuclear attractions decreases gradually.
$$r_{ionic} = \propto \frac{1}{Z_{eff}}$$

113. Due to lanthanoid contraction ……….. elements exhibit similar radii.
(a) Zn and Hg
(b) Zr and Hf
(c) Zr and Y
(d) Ag and Cd

NEET-2021
JCECE - 2018

Ans. (b) : Due to lanthanoid contraction, Zr and Hf elements exhibit similar radii. This contraction came into effect due to the poor shielding of 4f electrons because of the poor shielding effect, the attraction on the electrons by the nucleus increases and hence, radius decreases.

@apna_pdf

114. Which of the following orders of ionic radii is correctly represented?

(a) $H^- > H > H^+$ (b) $Na^+ > F^- > O^{2-}$

(c) $F^- > O^{2-} > Na^+$ (d) $Al^{3+} > Mg^{2+} > N^{3-}$

NEET-2014

Karnataka-CET-2018

Ans. (a) : It is known that the radius of cation is always smaller than that of a neutral atom due to decrease in the number of orbits. Where as the radius of anion is always greater than a cation due to decrease in effective nuclear charge hence, the order are-

$H^- > H > H^+$

115. The increasing order of the atomic radii of the following elements is

(A) C (B) O

(C) F (D) Cl

(E) Br

(a) (A) < (B) < (C) < (D) < (E)

(b) (C) < (B) < (A) < (D) < (E)

(c) (D) < (C) < (B) < (A) < (E)

(d) (B) < (C) < (D) < (A) < (E)

(JEE Main 2020, 8 Jan Shift-II)

JCECE-2008

Ans. (b) : On moving from left to right in period atomic radii decrease and moving from top to bottom in a group atomic radii increases.

$\therefore$ Thus, the increasing order of atomic radii are–

F < O<C < Cl < Br

116. The set representing the correct order of ionic radius is

(a) $Li^+ > Be^{2+} > Na^+ > Mg^{2+}$

(b) $Na^+ > Li^+ > Mg^{2+} > Be^{2+}$

(c) $Li^{2+} > Na^+ > Mg^{2+} > Be^{2+}$

(d) $Mg^{2+} > Be^{2+} > Li^+ > Na^+$

UPTU/UPSEE-2015

(AIEEE 2009)

Ans. (b) : Ionic radii increases when moving down the group and its decrease as the positive charge on the element increases due to effective nuclear charge. In the cation, number of electrons are less than number of protons, hence its effective nuclear charge increase and ionic radii decrease.

The correct order of ionic radii–

$$\underset{95}{Na^+} > \underset{76}{Li^+} > \underset{72}{Mg^{2+}} > \underset{31}{Be^{2+}}$$

Ionic radii (pm)

117. The ionic radii of N^{3-},O^{2-} , F^- and Na^+ follow the order

(a) $N^{3-} > O^{2-} > F^- > Na^+$

(b) $N^{3-} > Na^+ > O^{2-} > F^-$

(c) $Na^+ > O^{2-} > N^{3-} > F^-$

(d) $O^{2-} > F^- > Na^+ > N^{3-}$

UPTU/UPSEE-2012

CG PET -2008, 2007

Ans. (a) : When the isoelectronic species the number of electron is increases the effective nuclear charge decrease and size of ion increase.

$$\text{size of ion} \propto \frac{1}{\text{nuclear charge}}$$

Hence, the order are –

$N^{3-}>O^{2-}> F^-> Na^+$

118. Ce^{3+}, La^{3+}, Pm^{3+} and Yb^{3+} have ionic radii in the increasing order as

(a) $La^{3+} < Ce^{3+} < Pm^{3+} < Yb^{3+}$

(b) $Yb^{3+} < Pm^{3+} < Ce^{3+} < La^{3+}$

(c) $La^{3+} < Ce^{3+} < Pm^{3+} < Yb^{3+}$

(d) $Yb^{3+} < Pm^{3+} < La^{3+} < Ce^{3+}$

[BITSAT-2005]

(AIEEE 2002)

Ans. (b) : Ionic radii decrease on moving along a lanthanide series due to lanthanide contraction. As all ion are in +3 oxidation state.

Thus, the ionic radii follow the trend are–

$Yb^{3+} < Pm^{3+} < Ce^{3+} < La^{3+}$

119. The correct order of ionic radius of nitrogen family is

(a) $N^{3-}<P^{3-} <As^{3-}<Sb^{3-}<Bi^{3-}$

(b) $N^{3-}<P^{3-} <Sb^{3-}$

(c) $P^{3-} =As^{3-}>Bi^{3-}$

(d) $N^{3-}> Bi^{3-}>Sb^{3-}$

Manipal-2020

CG PET- 2015

Ans. (a) : On moving down top to bottom in a group atomic radii increase due to new shell are added.

Thus, the order of ionic radius of nitrogen family are –

$N^{3-} < P^{3-} < As^{3-} < Sb^{3-} < Bi^{3-}$

120. The correct order of radii is

(a) N < Be < B (b) $F^- < O^{2-} < N^{3-}$

(c) Na < Li < K (d) $Fe^{3+} < Fe^{2+} < Fe^{4+}$

BITSAT 2011

J & K CET-(2004)

Ans. (b) : Effective nuclear charge (i.e. Z/e ratio) decreases from F^- to N^{3-}. Hence, the radii follows the order : $F^- < O^{2-} < N^{3-}$. Z/e for F^- = 9/10 = 0.9, for O^{2-} = 8/10 = 0.8, for N^{3-} = 0.7

121. The ions O^{2-}, F^-, Na^+, Mg^{2+} and Al^{3+} are isoelectronic. Their ionic radii show :

(a) A decrease from O^{2-} to F^- and then increase from Na^+ to Al^{3+}

(b) A significant increase from O^{2-} to Al^{3+}

(c) A significant decrease from O^{2-} to Al^{3+}

(d) An increase from O^{2-} to F^- and then decrease from Na^+ to Al^{3+}

BITSAT 2013, NEET-2003

Ans. (c) : Amongst isoelectronic species, ionic radii of anion is more than that of cations. Further size of anion increase with increase in –ve charge and size of cation decrease with increase in +ve charge. Hence, ionic radii decreases from O^{2-} to Al^{3+}.

122. The radii of F, F^- O and O^{2-} are in the order

(a) $O^{2-} > F^- > O > F$ (b) $O^{2-} > F^- > F > O$

(c) $F^- > O^{2-} > F > O$ (d) $O^{2-} > O > F^- > F$

BITSAT 2005

AP EAMCET (Medical) -1998

@apna_pdf

Ans. (a): F, F^-, O and O^{2-} are of the same period. As the number of anions increases of isolated atom, the size of anion increases because of extra addition of electron in outer orbital. The size of anions are in the order–

$$O^{2-} > F^- > O > F$$

123. Which of the following options represents the correct ionic radii in Å of N^{3-}, O^{2-} and F^-, respectively?

(a) 1.71, 1.36 and 1.40 (b) 1.36, 1.40 and 1.71
(c) 1.71, 1.40 and 1.36 (d) 1.40, 1.36 and 1.71

TS-EAMCET (Engg.), 06.08.2021

Ans. (c):

Species (ion)	–	Ionic radii (Å)
N^{3-}	–	1.71
O^{2-}	–	1.40
F^-	–	1.36

124. The ionic radius of Na^+ ions is 1.02 Å. The ionic radii (in Å) of Mg^{2+} and Al^{3+}, respectively, are

(a) 1.05 and 0.99 (b) 0.72 and 0.54
(c) 0.85 and 0.99 (d) 0.68 and 0.72

[JEE Main-2021, 18 March Shift-I]

Ans. (b) : Radius (r) $\propto \frac{1}{Z_{\text{effective}}}$

Where Z = Atomic number

Na^+ Mg^{2+} Al^{3+}
Z = 11 Z = 12 Z = 13

Each have 10 electron.

Therefore, the ionic radii of Mg^{2+} and Al^{3+} are 0.72 and 0.54 respectively.

125. Effective nuclear charge is Maximum in case of______

(a) Lithium (b) Beryllium
(c) Oxygen (d) Fluorine

AP EAPCET 24.08.2021 Shift-II

Ans. (d) : On going from left to right in a period effective nuclear charge is maximum. So, the fluorine (F) has maximum effective nuclear charge.

The effective nuclear charge is the net positive charge experienced by valence electrons.

$$Z_{\text{eff.}} = Z - S$$

Where Z = Atomic number
S = Number of shielding electrons.

126. Which among the following property increases, as we move down group–I of the periodic table?

(a) Electronegativity (b) Ionic radius
(c) Melting point (d) Ionization enthalpy

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (b) : In periodic table when we move down the group ionic radius increases due to the formation of new shells. As atomic number increases, the number of shells increases that's why atomic radius of ionic radius also increases.

127. Among the following ions, the one with the highest value of ionic radius is

(a) O^{2-} (b) Mg^{2+}
(c) L^+ (d) L^-

TS EAMCET 10.08.2021, Shift-II

Ans. (a) : decreasing order of ionic radius of given species is–

$$O^{2-} > F^- > Li^+ > Mg^{+2}$$

On increasing –ve charge among the electronic species, ionic radius increases.

128. Identify the correct order of ionic radii of the given species:

(a) $Mn^{7+} > V^{5+} > Sc^{3+} > K^+ > S^{2-}$
(b) $S^{2-} > K^+ > Sc^{3+} > V^{5+} > Mn^{7+}$
(c) $S^{2-} > K^+ > V^{5+} > Sc^{3+} > Mn^{7+}$
(d) $K^+ > S^{2-} > Sc^{3+} > V^{5+} > Mn^{7+}$

AP EAPCET 25.08.2021, Shift-II

Ans. (b) : Ionic radii is the distance between the nucleus and the electron in the outermost shell of an ions. Increasing the electron on an atom, increases the ionic radii. Decrease the e^- on an atom will be decrease ionic radii. So the order is–

$$S^{2-} > K^+ > Sc^{3+} > V^{5+} > Mn^{7+}$$

129. Assertion (A) : Beryllium and aluminum forms Be F_4^{2-} and Al F_6^{3-} Reason(R) : Both B^{2+} and Al^{3+} have almost same ionic radius

The correct option among the following is

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET 10.08.2021, Shift-I

Ans. (a) : Beryllium and aluminum forms BeF_4^{-2} and AlF_6^{3-} and Be^{+2} and Al^{+3} have almost same ionic radius due to about same electronegativity, polarizing power and charge/radius radio, of their ion.

130. Which among the following compound shows the highest lattice energy?

(a) LiF (b) CsF
(c) NaF (d) KF

AP EAPCET 23-08-2021 Shift-I

Ans. (a) : According to Born-Lande equation-

$$U = \frac{N_A M z^+ z^- e^2}{4\pi\varepsilon_0 r}\left(1 - \frac{1}{n}\right)$$

Lattice energy is inversely proportional to radius of ion. So, smaller the size of ions, larger the magnitude of charges, and having the highest lattice energy. Hence, LiF has maximum lattice energy.

131. The ions S^{2-}, Cl^-, K^+, Ca^{2+} are iso-electronic. Their ionic radii show______

(a) A decrease from S^{2-} to Cl^- and then increase from K^+ to Ca^{2+}
(b) An increase from S^{2-} to Cl^- and then decrease from K^+ to Ca^{2+}
(c) A significant decrease from S^{2-} to Ca^{2+}
(d) A significant increase from S^{2-} to Ca^{2+}

AP EAPCET 23-08-2021 Shift-I

Ans. (c) : The ions S^{2-}, $C\ell^-$, K^+, Ca^{2+} are iso-electronic and their ionic radii decreases S^{2-} to Ca^{2+} respectively.

Hence, correct option is (c).

@apna_pdf

132. The ionic radii of F^- and O^{2-} respectively are 1.33 Å and 1.4 Å while the covalent radius of N is 0.74Å. The correct statement for the ionic radius of N^{3-} from the following is

(a) it is smaller than F^- and N
(b) it is bigger than O^{2-} and F^-
(c) it is bigger than F^- and N, but smaller than of O^{2-}
(d) it is smaller than O^{2-} and F^-, but bigger than of N

(JEE Main 2021, 25 July Shift-II)

Ans. (b) : The ionic radii of F^- and O^{2-} respectively are $1.33\ \overset{o}{A}$ and $1.4\ \overset{o}{A}$ while the covalent radius of N is $0.74\ \overset{o}{A}$, the ionic radius of N^{3-} is bigger than O^{2-} and F^-. The increasing order of ionic radii are $F^- < O^{2-} < N^{3-}$.

133. The correct order of ionic radii for the ions, P^{3-}, S^{2-}, Ca^{2+}, K^+, Cl^- is

(a) $P^{3-} > S^{2-} > Cl^- > K^+ > Ca^{2+}$
(b) $Cl^- > S^{2-} > P^{3-} > Ca^{2+} > K^+$
(c) $P^{3-} > S^{2-} > Cl^- > Ca^{2+} > K^+$
(d) $K^+ > Ca^{2+} > P^{3-} > S^{2-} > Cl^-$

(JEE Main 2021, 27 Aug Shift-II)

Ans. (a) : For the isolectronic species ionic radii increases on adding the electron in shell are increase but the on removing the electron the ionic radii decreases. Hence, the decreasing order of ionic radii are–

$$P^{3-} > S^{2-} > Cl^- > K^+ > Ca^{2+}$$

134. In general, the property (magnitudes only) that shows an opposite trend in comparison to other properties across a period is

(a) electronegativity
(b) electron gain enthalpy
(c) ionisation enthalpy
(d) atomic radius

(JEE Main 2020, 2 Sep Shift-I)

Ans. (d) : Electronegativity, Electron gain enthalpy and Ionisation enthalpy increases across a period but atomic radius decreases.

135. The difference between the radii of 3rd and 4th orbits of Li^{2+} is ΔR_1. The difference between the radii of 3rd and 4th orbits of He^+ is ΔR_2. Ratio $\Delta R_1 : \Delta R_2$ is

(a) 3 : 2 (b) 8 : 3
(c) 2 : 3 (d) 3 : 8

[JEE Main 2020, 5 Sep Shift-I]

Ans. (c) : Given that

$$\Delta R_1 = (R_4 - R_3)_{Li} + 2 = \frac{0.529}{3}(4^2 - 3^2)$$
$$= \frac{0.529}{3} \times 7$$
$$\Delta R_2 = (R_4 - R_3)_{He} + 2 = \frac{0.529}{2}(4^2 - 3^2)$$
$$= \frac{0.529}{2} \times 7$$
$$\therefore \frac{\Delta R_1}{\Delta R_2} = \frac{0.529 \times 7}{3} \times \frac{2}{0.529 \times 7} \text{ or } \frac{\Delta R_1}{\Delta R_2} = \frac{2}{3}$$

136. Two metals A and B having similar ionic radii, react with oxygen to give only monoxides and react with nitrogen to give nitrides. Then, A and B respectively are

(a) Li and Na (b) Na and Ca
(c) Li and Mg (d) Na and Be

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (c) : Li^+ among group - 1 metals and Mg^{2+} of group - 2 metals have similar ionic radii, because they are diagonally present in the periodic table. The stable monoxides (only) of Li and Mg are Li_2O and MgO respectively.

137. The atomic radius of Ag is closest to

(a) Hg (b) Au
(c) Ni (d) Cu

(JEE Main 2020, 7 Jan Shift-I)

Ans. (b) : The atomic radius of Ag is closest to Au because of lanthanide contraction, an increase in effective nuclear charge and so, the size of Au instead of being greater as is expected turns out be similar to that of Ag.

138. Which of the following statement is correct about "shielding effect" ?

1. It is effective, when the orbitals in the inner shells are completely filled.
2. Inner shells do not show any effect.
3. With increase of shielding down the group, ionisation energy increases.
4. With increasing nuclear charge, the shielding effect increases.

(a) 1 (b) 2
(c) 3 (d) 4

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (a) : 1. Shielding effect is effective, when orbitals in the inner shells are completely filled. So, statement (1) is correct.

2. Inner shells are show effect. So, statement 2 is incorrect.
3. Shielding effect as well as ionisation energy decrease down the group. So, statement 3 is incorrect.
4. With increase in nuclear charge, shielding effect decreases. So, statement 4 is incorrect.

139. Find the correct order of the given elements with respect to their size

(a) $Zn > Fe > Fe^{2+} > Fe^{3+}$
(b) $Fe^{2+} > Fe^{3+} > Zn > Fe$
(c) $Fe > Fe^{2+} > Fe^{3+} > Zn$
(d) $Zn > Fe^{3+} > Fe^{2+} > Fe$

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (a) : Zn atomic radii is 137 pm.
Fe atomic radii is 126 pm.
Fe^{3+} ionic radius is 63 pm.
Fe^{2+} has an ionic radius of 77 pm.
Thus, the correct order of their size is–

$$Zn > Fe > Fe^{2+} > Fe^{3+}$$

Hence, the correct option is (a).

140. The correct order of the atomic radii of C, Cs, Al and S is

(a) C < S < Al < Cs (b) C < S < Cs < Al
(c) S < C < Cs < Al (d) S < C < Al < Cs

(JEE Main 2019, 11 Jan Shift-I)

@apna_pdf

Ans. (a) : On moving from left to right in a period atomic radii decreases and the moving from top to bottom in a group atomic radii increases.

$\therefore$ The order of increasing atomic radii are–

$\underset{170}{C} < \underset{180}{S} < \underset{184}{Al} < \underset{300}{Cs}$

Atomic radii (pm)

141. For which of the following ionic species radius would be maximum?

(a) C^{4-} (b) N^{3-}

(c) O^{2-} (d) Mg^{2+}

AIIMS 25 May 2019 (Evening)

Ans. (a) : Among the isoelectronic species ionic radius increase with increase in negative charge or decrease in positive charge.

Therefore, the order of ionic radius maximum in C^{4-} and increasing order of ionic radius are–

$Mg^{2+} < O^{2-} < N^{3-} < C^{4-}$

142. The correct order of atomic radii is

(a) Ho > N > Eu > Ce (b) N > Ce > Eu > Ho

(c) Eu > Ce > Ho > N (d) Ce > Eu > Ho > N

(JEE Main 2019, 12 Jan Shift-II)

Ans. (c) : The atomic radii follows the order

$\underset{199pm}{Eu} > \underset{183pm}{Ce} > \underset{176pm}{Ho} > \underset{70pm}{N}$

143. Which has least covalent radius?

(a) Mn (b) Cu

(c) Zn (d) Ni

AIIMS 26 May 2019 (Morning)

Ans. (d): Covalent radius of an atom denotes half of the internuclear distance between the atoms of the monoatomic species.

It is different from ionic and atomic radius. It depends on the bond order of the compound formed by the covalent bonding.

Hence, the covalent radius in Pm are–

$\underset{125}{Ni} < \underset{128}{Cu} < \underset{137}{Zn} = \underset{137}{Mn}$

So, the least covalent radius is Ni.

144. The increasing order of size for the ionic species Na^{+}, F^{-}, O^{2-}, Mg^{2+} is

(a) $Na^{+} < F^{-} < O^{2-} < Mg^{2+}$

(b) $Mg^{2+} < Na^{+} < F^{-} < O^{2-}$

(c) $O^{2-} < Mg^{2+} < Na^{+} < F^{-}$

(d) $O^{2-} < F^{-} < Mg^{2+} < Na^{+}$

Assam CEE-2019

Ans. (b) : Ionic size increase with the addition of electrons and ionic size decreases with the loss of electrons. It has high inter electrons repulsion due to which it has the minimum size. The increasing order of ionic size is $Mg^{2+} < Na^{+} < F^{-} < O^{2-} < N^{3-}$.

They are iso-electronic species with same number of electrons. Higher is the atomic number higher will be the effective nuclear charge, lower will be the size.

145. Which set of elements have nearly the same atomic radii?

(a) Fe, Co, Ni, Cu (b) F,Cl, Br, I

(c) Na, K, Rb, Cs (d) Li, Be, B, C

CG PET -2019

Ans. (a) : Fe, Co, Ni and Cu are belong to the 3rd transition series in the same period. The atomic radii are not vary because of the extra screening by the 3d electrons with increasing by the additional protons. This is repel already present 1s electron. Hence, repulsion will increase the atomic radius.

In Fe, Co, Ni and Cu have nearly balance each other keeping the atomic radius same.

146. What is the correct increasing order of ionic or atomic radii in the following?

(a) $Si^{4+} < P^{5+} < S^{6+} < Cl^{7+}$

(b) $P^{5+} < Si^{4+} < Cl^{7+} < S^{6+}$

(c) $Cl^{7+} < S^{6+} < P^{5+} < Si^{4+}$

(d) $S^{6+} < P^{5+} < Cl^{7+} < Si^{4+}$

J & K CET-(2018)

Ans. (c) : For

$Si = 14, Si^{4+} = 10e^{-}$

$P = 15, P^{+5} = 10e^{-}$

$S = 16, S^{+6} = 10e^{-}$

$Cl = 17, Cl^{+7} = 10e^{-}$

Ionic radii $\propto \dfrac{1}{\text{charge}}$

Greater the charge ionic radii decrease

Hence, the increasing order of ionic radii are-

$Cl^{7+} < S^{6+} < P^{5+} < Si^{4+}$

147. The energy and radius of electron present in second orbit of He^{+} respectively are

(a) -1.09×10^{-18} J, 105.8 pm

(b) -8.72×10^{-18} J, 211.6 pm

(c) -4.36×10^{-18} J, 52.9 pm

(d) -2.18×10^{-18} J, 105.8 pm

AP EAMCET-2017

Ans. (d): For He^{+} : Z = 2

For n = 2 $E_n = -2.18 \times 10^{-18} \dfrac{Z^2}{n^2}$

$E_n = -2.18 \times 10^{-18} \times \dfrac{4}{4}$

$E_n = -2.18 \times 10^{-18}$ Joule

And $r_n = 52.9 \times \dfrac{n^2}{Z}$ pm

$r_n = 52.9 \times \dfrac{4}{2} = 105.8$ pm

Hence, the option (d) is correct.

148. The set representing the right order of ionic radius is

(a) $Li^{+} > Na^{+} > Mg^{2+} > Be^{2+}$

(b) $Mg^{2+} > Be^{2+} > Li^{+} > Na^{+}$

(c) $Na^{+} > Mg^{2+} > Li^{+} > Be^{2+}$

(d) $Na^{+} > Li^{+} > Mg^{2+} > Be^{2+}$

TS EAMCET-2017

Ans. (d) : On going down the group size increases and charge of cation increases size decreases.

$Na^{+} > Li^{+} > Mg^{2+} > Be^{2+}$

149. Atomic radius (pm) of Al, Si, N and F respectively is

(a) 117, 143, 64, 74 (b) 143, 117, 74, 64

(c) 143, 47, 64, 74 (d) 64, 74, 117, 143

TS EAMCET-2017

@apna_pdf

Ans. (b) : Nitrogen and Fluorine belong to second period. Al and Si are belong to 3rd period. The size of element decreases from left to right in a period.
Hence the decreasing order of atomic radius is –

$\underset{143}{\text{Al}} > \underset{117}{\text{Si}} > \underset{74}{\text{N}} > \underset{64}{\text{F}}$ (pm)

150. The ion having the highest mobility in aqueous solution is

(a) Ba^{2+} (b) Mg^{2+}
(c) Ca^{2+} (d) Be^{2+}

CG PET -2017

Ans. (a) : Larger the size of cation, less hydrated. Hence, it show higher mobility in aqueous solution. Among the given species Ba^{2+} ion has largest. size, so hydrate to smaller extent and show highest mobility.

$Be^{2+} < Mg^{2+} < Ca^{2+} < Ba^{2+}$

151. The ionic species having the largest size is

(a) $Li^+(g)$ (b) $Rb^+(aq)$
(c) $Li^+(aq)$ (d) $Cs^+(aq)$

CG PET -2017

Ans. (c) : Concept used

(i) In gaseous state, more the value of $\frac{Z}{e}$, smaller is the size of ion.
(ii) In aqueous solution i.e. in hydrated- state, Smaller the gaseous ion, more it get hydrated and therefore more is its size. Among given options Li^+ (g) has smallest, size, so it hydrates to large extent and its size becomes largest. Therefore, Li(aq) has the largest, size.

152. Arrange the following as per increasing order of ionic size $Mg^{2+}, O^{2-}, Na^+, F^-, N^{3-}$

(a) $N^{3-} < O^{2-} < F^- < Na^+ < Mg^{2+}$
(b) $O^{2-} < F^- < N^3 < Mg^{2+} < Na^+$
(c) $Na^+ < Mg^{2+} < O^{2-} < N^{3-} < F^-$
(d) $Mg^{2+} < Na^+ < F^- < O^{2-} < N^{3-}$

CG PET -2017

Ans. (d) : All the given ions are isoelectronic as they contain same number of electrons. For isoelectronic species,

$$\text{Ionic radius} \propto \frac{1}{\text{atomic number}}$$

Ion	N^{3-}	O^{2-}	F^-	Na^+	Mg^{2+}
atomic number	7	8	9	11	12

Hence, the correct increasing order of ionic size is
$Mg^{2+} < Na^+ < F^- < O^{2-} < N^{3-}$

153. The atom of largest size among the following is

(a) Li (b) At
(c) I (d) Be

J & K CET-(2016)

Ans. (a) : Atom	Li	Be	I	At
Atom radii (pm)	152	112	113	140

154. Which of the following pairs has the same size?

(a) Fe^{2+}, Ni^{2+} (b) Zr^{4+}, Ti^{4+}
(c) Zr^{4+}, Hf^{4+} (d) Zn^{2+}, Hf^{4+}

COMEDK-2015

Ans. (c) : Zr^{4+} and Hf^{4+} belonging to the same group of second and third transition series is due to the effect of lanthanide contraction.

155. Atomic radii of which metals are same?

(a) Cr, Mn, Cu (b) Cr, Fe, Co
(c) Sc, Ti, Zn (d) V, Ni, Cr

CG PET- 2015

Ans. (a) : Atomic radius is inversely proportional to the effective nuclear charge.
On moving from left to right in a period the effective nuclear charge increases, the number of electron in the 3d sub-shell will increases. This repel the already present 4s electrons. Hence, Cr, Mn and Cu are nearly balance the atomic radius same.

156. Decrease in ionic size in a period is observed in

(a) actinides (b) lanthanides
(c) both (a) and (b) (d) transition elements

SRMJEEE – 2014

Ans. (c) : Actinides and Lanthanides decrease in ionic size in a period is observed because increase in atomic number and the atomic size increases which attracts the outermost shell more effectively then they gradual decrease in atomic and ionic radii.

157. The increasing order of the atomic radius of Si, S, Na, Mg, Al is

(a) S < Si < Al < Mg < Na
(b) Na < Al < Mg < S < Si
(c) Na < Mg < Si < Al < S
(d) Na < Mg < Al < Si < S

AP-EAMCET (Engg.) - 2014

Ans. (a) : All these elements belong to the third period of periodic table, on moving from left to right in a period, effective nuclear charge increase due to atomic radius decreases.
The order is Na > Mg > Al > Si > S

158. Which of the following series of elements have nearly the same atomic radii?

(a) F, Cl, Br, l (b) Na, K, Rb, Cs
(c) Li, Be, B, C (d) Fe, Co, Ni, Cu

JCECE - 2014

Ans. (d) : These are transition metals with the $(n-1)d^{1-10}ns^{1-2}$ configuration. The atomic and ionic radii of transition elements in a given series show a decreasing trend for first five elements and then becomes almost constant for next five elements.

159. Atomic number of Na = 11; Mg = 12; Al = 13. Among Na^+, Na, Mg, Mg^{2+} and Al^{3+}, the smallest and the biggest are respectively

(a) Na; Na^+ (b) Mg^{2+}; Na
(c) Na^+; Mg^{2+} (d) Al^{3+}; Na

SRMJEEE – 2013

Ans. (d) : Number of positive charge on element increases, size decreases. Hence the order of increasing size $Al^{+3} < Mg^{2+} < Na^+ < Na$
Smallest size Al^{+3} and biggest size Na.

160. The correct order of atomic radius of Li, Be and B is

(a) B > Be > Li (b) B > Li > Be
(c) Li > B > Be (d) Li > Be > B

AP EAMCET (Medical) - 2013

@apna_pdf

Ans. (d) : In the period, when we move left to right then the size of atomic radius decreases and there is the one electron add in the same shell due to this enhanced nuclear charge. The electrons of all the shells are pulled little closer to the nucleous thereby making each individual shell smaller and smaller. Thus, the correct decreasing order of atomic radius is: Li > Be > B.

161. Which of the following is correct?
(a) Radius of $Ca^{2+} < Cl^{-} < S^{2-}$
(b) Radius of $Cl^{-} < S^{2-} < Ca^{2+}$
(c) Radius of $S^{2-} = Cl^{-} = Ca^{2+}$
(d) Radius of $S^{2-} < Cl^{-} < Ca^{2+}$

WB-JEE-2012

Ans. (a) : For the given species are isoelectronic having the same number of electron are present.

$$\text{Ionic radii} \propto \frac{1}{Z_{eff}}$$

Hence, the increasing order of radius are-

$$Ca^{2+} < Cl^{-} < S^{2-}$$

162. Consider the following ions:
1. Na^{+}
2. Al^{3+}
3. Si^{4+}
In naturally occurring zeolites which of the above ions are present?
(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

SCRA 2012

Ans. (d) : Natural zeolites are non-porus, amorphous and durable. Na^{+}, Al^{3+}, and Si^{4+} are some of the naturally occurring zeolites.

163. Consider the following statements.
I. The radius of an anion is larger than that of the parent atom.
II. The ionization energy generally increases with increasing atomic number in a period.
III. The electronegativity of an element is the tendency of an isolated atom to attract an electron.
Which of the above statements is/are correct?
(a) only I (b) only II
(c) I and II (d) II and III

AIIMS-2012

Ans. (c): Ionisation energy is increases from left to right in a period generally due to increase in the nuclear charge and decrease in the atomic radii in a period. The radius of an anion is larger than that charge decrease when an electron is added to an atom. The anion becomes larger than the corresponding atom.

The electronegativity of an element is the tendency of an atom in a compound to attract a pair of bonded electrons towards itself. The tendency to attract an electron of an isolated atom is measured by electron affinity.

164. Among the elements Ca, Mg, P and Cl, the order of increasing radii is
(a) Mg < Ca < Cl < P (b) Cl < P < Mg < Ca
(c) P < Cl < Ca < Mg (d) Ca < Mg < P < Cl

VITEEE- 2012

Ans. (b) : Atomic radii increases, as the number of shells increases. Thus, on moving down a group atomic radii increases.

The electronic configuration of the given element is

$_{12}Mg = [Ne]3s^{2}$

$_{20}Ca = [Ar]4s^{2}$

$_{15}P = [Ne]3s^{2}3p^{3}$

$_{17}Cl = [Ne]3s^{2}3p^{5}$

On the other hand, on increasing the number of electron in the same shell, the atomic radii decreases because effective nuclear charge is increases.

In Mg, P and Cl, the number of electrons are increasing in the same shell, thus the order of their atomic radii is

Cl < P < Mg

In case of Ca, the electron is entering in higher shell.

So, its atomic radii is highest.

Thus, the order of radii is

Cl < P < Mg < Ca

165. The increasing order of the ionic radii of the given isoelectronic species is
(a) $Cl^{-}, Ca^{2+}, K^{+}, S^{2}$ (b) $S^{2-}, Cl^{-}, Ca^{2+}, K^{+}$
(c) $Ca^{2+}, K^{+}, Cl^{-}, S^{2-}$ (d) $K^{+}, S^{2-}, Ca^{2+}, Cl^{-}$

(AIEEE 2012)

Ans. (c) : The species (atoms/molecules) is negatively charged, as an additional electron occupies an outer orbital, there is increased in electron electron repulsion because the protons in the ion cannot pull the extra electron towards the nucleus then decreased effective nuclear charge.

Therefore, the ionic radii increased. The increasing order of the ionic radii of the given isoelectromic species are-

$$Ca^{2+}, K^{+}, Cl^{-}, S^{2-}$$

166. Which of the following is the largest in size?
(a) Cl^{-} (b) S^{2-}
(c) Na^{+} (d) F^{-}

J & K CET-(2011)

Ans. (b) : All these ion contain 18 electron each so these are isoelectronic. For isoelectronic ions smaller the positive nuclear charge greater is the size of the ion decrease and greater the negative charge nuclear charge decrease hence the size of ion is large.

So, S^{2-} has largest in size.

167. There is a general understanding of ionic radius based on the nuclear charges and the number of electrons surrounding the nucleus which generally works very well. Which one of the following represents the correct decreasing order of ionic radius for C^{4-}, N^{3-}, O^{2-} and F^{-}?
(a) $C^{4-} > N^{3-} > O^{2-} > F^{-}$ (b) $F^{-} > O^{2-} > N^{3-} > C^{4-}$
(c) $O^{2-} > N^{3-} > C^{4-} > F^{-}$ (d) $F^{-} > N^{3-} > C^{4-} > O^{2-}$

UPTU/UPSEE-2011

Ans. (a) : For the given species are isoelectronic having the same number of electron are present. The ionic radii are decrease with the increase in the magnitude of nuclear charge because the force of attraction by the nucleus on the electrons also increases. Thus, the correct decreasing order of ionic radii.

$$C^{4-}, N^{3-}, O^{2-}, F^{-}$$

@apna_pdf

168. Which ion has the lowest radius from the following ions?

(a) Na^+ (b) Mg^{2+}

(c) Al^{3+} (d) Si^{4+}

JCECE - 2011

Ans. (d) : Ionic radii varies inversely with nuclear charge. Higher the nuclear charge, smaller is the ionic radii. Since, Si^{4+} has the highest nuclear charge among the given, so it has lowest ionic radii.

169. Which of the following sets will have highest hydration enthalpy and highest ionic radius?

(a) Na and Li (b) Li and Rb

(c) K and Na (d) Cs and Na

AMU – 2010

Ans. (b) : Smaller the size, greater is the hydration enthalpy. So, Li will have highest hydration enthalpy. Down the group ionic radius increases, so Rb will have highest ionic radius.

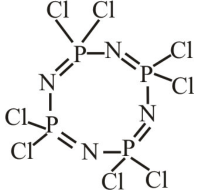
170. What type of structure does $(NPCl_2)_4$ Have?

(a) Linear (b) Hexagonal

(c) Cyclic (d) Polymeric

AMU – 2010

Ans. (c) : Phosphonitrilic compounds are known as phosphazenes. Their general formula is $(NPCl_2)_n$.



171. Which one of the following ions has the highest value of ionic radius?

(a) O^{2-} (b) B^{3+}

(c) Li^+ (d) F^-

BITSAT 2009

Ans. (a) : The ionic radii follows the order

$O^{2-} > F^- > Li^+ > B^{3+}$

172. Atomic radii of Ti, Zr and Hf vary

(a) Ti> Zr > Hf (b) Ti < Zr < Hf

(c) Ti < Hf < Zr (d) Ti < Zr=Hf

CG PET -2009

Ans. (d) : As we move down a group from top to bottom, radii increase but Zr and Hf have almost same radius due to poor shielding of f-orbitals. The atomic radii of 4d and 5d transition element are nearly same. This similarity in size is consequence of lanthanide contraction. Because of this lanthanide contraction the radii of HF becomes nearly equal to that of Zr.

Hence, the order are–

Ti < Zr = Hf

173. The atom of smallest atomic radius among the following is

(a) Na (b) K

(c) Br (d) Li

J & K CET-(2009)

Ans. (c) : When on moving in period from left to right atomic radius decreases. While in a group atomic radius increases from top to bottom. The radius of alkali metal is metallic radius and that of halogens is cavalent radius and metallic radius > covalent radius. Thus Br has the smallest atomic radius.

Atom	Na	K	Br	Li
Atom size(pm)	186	226	114	152

174. Difference between S and S^{2-} as S^{2-} has

(a) larger radii and larger size

(b) smaller radii and larger size

(c) larger radii and smaller size

(d) smaller radii and smaller size

BCECE-2008

Ans. (a) : The radii of anion is always larger than the atomic radii of its original atom. In an anion as electron are added to the neutral atom the nuclear charge acts more electron so that each electron is held less tightly and electron clouds are expand.

Thus, S^{2-} has larger radii and larger size.

175. Al^{3+} has a lower ionic radius than Mg^{2+} because

(a) Mg atom has less number of neutrons than Al

(b) Al^{3+} has a higher nuclear charge than Mg^{2+}

(c) their electronegativities are different

(d) Al has a lower ionisation potential than Mg atom.

SRMJEEE – 2007

Ans. (b) : Al^{3+} has a lower ionic radius than Mg^{2+} because Al^{3+} has higher nuclear charge than Mg^{2+}.

176. Which is the correct order of size of O^-, O^{2-}, F and F^-?

(a) $O^{2-} > F^- > O^- > F$ (b) $O^{2-} > F^- > F > O^-$

(c) $O^- > O^{2-} > F > F^-$ (d) $O^{2-} > O^- > F^- > F$

SRMJEEE – 2007

Ans. (d) : As negative charge of ions increases, outer electron will be at a greater distance from the nucleus, hence the greater in size.

The order of size of given ions is $O^{2-} > O^- > F^- > F$.

177. Increase in atomic size down the group is due to

(a) increase in number of electrons

(b) increase in number of protons and neutrons

(c) increase in number of protons

(d) increase in number of protons, neutrons and electrons

UP CPMT-2007

Ans. (a) : In a given group, atomic size increases due to addition of extra shell which outweighs the effect of increased nuclear charge. Number of electron increase with increases in addition of extra shell.

Hence, increase in atomic size down the group is due to increase in number of electron.

178. Which of the following has largest ionic radius?

(a) Cs^+ (b) Li^+

(c) Na^+ (d) K^+

BCECE-2006

Ans. (a) : Atomic and ionic radii increase from top to bottom in a group due to adding of shell at every step. Therefore, Cs^+ ion has largest ionic radius among the given ions.

179. Atomic radii of F and Ne, in Å, are given by :

(a) 0.72, 0.71 (b) 0.72, 1.6

(c) 1.6, 1.58 (d) 0.71, 0.72

BCECE-2006

@apna_pdf

Ans. (b) : Atomic radii is the total distance from the nucleus of an atom of the outermost orbital of its electron.

On moving from left to right in a period generally atomic radii decrease due to increase in the effective nuclear charge with increase in atomic number.

And on moving down in the group shells are increases resulting in a large size.

Thus, the atomic radii of fluorine and neon in are 0.75Å and 1.60 Å respectively.

180. Consider the following abbreviations for hydrated alkali ions.
$X=[Li(H_2O)_n]^+$; $Y=[K(H_2O)_n]^+$; $Z=[Cs(H_2O)_n]^+$
Which is the correct order of size of these hydrated alkali ions?

(a) $X > Y > Z$ (b) $Z > Y > X$
(c) $X = Y = Z$ (d) $Z > X > Y$

J & K CET-(2006)

Ans. (a) : For the given hydrated alkali ions–

$X= [Li(H_2O)_n]^+$
$Y= [K(H_2O)_n]^+$
$Z= [Cs(H_2O)_n]^+$

Hydrated ion radii $\propto$ solution $\propto \frac{\text{charge}}{\text{radius}}$

181. The ionic radii $(\overset{o}{A})$ of C^{4-} and O^{2-} respectively are 2.60 and 1.40. The ionic radius of the isoelectronic ion N^{3-} would be

(a) 2.6 (b) 1.71
(c) 1.4 (d) 0.95

J & K CET-(2006)

Ans. (b) : For the ionic radii of isoelectronic ions decrease with the increase in the magnitude of the nuclear charge.

So, decreasing order of ionic radii is

$C^{4-} > N^{3-} > O^{2-}$
2.60 1.71 1.40(pm)

182. The most probable radius (in pm) for finding the electron in He^+ is

(a) 0.0 (b) 52.9
(c) 26.5 (d) 105.8

AIIMS-2005

Ans. (c) : Given that :
For He^+ (Z) = 2
Number of shell (n) = 1
we know that

Bohr's radius $(r_n) = \frac{59.2n^2}{Z}$ pm

Where n = number of shell
Z = atomic number

$r_n = \frac{59.2\times1^2}{2} = 26.45$ pm

183. Identify the correct order in which the ionic radius of the following ions increases:
(I) F^- (II) Na^+ (III) N^{3-}

(a) III, I, II (b) I, II, III
(c) II, III, I (d) II, I, III

AP-EAMCET (Engg.)-2005

Ans. (d) : The given species are F^- (I), Na^+ (II) and N^{3-} (III). These are iso-electronic species. As the –ve charge are increases in the element then the size of anion increases. More the –ve charge more will be size of element. Hence the correct increasing order of ionic sizes are- II < I < III

184. Which of the following order is correct for the size of Fe^{3+}, Fe and Fe^{2+} ?

(a) $Fe < Fe^{2+} < Fe^{3+}$ (b) $Fe^{2+} < Fe^{3+} < Fe$
(c) $Fe < Fe^{3+} < Fe^{2+}$ (d) $Fe^{3+} < Fe^{2+} < Fe$

AP-EAMCET (Engg.)-2004

Ans. (d) : The species are Fe^{3+}, Fe and Fe^{2+}. The atom contains more the +ve charge, less the size of metal. The more electrostatic force act in small size of metal. Hence, the correct order of ionic sizes are – $Fe^{3+} < Fe^{2+} < Fe$.

185. Which of the following has largest size?

(a) Al (b) Al^+ (c) Al^{2+} (d) Al^{3+}

CG PET -2004

Ans. (a) : The atom contain more the +ve charged less the size of metal. The more electrostatic force act in small size of metal. Hence, the largest size is Al.

So, the decreasing order of size are –
$Al > Al^+ > Al^{2+} > Al^{+3}$

186. Which one of the following ions has the highest value of ionic radius ?

(a) Li^+ (b) B^{3+} (c) O^{2-} (d) F^-

(AIEEE 2004)

Ans. (c) : Z/e ratio increases the size decreases and when Z/e ratio decrease the size increases.

$Z/e = \frac{\text{nuclear charge}}{\text{no. of electrons}}$

For Li^+, $Z/e = \frac{3}{2} = 1.5$

For B^{3+}, $Z/e = \frac{5}{2} = 2.5$

For O^{2-}, $Z/e = \frac{8}{10} = 0.8$

For F^-, $Z/e = \frac{9}{10} = 0.9$

Therefore, O^{2-} has highest value of ionic radius

187. The atomic size of cerium and promethium is quite close, due to:

(a) they are in same period in periodic table
(b) their electronic configuration is same
(c) f-electrons have poor shielding effect
(d) nuclear charge is higher on cerium than promethium

JCECE - 2004

Ans. (c) : For the lanthanide is the contraction of the atomic size with increase in atomic number called as lanthanide contraction while moving along the lanthanide series from Ce^{58} to Lu^{71}, a regular decrease in the size of the atom/ion and an increase in atomic number. This decrease in size is called as lanthanide contraction. Lanthanide contraction take place due to imperfect shielding of electron which increase by one by one more sub shell so, due to f-electrons have shielding effect.

@apna_pdf

188. Consider the ions K^+, S^{2-}, Cl^- and Ca^{2+}. The radii of these ionic species follow the order:

(a) $Ca^{2+} > K^+ > Cl^- > S^{2-}$

(b) $Cl^- > S^{2-} > K^+ > Ca^{2+}$

(c) $Ca^{2+} > Cl^- > K > S^{2-}$

(d) $K^+ > S^{2-} > Cl^- > Ca^{2+}$

(e) $S^{2-} > Cl^- > K^+ > Ca^{2+}$

Kerala-CEE-2004

Ans. (e) Ionic radii $\propto \dfrac{1}{\text{charge}}$

The charge of species is increases then the ionic radii will be decreases hence the decreasing order of the ionic radii will be-

$S^{2-} > Cl^- > K^+ > Ca^{2+}$

189. Which one of the following is expected to have largest size?

(a) F^- (b) O^{2-}

(c) Al^{3+} (d) N^{3-}

UPTU/UPSEE-2004

Ans. (d) : Radius $\propto \dfrac{1}{Z}$

All the ions are isoelectronic but they have different size due to different values of Z. In, Na^+, O^{2-}, N^{3-}, F^-, the number of electron 10.

Thus greater the value of $\dfrac{e}{Z}$ greater the size of iso-electronic species. Hence N^{3-} is largest in size.

190. The radius of hydrogen atom is 0.53 Å. The radius of $_3Li^{2+}$ is of

(a) 1.27 Å (b) 0.17 Å

(c) 0.57 Å (d) 0.99 Å

UP CPMT-2003

Ans. (b) :

Radius of n^{th} orbit $= \dfrac{n^2}{Z} \times 0.53$

where n = number of orbit

and Z = atomic number = 3

$\therefore$ In $_3Li^{2+}$, no. of electrons = 1

$\therefore$ Radius$= \dfrac{(1)^2 \times 0.53}{3}$

$= \dfrac{0.53}{3} = 0.17\,\overset{o}{A}$

191. Which of thr following is thr smallest anion?

(a) O^{2-} (b) S^{2-}

(c) Cl^- (d) Br^-

J & K CET-(2002)

Ans. (a) : O^{2-} is belong the second period and S^{2-}, Cl^- belong the third period and Br^- belong to the fourth period on moving from top to bottom in a group atomic radii increase.

Hence, the O^{2-} is the smallest anion.

192. Which of the following has least ionic radius?

(a) I^+ (b) I^{3+} (c) I^{5+} (d) I^{7+}

J & K CET-(2001)

Ans. (d) : Ionic radii $\propto \dfrac{1}{\text{charge}}$

More is the positive charge smaller the size of ion.

So, the least ionic radius is I^{7+}.

193. Of the metals Be, Mg, Ca and Sr of group 2 in the periodic table, the least ionic chloride will be formed by

(a) Be (b) Ca (c) Mg (d) Sr

J & K CET-(2000)

Ans. (a) : Beryllium chlorides are covalent in nature. This is due to the small size and high charge density of Be^{2+} ion i.e., it has high polarising power. However, the halides of the other alkaline earth metals are ionic solids.

194. O^{2-} and Si^{4+} are isoelectronic ions. If the ionic radius of O^{2-} is 1.4 Å, the ionic radius of Si^{4+} will be

(a) 1.4 Å (b) 0.41 Å

(c) 2.8 Å (d) 1.5 Å

A.P.EAMCET 1999

Ans. (b) : Given that, O^{2-} and Si^{4+} are isoelectronic ions i.e. 10 e^-.

Nuclear charge $\propto \dfrac{1}{\text{ionic radius}}$

$\therefore$ Nuclear charge for Si is larger, so it should be less than 1.4Å.

195. Of the following, the one with largest size is

(a) Cl^- (b) Ar

(c) K^+ (d) Ca^{2+}

A.P.EAMCET 1997

Ans. (a) : Cl^-, Ar, K^+ and Ca^{2+} have isoelectronic species and each have $18e^-$. The size of atom decreases with increase in nuclear charge. The Cl^- ion has the least nuclear charge among the given. Hence, it has largest size.

196. Which of the following, the one with largest size is:

(a) Cl^- (b) Ar

(c) K^+ (d) Ca^{2+}

AP – EAMCET - (Medical)-1997

Ans. (a) : Chloride ion has more ionic radius than Ar, K^+ and Ca^{2+}. When the electrons are added in the outer most orbit, the attractive force of the nucleus on the electron decreases. So that after adding electron or in case of –ve ion the ionic radius increases.

197. The pair of elements that have similar chemical properties are

(a) beryllium and boron

(b) aluminium and magnesium

(c) carbon and nitrogen

(d) lithium and magnesium

A.P.EAMCET 1996

Ans. (d) : Lithium and magnesium are similar chemical properties, since they have same electronegativity. Lithium and magnesium show diagonal relationship.

@apna_pdf

198. If a neutral atoms is converted into a cation, then its
(a) atomic weight increases
(b) size increases
(c) atomic weight decreases
(d) size decreases

AIIMS-1996

Ans. (d): A cation is formed when a neutral atom loses electrons from the outermost shell.
Cation with a more positive charge has less ionic radii because the more nuclear charge is experienced by the electron. Anion has more negative charge having the more ionic radii.
When cation is formed, there is no change in the atomic number of the element, only the number of electron change. Hence the neutral atom is converted into cation, there is a decreases in size.

199. In the P^{3-}, S^{2-} and Cl^- ions, the increasing order of size is
(a) $S^{2-} < Cl^- < P^{3-}$
(b) $Cl^- < S^{2-} < P^{3-}$
(c) $S^{7-} < P^{3-} < Cl^-$
(d) $P^{3-} < S^{2-} < Cl^-$

AIIMS-1996

Ans. (b): We know that phosphorus belong to VA group, sulphur belongs to VIA group and chlorine belong to VII A group.
The atomic size is decrease from left to right in a period.
In isoelectronic species, the size of ions decreases as nuclear charge or atomic weight increases.
Therefore, $Cl^- < S^{2-} < P^{3-}$

200. The radius of hydrogen atom in the ground state is 0.53 Å. The radius of Li^{2+} ion (atomic number = 3) in a similar state is
(a) 0.53 Å
(b) 1.06 Å
(c) 0.17 Å
(d) 0.236 Å

NEET-1995

Ans. (c) : Radius of Hydrogen atom in the ground state is 0.53 Å
∴ Atomic number of Li is 3

$$\because \text{Radius of } Li^{2+} \text{ ion} = \frac{r \times n^2}{2}$$

$$= \frac{0.53 \times 1^2}{3} = 0.17\text{Å}$$

201. Which one of the following is the largest ion?
(a) Na^+
(b) Mg^{2+}
(c) O^{2-}
(d) F^-

A.P.EAMCET 1994

Ans. (c) : Size of ion $\propto \dfrac{1}{\text{Nuclear Charge}}$
The radius of ion depend on the effective nuclear charge, more the charge more heavily the electrons are attracted towards the centre and lesser in the size.
O^{2-} has least nuclear charge and have largest size.

202. Kr nucleus has a ….. radius than that of Ba.
(a) Lesser
(b) Greater
(c) Same
(d) None of these

A.P.EAMCET 1992

Ans. (a) : Atomic radius decrease in a period from left to right. So, the Kr nucleus has lesser radius than that of Ba.

203. Which of the following does not represent the correct order of the property indicated?
(a) $Sc^{3+} > Cr^{3+} > Fe^{3+} > Mn^{3+}$ – ionic radii
(b) $Sc < Ti < Cr < Mn$ – density
(c) $Mn^{2+} > Ni^{2+} > Co^{2+} < Fe^{2+}$ – ionic radii
(d) $FeO < CaO < MnO < CuO$ – basic nature

VITEEE, 2014

Ans. (a) : The correct order of ionic radii is
$Cr^{3+} > Mn^{3+} > Fe^{3+} > Sc^{3+}$.

204. Which has the smallest size?
(a) Na^+
(b) Mg^{2+}
(c) Al^{3+}
(d) P^{5+}

JEE Main, 30.11.2020

Ans. (d) : The smallest size is P^{5+} because having maximum nuclear charge per electron. When nuclear charge increases then atomic size decreases.

4. Electro Negativity

205. Correct order of electronegativeity is:
(a) F > O > Cl = N
(b) F > Cl > O > N
(c) Cl > F > O < N
(d) None of these

CG PET-22.05.2022

Ans. (a) : Electronegativity – Electronegativity is the tendency of an atom in a molecule to attract electrons toward itself.
- We know that electronegativity simply increases from left to right in a period and decreases from to down in a group.

So, option (a) is correct.
F > O > Cl = N
Therefore, electronegativity of Cl & N are 3 (same).

206. The electronegativity of the following elements increases in the order
(a) C, N, Si, P
(b) N, Si, C, P
(c) Si, P, C, N
(d) P, Si, N, C

Kerala CEE-2018, Karnataka CET-2017
Assam CEE-2014, UPCPMT-2012
BITSAT 2005
J&K CET-1999

Ans. (c) : Si and P are in the 3rd period while C and N are in the 2nd period. Elements in 2nd period have higher electronegativities than those in the 3rd period. Since N has smaller size and has higher nuclear charge than C, its electronegativity is higher than that of C. Similarly, the electronegativity of P is higher than that of Si. Thus, the overall order is : Si, P, C, N.

207. Pauling's electronegativity values for elements are useful in predicting
(a) polarity of the molecules
(b) position in the EMF series
(c) coordination numbers
(d) dipole moments

BCECE-2011
UPTU/UPSEE-2004

@apna_pdf

Ans. (a) : Pauling electronegativity values for element are useful in predicting of polarity of molecules. Pauling introduced the electronegativity idea that the ionic character of a bond varies with the difference in electronegativity. A large difference in electronegativity leads to a bond with high degree of polar character.

208. Which of the following indicates the correct variation in electronegativities?

(a) $F > N < O > C$ (b) $F > O > N > C$
(c) $F < N < O < C$ (d) $F > N > O < C$

CG PET -2018
UPTU/UPSEE-2005

Ans. (b) : On moving from left to right in a 2nd period electronegativity increases.

Element	C	N	O	F
EN, Value	2.5	3.0	3.5	4

Hence, the order of EN are-
$F > O > N > C$

209. Pauling's equation for determining the electronegativity of an element is

(a) $X_A - X_B = 0.208\sqrt{\Delta}$
(b) $X_A + X_B = 0.208\sqrt{\Delta}$
(c) $X_A - X_B = 0.208\Delta^2$
(d) $X_A - X_B = \sqrt{\Delta}$

J & K CET-(2006)
UPTU/UPSEE-2010

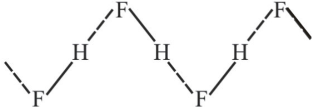
Ans. (a) : According to Pauiling equation.
$X_A–X_B= 0.208[E_{A–B}–(E_{A–A}\times E_{B–B})^{1/2}]^{1/2}$
$X_A – X_B = 0.208\sqrt{\Delta}$
Where, Δ is the difference of bond dissociation energies of A-A and B-B bonds.
X_A and X_B are the electronegativities of A and B respectively.
The factor 0.208 arises from the conversion of Kcals to electron volt.

210. Given below are two statements: One is labelled as Assertion (A) and the other is labelled as Reason (R).
Assertion (A) : Dipole - dipole interactions are the only non-covalent interactions, resulting in hydrogen bond formation.
Reason (R) : Fluorine is the most electronegative element and hydrogen bonds in HF are symmetrical.
In the light of the above statements, choose the most appropriate answer from the options given below.

(a) A is false but R is true.
(b) Both A and R are true and R is the correct explanation of A.
(c) A is true R is false.
(d) Both A and R are true but R is not the correct explanation of A.

(JEE Main 2021, 26 Feb. Shift-II)

Ans. (a) : Dipole -dipole are not only the interact ion responsible for hydrogen bond formation ion-dipole can also be responsible for hydrogen bond formation.
F is most electronegative element and HF in solid phase has symmetrical Hydrogen bonding the strongest bond are formed by F-atoms



Symmertical H-bonds are present

211. Which of the following is not true for oxidation?

(a) Addition of oxygen
(b) addition of electronegative element
(c) removal of hydrogen
(d) removal of electronegative element

Kerala-CEE-29.08.2021

Ans. (d) : In the oxidation reaction, addition of oxygen and removal of hydrogen takes place. As we know, oxygen is more electronegative atom if we remove any electronegative atom then this process is termed reduction.

212. The correct increasing order of the electronegativity is

(a) $B < C < S < Cl$ (b) $B < S < C < Cl$
(c) $B < C < Cl < S$ (d) $C < B < S < Cl$

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (a) : When we move left to right in the period then electronegative increases whereas electronegativity decreases down the group. Hence, the correct order will be–

$\boxed{B < C < S < Cl}$

213. The electronegativity order of the following elements is

(a) $N > S > Te > I$ (b) $I > N > S > Te$
(c) $N > I > S > Te$ (d) $N > S > I > Te$

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (c) :

Element	–	Electronegativity
N	–	3.04
I	–	2.66
S	–	2.58
Te	–	2.1

Thus, electronegativity order is $N > I > S > Te$.

214. $HClO_4$ is a stronger acid than H_2SO_4 due to which of the following reasons?

(i) Oxidation state of Cl in $HClO_4$ is +7 and that of S in H_2SO_4 is +6
(ii) Cl is more electronegative then S
(iii) ClO_3 part of $HClO_4$ can break O-H bond more easily to liberate a proton than SO_3 is dibasic
(iv) ClO_3 part of $HClO_4$ can break O-H bond more easily to liberate a proton than SO_3 part in H_2SO_4

(a) (i), (ii) and (iii) only
(b) (i), (ii), and (iv) only
(c) (i), (iii), and (iv) only
(d) (ii), (iii), (iv) only

AP EAPCET 24.08.2021 Shift-II

@apna_pdf

Ans. (b) : In $HClO_4$ Oxidation state of Cl is + 7 and in H_2SO_4 Oxidation state of S is + 6, Cl is more electronegative than S. $HClO_4$ is mono acidic where as H_2SO_4 is dibasic ClO_3 part of $HClO_4$ can break O–H bond more easily to liberate a proton than SO_3 part in H_2SO_4.
So, the option (b) is correct.

215. Given that ionization potential and electron gain enthalpy of chlorine are 13 eV and 4 eV respectively. The electronegativity of chlorine on Mulliken scale approximately equals to
(a) 8.5 eV (b) 6.0 eV
(c) 3.0 eV (d) 1.5 eV

AP EAPCET 19-08-2021 Shift-I

Ans. (c) : Mulliken defined the electro negativity of an atom as the arithmetic mean of its ionization energy and electron.

i.e. $X_A = \frac{\text{Ionisation Potential} + \text{Electron Affinity}}{2}$

Given that, I.P. = 13eV, E.A = 4eV
The values are in the form of e.V so he formula will be-

$$X_{Cl} = \frac{(I.P)_{Cl} + (E.A)_{Cl}}{5.6}$$

$$X_{Cl} = \frac{13eV + 4eV}{5.6}$$

$$X_{Cl} = \frac{170eV}{5.6} = 3.03 \text{ eV}$$

216. The electronegativity of the given elements increases in the order__________
(a) C, N, Si, P (b) N, Si, C, P
(c) Si, P, C, N (d) P, Si, N, C

AP EAPCET 20.08.2021 Shift-II

Ans. (c): Electro negativity of given element is–
Si = 1.9
P = 2.19
C = 2.55
N = 3.04
Therefore the increasing order is – Si < P < C < N.

217. Assertion: Cl, Br and I show disproportionation, but F doesn't.
Reason: This is because it is the most electronegative element of the group.
(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Evening)

Ans. (a) : Cl, Br and I show disproportionation but fluorine (F) does not show disproportionation tendency since it can only take up electron (oxidation state = –1) and cannot lose electron. This is because it is the most electronegative element of the group.

218. Which pair of elements has maximum electro negativity difference?
(a) Li & F (b) Na & F
(c) Na & Br (d) Na & Cl

AIIMS 26 May 2019 (Evening)

Ans. (b): Among the following Li and Na are the most electropositive and F, Cl and Br are most electronegative.
So, the electronegative of the species are-

Atom	F	Cl	Br	I	Li	Na
EN Value	4	3	2.8	2.5	1	0.9

The difference in electronegativity are.
(i) F – Li = 4 – 2.5 = 1.5
(ii) F – Na = 4 – 0.9 = 3.1
(iii) Br – Na = 2.8 – 0.9 = 1.9
(iv) Cl – Na = 3 – 0.9 = 2.1
Hence, the Na and F pairs of elements has maximum electronegativity difference.

219. The correct option with respect to the Pauling electronegativity values of the elements is
(a) P > S (b) Si < Al
(c) Te > Se (d) Ga < Ge

(JEE Main 2019, 11 Jan Shift-II)

Ans. (d) : When moving from left to right in period electronegativity increases.
Si > Al, S > P, Ge > Ga
and moving from top to bottom in group electronegativity decreases.
Se > Te

220. Bond between A and B can b represented by :

A – B, A^+B^-, A^-B^+
(I) (II) (III)

If A is more electronegative than B, then least contribution to the actual structure comes from:
(a) I
(b) II
(c) III
(d) All the structures have equal contribution

Manipal-2019

Ans. (b) : A polar covalent bond is formed between the two element of different electronegativities. The polarity of a bond depends on the electronegativity difference.
Hence, the A is more electronegative than B, then least contribution to the actual structure comes from the II.

221. Two elements A and B have electronegativities 1.2 and 3.0 respectively. The nature of bond between A and B would be
(a) ionic (b) covalent
(c) co-ordinate (d) metallic

BITSAT 2017

Ans. (a) : ∵ Difference of electronegativity between 'A' and 'B' = 3.0 – 1.2 = 1.8. A bond having electronegativity difference greater than 1.65 is ionic nature.
Hence, bond between 'A' and 'B' would be of ionic nature.
While a covalent bond consists of the mutual sharing of one or more pairs of electrons between two atoms.
And co-ordinate is a covalent bond that consists of a pair of electrons supplied by only one of the two atoms it joins.

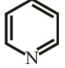
222. Among Me_3N, C_5H_5N and MeCN (Me = methyl group) the electronegativity of N is in the order
(a) MeCN > C_5H_5N > Me_3N
(b) C_5H_5N > Me_3N > MeCN

@apna_pdf

(c) $Me_3N > MeCN > C_5H_5N$
(d) Electronegativity same in all

WB-JEE-2017

Ans. (a) : In $Me_3N \Rightarrow$ N is sp^3 hybrid
In $C_5H_5N \Rightarrow$ N is sp^2 hybrid.

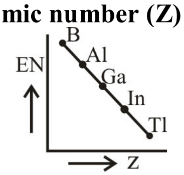


In MeCN $\Rightarrow$ N is sp-hybrid
Therefore, the electronegativity of element depend on s-character, s-character is increase then electronegativity increases.

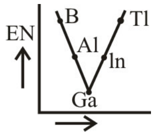
$MeCN > C_5H_5N > Me_3N$

223. Which one of the following correctly represents the variation of electronegativity (EN) with atomic number (Z) of group 13 elements?

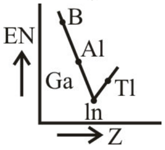
(a)



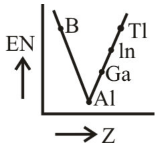
(b)



(c)



(d)



AP EAMCET (Engg.) -2014

Ans. (d) : The electronegativity of group 13 element decreases from B to Al and then increase from Al to Te because of the discrepancies in the atomic size of the elements.

224. The correct order of electronegativities of N, O, F and P is

(a) F > O > P > N
(b) F > O > N > P
(c) N > O > F > P
(d) F > N > P > O

Karnataka-CET-2012

Ans. (b) : In a period, electronegativity increases from left to right.

F > O > N

In a group, electronegativity decreases down the group.
Hence, N > P
So, the order of electronegativity are-

F > O > N > P
4 3.5 3 2.19

225. Indicate the pair whose one member has the highest and other has the lowest electronegativity

(a) I and F
(b) Fr and Li
(c) K and Cs
(d) F and Fr

CG PET- 2011

Ans. (d) : Francium (Fr) has least electronegative element due to its large size.
Fluorine (F) is the highest electronegative element due to its small size.
Therefore, F and Fr are the pair whose one member has the highest and other has lowest electronegativity.

226. The property of attracting electrons by the halogen atoms in a molecule is called

(a) ionization potential
(b) electron affinity
(c) electronegativity
(d) electronic attraction

JCECE - 2010

Ans. (c) : The property of attracting electrons by an atom of a molecule is called electronegativity. However electron affinity is the amount of energy liberated when an electron is added to an isolated gaseous atom.
Ionisation energy, also called ionization potential, the amount of energy required to remove an electron from an isolated atom or molecule.

227. Which one of the following is maximum electronegative?

(a) Lead
(b) Silicon
(c) Carbon
(d) Tin

CG PET -2008

Ans. (c) : For the given elements are present in group–14 on moving down a group from top to bottom, the electronegativity decreases. Thus, the carbon has most electronegative than other given element.

228. The electronic configuration of most electronegative elements is–

(a) $1s^2, 2s^2, 2p^5$
(b) $1s^2, 2s^2, 2p^4, 3s^1$
(c) $1s^2, 2s^2, 2p^6, 3s^1, 3p^1$
(d) $1s^2, 2s^2, 2p^6, 3s^2, 3p^5$

BCECE-2007

Ans. (a) : The given electronic configuration the most electronegative element is $1s^2$, $2s^2$ $2p^5$ are fluorine. Fluorine is the most electronegative element in the periodic table.

229. Which of the following is second most electronegative element?

(a) Chlorine
(b) Oxygen
(c) Sulphur
(d) Fluorine

UP CPMT-2007

Ans. (b) : The tendency of an atom in a compound to attract a pair of bonded electron towards itself is known as electronegativity of the atom.
Fluorine is most electronegative element. After fluorine, the most electronegative element is oxygen as per Pauling's scale of electronegativity.

x_F=4.0, x_{Cl}=3.0, x_O= 3.5, x_s=2.5

230. Observe the following statements

I. The physical and chemical properties of elements are periodic functions of their electronic configuration.
II. Electronegativity of fluorine is less than the electronegativity of chlorine.
III. Electropositive nature decreses from top to bottom in a group.

The correct answer is

(a) I, II and III are correct
(b) only I is correct
(c) only I and II are correct
(d) only II and III are correct

A.P.EAMCET 2006

Ans. (b) : The physical and chemical properties of element are periodic functions of their electronic configuration.

- Electronegative of fluorine is greater than chlorine.
- Electropositive nature increase on top to bottom in a group.

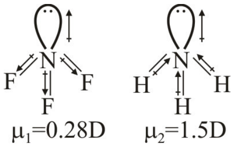
@apna_pdf

231. The electro-negativity difference between N and F is greater than that between N and H yet the dipole moment of NH_3 (1.5 D) is larger than that of NF_3 (0.2D). This is because

(a) in NH_3 the atomic dipole and bond dipole are in the opposite directions whereas in NF_3 these are in the same direction
(b) in NH_3 as well as in NF_3 the atomic dipole and bond dipole are in the same direction
(c) in NH_3 the atomic dipole and bond dipole are in the same direction whereas in NF_3 these are in opposite directions
(d) in NH_3 as well as in NF_3 the atomic dipole and bond dipole are in opposite directions.

NEET-2006

Ans. (c) : Electronegativity of N is greater than that of H but in NF_3 electronegativity of F is greater than that of N. So, in NH_3 the atomic dipole and bond-dipole are in the same direction whereas in NF_3 these are in opposite direction.



232. Which one of the following has the highest electronegativity?

(a) Br (b) C*l*
(c) P (d) Si

UPTU/UPSEE-2004

Ans. (b) : In a period moving from left to right then the electronegativity increases due to increase in effective nuclear charge-

Cl > P > Si

On moving from top to bottom in a group electronegativity decrease Cl > Br.
Hence, Cl has highest electronegativity.

233. Which of the following equation is used in Pauling's scale of electronegativity ?

(a) $x_A = 0.187\,(IE + EA) + 0.17$
(b) $x_A - x_B = 0.182 \left[E_{A-B} - \sqrt{(E_{A-A} \times E_{B-B})}\right]^{1/2}$
(c) $x_A = \dfrac{0.359 Z_{eff}}{r_A^2} + 0.744$
(d) None of the above

JCECE - 2004

Ans. (b) : According to Pauiling scale-

$$X_A - X_B = 0.182\left[E_{A-B} - \sqrt{E_{A-A} \times E_{B-B}}\right]^{\frac{1}{2}}$$

234. Which carbon is more electronegative?

(a) sp^3-hybridized carbon
(b) sp-hybridized carbon
(c) sp^2-hybridized carbon
(d) Always same irrespective of its hybrid state
(e) None of the above

Kerala-CEE-2004

Ans. (b) Electronegativity is defined as the relative tendency of an atom or species to attract towards it and we know that attract the electron, positive charge is required that comes from the nucleus. In sp hybridized carbon two orbitals are involved in hybridization among only one is s. The percentage of s-character it will be equal to 50%. For sp^2 hybridised the percentage of s-character will be 33.3% and for sp^3 hybridised the percentage of s-character will be 25%. Hence, the sp-hybridsed carbon is more electronegative.

235. Which one of the following represents the correct order of electronegativity?

(a) P > O > N (b) N > P > O
(c) O > N > P (d) N > O > P

A.P.EAMCET 2002

Ans. (c) : Electro-negativity is defined as the ability of an atom to attract shared electrons in a covalent bond. The correct order of electro-negativity is O > N > P.

236. Which one of the following is most basic?

(a) Cl^- (b) F^-
(c) I^- (d) Br^-

AMU 2002

Ans. (b) : In halides, electronegativity of the element plays an important role in determining the basicity. According to Bronsted Lowry concept, bases are proton acceptor and acid a proton donor. Down the group, size of the halides increase. So electronegativity or the ability to pull electrons towards itself decrease. So fluorine with its high electronegativity is a strong base.

237. In X – H .... Y, X and Y both are electronegative elements. Then

(a) electron density on X will increase and on H will decrease
(b) in both electron density will increase
(c) in both electron density will decrease
(d) on X electron density will decrease and on H increases

NEET-2001

Ans. (a) : For X–H ------ Y, 'H' is directly bonded to 'X' and there is a hydrogen, bond between 'H' and 'Y' As 'X' and 'Y' are electronegative active element that pull electron density towards themselves.
Therefore, the electron density on X increases on 'H' electron density decreases.

238. Let electronegativity, ionization energy and electron affinity be represented as EN, IP and EA respectively. Which one of the following equation is correct according to Mulliken?

(a) $EN = IP \times EA$ (b) $EN = \dfrac{IP}{EA}$
(c) $EN = \dfrac{IP + EA}{2}$ (d) $EN = IP - EA$

A.P.EAMCET (Engg.)-2001

Ans. (c) : Given,
Electronegativity = EN
Ionisation energy = IP
Electron affinity = EA
Mulliken has defined electronegativity as the average of ionization potential and electronegativity.

$$EN = \frac{IP + EA}{2}$$

239. Which one of the following would you expect to have highest electronegativity ?

@apna_pdf

(a) Mg (atomic number 12)
(b) S (atomic number 16)
(c) B (atomic number 5)
(d) Te (atomic number 52)

A.P.EAMCET 1995

Ans. (b) : Electronegativity decreases from top to bottom in a group and left to right increase in period. So, the sulphur has highest electronegative than Mg, B and Te.

240. The most electronegative element is

(a) nitrogen (b) oxygen
(c) fluorine (d) chlorine

A.P.EAMCET 1992

Ans. (c) : The most electronegative element is fluorine. The tendency of an atom in a molecule to attract the shared pair of electron towards itself is known as electronegativity.

241. If the ionization energy and electron affinity of an element are 275 and 86 kcal mol^{-1} respectively, then electronegativity of the element on the Mulliken scale is

(a) 2.8 (b) 0.0
(c) 4.0 (d) 2.6

Ans. (a) : Given that
Ionisation energy (I.E) = 275 Kcal/mol
Electron affinity (E.A) = 86 Kcal/mol
According to Mulliken, electronegativity of an atom is average of IE and E.A.

$$EN = \frac{IE + EA}{2}$$

If IE and E.A are in K.cal.mol^{-1}.

$$EN = \frac{IE + EA}{125} = \frac{275 + 86}{125} = 2.88.$$

5. Ionization Energy

242. Gadolinium has a low value of third ionisation enthalpy because of

(a) high basic character
(b) small size
(c) high exchange enthalpy
(d) high electro negativity

NEET-17.07.2022

Ans. (c) : Gadolinium has a low value of third ionization enthalpy because of high exchange enthalpy. In case of third ionization enthalpy electron will be removed from 5d and resulting configuration will be more stable electronic configuration.

243. The correct order of electron gain enthalpies of Cl, F, Te and Po is:

(a) F < Cl < Te < Po (b) Po < Te < F < Cl
(c) Te < Po < Cl < F (d) Cl < F < Te < Po

JEE Main-25.06.2022, Shift-II

Ans. (b) : The correct order of electron gain enthalpies of Cl, F, Te and Po is –
Po < Te < F < Cl
Table of electron gain enthalpies are given below –

Element	Electron Gain Enthalpies (kJmol^{-1})
Po	–174
Te	–190
F	–328
Cl	– 349

244. Elements X, Y and Z have atomic number 19, 37 and 55 respectively. Which of the following statements is true about them ?

(a) Z would have the highest ionization potential
(b) Y would have the highest ionization potential
(c) Their ionization potential would increase with increasing atomic number
(d) Y would have an ionization potential between those of X and Z

Karnataka CET-17.06.2022, Shift-II

Ans. (d) : Given that, X, Y and Z have atomic number 19, 37 and 55 respectively.
Then X = $_{19}$K = ionization potential = 4.3407 eV.
Y = $_{37}$Rb = ionization potential = 4.17771 eV.
Z = $_{55}$Cs = ionization potential = 3.8939 eV.
Therefore,

$$\text{Ionization potential of } (_{37}\text{Rb}) = \frac{\text{I.P.of (Cs)} + \text{I.P.of (K)}}{2}$$

$$\text{By symbolic, } Y = \frac{X + Z}{2}$$

So, Y would have an ionization potential between those of X and Z.

245. Given below are two statements. One is labelled as. Assertion A and the other is labelled as Reason R

Assertion A: The first ionization enthalpy for oxygen is lower than that of nitrogen.

Reason R: The four electrons in 2p orbital's of oxygen experience more electron- electron repulsion

In the light of the above statements. Choose the correct answer from the options given below.

(a) Both A and R are correct and Rj is the correct explanation of A
(b) Both A and R correct but R is NOT the correct explanation of A
(c) A is correct but R is not correct
(d) A is not correct but R is correct

JEE Main-29.06.2022, Shift-II

Ans. (b) : The first ionization enthalpy for oxygen is lower than that of nitrogen because as you move from left to right the atomic size decreases. So, ionization enthalpy will be increased.
In case, four electrons in 2p-orbital's of oxygen greater electron-electron repulsion.
As a result there is strong inter-electronic repulsion in the relatively small 2p-orbital of oxygen and thus the incoming electron does not experience much net attract force from the nucleus to hold the incoming electron.

246. The ionisation potential of which element is highest?

(a) H (b) He
(c) Ar (d) F

CG PET-22.05.2022

Ans. (b) : The ionization potential of He element is highest because ionization potential (Energy) decreases as move from down a group and increases as move from left to right across a period.
So, inert gas has highest ionization potential.

@apna_pdf

247. The correct order of 2nd ionisation energy for the elements carbon, nitrogen, oxygen and fluorine is–

(a) F > O > N > C (b) C > N > O > F
(c) O > F > N > C (d) O > N > F > C

BCECE-2016
Assam CEE-2014
WB JEE-2010
UPTU/UPSEE-2004

Ans. (c) : The electronic configuration of element after removal of first electron.

$O^+ =$	$1s^2$	$2s^2$	$2p^3$
$F^+ =$	$1s^2$	$2s^2$	$2p^4$
$N^+ =$	$1s^2$	$2s^2$	$2p^2$
$C^+ =$	$1s^2$	$2s^2$	$2p^1$

Therefore, the second ionization potential of oxygen is more as it acquires a half filled stable configuration so it energy requires a lot of energy to remove from the oxygen.

So, the correct order of second ionization potential is-
O > F > N > C

248. The set representing the correct order for first ionisation potential is

(a) K > Na > Li (b) Be > Mg > Ca
(c) B > C > N (d) Ge > Si > C

Tripura JEE-2019
Manipal-2017
JIPMER-2008
JCECE – 2007

Ans. (b) : On moving down the group top to bottom ionisation energy decreases due to the size increase. Hence, the correct order of first ionisation energy–
Be > Mg > Ca

249. The correct order in which the first ionization potential increases is

(a) Na, K, Be (b) K, Na, Be
(c) K, Be, Na (d) Be, Na, K

WB JEE-2015
MHT CET-2014
Karnataka CET, 2008

Ans. (b) : The first ionization potential generally increases in a period from left to right and decreases in a group from up to down. Thus, the correct order of first ionization potential is
K < Na < Be

250. The first ionization potential of Na, Mg and Si are respectively 496, 737 and 786 kJ mol^{-1}. The ionization potential of Al will be closer to

(a) 760 kJ mol^{-1} (b) 575 kJ mol^{-1}
(c) 801 kJ mol^{-1} (d) 419 kJ mol^{-1}

AMU-2014
CGPET-2010
J&K CET-2000

Ans. (b) : The ionization energy of Mg will be larger than that of Na due to fully filled configuration. The ionization energy of Al will be smaller than that of Mg due to one electron extra than the stable configuration but smaller than Si due to increase in effective nuclear of Si. Hence, the ionization potential of Al will be 760 kJ/mole.

251. The decreasing order of the ionization potential of the following elements is

(a) Ne > Cl > P > S > Al > Mg
(b) Ne > Cl > P > S > Mg > Al
(c) Ne > Cl > S > P > Mg > Al
(d) Ne > Cl > S > P > Al > Mg

JEE Main-27.07.2021, Shift-II
BITSAT 2016, CG PET -2005

Ans. (b) : On moving from left to right in a period ionization potential increases. On moving from top to bottom in a group ionization potential decreases. Rare gases are more ionization potential than full filled orbital than half-filled orbital. Hence, the order is Ne > Cl > P > S > Mg > Al.

252. In which of the following arrangements, the order is NOT according to the property indicated against It

(a) Li < Na < K< Rb:
Increasing metallic radius
(b) I<Br<F<CI:
Increasing electron gain enthalpy
(c) B<C<N<O
Increasing first ionization enthalpy
(d) $Al^{3+} < Mg^{2+} < Na^+ < F^-$
Increasing ionic size

NEET-I, 2016
AIIMS-2015, 2005

Ans. (c): When we move from B to O in periodic table first ionization enthalpy increases due to the attraction of nucleus towards the outer most of electron. Hence, the order is- B < C < N < O : increasing first ionization enthalpy.

253. In the following, the element with the highest ionization energy is

(a) [Ne] $3s^2 3p^2$ (b) [Ne] $3s^2 3p^3$
(c) [Ne] $3s^2 3p^2$ (d) [Ne] $3s^2 3p^4$

JIPMER-2010
JCECE - 2009
NEET-2009

Ans. (b) : The given electronic configuration [Ne] $3s^2$ $3p^3$ are half-filled electronic configuration on removing the one electron the amount of energy is required to high. So, it has highest ionisation energy.

254. For the second period elements the correct increasing order of first ionization enthalpy is

(a) Li < Be < B < C < O < N < F < Ne
(b) Li < Be < B < C < N < O < F < Ne
(c) Li < B < Be < C < O < N < F < Ne
(d) Li < B < Be < C < N < O < F < Ne

J & K CET-(2015)
JEE Main-2013, NEET-2009

Ans. (c) : When we move from left to right in a period ionisaiton energy increase. Be has full filled 2s subshell so the ionisation energy is maximum in comparison to B, N is half filled 2p orbital so ionisation energy is maximum in comparison to oxygen atom. Thus, order of first ionisation enthalpy is-
Li < B < Be < C < O < N < F < Ne

255. What will be the order of Ist ionisation energy?

(a) Li > Na > K (b) K > Li < Na
(c) Na > Li > K (d) Li > K > Na

UPTU/UPSEE-2015
JIPMER-2006

@apna_pdf

Ans. (a) : On moving from top to bottom in a group ionisation energy decreases because atomic size increases and due to lessening of the nucleus by inner electrons. This means that Li will be having highest ionisation energy and K will be having the lowest energy.
So, the ionisation energy of Li, Na and K are 520 kJ/mole, 496 kJ/mole and 419 kJ/mole respectively.

256. Generally, the first ionization energy increases along a period. But there are some exceptions. One which is not an exception is
(a) N and O (b) Na and Mg
(c) Mg and Al (d) Be and B

KARNATAKA-CET, 2010
Karnataka-CET-2011

Ans. (b) : Na belongs to IA group and Mg belongs to IIA group. On moving form left to right in a period, first ionization energy increases, thus, IE of Mg is greater than the IE of Na.
IE order Mg > Na

257. The correct of ionisation energy of C, N, O, F is
(a) $F < O < N < C$ (b) $F < N < C < O$
(c) $C < N < O < F$ (d) $C < O < N < F$

KARNATAKA-CET, 2009
Karnataka-CET-2012

Ans. (d) : Ionisation energy generally increases from left to right in a period but ionization energy of nitrogen is greater than oxygen dud to stable p^3 configuration. Hence, the order is as
$C < O < N < F$

258. The one electron species having ionization energy of 54.4 eV is:
(a) H (b) He^+
(c) B^{4+} (d) Li^{2+}
(e) Be^{2+}

UPTU/UPSEE-2016
Kerala-CEE-2004

Ans. (b) We know that,

$$E(\text{ionisation energy}) = \frac{-13.6\times z^2}{n^2}\text{eV}$$

Where, z = atomic number
n = shell
For, He^+, z = 2, n = 1

$$\therefore \quad E = \frac{-13.6\times 2^2}{1^2}$$
$$= -13.6 \times 4$$
$$= -54.4 \text{ eV}$$

259. Which element has the highest first ionization potential?
(a) N (b) Ne
(c) He (d) H
(e) Li

Manipal-2020
Kerala-CEE-2018

Ans. (c) : On moving from up to down in a group ionization potential decrease and across a period ionisation energy increase. He is small size and fully filled inert gas configuration. Therefore, He has the highest first ionization potential.

260. With which of the following electronic configuration an atom has the lowest ionisation enthalpy?
(a) $1s^2 2s^2 2p^3$ (b) $1s^2 2s^2 2p^6 3s^1$
(c) $1s^2 2s^2 2p^6$ (d) $1s^2 2s^2 2p^5$

WB JEE-2011
NEET-2007

Ans. (b) : The given electronic configuration has $1s^2 2s^2 2p^6 3s^1$. On removing the one electron easily due to form stable noble gas configuration. Hence, the electronic configuration $1s^2$, $2s^2$, $2p^6$, $3s^1$ has lowest ionisation enthalpy.

261. Proper decreasing order of first ionization potential of the elements Be, B, C and Li will be which one of the following?
(a) $C > B > Be > Li$ (b) $C > Be > B > Li$
(c) $B > C > Be > Li$ (d) $Be > Li > B > C$

Tripura JEE-2022
JIPMER-2012

Ans. (b) : When we move from left to right in a period, ionisation enthalpy increase. Be has full filled 2s-subshell then the Boron atom. Therefore, the order is-
$C > Be > B > Li$

262. The first ionisation potenital (in eV) of N and O atoms are
(a) 14.6, 13.6 (b) 13.6,14.6
(c) 13.6, 13.6 (d) 14.6, 14.6

CG PET- 2016, 2013

Ans. (a) : The electronic configuration of nitrogen and oxygen are-

N -	$1s^2$	$2s^2$	$2p^3$
O -	$1s^2$	$2s^2$	$2p^4$

When oxygen loses one electron it will attain half-filled configuration.
So, it can lose an electron easily but nitrogen has already in a half filled configuration and hence losing an electron will require more energy than that of oxygen.
Therefore, the first ionization potential of N and O atoms are 14.6 and 13.6 respectively.

263. Four successive members of the first row transition elements are listed below with their atomic numbers. Which one of them is expected to have the highest third ionisation enthalpy?
(a) Vanadium (Z=23) (b) Manganese (Z=25)
(c) Chromium (Z=24) (d) Iron (Z=26)

CG PET -2007
NEET-2005

Ans. (b) : The electronic configuration of Mn is-
$_{25}Mn = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^5$
Third electron which is removed in third ionization potential belong to $3d^5$ subshell. The $3d^5$ subshell has highest stability because of it is a half-filled subshell so, Mn shows highest third ionization potential.

264. The second ionization enthalpies of Li, Be, B and C are in order
(a) Li >B>C>Be (b) Li >C>B>Be
(c) Be >C>B>Li (d) B >C>Be>Li

CG PET -2017
J & K CET-(2011)

@apna_pdf

Ans. (a) : The ionization enthalpy depend on the following factors:
(i) Half- filled or full filled atomic orbitals are more stable than other incomplete orbital.
(ii) Smaller the size of atom/ion, more is the ionization energy. (I.E.) For 2nd I.E. all elements have M^+ configuration

	Total no. of electrons	**Outermost configuration**
$Li^+(Z=3)$	2	$1s^2$ (fully filled)
Be^+ (Z=4)	3	$2s^1$ (has more size) than carbon)
$B^+(Z=5)$	4	$2s^2$ (fully filled)
$C^+(Z=6)$	5	$2s^2 2p^1$ (Smaller size)

Hence, correct, order for 2nd I.E. is

$$Li^+ > B^+ > C^+ > Be^+$$

or $$Li > B > C > Be^+$$

265. Which element has maximum first ionisation potential?
(a) Cs (b) F
(c) Na (d) He

CG PET- 2015
J&K CET-2001

Ans. (d) : On moving from left to right in a period generally ionisation energy increases helium (He) is stable configuration is remove one electron from filled s-subshell. The required is more due to filled 1s orbital. Hence, the first ionisaiton energy is maximum in He.

266. The increasing order of the first ionisation enthalpies of the elements B, P, S and F (lowest first) is
(a) F < S < P < B (b) P < S < B < F
(c) B < P < S < F (d) B < S < P < F

UPTU/UPSEE-2017
(AIEEE 2006)

Ans. (d) : On moving from left to right in a period ionisaiton energy increase but on moving from top to bottom in group ionisation energy decreases. Phosphorous (P) has half-filled configuration, it has higher IE_1 than of S-atom.
Hence, the correct order of first ionisation energy is

$$\underset{800}{B} < \underset{999.4}{S} < \underset{1012}{P} < \underset{1680.8\ kJ/mole}{F}$$

267. A sudden large jump between the values of second and third ionization energies of elements would be associated with which of the following electronic configurations?
(a) $1s^2\ 2s^2\ 2p^6\ 3s^1$ (b) $1s^2\ 2s^2\ 2p^6\ 3s^2 3p^1$
(c) $1s^2\ 2s^2\ 2p^6\ 3s^1\ 3p^2$ (d) $1s^2\ 2s^2\ 2p^6\ 3s^2$

J & K CET-(2004), NEET-1993

Ans. (d) : The sudden large jump between the value of second and third ionisaiton energies of an element. Because after losing two electron it has acquired stable configuration. Thus, in order to remove third electron much higher energy is needed. Therefore, the electronic configuration is $1s^2\ 2s^2\ 2p^6\ 3s^2$.

268. First ionisation potential of Be and B will be
(a) 8.8 and 8.8 (b) 6.6 and 6.6
(c) 6.6 and 8.8 (d) 8.8 and 6.6

CG PET -2007
NEET-1998

Ans. (d) : Ionization potential increase from left to right in a period but in case of Be and B. Beryllium is having more ionization potential than boron to completely filled s-orbital in beryllium.
So, the first ionization potential of Be and B will be 8.8 and 6.6 respectively.

269. Which of the order for ionization energy is correct?
(a) Be < B< C<N<O (b) B < Be< C<O<N
(c) Be > B> C>N>O (d) B < Be< N<C<O

AIIMS-2013
NEET-2001

Ans. (b): The energy required to remove the most loosely bound electron from an isolated gaseous atom is called the ionization energy. The ionization potential decreases as the size of the atom decrease. Atom will fully or partly filled orbitals have high ionization potential.
Hence, the order-

B < Be < C < O < N

270. Which one of the following order is correct for the first ionization energies of the elements?
(a) B < Be < N < O (b) Be < B < N < O
(c) B < Be < O < N (d) B < O < Be < N

VITEEE- 2009
JIPMER-2004

Ans. (c) : Along a period first ionization energy increases. Thus, the first IE of the elements in second period should follow the order Be < B < N < O
The first IE of these elements follows the order B < Be < O < N The lower IE of B than that of Be is because in B ($1s^2$, $2s^2\ 2p^1$), electron is to be removed from 2p which is easy while in Be ($1s^2$, $2s^2$), electron is to be removed from 2s which is difficult. The low IE of O than that of N is because of the half-filled 2p orbitals in N ($1s^2$, $2s^2\ 2p^3$).

271. Which of the following elements has the lowest ionisation potential?
(a) Sodium (b) Potassium
(c) Rubidium (d) Cesium

AMU–2003
J & K CET-(2008)

Ans. (d) : The ionization energy decreases on moving down the group
As we go down in a group, the nuclear charge increases.
(2) As we go down in a group the atomic size increases. due to the addition of a new shell to each element.
(3) As we go down in a group , the number of inner electrons increases . This increases the shielding effect on outer electrons.
The combined effect of the increases in atomic size, and the shielding effect more than the effect of the increases of the nuclear charge. These effects act in such a way that the force of attraction between the nucleus, and the outermost electron decreases as we go down the group.

272. Identify the elements X and Y using the ionisation energy values given below.

	Ionisation energy (Ist)	**kJ/mol (IInd)**
X	**495**	**4563**
Y	**731**	**1450**

@apna_pdf

(a) X = Na, Y = Mg (b) X = Mg, Y = F
(c) X = Mg, Y = Na (d) X = F, Y = Mg

(JEE Main 2021, 16 March Shift-II)

Ans. (a) : The electronic configuration of Na = [Ne] $3s^1$ ionisatin energy of sodium is very low but second ionisation energy is very high due to stable noble gas configuration of Na^+.
The electronic configuration of Mg = $[Ne]3s^2$ first and second ionisation energy is low.

273. The first ionisation energy of magnesium is smaller as compared to that of elements X and Y, but higher than that of Z. The elements X, Y and Z, respectively, are
(a) chlorine, lithium and sodium
(b) argon, lithium and sodium
(c) argon, chlorine and sodium
(d) neon, sodium and chlorine

(JEE Main 2021, 18 March Shift-II)

Ans. (c) : On moving from left to right in a 3rd period ionisaiton energy increases.
Ionisation energy of the 3rd period are-
Na < Al < Mg < Si < S < P < Cl < Ar
Hence, the element X, Y and Z are argon, chlorine and sodium respectively.

274. Electromagnetic radiation of wavelength 663 nm is just sufficient to ionise the atom of metal A. The ionisation energy of metal A in kJ mol^{-1} is ....(Rounded off to the nearest integer) [$h = 6.63 \times 10^{-34}$ J-s, $c = 3.00 \times 10^8$, ms^{-1}, $N_A = 6.02 \times 10^{23}$ mol^{-1}]

[JEE Main 2021, 25 Feb Shift-II]

Ans. (180) : Given that, $h = 6.63 \times 10^{-34}$ J.sec,
$c = 3 \times 10^8$ m/sec, $N_A = 6.02 \times 10^{23}$ mol^{-1}
$N = 663$ nm $= 663 \times 10^{-9}$ m

$\therefore$ Ionisation energy of atom of metal A = $\dfrac{hc}{\lambda}$

$$= \frac{6.63\times10^{-34}\times3\times10^{8}}{663\times10^{-9}}$$

$= 3 \times 10^{-19}$ Joule
Since, Ionisation energy per mole
$= 3\times10^{-19} \times 6.02\times10^{23}$
= 180. 6kJ/mole
= 180 kJ/mole

275. The third ionisation enthalpy is highest in
(a) Alkali metals (b) Alkaline earth metals
(c) Chalcogens (d) Pnictogens

Kerala-CEE-29.08.2021

Ans. (b) : Alkaline earth metals acquired the outer two electron in s-orbital. After removing of two electron from alkaline earth's metal, they get the stable configuration. So more energy required for the removing of electron. Hence, alkaline earth metals have the highest third ionization enthalphy.

276. Choose the correct option regarding the following statements :
Statement-1: Nitrogen has lesser electron gain enthalpy than oxygen.
Statement-2: Oxygen has lesser ionization enthalpy than nitrogen.
(a) Statement - 1 is correct. Statement -2 is wrong
(b) Both statement 1 and 2 are wrong
(c) Both statement 1 and 2 are correct
(d) Statement -1 is wrong. Statement -2 is correct.

AP EAPCET 19-08-2021, Shift-II

Ans. (c) :
Electronic configuration of $_7N = 1s^2, 2s^2, 2p^3$
↑ | ↑ | ↑

Electronic configuration of $_8O = 1s^2, 2s^2, 2p^4$
⇅ | ↑ | ↑

N has lesser electron gain enthalpy because the extra addition of one electron in 2p orbital is very energy consuming.
Oxygen has lower ionisation enthalpy than nitrogen because by removing one electron from 2p - orbital, oxygen acquires stable configuration i.e. $2p^3$.On the other hand, in case nitrogen it is not easy to remove one of the three 2p electronic due to its stable configuration.

277. Which order among the following is incorrect?
(a) $NH_3 < PH_3 < AsH_3$: (Acidic nature)
(b) Li < Be < B < C : IE_1 (ΔH_1)
(c) $Al_2O_3 < MgO < Na_2O < K_2O$: (Basic Nature)
(d) $Li^+ < K^+ < Cs^+$: (Ionic radius)

AP- EAPCET- 07-09-2021, Shift-I

Ans. (b) : Ionization enthalpy is defined as the amount of energy an isolated gaseous atom. Atom would take to lose an electron in its ground state.
So the correct order is-

Li	<	B	<	Be	<	C
520		801		899		1086 kJ/Mole (ΔH_1)

278. The successive ionization energies of an element in kJ. mol^{-1} are 1060, 1900, 2920, 6280 and 21200. This element would belong to group-____
(a) V (b) VI
(c) VII (d) IV

AP- EAPCET- 07-09-2021, Shift-I

Ans. (a) : The successive ionization energies of an element in $kJmole^{-1}$ are 1060,1900, 2920, 6280 and 21200. The element belong to group V.

279. Starting from the 1st, the successive ionization potentials of an element are respectively 5.98, 18.8, 28.4, 120.1, 154eV. The elements is
(a) B (b) Al
(c) P (d) Mg

TS EAMCET 05.08.2021, Shift-I

Ans. (b) : The amount of energy required to remove an electron from an isolated gaseous atom in its gaseous state.
$I.E_1 = 5.98$ eV
$I.E_2 = 18.8$ eV
$I.E_3 = 28.4$ eV
$I.E_4 = 120.1$ eV
$I.E_5 = 154$ eV
Hence, the ionization potential difference between $I.E_3$ and $I.E_4$ is maximum. So, the element is Al.

280. The first ionization energies (in kJ mol^{-1}) of four consecutive elements of the second period are given in the options. The first ionization energy of nitrogen is

@apna_pdf

(a) 1086 (b) 1402
(c) 1681 (d) 1314

TS EAMCET 04.08.2021, Shift-I

Ans. (b) : The amount of energy required to remove an electron from an isolated atom or molecules is called ionization energy. The first ionization energy of nitrogen is 1402 kJ/mole energy.

281. Match List-I with List-II

List-I Electronic configuration of elements		List-II $\Delta_i H$ in kJ mol^{-1}	
(a)	$1s^2\ 2s^2$	(i)	801
(b)	$1s^2\ 2s^2 2p^4$	(ii)	899
(c)	$1s^2\ 2s^2\ 2p^3$	(iii)	1314
(d)	$1s^2\ 2s^2 2p^1$	(iv)	1402

Choose the most appropriate answer from the options given below:

(a) (a) → (i), (b) → (iv), (c) → (iii), (d) → (ii)

(b) (a) → (iv), (b) → (i), (c) → (ii), (d) → (iii)

(c) (a) → (ii), (b) → (iii), (c) → (iv), (d) → (i)

(d) (a) → (i), (b) → (iii), (c) → (iv), (d) → (ii)

JEE Main 26.02.2021, Shift-I

Ans. (c) : Ionisation energy in second period.

$Be(1s^2\ 2s^2)$ = 899 kJ/mole
$O(1s^2\ 2s^2\ 2p^4)$ = 1314 kJ/mole
$N(1s^2\ 2s^2\ 2p^3)$ = 1402 kJ/mole
$B(1s^2\ 2s^2\ 2p^1)$ = 801 kJ/mole

282. The correct order for the increasing ionization enthalpies for the following is:

(i) $1s^2\ 2s^2\ 2p^6\ 3s^2$ (ii) $1s^2\ 2s^2\ 2p^6\ 3s^1$
(iii) $1s^2\ 2s^2\ 2p^6$ (iv) $1s^2\ 2s^2\ 2p^2$
(v) $1s^2\ 2s^2\ 2p^1$

Options:

(a) (ii)<(iii)<(i)<(v)<(iv)
(b) (ii)<(i)<(iii)<(v)<(iv)
(c) (ii)<(i)<(v)<(iv)<(iii)
(d) (ii)<(i)<(iv)<(v)<(iii)

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (c) Mg (12): $1s^2, 2s^2, 2p^6, 3s^2$
Na (11): $1s^2, 2s^2, 2p^6, 3s^1$
Ne (10): $1s^2, 2s^2, 2p^6$
C (6): $1s^2, 2s^2, 2p^2$
B (5): $1s^2, 2s^2, 2p^1$

The correct order for increasing ionization enthalpies are:–

$\boxed{\text{(ii)<(i)<(v)<(iv)<(iii)}}$

Na<Mg<B<C<Ne

283. If the successive ionization energies of an element A are 165, 190, 550 and 595 kcal. respectively. then the ground state electronic configuration of element A is ______.

(a) $[Ne]\ 3s^2\ 3p^2$ (b) $[He]\ 2s^1$
(c) $[He]\ 2s^2\ 2p^2$ (d) $[Ne]\ 3s^2$

AP EAPCET 24.08.2021, Shift-I

Ans. (d) : The given ionization energies are –

$\Delta_1H = 165$ Kcal
$\Delta_2H = 190$ Kcal
$\Delta_3H = 595$ Kcal

Δ_1H and Δ_2H are less that indicates that there are two valence electrons and they are in p-orbital from given options the only satisfying option is $1s^2\ 2s^2\ 2p^6\ 3s^2$ or $[Ne]\ 3s^2$.

284. Match the following?

property	metal
(a) Element with highest second ionization enthalpy (is) (Δ_1H_2)	(i) Co
(b) Element with highest third ionization enthalpy (Δ_1H_3)	(ii) Cr
(c) M in $[M(CO)_6]$	(iii) Cu
(d) element with highest heat of atomization (Δ_1H)	(iv) Zn
	(v) Ni

(a) (a → iii), (b → i), (c → v), (d → iv)
(b) (a → iii), (b → iv), (c → ii), (d → v)
(c) (a → iv), (b → i), (c → ii), (d → iii)
(d) (a → v), (b → iv), (c → i), (d → iii)

AP EAPCET 20.08.2021 Shift-II

Ans. (b): Element with highest second ionization enthalpy (Δ_1H_2) = Cu

Element with highest third ionization enthalpy(Δ_1H_3) = Zn

Element with highest heat of atomization (Δ_1H) is Ni and $[M(CO)_6]$ metal is Cr.

285. The first ionization enthalpies of Mg and Al can be expected to be______

(a) IE_1 (Mg) = 577.5 kJ. mol^{-1}, IE_1 (Al) = 577.5 kJ. mol^{-1}
(b) IE_1 (Mg) = 577.5 kJ. mol^{-1}, IE_1 (Al) = 737.7 kJ. mol^{-1}
(c) IE_1 (Mg) = 737.7 kJ. mol^{-1}, IE_1 (Al) = 737.7 kJ. mol^{-1}
(d) IE_1 (Mg) = 737.7 kJ. mol^{-1}, IE_1 (Al) = 577.5 kJ. mol^{-1}

AP EAPCET 20.08.2021 Shift-II

Ans. (d): Ionization enthalpy is defined by the amount of energy an isolated gaseous atom would take to lose an electron in its ground state.

(i) $Mg \longrightarrow Mg^+ + e^-$
$I{\cdot}E_1(Mg) = 737.7$ kJ mole^{-1}
(ii) $Al \longrightarrow Al^+ + e^-$
$I{\cdot}E_1(Al) = 577.5$ kJ mole^{-1}

286. Identify the incorrect order corresponding the mentioned property?

(a) $Al_2O_3 < MgO < Na_2O < K_2O$: Basicity
(b) $NH_3 < PH_3 < AsH_3$: Acidity
(c) $Li^+ < Na^+ < K^+ < Cs^+$: Ionic radius
(d) Li < Be < B < C : First Ionization enthaply

AP EAPCET 24.08.2021 Shift-II

Ans. (d) : Option (1), (2) and (3) are correct. Ionization enthalpy defined as the amount of energy an isolated gaseous atom would take to lose an electron in its ground state.

So, the order is –

Li < B < Be < C (for first ionization energy)

520, 801, 899, 1086, kJ/ mole.

287. Identify the elements X and Y using the ionisation energy values given below:

@apna_pdf

Ionization energy (kJ/mol)

	1st	**2nd**
X	**495**	**4563**
Y	**731**	**1450**

(a) X = Na; Y = Mg (b) X = Mg; Y = Na
(c) X = F; Y = Mg (d) X = Mg; Y = F

JEE Main 16.03.2021, Shift-II

Ans. (a) : As we know, first ionization energy is always less than second ionization energy. After removal of one electron from outer orbit, it's attains the stable noble gas configuration i.e

$Na^+ \rightarrow [Ne], 3s^0$

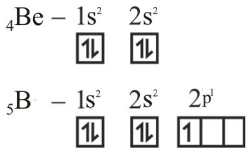
due to which ionization energy of Na^+ is very low but second ionization energy is very high.

$Mg \rightarrow [Ne]\ 3s^2$, The first and second ionization enthalpy of Mg is low but the third ionization enthalpy is very high due to noble gas configuration.

288. Assertion (A): The first ionization energy of Be is greater than that of B.
Reason (R): 2p orbital has lower energy than 2s orbital.
(a) Both A and R are true and R is a correct explanation for A
(b) Both A and R are true but R is not a correct explanation for A
(c) A is true R is false
(d) A is false, R is true

AP EAPCET 23-08-2021 Shift-I

Ans. (c) : Electronic configuration of-



Ionisation energy is defined by the atom which required minimum energy to remove the one electron in outer shell.

So, Be has stable subshell to remove one electron is maximum in comparison to B.

Now, according to Aufbau principle.

$1s^2\ \ 2s^2\ \ 2p^6\ \ 3s^2\ \ 3p^6$ ....

So, the energy of 2s is lower than 2p.

So, the option (c) is correct.

289. The second ionisation energies of Li, Be, B and C are in the order ....
(a) Li > C > B > Be (b) Li > B > C > Be
(c) Be > C > B > Li (d) B > C > Be > Li

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) : The second ionisation energy is the energy required to remove an electron from a 1^+ cation in the gaseous state.

$$X^+(g) \rightarrow X^{2+}(g) + e^-$$

Just like the first ionisation energy, the second ionisation energy is affected by size, effective nuclear charge, and electron configuration. Li has highest IE_2 than because the second electron remove from stable noble gas configuration and B has higher IE_2 than C due to the extra stability of the $2s^2$ subshell in the B^+ ion. Therefore, the order is Li > B > C > Be

Hence, the correct option is (b).

290. Which element of the 3d-series has highest third ionisation enthalpy ?
(a) Mn (b) Zn
(c) Fe (d) Cu

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (b) : The electronic configuration of zinc metal is

$Zn = [Ar]3d^{10}, 4s^2$

The third ionisation enthalpy of Zn means removal of electron from the stable configuration of $3d^{10}$. The metal having the highest third ionisation enthalpy is Zn. Hence, the correct option is (b).

291. B has a smaller first ionisation enthalpy than Be. Consider the following statements:
(I) It is easier to remove 2p electron than 2s electron
(II) 2p electron of B is more shielded from the nucleus by the inner core of electrons than the 2s electrons of Be
(III) 2s electron has more penetration power than 2p electron
(IV) atomic radius of B is more than Be
(atomic number B = 5, Be = 4)
The correct statements are
(a) (I), (II) and (III) (b) (II), (III) and (IV)
(c) (I), (III) and (IV) (d) (I), (II) and (IV)

(JEE Main 2020, 9 Jan Shift-II)

Ans. (a) : Boron (B) has a smaller first ionisation energy than Be because Be has a stable complete electronic configuration so, it requires to more energy to remove the first electron from it.
(i) It is easier to remove 2p electron than 2s electron.
(ii) 2p electron of B is more shielded from the nucleus by the inner core of electrons than the 2s electrons of Be.
(iii) 2s electron has more penetration power than 2p electron.

292. The first and second ionisation enthalpies of a metal are 496 and 4560 kJ mol^{-1}, respectively. How many moles of HCl and H_2SO_4, respectively, will be needed to react completely with 1 mole of the metal hydroxide?
(a) 1 and 2 (b) 1 and 1
(c) 2 and 0.5 (d) 1 and 0.5

(JEE Main 2020, 9 Jan Shift-II)

Ans. (d) : Given that, $IE_2 > IE_1$, So the element belong the first group.

Therefore, this element will be a monovalent and thus forms a monoacidic base of the type MOH.

$MOH + HCl \rightarrow MCl + H_2O$

$2MOH + H_2SO_4 \rightarrow M_2SO_4 + 2H_2O$

So, from the above equation we can say that 1 mole of metal hydroxide required 1 mole of HCl and 0.5 mole of H_2SO_4.

293. The first ionisation energy (in kJ/mol) of Na, Mg, Al and Si respectively, are:
(a) 496, 577, 737, 786 (b) 786, 737, 577, 496
(c) 496, 577, 786, 737 (d) 496, 737, 577, 786

(JEE Main 2020, 8 Jan Shift-I)

Ans. (d) : Ionisaiton energy is directly proportional to the effective nuclear charge (Zeff). As the size of atom increase Zeff also increase i.e. ionisaiton energy also increase.

@apna_pdf

Ionisation energy $\propto$ Zeff

Ionisation energy is the amount of energy required to remove the outer shell electron of an atom.

Thus, the correct order of ionization energy are-

Na = 496, mg = 737, Al = 577, Si = 786

294. The third ionisation enthalpy is minimum for:

(a) Mn (b) Ni

(c) Co (d) Fe

(JEE Main 2020, 8 Jan Shift-I)

Ans. (d) : The electronic configuration of Fe is

$_{26}Fe = [Ar]\ 3d^6\ 4s^2$

In Fe three electron are removed the electron will be attain a stable configuration i.e., $_{26}Fe^{3+} = [Ar]\ 3d^5$

So, the ionization energy will be least as compared to others, so, the third ionization enthalpy is minimum is Fe.

295. The correct order of the first ionisation enthalpies is

(a) Mn < Ti < Zn < Ni (b) Ti < Mn < Zn < Ni

(c) Zn < Ni < Mn < Ti (d) Ti < Mn < Ni < Zn

(JEE Main 2019, 10 April Shift-II)

Ans. (d) : When we move from left to right in a period ionisation enthalpies increases

Species	Ti	Mn	Ni	Zn
Ionisation enthalpy (kJ/mole)	656	717	736	906

296. In comparison to boron, beryllium has

(a) lesser nuclear charge and lesser first ionisation enthalpy

(b) greater nuclear charge and lesser first ionisation enthalpy

(c) greater nuclear charge and greater first ionisation enthalpy

(d) lesser nuclear charge and greater first ionisation enthalpy

(JEE Main 2019, 12 April Shift-II)

Ans. (d) : The first ionisation of beryllium is greater than that of boron because beryllium has a stable complete electronic configuration ($1s^2\ 2s^2$) so it requires more energy to remove the first electron from it.

Thus, the nuclear charge of boron is greater than nuclear charge of Beryllium (Be)

297. Assertion: Ionisation enthalpy of beryllium is higher than that of boron.

Reason: Across the period, from left to right, ionisation enthalpy decreases.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Morning)

Ans. (c): According to periodic trends, boron should have a higher ionization energy but because its valence shell $2p^1$ is Shielded by the 2s electron, less energy is required to remove the 2p electrons from a boron atom than is required to remove the 2s electron from a beryllium atom.

298. Assertion: Li has high ionisation enthalpy, while Li is the strongest reducing agent in aqueous medium.

Reason : Li has high oxidation potential.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Evening)

Ans. (a): Li has high ionization energy, while Li is the strongest reducing agent in aqueous medium because of large amount of hydration energy is realized and on account of large amount of hydration energy molecules it strongest reducing agent and Li has high oxidation potential.

299. The element having greater difference between its first and second ionization energies, is:

(a) Ca (b) Sc

(c) Ba (d) K

(JEE Main 2019, 9 April Shift-I)

AIIMS 25 May 2019 (Morning)

Ans. (d): Alkali metal have high difference in the first and second ionization energy and they achieve stable noble gas configuration offer first ionization. First ionization energy is the energy required to remove an electron from an atom in the gaseous state.

The second ionization energy is defined as the energy needed to remove one mole of 1^+ ions in the gaseous state to form one mole of 2^+ ions in the gaseous state.

The value of 2nd I.E. are-

For Ca, $I.E_2 = 1145.4$ kJ/mole

Sc, $I.E_2 = 1235.0$ kJ/mole

K, $I.E_2 = 3052.0$ kJ/mole

Ba, $I.E_2 = 965.2$ kJ/mole

Hence, potassium (K) has highest ionization energy.

300. The first ionization enthalpy of the following elements are in the order:

(a) C < N < Si < P (b) P < Si < N < C

(c) P < Si < C < N (d) Si < P < C < N

Karnataka-CET-2019

Ans. (d) : When moving from left to right in a period ionization energy increase and moving from top to bottom in a group ionization energy decreases.

Therefore nitrogen has higher ionization energy and silicon has lower ionization energy so, the first ionization enthalpy order of the element are-

Si < P < C < N

301. Which of the following has highest second ionisation energy :

(a) Chromium (b) Calcium

(c) Iron (d) Cobalt

Manipal-2019

Ans. (a) : The electronic configuration of Cr is

$_{24}Cr = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^1, 3d^5$

After ionisation of one electron then the electronic configuration is-

@apna_pdf

$Cr^+ = 1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^0, 3d^5$
It has half-filled stable configuration. So, the second ionisation of Cr will require much greater ionisation energy than the expected one.

302. The second ionisation energy of the following elements follows the order
(a) Zn > Cd > Hg (b) Zn > Cd > Hg
(c) Cd > Hg < Zn (d) Zn < Cd < Hg

WB-JEE-2019

Ans. (a) : From moving top to bottom in a group ionisation energy decrease due to nuclear charge increases, atomic size increase and the number of shells increases. Thus the electron are loosely held with the nucleus.
The order of ionisation energy is–
Zn > Cd > Hg

303. The successive ionization energies in kJ/mol of an element P are 740, 1500, 7000, 10500, 13600, 18000 and 21700. Which ion is the most likely to be formed when P reacts with chloride?
(a) p^{2-} (b) p^+
(c) p^{2+} (d) p^{3+}

COMEDK 2018

Ans. (c) : After losing two electrons, there is sudden huge increase in IE from 1500 to 7000 kJ/mol. It means that after losing two electrons, some stable configuration is achieved. So, element P forms P^{2+} ion.

304. Assertion: Second ionization enthalpy will be higher than the first ionization enthalpy.
Reason: Ionization enthalpy is quantitative measure of the tendency of an element to lose electron.
(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-27 May, 2018

Ans. (b): Second ionization enthalpy will be highest than first ionization energy because after removal of first electron. The nuclear charge increases and electrons are held more tightly by the nucleus. This is makes the removal of second electrons difficult and thus, requires more energy.

305. Amongst the elements with following electronic configurations, which one of them may have the highest ionization energy?
(a) $Ne[3s^2 3p^2]$ (b) $Ar[3d^{10} 4s^2 4p^3]$
(c) $Ne[3s^2 3p^1]$ (d) $Ne[3s^2 3p^3]$

BITSAT 2018

Ans. (d) : The smaller the atomic size, larger is the value of ionization potential. Further the atoms having half filled or fully filled orbitals are comparatively more stable, hence more energy is required to remove the electron from such atoms.

306. What will be ionization energy of Be atom? Consider the first ionization energy of H atom as 13.6 eV.
(a) –217.6 eV (b) 54.4 eV
(c) 108.8 eV (d) 4 eV

J & K CET-(2018)

Ans. (a) : According to Bohr's model of energy

$$E = -13.6 \times \frac{z^2}{n^2}$$

Where, E = Energy of electron
n = Shell
Z = Atomic number

$$\text{Ionisation energy of } 1^{st} \text{ orbit of Be} = \frac{-13.6 \times 4^2}{1^2}$$
$$= -13.6 \times 16$$
$$= -217.6 \text{ eV}$$

So, Ionisation energy = 217.6 eV

307. The ionisation energy of nitrogen is larger than that of oxygen because :
(a) the size of nitrogen atom is smaller
(b) there is greater attraction of electrons towards the nucleus
(c) half-filled p-orbitals of nitrogen have extra stability
(d) None of the above

Manipal-2017

Ans. (c) : The electronic configuration of nitrogen and oxygen are-
$_7N$ - $1s^2, 2s^2, 2p^3$
$_8O$ - $1s^2, 2s^2, 2p^4$
Thus, the ionisation energy of nitrogen is larger than that of oxygen because of half-filled p-orbitals of nitrogen have extra stability.

308. The first four ionization enthalpy values of an element are 191 kcal mol^{-1}, 578 kcal mol^{-1}, 872 kcal mol^{-1} and 5962 kcal mol^{-1} . The number of valence electrons in the element is
(a) 1 (b) 2
(c) 3 (d) 4

CG PET -2017

Ans. (c) : In the given statement, first three I.E. values are low, but 4^{th} I.E. value is quite high and cannot be achieved (i.e.5962 kcal/mol)
∴ Only three electrons are possible in the valence shell.
So, possible valency is (3).

309. First and second ionisation enthalpies of Mg are 737.76 and 1450.73 J mol^{-1} respectively. The energy required to convert all the atoms of magnesium to magnesium ions present in 24g of magnesium vapours is
(a) 24 kJ (b) 2.188 kJ
(c) 12 kJ (d) 4.253 kJ

CG PET- 2016

Ans. (b) : Given that,
$Mg(g) + \Delta H_1 \rightarrow Mg^+(g) + e^-$;735.76 kJ/mole
$Mg^+(g) + \Delta H_2 \rightarrow Mg^{+2}(g)\ e^-$; 1450.73 kJ/mole
∴ Total amount of energy needed to convert Mg(g) atom into $Mg^{+2}(g)$ ions = $\Delta H_1 + \Delta H_2$
$= 737.76 + 1450.73$
$= 2188.49$ kJ/mole

$$\text{Since, 24g of Mg} = \frac{24}{1000}\text{ kg} = \frac{24}{24 \times 1000}\text{ mole}$$
$$= 10^{-3} \text{ mole}$$

@apna_pdf

∴ Amount of energy needed to ionize 10^{-3} mole of Mg vapours = 2188.49 × 10^{-3}
= 2.188 kJ

310. Elements which have relatively high ionisation energy and occur as sulphides are
(a) halogens (b) transition elements
(c) alkali metals (d) metalloids.
SRMJEEE-2016

Ans. (d) : Metalloids have high ionisation energy and occur as sulphides.

311. The correct decreasing order of first ionisation enthalpies of five elements of the second period is
(a) Be >B>C>N>F (b) N >F>C>B>Be
(c) F >N>C>Be>B (d) N >F>B>C>Be
AIIMS-2016

Ans. (c): The ionization enthalpy of B is lower than that of Be. This is because electronic configuration of ($1s^2$, $2s^2$, $2p^1$) is less stable than that of Be($1s^2$, $2s^2$) which has completely filled orbitals. The 2p orbital of B is not strongly attracted by the nucleus as the 2s electron of Be. Thus, the increasing order of first ionization enthalpies of element is-
F > N > C > Be > B

312. The second ionisation enthalpy of which of the following alkaline earth metals is the highest?
(a) Ba (b) Mg
(c) Ca (d) Sr
(e) Be
Kerala-CEE-2016

Ans. (e) : Ionization energy increase on decreasing the size of atom.

$$\text{Ionisation energy} \propto \frac{1}{\text{size}}$$

The second ionisation energy of Be is the enthalpy change when 1 mole of gaseous ion of an element each with a single positive charge each lose an electron to form gaseous ion each with a double positive charge ie. Be^{+2} due to less size and high ionisation potential.

313. Which of the following atoms has the highest first ionisation energy?
(a) Na (b) K
(c) Sc (d) Rb
(JEE Main 2016)

Ans. (c) : Order of ionisation energy is Sc > Na > K > Rb. It is poor shielding effect and removal of one electron from 4s orbital is difficult as compared to 3s-orbital.

314. The ionization energy of hydrogen atom in the ground state is
(a) 13.6 MeV (b) 13.6 eV
(c) 13.6 Joule (d) Zero
NDA (II)-2017

Ans. (b) Ionization energy is the amount of energy required to remove an electron from an isolated atom or molecule. The ionization energy of hydrogen atom in the ground state is 13.6 eV.

315. Highest energy will be absorbed to eject out the electron in the configuration.
(a) $1s^2 2s^2 2p^1$ (b) $1s^2 2s^2 2p^3$
(c) $1s^2 2s^2 2p^2$ (d) $1s^2 2s^2 2p^4$
JIPMER-2016

Ans. (b) : The electronic configuration $1s^2$ $2s^2$ $2p^3$ having a half-filled electronic configuration which is stable. If one electron is removed then the high amount of energy is required.

316. For one of the element various successive ionisation enthalpies (in kJ mol^{-1}) are given below.

IE	1st 577.5	2nd 1810	3rd 2750	4th 11,580	5th 14,820

The element is
(a) Si (b) P
(c) Al (d) Mg
Karnataka-CET-2015

Ans. (c) : For the given third ionisation energy is 2750 KJ and fourth ionisation energy is 11580 KJ. Therefore, the fourth ionisaiton energy is much higher, it means removal of the 4th electron is from the stable configuration, so the element is aluminum.

317. The correct order of first ionization enthalpies of the following elements is
(a) Be > Mg > Ca > Sr > Ra > Ba
(b) Ra > Ba > Sr > Ca > Mg > Be
(c) Be > Mg > Ca > Sr > Ba > Ra
(d) Ra > Sr > Ba > Mg > Ca > Be
(e) Be > Mg > Ca > Ra > Ba > Sr
Kerala-CEE-2015

Ans. (a) : On moving from up to down in a group ionization energy decrease due to effective nuclear charge increase. So, the correct order of first ionization enthalpies of the element is-
Be > Mg > Ca > Sr > Ra > Ba

318. The energy required to excite the electron in the atom from n = 1 to n = 2, when the ionization enthalpy of hydrogen atom is 1.312 × 10^6J/mole will be (in the unit of 10^5).
(a) 8.53 (b) 7.51
(c) 8.92 (d) 9.86
BCECE-2015

Ans. (d) : Given that, I.E. = 1.312 × 10^6

$$IE = E_\infty - E_1$$
$$1.312 \times 10^6 = 0 - E_1$$
$$E_1 = -1.312 \times 10^6 \text{ J/mole}$$
$$\therefore \quad E_2 = \frac{1.312\times10^6 \times (1)^2}{2^2} = \frac{-1.312\times10^6}{4}$$
$$E_2 = -3.28 \times 10^5 \text{ J/mole}$$
$$\Delta E = E_2 - E_1$$
$$= -3.28 \times 10^5 - (-1.312 \times 10^6)$$
$$= 9.86 \times 10^5 \text{ J/mole.}$$

319. Atomic numbers of vanadium, chromium, nickel and iron are 23, 24, 28 and 26 respectively. Which one of these is expected to have the highest second ionization enthalpy?
(a) Cr (b) V
(c) Fe (d) Ni
COMEDK 2014

Ans. (a) : Second ionization enthalpy of Cr is highest because after the removal of 1st electron, Cr acquires a stable half-filled d^5 configuration thus, removal of 2nd electron is very difficult.

@apna_pdf

320. Ionization energy and electron affinity are defined at

(a) enthalpy (b) spontaneity
(c) equilibrium (d) absolute zero.

J & K CET-(2014)

Ans. (d) : The electron affinity of an atom or molecule is defined as the amount of energy released when an electron is attached to a neutral atom or molecule in the gaseous state to form a negative ion. The ionisation enthalpy is defined as the change of electron as negative sign when energy released overall say that electron affinity and ionisation energy are defined at absolute zero.

321. The incorrect statements among the following is

(a) the first ionization potential of Al is less than the first ionization potential of Mg
(b) the second ionization potential of Mg is lower than the second ionization potential of Na
(c) the first ionization potential of Na is less than the first ionization potential of Mg
(d) the third ionization potential of Mg is greater than the third ionisation potential of Al

UPTU/UPSEE-2014

Ans. (b) : Ionisation energy is the energy required to remove one electron from the atom. The second ionization potential indicates the energy required to remove another electron after the first ionization.
Hence, the second ionization potential of Mg is higher than the second ionization potential of Na.

322. The correct order of ionization energies is

(a) Cu > Ag > Au (b) Cu > Au > Ag
(c) Au > Cu > Ag (d) Ag > Au > Cu

UPTU/UPSEE-2013

Ans. (c) : These element belong to the 11 group of Periodic tables. As we move down the group, ionization energy decreases, but due to f-electrons and its ionization energy becomes high so, the order of ionization energies is-

Au > Cu > Ag

323. When the first ionization energies are plotted against atomic number, the peaks are occupied by

(a) Alkali metals (b) Rare gases
(c) Halogens (d) Transition elements

BITSAT 2013

Ans. (b) : Rare gases; as the electron is to be removed from stable configuration.

324. Which of the following represents the correct order of increasing first ionization enthalpy for Ca, Ba, S, Se and Ar ?

(a) Ca < S < Ba < Se < Ar
(b) S < Se < Ca < Ba < Ar
(c) Ba < Ca < Se < S < Ar
(d) Ca < Ba < S < Se < Ar

(JEE Main 2013)

Ans. (c) : Ionisation energy of element increases across a period in the periodic table because the electrons are held tightly by the higher effective nuclear charge.
The ionisation energy of the elements decreases on moving down the group because the electrons are held in lower energy orbitals away from the nucleus.
Ar is higher ionisation energy because it is a noble gas and Ba has the lowest ionization energy as it in six period of element.
So, the increasing order of first ionisation energy are-

Ba < Ca < Se < S < Ar

325. Which of the following elements has highest ionisation potential?

(a) B (b) C
(c) N (d) O

MPPET - 2012

Ans. (c) : Amount of energy required to remove an e^- from the valence shell called ionisation energy. Nitrogen has greater ionization energy than oxygen because nitrogen has half filled stable configuration than the other element so removal of electron required the more energy hence highest ionisation potential.

326. The atomic number of the element with highest ionization energy among the following is

(a) Z = 16 (b) Z= 14
(c) Z=13 (d) Z= 15

COMEDK 2012

Ans. (d) : For element with Z = 15, electronic configuration is $1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p_x^1 3p_y^1 3p_z^1$.
Due to exactly half filled configuration of 3p orbital, the element will have the highest ionization energy.

327. A large increase from the first to the second ionisation energy of an element 'A' can be seen if its electronic configuration is

(a) $1s^22s^22p^63s^1$ (b) $1s^22s^22p^63s^2$
(c) $1s^22s^22p^5$ (d) $1s^22s^22p^63s^23p^2$

SRMJEEE – 2012

Ans. (a) : Element with electronic configuration $1s^2\ 2s^2\ 2p^6\ 3s^1$ have large increase in first ionization energy to second ionisation energy due to stable configuration.

328. Among the following the elements of highest first ionization enthalpy is

(a) C (b) F
(c) Be (d) N
(e) Ne

Kerala-CEE-2012

Ans. (e) : Ne has high ionisation enthalpy because noble gases have completely filled valence shells that are highly stable, a high amount of energy would be required to remove even a single electron from the valence shell of a noble gas. It can difficult to remove an electron from any of the noble gases.

329. If the first ionization energy of H atom is 13.6 eV, then the second ionization energy of He atom is

(a) 27.2 eV (b) 40.8 eV
(c) 54.4 eV (d) 108.8 eV

WB-JEE-2012

Ans. (c) : We know that,

$$E = -13.6\times\frac{Z^2}{n^2}\text{ eV}$$

For second ionisation energy

$$E = -13.6\times\frac{2^2}{1^2}$$

@apna_pdf

$= -13.6 \times 4$
$= -54.4$ eV
Hence, the second ionization energy of He atom is 54.4 eV.

330. Which one of the following does not correctly represent the correct order of the property indicated against it?
(a) Ti < V < Cr < Mn; increasing number of oxidation states
(b) $Ti^{3+} < V^{3+} < Cr^{3+} < Mn^{3+}$; magnetic moment
(c) Ti < V < Cr < Mn : increasing 2nd ionization
(d) Ti < V < Mn < Cr : increasing 2nd ionization enthalpy

(NEET-Mains 2012)

Ans. (c) : The increasing order of second ionisation energy is Cr > Mn > V > Ti
(A) Ti < V < Cr < Mn has increasing oxidation state
(B) $Ti^{3+} < V^{3+} < Cr^{3+} < Mn^{3+}$ has magnetic moment increases
(C) Ti < V < Mn < Cr has increasing 2nd ionisation enthalpy

331. Which one of the following electronic configuration corresponds to the highest value of ionisation potential?
(a) $[Xe]6s^2$
(b) $[Ar]\ 4s^2\ 3d^{10}$
(c) $1s^2$
(d) $[Rn]7s^2 6d^1 5f^{14}$

UP CPMT-2012

Ans. (c) : $1s^2$ has the highest value of ionisation potential, because the outermost electrons are very close to nucleus.

332. On adding $AlCl_3$ to water
(a) the ionisation of water increases
(b) the ionisation of water decreases
(c) the ionisation of water remains constant
(d) the ionic product of water increases

UP CPMT-2011

Ans. (a) : $AlCl_3$ gives Al^{3+} ions which combine with OH^- ions given by H_2O so that dissociation equilibrium of H_2O shifts in forward direction i.e. ionisation of water increases.

333. Which one of K, I, Cl and Li will display the highest first ionisation energy?
(a) K
(b) I
(c) Cl
(d) Li

UPTU/UPSEE-2011

Ans. (c) : On moving down a group the valence shell becomes for away from the nucleus and thus, nuclear attraction towards valence electron decreases which results in decreases in ionisation energy. Thus, chlorine has the highest first ionisation energy among all the given elements.

334. The correct decreasing order of first ionisation enthalpies of five elements of the second period is
(a) Be > B > C > N > F
(b) N > F > C > B > Be
(c) F > N > C > Be > B
(d) N > F > B > C > Be
(e) F > C > N > B > Be

Kerala-CEE-2011

Ans. (c) : We move from left to right in a period the ionisation enthalpy increase with increasing atomic number.
In Be and B, Be has full-filled 2s-subshell has extra ionisation energy than boron. As a result the 2p electron of B is not strongly attracted by the nucleus of 2s-electron of Be. So, the decreasing order of first ionisation energy of element are-
F > N > C > Be > B

335. Which one of the following is correct order of second ionisation potential of Na, Ne, Mg and Al?
(a) Al < Na < Mg < Ne
(b) Ne < Al < Na < Mg
(c) Mg < Al < Ne < Na
(d) Na < Mg < Ne < Al

AP-EAMCET- (Engg.)-2011

Ans. (c) : $Na^{+2} - 1s^2\ 2s^2\ 2p^5$
$Ne^{+2} - 1s^2, 2s^2, 2p^4$
$Mg^{+2} - 1s^2, 2s^2, 2p^6, 3s^0$
$Al^{+2} - 1s^2, 2s^2, 2p^6, 3s^1$
Thus, the ionization energy decreases as the size of the atom increases. Since, Mg^{+2} is stable electronic configuration. Hence the ionization energy ($I.E_2$) is the highest than other species.
$IE_2 \Rightarrow$ Mg < Al < Ne < Na.

336. Assertion: Element has a tendency to lose the electron(s) to attain the stable configuration.
Reason: Ionization enthalpy is the energy released to remove and electron from an isolated gaseous atom in its ground state.
(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2011

Ans. (c): The element has tendency to lose the electrons to attain the stable configuration. The atom with one valence electron will lose one electron to form a stable configuration.
Ionization enthalpy is the energy required to remove an electron from an isolated gaseous atom in its ground state. Energy is required to overcame the attraction between nucleus and valence electron.

337. Which element is expected to have lowest first ionization energy?
(a) Sr (b) As (c) Xe (d) S

J & K CET-(2010)

Ans. (a) : The electronic configuration of given element are-
$_{38}Sr = [Kr]\ 5s^2$
$_{33}As = [Ar]\ 3d^{10}\ 4s^2\ 4p^3$
$_{54}Xe = [Kr]\ 3d^{10}\ 5s^2\ 5p^6$
$_{16}S = [Ne]\ 3s^2\ 3p^4$
When the distance from outer electron from nucleus increases, it becomes very easy to remove an electron. Therefore, the ionisaiton energy decrease. So, Sr is lowest first ionisation energy among the given.

@apna_pdf

338. Which of the following relation is correct?
(a) Ist IE of C > Ist IE of B
(b) Ist IE of C < Ist IE of B
(c) IInd IE of C > IIst IE of B
(d) Both (b) and (c)

JIPMER-2010

Ans. (a): The electronic configuration of carbon is $1s^2\ 2s^2\ 2p^2$ and electronic configuration of boron is $1s^2\ 2s^2\ 2p^1$
If one electron is removed easily due to stable configurations. Ionisation energy is minimum but in carbon one electron is removed due to high ionisation energy.

339. The incorrect order of second ionization energies in the following is
(a) Rb > K
(b) Na > Mg
(c) Cr > Mn
(d) S > P

AP- EAMCET(Medical) -2010

Ans. (a): As we know that ionisation energies decreases down the group due to increase of size of metal and increases left to right in periodic table. Rb and K are belongs to the 1st group of the periodic table. The correct order of second ionisation energy will be K>Rb.
The correct order is given as follows –
Na > Mg (Third period metal)
Cr > Mn (Fourth period metals)
S > P (Third Period metal)

340. Which of the following statement is correct about ionization potential?
(a) It is independent of atomic radii.
(b) It remains constant with change in atomic radii.
(c) It increases with an increase in atomic radii.
(d) It decreases with an increased in atomic radii.

AIIMS-2010

Ans. (d): The ionization energy is the energy to remove an electron from the neutral atom. On moving across a row with decrease in atomic radii.
The ionization potential decreases with increase in atomic radii.

341. Assertion (A) K, Rb and Cs form superoxide's. Reason (R) the stability of the superoxide's increases from 'K' to 'Cs' due to decrease in lattice energy.
The correct answer is
(a) Both **(A)** and **(R)** are true and **(R)** is the correct explanation of **(A)**
(b) Both **(A)** and **(R)** are true but **(R)** is not the correct explanation of **(A)**
(c) **(A)** is true but **(R)** is not true
(d) **(A)** is not true but **(R)** is not true

AP EAMCET (Engg.)-2009

Ans. (c): R$^+$, Rb$^+$ and Cs$^+$ are large cations and superoxide ion is bigger than oxide and peroxide ions because of the higher lattice energies, a large cation Stabilizes a large anion, hence these metals form super oxides.
As, we move down the group, the size of an atom from K to Cs increases so, lattice energy decreases, therefore the stability of superoxide also decreases.

342. The successive ionisation energies of an element are 800, 2,000, 3,600, 25,000 and 32,000 kJ/mol. The number of valence electrons are
(a) 5
(b) 2
(c) 3
(d) 4

BCECE-2009

Ans. (c) : Let the element is Z.

$$Z \xrightarrow[800]{IE_1} Z^{+} \xrightarrow[2000]{IE_2} Z^{2+} \xrightarrow[3600]{IE_3} Z^{3+}$$

$$Z^{+5} \xleftarrow[32000]{IE_5} Z^{4+} \xleftarrow[25000]{IE_4}$$

Thus, Z^{3+} has stable inert gas configuration as there is high jump after IE$_3$. So, the valence electrons are 3.

343. Which one of the following order is correct for the first ionisation energies of the elements?
(a) B < Be < N < O
(b) Be < B < N < O
(c) B < Be < O <N
(d) B < O < Be < N

AP EAMCET (Engg.)-2009

Ans. (c): Ionisation energy of B than that of Be because B($1s^2$, $2s^2$, $2p^2$) electron is to removed from 2p orbitals while Be($1s^2$, $2s^2$) electron is to be removed from 2s is difficult due to filled s-orbitals. The ionization energy of oxygen is lower than N due to half filled 2p orbitals in N($1s^2$, $2s^2$, $2p^3$)
Therefore, the increasing order are-
B < Be < O < N

344. The pair of elements having approximately equal ionization potential is
(a) Al, Ga
(b) Al, Si
(c) Al, Mg
(d) Al, B

UPTU/UPSEE-2009

Ans. (a) : The pair of elements having approximately equal ionisaiton energy is Al and Ga. Ionisation energy increases with a decreases in atomic size and due to the increase in the shielding effect of inner electrons.

345. The ionisation energy of nitrogen is larger than that of oxygen because of
(a) greater attraction of electons by the nucleus
(b) the size of the nitrogen atom being smaller
(c) the half-filled p-orbitals possess extra stability
(d) greater penetration effect.

SRMJEEE – 2008

Ans. (c) : The ionisation energy of nitrogen is larger than of oxygen because of nitrogen has half-filled p-orbital is more stable thus, it is difficult to remove an electron from it. Hence nitrogen has larger ionisation energy than oxygen.

346. The first ionization potential of Al, as compared to that of Mg is :
(a) Greater
(b) Lower
(c) The same
(d) Twice as much

BITSAT 2008

Ans. (b) : The first ionization potential of Al is lower than that of Mg because valence shell configuration of Mg is $3s^2$ and of Al is $3s^2$, $3p^1$. As s-orbital is close to nucleus than p-orbital. So removal of 1st e^- from Mg is difficult and require more energy as compare to Al.

347. The first ionization energy of oxygen is less than that of nitrogen. Which of the following is the correct reason for this observation?
(a) Lesser effective nuclear charge of oxygen then nitrogen
(b) Lesser atomic size of oxygen than nitrogen

@apna_pdf

(c) Greater interelectron repulsion between two electrons in the same p-orbital counter balances the increase in effective nuclear charge on moving from nitrogen to oxygen
(d) Greater effective nuclear charge of oxygen than nitrogen
(c) Higher electronegativity of oxygen than Nitrogen

Kerala-CEE-2008

Ans. (c): The first ionization energy of oxygen is less than that of nitrogen because we move from left to right in a period atomic size decrease and ionization energy will be increased due to greater effective nuclear charge of oxygen than nitrogen.

348. The correct order of decreasing second ionization enthalpy of Ti (22), V(23), Cr (24) and Mn (25) is
(a) Mn > Cr > Ti > V
(b) Ti > V > Cr > Mn
(c) Cr > Mn > V > Ti
(d) V > Mn > Cr > Ti

(NEET-2008)

Ans. (c) : The electronic configuration are follow as-

Cr - $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^1, 3d^5$
Mn - $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^5$
V - $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^3$
Ti - $1s^2, 2s^2, 2p^6, 3s^2, 3p^6, 4s^2, 3d^2$

The value of the second ionisation energy of Cr is more due to Cr^+ has $3d^5$ configuration which is extra energy is required than the Mn.
So, the order of 2nd ionisation energy is-
Cr > Mn > V > Ti

349. The comparatively high b.pt. of HF is due to
(a) high reactivity of fluorine
(b) small size of hydrogen atom
(c) formation of hydrogen bonds and consequent association
(d) high IE of fluorine

MHT CET-2007

Ans. (c) : Intermolecular hydrogen bonding is found in $(HF)_n$ due to higher electronegativity of fluorine atoms

H——F– – –H——F– – –H

Hydrogen bonding

Hydrogen bonding is associated of HF molecule. So, the high boiling point of HF is due to formation of hydrogen bonds and consequent association.

350. Highest ionizing power is exhibited by
(a) α-rays
(b) β-rays
(c) γ-rays
(d) X-rays

UP CPMT-2007

Ans. (a) : Highest ionizing power is exhibited by α-rays. This is 100 times greater than β-rays and 10,000 times greater than γ-rays. This is due to high kinetic energy of α–particle.

351. Ionisation energy decreases down the group due to
(a) increase in charge
(b) increase in atomic size
(c) decrease in atomic size
(d) decrease in shilding effect

UP CPMT-2007

Ans. (b) : Ionisation energy is defined as the energy required to remove an electron from the outermost orbit of an isolated gaseous atom in its ground state.

$$A \rightarrow A^+ + e^- \qquad \text{[first IE]}$$

Ionisation energy decrease in a group as the atomic number increases. It is based on the fact that we move down a group, the size of atom increases, and the outer electrons became further away from the nucleus thus reducing the force of attraction and hence ionization energy decreases with increase in the atomic size.

352. Which of the following has lowest ionization energy?
(a) Oxygen
(b) Nitrogen
(c) Fluorine
(d) Sulphur

UP CPMT-2007

Ans. (d) : Ionisation energy is defined as the energy required to remove an electron from the outermost orbit of an isolated gaseous atom in its ground state.
As down the group, the number of inner shells increase. Therefore, ionization energy decrease due to screening effect.
Among oxygen, nitrogen, fluorine and sulphur, the lowest ionization energy is of sulphur. As their first ionization values indicated below.
N= 1402. 1kJ/mil, O= 1313.7 kJ/mol
F= 1680.8kJ/mol, S= 999.4 kJ/mol

353. The successive ionization energy values for an element 'X' are given below :
(i) 1st ionisation energy = 410 kJ mol^{-1}
(ii) 2nd ionisation energy = 820 kJ mol^{-1}
(iii) 3rd ionisation energy = 1100 kJ mol^{-1}
(iv) 4th ionisation energy = 1500 kJ mol^{-1}
(v) 5th ionisation energy = 3200 kJ mol^{-1}
Find out the number of valence electron for the atom 'X'.
(a) 4
(b) 3
(c) 5
(d) 2
(e) 1

Kerala-CEE-2006

Ans. (a) : According to the given species there is a large jump from first to second ionization energy. The second ionisation energy is more indicate that its than the first ionisation energy. It stable electronic configuration after the removal of one electron. Hence, the number of valence electron is 1. This indicates that element 'x' belong to alkali matal group, so, the valence electron of the x is 4.

354. First inonisation potential is highest for
(a) Na
(b) Mg
(c) Al
(d) None of these

CG PET -2006

Ans. (b) : The electronic configuration of Mg is $1s^2, 2s^2, 2p^6, 3s^2$
Mg has stable electronic configuration due to full filled of 3s orbital. Hence, the amount of energy require to remove the electron is high.

355. Element having maximum ionization energy
(a) Na
(b) Li
(c) K
(d) Rb

UP CPMT-2005

@apna_pdf

Ans. (b) : The ionisation enertgy is amount of energy required to take out most loosely bonded electron from an isolated gaseous atom. The ionisation energy decreases down the group.

∵ the choices given are all members of group (Na, Li, K, Rb)

∴ the first member (Li) will have maximum ionization energy.

356. Assertion: First ionization energy for nitrogen is lower than oxygen.
Reason: Across a period effective nuclear charge decreases.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2005

Ans. (e): When on moving from left to right in a period atomic number and nuclear charge increase and size decrease, as a result ionization energy increase, But the element of IIA and VA group on the account of their half-filled and completely filled orbitals respectively have stable configuration.

357. The order of first ionization energies of the elements Li, Be, B, Na is:

(a) Li > Be > B > Na
(b) Be > B > Li > Na
(c) Na > Li > B > Be
(d) Be > Li > B > Na
(e) B > Be > Li > Na

Kerala-CEE-2005

Ans. (b) : The electronic configuration of the given species are-

Be = $1s^2\ 2s^2$
B = $1s^2\ 2s^2\ 2p^1$
Li = $1s^2\ 2s^1$
Na = $1s^2\ 2s^2\ 2p^6\ 3s^1$

In Be has stable electronic configuration with fully filled 2s-subshell has extra ionisation energy in compared to other element. Thus, the correct order of ionisation energy is-

Be > B > Li > Na

358. Which among the following elements have lowest value of IE_1?

(a) Pb
(b) Sn
(c) Si
(d) C

UP CPMT-2004

Ans. (b) : Ionisation energy decreases down the group due to increase in size but ionization energy of Sn is less than that of Pb due to the effective shielding of the valence electrons by the intervening d and f- electrons.

Element	C	Si	Ge	Sn	Pb
IE (kJ/mol)	1086	786	761	708	715

359. The first ionisation potential is maximum for

(a) B
(b) N
(c) O
(d) Be

UP CPMT-2004

Ans. (b) : The first ionisation potentials generally increases when we move from left to right in a period. But elements with stable configurations have higher ionization potentials than expected.

IInd period	Be	B	C	N	O
Valence shell configuration	$2s^2$	$2s^2,2p^1$	$2s^2,2p^2$,	$2s^2,2p^3$	$2s^2,2p^4$

All the given options are of second period. Among them oxygen is expected to have highest ionization potential, but nitrogen ($2s^2,2p^3$) has higher ionisation potential due to its more stable configuration as compared to oxygen ($2s^2,2p^4$).

360. Ionisation depends upon

(a) Pressure
(b) Volume
(c) Dilution
(d) None of these

UP CPMT-2004

Ans. (c) : Ionisation of strong electrolyte increases with dilution.

Ionisation of electrolytes also depend on concentration temperature, nature of solute and nature of solvent.

361. The energy of last element of Li will be:

(a) –30.6 eV
(b) –13.6 eV
(c) –24.6 eV
(d) –28.6 eV

JCECE - 2004

Ans. (a) : We know that,

$$E = -13.6\ \frac{Z^2}{n^2}\ \text{eV}$$

For Li, Z = 3, n = 2

Hence, the energy of last element of Li will be

$$E = \frac{-13.6\times3^2}{2^2} = \frac{-13.6\times9}{4} = -30.6\ \text{eV}$$

362. Which of the following has maximum ionization energy?

(a) Cesium
(b) Fluorine
(c) Xenon
(d) Nitrogen

JCECE - 2004

Ans. (b) : Ionisation energy is the amount of energy required to take out most lossely bonded electron from isolated gaseous atom on moving left to right in a period ionisation energy increase and on a group decreases. Therefore, fluorine has maximum ionisation energy.

363. Which of the following is a favourable factor for cation formation?

(a) High electronegativity
(b) High electron affinity
(c) Low ionization potential
(d) Smaller atomic size

A.P.EAMCET 2004

Ans. (c) : The low ionization potential energy mean that electron can be easily lost and cation formation is easier or elements with a low ionization potential tend to be reducing agents and form cations.

364. The first ionisation potentials of four consecutive elements, present in the second period of the periodic table, are 8.3, 11.3, 14.5 and 13.6 eV respectively. Which one of the following is the first ionisation potential (in eV) of nitrogen?

(a) 13.6
(b) 11.2
(c) 8.3
(d) 14.5

AP-EAMCET (Engg.)-2004

@apna_pdf

Ans. (d) : The atomic number of nitrogen is 7. The electronic configuration of ${}_7N$ is $1s^2, 2s^2, 2p^3$
It is clear that N has half filled configuration which is stable. The removal of electron from outer shell of nitrogen is very tedious and consuming high amount of energy. Hence, the first ionisation potential energy of nitrogen has more in values i.e. 14.5 eV.

365. The highest first ionisation potential is of :
(a) carbon
(b) boron
(c) oxygen
(d) nitrogen
BCECE-2004

Ans. (d) : First ionization energy is the amount of energy required to remove one mole of electron from a gaseous atom under standard condition.
It is easy to remove one of the electron than the unpaired electron in nitrogen. Hence, nitrogen has highest first ionization potential.

366. The atomic numbers of vanadium (V), chromium (Cr), manganese (Mn) and iron (Fe) are, respectively 23, 24, 25 and 26. Which one of these may be expected to have the highest second ionisation enthalpy?
(a) V
(b) Cr
(c) Mn
(d) Fe
(AIEEE 2003)

Ans. (b) : The electronic configuration are-
${}_{23}V = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^2\ 3d^3$
${}_{24}Cr = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^1\ 3d^5$
${}_{25}Mn = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^2\ 3d^5$
${}_{26}Fe = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^6\ 4s^2\ 3d^6$
The chromium it loses one electron to form $[Ar]\ 3d^5\ 4s^0$ in which 3d subshell is half-filled and stable when another electron is removed, it is removed from half-filled 3d subshell is lost. This requires more energy.

367. Which one of the following is correct about stability of the given ions?
(a) $Pb^{2+} > Pb^{4+}$
(b) $Pb^{4+} > Pb^{2+}$
(c) $Si^{2+} > Si^{4+}$
(d) $Sn^{4+} > Sn^{2+}$
AP EAMCET- 2003

Ans. (a) : On going from top to bottom in a group, the stability of lower oxidation state increases due to inert pair effect. So, the correct order is $Pb^{2+} > Pb^{4+}$.

368. Which of the following has maximum energy?

(a)

(b)

(c)

(d)

AIIMS-2002

Ans. (c): The energy of orbital in increasing order are-
$s < p < d < f$
The energy is excited state is more than ground state.
Hence, the option (c) is correct.

369. The correct order of decreasing first ionization potential is
(a) Ca > K > Rb > Cs
(b) Cs > Rb > K > Ca
(c) Ca > Cs > Rb > K
(d) K > Rb > Cs > Ca
UP CPMT-2001

Ans. (a) : Ionisation potential $\propto \frac{1}{\text{Atomic size}}$
The atomic size increases down the group but decreases in a period.
∴ The correct order of decreasing first ionization potential is Ca > K > Rb > Cs.

370. Sodium forms Na^+ ion but it does not form Na^{2+} because of
(a) very low value of I^{st} and II^{nd} I.E
(b) very high value of I^{st} and II^{nd} I.E
(c) high value of I^{st} I.E. and low value of II^{nd} I.E.
(d) low value of I^{st}. I.E. and high value of II^{nd} I.E.
AIIMS-2001

Ans. (d): Sodium has one valence electron sodium from a Na^+ ion by losing its valence electron and attains the stable electronic configuration of Ne with a completed octet. This energy requires less energy. The removal of second electron will break this stable electronic configuration and requires high energy. Sodium forms Na^+ ions but does not form Na^{+2} because of the low value of $(I.E)_1$ and high value of $(I.E)_2$.

371. Ionic radius (in Å) of As^{3+}, Sb^{3+} and Bi^{3+} follow the order
(a) $As^{3+} > Sb^{3+} > Bi^{3+}$
(b) $Sb^{3+} > Bi^{3+} > As^{3+}$
(c) $Bi^{3+} > As^{3+} > Sb^{3+}$
(d) $Bi^{3+} > Sb^{3+} > As^{3+}$
A.P.EAMCET 2001

Ans. (d) : Ionic radii increases in a group from top to bottom due to increase in atomic number .
$Bi^{3+} > Sb^{3+} > As^{3+}$

372. The electronic configuration of elements A, B, and C are [He] $2s^1$, [Ne] $3s^1$ and [Ar] $4s^1$ respectively, which one of the following order is correct for the first ionization potentials (in kJ mol^{-1}) of A, B and C?
(a) A > B > C
(b) C > B > A
(c) B > C > A
(d) C > A > B
A.P.EAMCET 2001

Ans. (a) : Given that
Electronic configuration of element
A = [He] $2s^1$ = Li
B = [Ne] $3s^1$ = Na
C = [Ar] $4s^1$ = K
Element A to C has increasing atomic size but ionization potential decreases in the same order.
A > B > C

373. The electronic configuration of elements A, B and C are [He]$2s^1$, [Ne]$3s^1$ and [Ar]$4s^1$ respectively, which one of the following protentials is correct for the first ionization potentials (in KJ mol^{-1}) of A, B and C?
(a) A > B > C
(b) C > B > A
(c) B > C > A
(d) C > A > B
AP EAMCET (Engg.) 2001

Ans. (a) : Given that

$$\left.\begin{array}{r} A = [He]1s^1 = Li \\ B = [Ne]1s^1 = Na \\ C = [Ar]1s^1 = K \end{array}\right| \text{I.P. decreases} \downarrow$$

@apna_pdf

$$\text{Size} \propto \frac{1}{\text{Ionisation potential}}$$

Order of ionization potential-

K < Na < Li

C < B < A

374. Which of the following has the highest first IP?

(a) Al (b) Si

(c) K (d) P

A.P.EAMCET 2000

Ans. (d) : The amount of energy required to remove electron from an isolated atom or molecule. Phosphorus has highest first ionisation potential due to half filled orbitals. It has stable configuration than other.

Electronic configuration of phosphorus.

$P = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^3$

375. Which of the following species has the highest ionization potential?

(a) Li^+ (b) Mg^+

(c) Al^+ (d) Ne

A.P.EAMCET 1998

Ans. (a) : $Li^+ = 1s^2$

$Mg^+ = 1s^2\ 2s^2\ 2p^6\ 3s^1$

$Al^+ = 1s^2\ 2p^2\ 2p^6\ 3s^2$

$Ne = 1s^2\ 2s^2\ 2p^6$

$Li^+ = 1s^2$

Both Li^+ and Ne have noble gas configuration but due to small size and higher nuclear charge per electron in Li^+, it has higher ionisation energy.

376. Which of the following has the highest first ionization potential?

(a) Boron (b) Nitrogen

(c) Oxygen (d) Carbon

AP EAMCET (Medical) -1998

Ans. (b): The electronic configuration of non-metals are given below–

Boron $({}_5B) = 1s^2, 2s^2, 2p^1$

Nitrogen $({}_7N) = 1s^2, 2s^2, 2p^3$

Oxygen $({}_8O) = 1s^2, 2s^2, 2p^4$

Carbon $({}_6C) = 1s^2, 2s^2, 2p^2$

Nitrogen has half-filled stable configuration due to which there are more energy required for the removal of electron so that's nitrogen has more first ionization enthalpy.

377. The first ionisation potential is maximum for:

(a) Lithium (b) Uranium

(c) Iron (d) Hydrogen

AIIMS-1998

Ans. (d): The first ionization energy will be maximum for hydrogen since it has small size hydrogen has only one electron and after losing that electron it will be a nucleus with positive charge which is unstable.

378. Which one of the following configurations represents atom of the element having the highest second ionization energy?

(a) $1s^2\ 2s^2\ 2p^4$ (b) $1s^2\ 2s^2\ 2p^6$

(c) $1s^2\ 2s^2\ 2p^6\ 3s^1$ (d) $1s^2\ 2s^2\ 2p^6\ 3s^2$

J & K CET-(1998)

Ans. (c) : The element with the electronic configuration $1s^2\ 2s^2\ 2p^6\ 3s^1$ will have the highest second ionization enthalpy because the $1s^2\ 2s^2\ 2p^6\ 3s^1$ loses one electron to form $1s^2\ 2s^2\ 2p^6$. It is a stable electronic configuration of noble gas. The removal of second electron will required to high amount of energy.

379. Identify the correct statement in respect of an element in a particular group of the periodic table?

(a) A decrease is nuclear charge causes an increase in ionization energy.

(b) An increase in nuclear charge causes an increase in ionization energy.

(c) A decrease in atomic size decreases the ionization energy.

(d) An increase in the number of valence electrons decreases the ionization energy.

J & K CET-(1997)

Ans. (b) : On moving left to right in a period ionisation energy increase due to nuclear charge increase.

Ionisation energy $\propto$ Zeff

380. Which one of the following elements has the highest first ionization potential ?

(a) Boron (b) Carbon

(c) Nitrogen (d) Oxygen

A.P.EAMCET 1997

Ans. (c) : Nitrogen element has the highest first ionisation potential because of it has half-filled orbital and stable configuration so energy has high to remove the electron of nitrogen.

381. Assertion: Electrons are ejected from a certain metal when either blue or violet light strikes the metal surface. However, only violet light causes electron ejection from a second metal.

Reason: The electrons in the first metal require less energy for ejection.

(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion

(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion

(c) If Assertion is true but the Reason is false

(d) If both Assertion and Reason are false

AIIMS-1996

Ans. (a): The energy required to remove one electron in the gaseous state is lesser i.e. ionization energy first than as compared to the second ionization energy.

382. The order of decreases in atomic radii for Be, Na, and Mg is

(a) Na > Mg > Be (b) Mg > Na > Be

(c) Be > Na > Mg (d) Be > Mg > Na

A.P.EAMCET 1995

@apna_pdf

Ans. (a) : $_4Be = 1s^2\ 2s^2$

$_{11}Na = 1s^2\ 2s^2\ 2p^6\ 3s^1$

$_{12}Mg = 1s^2\ 2s^2\ 2p^6\ 3s^2$

The size of group IIA is less than group IA due to electron enter in the same shell and attraction towards the nucleus and electron increases.

Thus, correct order is

Na > Mg > Be

383. The halogen with the highest ionization potential is

(a) F (b) Cl
(c) Br (d) I

A.P.EAMCET 1993

Ans. (a) : Ionization potential decrease on moving down the group hence fluorine has highest ionisation potential.

384. EN of an atom is given by the average of EA and …..

(a) EN
(b) Ionization energy
(c) Electron affinity
(d) Electropositive character

A.P.EAMCET 1992

Ans. (b) : According to Mulliken, Electronegativity of an elements is the average of Ionization Potential and Electron affinity.

$$\text{Electronegativity (EN)} = \frac{\text{Ionization potential} + \text{Electron affinity}}{2}$$

385. Ionisation potential of 1s electron is ….. than that of 2s electron in the same atom.

(a) Same (b) Lesser
(c) Greater (d) None of these

A.P.EAMCET 1992

Ans. (c) : Ionisation potential of 1s electron is greater than that of 2s electron in the same atom because former is more closer to the nucleus.

386. Al^{3+} ion has a lower ionic radius than Mg^{2+} ion because

(a) Mg atom has less number of neutrons than Al
(b) Al^{3+} has a higher nuclear charge than Mg^{2+}
(c) their electronegativities are different
(d) Al has a lower ionization potential than Mg atom

A.P.EAMCET 1992

Ans. (b) : Al^{3+} ion has a lower ionic radius than Mg^{2+} ion because of Al^{3+} has a higher nuclear charge than Mg^{2+}. Nuclear charge increase then ionic radius decrease.

387. Among the alkali metals, the metal with the highest ionisation potential is

(a) Na (b) K
(c) Li (d) Cs

A.P.EAMCET 1991

Ans. (c) : Ionisation potential is decrease from down the group hence Li metal has highest ionisation potential.

388. First three ionisation energies (in kJ/mol) of three representative elements are given below:

Element	**IE_1**	**IE_2**	**IE_3**
P	**495.8**	**4562**	**6910**
Q	**737.7**	**1451**	**7733**
R	**577.5**	**1817**	**2745**

Then incorrect option is:

(a) Q: Alkaline earth metal
(b) P: Alkali metals
(c) R: s-block element
(d) They belong to same period

Ans. (c): The difference between Ionisation energy second and ionisation energy third is not very high as compared to between ionisation energy second hence stable oxidation state of R will be higher than +2.

Hence, first three ionization energies of three representative elements are R: s-block element.

389. Calculate the energy needed to convert three moles of sodium atoms in the gaseous state to sodium ions. The ionization energy of sodium is 495 kJ mol^{-1}_

(a) 1485 kJ (b) 495 kJ
(c) 148.5 kJ (d) none

VITEEE-2019

Ans. (a) : Given, the ionization energy of sodium is 495 kJ mol^{-1}

∴ Energy needed to convert 3 moles of Na (g) to Na^+ ions = 495 × 3 = 1485 kJ.

390. Ionisation energy of He^+ is 19.6×10^{-18} J $atom^{-1}$. The energy of the first stationary state (n = 1) of Li^{2+} is

(a) 4.41×10^{-16} J $atom^{-1}$
(b) -4.41×10^{-17} J $atom^{-1}$
(c) -2.2×10^{-15} J $atom^{-1}$
(d) 8.82×10^{-17} J $atom^{-1}$

JEE Main, 2018

Ans. (b) : Using the following equation-

$$E_n = -2.18 \times 10^{-18}\left(\frac{Z^2}{n^2}\right)J$$

Where, E_n = Energy of n^{th} orbit
Z = Atomic number
n = No. of orbit

Given– $E_1 = -19.6 \times 10^{-18}$ J $atom^{-1}$, $Z_1 = 2$, $n_1 = 1$

And $E_2 = ?$, $Z_2 = 3$, $n_2 = 1$

$$\therefore \quad E_1 = -2.18 \times 10^{-18}\left(\frac{Z_1^2}{n_1^2}\right)J \quad \text{.....(i)}$$

$$E_2 = -2.18 \times 10^{-18}\left(\frac{Z_2^2}{n_2^2}\right)J \quad \text{....(ii)}$$

From (i) and (ii) – we get

$$\frac{E_1}{E_2} = \frac{Z_1^2}{Z_2^2} \times \frac{n_2^2}{n_1^2}$$

Or $$E_2 = \frac{E_1 Z_2^2 n_1^2}{Z_1^2 n_2^2}$$

$$E_2 = \frac{-19.6 \times 10^{-18}(\text{J atom}) \times 9 \times 1}{4 \times 1}$$

$$E_2 = -4.41 \times 10^{-17}\ \text{J atom}^{-1}$$

@apna_pdf

391. Consider the following changes

$M(s) \rightarrow M(g)$ ….(1)

$M(g) \rightarrow M^{2+}(g) + 2e^-$ ….(2)

$M(g) \rightarrow M^{+}(g) + e^-$ ….(3)

$M^{+}(g) \rightarrow M^{2+}(g) + e^-$ ….(4)

$M(g) \rightarrow M^{2+}(g) + 2e^-$ ….(5)

The second ionization energy of M could be determined from the energy values associated with

(a) 1 + 2 + 4 (b) 1 + 5 – 3

(c) 2 + 3 – 4 (d) 5 – 3

VITEEE, 2015

Ans. (d) : The second ionization energy is amount of energy required to take out an electron from the monopositive cation.

Hence,

$M(g) \rightarrow M^{2+} + 2e^-$ …..(v)

$M(g) \rightarrow M^{+} + e^-$ …..(iii)

On subtracting equation (iii) from equation (v), we get–

$M^{+} \rightarrow M^{2+} + e^-$

Hence, the correct is 5-3.

392. The incorrect statement among the following is

(a) the first ionisation potential of Al is less than the first ionisation potential of Mg

(b) the second ionisation potential of Mg is greater than the second ionisation potential of Na

(c) The first ionisation potential of Na is less than the first ionisation potential of Mg

(d) the third ionisation potential of Mg is greater than the third ionisation potential of Al

IIT JEE, 1997

Ans. (b) : The second ionisation potential of Mg is less than the second ionisation potential of Na.

$Na = IE_2 = 4560$ kJ/mol

$Mg = I.E_2 = 1450$ kJ/mol

Hence the option (b) is correct.

6. Electron Affinity

393. Which halogen has the maximum electron affinity?

(a) Fluorine (b) Chlorine

(c) Bromine (d) Iodine

UP CPMT-2010
BCECE-2007, UP CPMT-2007
JIPMER-2006, UPTU/UPSEE-2015, 2006
NEET-1999

Ans. (b): On moving down a group, generally, electron affinity decreases. But in fluorine, due to its smaller size, the incoming electron experiences greater force of repulsion and hence, its electron affinity is lesser as compared to the electron affinity of chlorine. Thus, among the given, electron affinity is maximum for chlorine.

394. The correct order of electron affinity of F, Cl, Br and I is

(a) F > Cl > Br > I (b) Cl > F > Br > I

(c) I > Br > Cl > F (d) Br > I > Cl > F

UPTU/UPSEE-2016 / J&K CET-2012, 2008
CG PET -2009 / AMU–2003 / JCECE – 2003

Ans. (b) : Electron affinity of elements decreases on going from top to bottom in a group. But, electron affinity of fluorine is unexpectedly lower than that of chlorine. This can be explained as follows:-

Fluorine atom is small. So, electron charge density of F-atom is very high. The added electron will experience strong electron-electron repulsion. As a result, when an electron is added to F atom a certain amount of energy is absorbed, and the net energy released during the formation of anion is lesser. However, if an electron is added to a relatively large p-orbital (3p in the case of Cl), electron-electron repulsion is minimised, and higher electron affinity is observed.

395. Maximum electron affinity is shown by the following:

(a) Cl (b) Br

(c) N (d) Na

MHT CET-2017
MPPET - 2012, J&K CET-2001
AIIMS-1998, 1994

Ans. (a) : Electron affinity:- The amount of energy liberated when an electron is added to a neutral atom to form a negatively charged ion.

Electron affinity : Cl > F > Br > I.

$\text{Electron affinity} \propto \frac{1}{\text{Atomic size}}$.

396. Which one of the following arrangements represent the correct order of electron gain enthalpy (with negative sign) of the given atomic species?

(a) F < Cl < O < S (b) S < O < Cl < F

(c) Cl < F < S < O (d) O < S < F < Cl

UPTU/UPSEE-2014, 2007
UP CPMT-2013, BITSAT-2014

Ans. (d) : In general, on moving down in a group, EA values decreases due to increase in size, because greater is the size of valence shell, lesser is the attraction and in turn lesser is the EA.

But in period II and III, this order is reversed due to the small size of period II elements.

Thus,

O < S and F < Cl

Because O and F atoms have high electron density $\left(\frac{\text{charge}}{\text{volume}}\right)$ and so repel the test electrons.

Further, EA values increases as moving left to right along a period. It is because effective nuclear charge increases on moving left to right and more is the effective nuclear charge, more is the attraction of nucleus towards test electrons and thus more will be electron affinity. Thus, the overall increasing order of EA would be

O < S < F < Cl

397. The correct order of electron affinity is

(a) B < C < O > N (b) B > C > N > O

(c) O > C > B > N (d) O < C < B < N

J & K CET-(2005)
Assam CEE-2014

@apna_pdf

Ans. (c) : When on going from left to right in the periodic table, electron affinity increases, because the distance between the nucleus and outermost shell decreases. So the attraction of the nucleus and electrons of the outermost shell increases hence the added electron get stabilization. Nitrogen has a half-filled electronic configuration, so, it tendency to accept electron is very less than carbon and boron.
Hence, the electron affinity order is-
$O > C > B > N$

398. Born-Haber cycle can be used to estimate
(a) electronegativity (b) electron affintiy
(c) ionic radii (d) All of these
UPTU/UPSEE-2010, 2008

Ans. (b) : The Born Haber– Cycle can be used to estimate the electron gain enthalpy, electron affinity, lattice energy of ionic solid, dissociation energy, heat of formation etc.
Born Haber cycle cannot be estimate by the electronegativity and hydration energy, ionic radii etc.

399. Which one of the following ionic species has the greatest proton affinity to form stable compound?
(a) NH^{-}_{2} (b) F^{-}
(c) I^{-} (d) HS^{-}
BCECE-2012
NEET-2007

Ans. (a) : Proton affinity decreases across a period from left to right and down a group from top to bottom. Hence, the nitrogen family has highest proton followed by oxygen family, followed by halogen. Also the ionic pieces with greatest proton affinity form the strongest base. Therefore, NH_2^- has the greatest proton affinity to form a stable compound.

400. The electron affinity of Be is similar to
(a) He (b) B
(c) Li (d) Na
UP CPMT-2002
Manipal-2018

Ans. (a) : The electronic configuration of these element are–
$_4Be = 1s^2, 2s^2$
$_2He = 1s^2$
$_5B = 1s^2, 2s^2\ 2p^1$
$_3Li = 1s^2\ 2s^1$
$_{11}Na = 1s^2\ 2s^2\ 2p^6\ 3s^1$
Thus, we can say that electron affinity of Be is similar to He.

401. The correct order of electron affinity of oxygen, sulphur, chlorine, fluorine is
(a) $S < O < Cl < F$ (b) $S < O < F < Cl$
(c) $O < S < F < Cl$ (d) $O < S < Cl < F$
WB JEE-30.04.2022
UPTU/UPSEE-2010

Ans. (c) : On moving from top to bottom in a group the electron affinity became less negative and on moving from left to right across a period, the electron affinity became more negative. Chlorine has more negative electron affinity than fluorine because on adding on electron to fluorine 2p orbital causes greater repulsion than adding on electron to chlorine 3p orbital which is larger size. Therefore, the order is-
$O < S < F < Cl$

402. The correct order of electron gain enthalpy is:
(a) $O > S > Se > Te$ (b) $Te > Se > S > O$
(c) $S > O > Se > Te$ (d) $S > Se > Te > O$
JEE Main 26.02.2021,Shift-II
CGPET-2019

Ans. (d) : Electron gain enthalpy of oxygen is very low due to small size and compact nature of oxygen atom. Sulphur has highest electron gain enthalpy because sulphur has vacant d-orbital. So the order of electron gain enthalpy is –
$\boxed{S > Se > Te > O}$

403. Electron affinity is positive when
(a) O^- is formed from O
(b) $O^{2-}$is formed from O^-
(c) O^+ is formed from O
(d) electron affinity is always a negative value
CG PET- 2013
BCECE-2006

Ans. (b) : When O^{2-} formed from O^-, change is endothermic because O^- repels the incoming electron due to similar charge. Therefore, it needs energy to accept the electron. The second electron affinity of oxygen is particularly high because the electron is being forced into a small, very dense electron. Hence, the electron affinity is positive.

404. Which of the following elements has the highest value of electron affinity?
(a) O (b) S
(c) Se (d) Te
J & K CET-2016, 2012
BCECE-2010

Ans. (b) : Oxygen has exceptionally smaller value of electron affinity (–141 kJ) due to smaller atomic size then sulphur. Hence S is highest value of electron affinity.

405. What is the value of electron gain enthalpy of Na^+ if IE_1 of Na = 5.1 eV?
(a) –5.1 eV (b) –10.2 eV
(c) +2.55 eV (d) +10.2 eV
VITEEE- 2012
NEET-2011

Ans. (a) : Given that,
Ionisation enthalpy of Na = 5.1 eV
Thus, the electron gain enthalpy of sodium cation is equal in magnitude and opposite in sign to the first ionization energy of sodium atom. It is equal to –5.1 eV.

406. The correct order of electron gain enthalpy with negative sign of F, Cl, Br and I, having atomic number 9, 17, 35 and 53 respectively, is
(a) $I > Br > Cl > F$ (b) $F > Cl > Br > I$
(c) $Cl > F > Br > I$ (d) $Br > Cl > I > F$
JEE Main-07.01.2020, Shift-I
(AIEEE 2011)

@apna_pdf

Ans. (c) : Electron gain enthalpy has maximum in corresponding period of halogen and it becomes less negative down the group. However, the negative electron gain enthalpy of fluorine is less than that of chlorine due to the small size of fluorine atom.

Therefore, there are strong inter electronic repulsion in the relatively small 2p-orbital of fluorine thus, The incoming electron does not experience much attraction. The correct order of electron gain enthalpy are-

$Cl > F > Br > I$

407. Among the options, the element with highest electron gain enthalpy is

(a) He (b) Ne
(c) Kr (d) Xe

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (b) :

Noble gas		**Electron gain enthalpy**
He	–	+ 48
Ne	–	+ 116
Ar	–	+ 96
Kr	–	+ 96
Xe	–	+ 77

Hence, from the above data, electron gain enthalpy of Ne has the highest value of electron gain enthalpy.

408. Which of the given atoms has the greatest electron affinity?

(a) F (b) Cl
(c) P (d) Al

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (b) : The electron affinity is a measure of the attraction between the incoming electron to the nucleus. Generally electron affinity decreases down a group, but electron affinity of Cl is greater than electron affinity of F due to small size of F atom which can not easily accomodate the electron rather than the chlorine. Hence, Cl has highest electron affinity.

409. Arrange the elements with the following electronic configurations in increasing order of electron affinity

(i) $1s^2\, 2s^2\, 2p^5$
(ii) $1s^2\, 2s^2\, 2p^4$
(iii) $1s^2\, 2s^2\, 2p^6\, 3s^2\, 3p^4$
(iv) $1s^2\, 2s^2\, 2p^6\, 3s^2\, 3p^5$

(a) (ii)<(iii)<(i)<(iv) (b) (iii)<(ii)<(iv)<(i)
(c) (iii)<(ii)<(i)<(iv) (d) (ii)<(iii)<(iv)<(i)

COMEDK 2019

Ans. (a) : Electron affinity increases as we move left to right in a period and decreases as we move down in a group.

But electron affinity of Cl is greater than F and that of S is greater than O due to very small size of F and O. As a result, there is a strong inter-electronic repulsion when extra electron is added to these atoms.

(i) $1s^2\, 2s^2\, 2p^5$: F
(ii) $1s^2\, 2s^2\, 2p^4$: O
(iii) $1s^2\, 2s^2\, 2p^6\, 3s^2\, 3p^4$: S
(iv) $1s^2\, 2s^2\, 2p^6\, 3s^2\, 3p^5$: Cl

Thus correct order is
$Cl > F > S > O$
(iv)>(i)> (iii)>(ii)

410. The first electron affinity of C, N and O will be of the order

(a) $C < N < O$ (b) $N < C < O$
(c) $C < O < N$ (d) $O < N < C$

WB-JEE-2019

Ans. (b) : The electron affinity of an atom or molecules can be defined as the amount of energy released when an electron is attached or gained by an electrically neutral atom.

Nitrogen has a stable half-filled p-orbital.

Thus, the correct order of first electron affinity of C, N and O will be

$N < C < O$

411. Which of the following atoms should have the highest Ist electron affinity?

(a) F (b) O
(c) N (d) C

WB-JEE-2017

Ans. (a) : Fluorine has highest first electron affinity because on moving left to right in a period the electron affinity increases.

412. Why is F_2 the strongest oxidizing agent (among halogens) although electron affinity of Cl_2 is higher than F_2?

(a) Low enthalpy of dissociation and high free energy of hydration
(b) Low enthalpy of dissociation
(c) High free energy of hydration
(d) High electronegativity and low free energy of hydration

J & K CET-(2017)

Ans. (a) : F_2 is the strongest oxidizing agent among the halogen due to greater heat of hydration of F^- than Cl^- which compensates for the lower electron affinity of F than of Cl. F_2 has low enthalpy of dissociation as F–F bond is weak and high enthalpy of hydration of small F^- ion.

413. Which of the following has the highest electron affinity?

(a) K (b) O^-
(c) F^- (d) O

Manipal-2016

Ans. (d) : Electron affinity is defined as the minimum energy released electron add to the valence shell of isolated atom.

$$\text{Electron affinity} \propto \frac{1}{\text{size}}$$

Therefore, O^- has less electron affinity due to complete the shell to form stable configuration but in case of oxygen has high electron affinity.

414. Among P, S, Cl, F, the elements with most negative and least negative electron gain enthalpy respectively are

(a) Cl, S (b) F, S
(c) Cl, P (d) F, P

J & K CET-(2015)

@apna_pdf

Ans. (c) : On moving from left to right in a period generally electron gain enthalpy increases and decrease down the group. But the electron affinity of third period is greater than the electron affinity of second period element due to small atomic size of second period element.

Hence, the order is P < S < F < Cl

Therefore, Cl and P has more negative and less negative electron gain enthalpy respectively.

415. Electron gain enthalpy with negative sign of fluorine is less than that of chlorine due to

(a) high ionisation enthalpy of fluorine
(b) smaller size of chlorine atom
(c) smaller size of fluorine atom
(d) bigger size of 2p orbital of fluorine

JCECE - 2015

Ans. (c) : Due to smaller size and high repulsive force within the outermost orbit of fluorine. Its electron gain enthalpy is less negative.

416. Copper is extracted from copper pyrites by heating in a Bessemer converter. The method is based on the principle that

(a) copper has more affinity for oxygen than sulphur at high temperature
(b) iron has less affinity for oxygen than sulphur at high temperature
(c) copper has less affinity for oxygen than sulphur at high temperature
(d) sulphur has less affinity for oxygen at high temperature

Karnataka-CET-2015

Ans. (a) : Copper is extracted from the copper pyrites by heating in a Bessemer Convertor. The method is based on the principle of copper has more affinity for oxygen than sulphur at high temperature.

417. How does electron affinity change when we move from left to right in a period in the periodic table?

(a) It increases.
(b) It decreases.
(c) It remains unchanged.
(d) It first increases and then decreases.

J & K CET-(2013)

Ans. (a) : The electron affinity generally increases in a period from left to right due to the size of the atom decrease along the period.

418. Which one of the following arrangement represents the correct order of least negative to most negative electron gain enthalpy for C, Ca, Al, F and O?

(a) Al < Ca < O < C < F
(b) Al < O < C < Ca < F
(c) C < F < O < Al < Ca
(d) Ca < Al < C < O < F

Karnataka NEET-2013

Ans. (d) : The nuclear charge increases, the force of attraction between the nucleus and the incoming electron increase and thus, the electron gain enthalpy becomes more negative.

On moving from left to right in a period, the effective nuclear charge increases. Therefore, the order are–

Ca < Al < C < O < F

419. The amount of energy released when 10^6 atoms of iodine in vapour state are converted to I^- ions is 4.9×10^{-13} J. What will be electron affinity of iodine in eV per atom?

(a) 2.0
(b) 2.5
(c) 2.75
(d) 3.06

MPPET-2013

Ans. (d) :

Electron gain enthalpy = energy release when an atom in gaseous state

$= 4.8 \times 10^{-13}$ J

Atoms of $I_2 = 10^6$

$\therefore$ 4.8×10^{-13} J for 10^6 atoms.

$$\text{Joule per atom } = \frac{4.8\times10^{-13}\text{J}}{10^6\text{ atom}}$$

Electron affinity = Electron gain enthalpy,

$$\text{E.A} = \frac{4.8\times10^{-13}}{10^6}\text{J / atom}$$

$$1\text{J} = \frac{1}{1.6021\times10^{-19}}\text{ eV}$$

$$\text{EA} = \frac{4.8\times10^{-13}}{1.6021\times10^6\times10^{-19}}\text{ eV / atom}$$

$$= 2.99\text{ eV / atom}$$

$$\text{EA} \approx 3.00\text{ eV / atom}$$

420. Which one of the following arrangements represents the correct order of least negative to most negative electron gain enthalpy for C, Ca, Al, F and O?

(a) Al<Ca<O<C<F
(b) Al<O<C<Ca<F
(c) C<F<O<Al<Ca
(d) Ca<Al<C<O<F

KARNATAKA NEET 2013

Ans. (d) : Electron gain enthalpy becomes less negative from top to bottom in a group while is becomes more negative from left to right within a period.

421. Assertion: Electron affinity refers to an isolated atom's attraction for an additional electron while electronegativity is the ability of an atom of an element to attract electrons towards itself in a shared pair of electrons.

Reason: Electron affinity is a relative number and electronegativity is experimentally measurable.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2010

Ans. (c): Electron affinity refers to an isolated atom's attraction for an additional electron while electronegativity is the ability of an atom of an element to attract electrons towards itself in a shared pair of electron due to electron affinity is experimentally measurable while electronegativity is relative number.

@apna_pdf

422. The electron affinity values of elements A, B, C and D are respectively –135, –60, –200 and –348 kJ mol^{-1}. The outer electronic configuration of element B is

(a) $3s^23p^5$ (b) $3s^23p^4$
(c) $3s^23p^3$ (d) $3s^23p^2$

AP-EAMCET- (Engg.) - 2010

Ans. (c) : Given that the electron affinity of elements A = –135 kJ/mole, B= –60 kJ/mole, C = –200 kJ/mole and D = –348 kJ/mole then the element having half-filled or completely filled orbitals are stable electronic configuration, and have low negative value of electron affinity.
Since, the electron affinity of B is lowest and electronic configuration is – $1s^2\,2s^2\,2p^6\,\underline{3s^2\,3p^3}$

423. Carbon can reduce ferric oxide to iron at a temperature above 983 K because

(a) carbon monoxide formed is thermodynamically less stable than ferric oxide
(b) carbon has a higher affinity towards oxidation than iron
(c) free energy change for the formation of carbon dioxide is less negative than that for ferric oxide
(d) iron has a higher affinity towards oxygen than carbon

KARNATAKA-CET, 2010

Ans. (b) : Above 983 K, free energy change for the formation of CO_2 is more negative than that for ferric oxide. Thus, above this temperature, carbon has a higher affinity towards oxidation than iron.

424. The atomic numbers of elements A, B, C and D are Z–1, Z, Z+1 and Z+2, respectively. If 'B' is a noble gas, choose the correct answers from the following statements

(1) 'A' has higher electron affinity
(2) 'C' exists in +2 oxidation state
(3) 'D' is an alkaline earth metal

(a) (1) and (2) (b) (2) and (3)
(c) (1) and (3) (d) (1), (2) and (3)

A.P.EAMCET 2008

Ans. (c) : Given that,
Atomic no. of element A = Z – 1, i.e, halogen
Atomic no. of element B = Z, i.e, noble gas
Atomic no. of element C = Z + 1, i.e, group IA
Atomic no. of element D = Z + 2, i.e, group IIA
∴ • Element A must be halogen i.e, have the highest electron affinity.
• Element B is Noble gas.
• Element C must be an alkali metal exist as +1 oxidation state.
• Element D must be alkaline earth metal.

425. Which one of the following statements is false

(a) The electron affinity of chlorine is less than that of fluorine
(b) The electronegativity of fluorine is more than that of chlorine
(c) The electron affinity of bromine is less than that of chlorine
(d) The electronegativity of chlorine is more than that of bromine

MPPET-2008

Ans. (a) : (i) The electron affinity of chlorine is greater than the fluorine.
(ii) The EN of fluorine is greater than chlorine.
(iii) The electron affinity of bromine is less than of chlorine.
(iv) The electronegative of Chlorine is more than that of bromine.

426. The electronic configuration of the element with maximum electron affinity is

(a) $1s^2, 2s^2, 2p^3$
(b) $1s^2, 2s^2, 2p^5$
(c) $1s^2, 2s^2, 2p^6, 3s^2, 3p^5$
(d) $1s^2, 2s^2, 2p^6, 3s^2, 3p^3$
(e) $1s^2, 2s^2, 2p^6, 3s^1$

Kerala-CEE-2008

Ans. (c): The electronic configuration of $1s^2, 2s^2, 2p^6, 3s^2, 3p^5$ is chlorine. The electron affinity is a measure the attraction between the incoming electrons to the nucleus. Electron affinity of Cl is greater than electron affinity of F due to small size of F atom. Hence, electron affinity is highest for chlorine.

427. Which of the following is a favourable factor for cation formation?

(a) Low ionisation potential
(b) High electron affinity
(c) High electronegativity
(d) Small atomic size

AP-EAMCET (Engg.)-2005

Ans. (a) : As the ionization potential decreases the removal of electron get place easily and the cation formed. Hence, low ionization potential is a favourable factor for cation formation.

428. Which of the following has lowest electron affinity?

(a) Cl (b) I
(c) F (d) Br

J & K CET-(2005)

Ans. (b) : When we moving on a group, electron affinity decrease due to the size of atom increase.

Halogen	F	Cl	Br	I
EA(eV)	–3.6	–3.8	–3.5	–3

Hence, the electron affinity is highest in Cl and lowest in Iodine(I).

429. The electron affinity values (in kJ mol^{-1}) of three halogens X, Y and Z are respectively –349, –333 and –325. Then X, Y and Z respectively are:

(a) F_2, Cl_2 and Br_2 (b) Cl_2, F_2 and Br_2
(c) Cl_2, Br_2 and F_2 (d) Br_2, Cl_2 and F_2

AP-EAMCET (Medical), 2003

Ans. (b) : As we know, group 17 elements shows the highest negative value of electron affinity.
Chlorine has highest value of electron affinity than fluorine due to small size of fluorine and more electrostatic repulsion occur between nucleus and F outer shell. Thus, the electron affinity values (in $kJmol^{-1}$) of three halogens Cl_2, F_2 and Br_2 are respectively –349, –333 and –325.

@apna_pdf

430. Which one of the following reagents is used for detection of unsaturation in alkenes?

(a) NaOH + CaO
(b) Cold dilute alkaline $KMnO_4$
(c) $Cl_2/h\nu$
(d) KOH / C_2H_5OH

AP-EAMCET (Medical), 2003

Ans. (b) : Both bromine water or alkaline $KMnO_4$ (Baeyer's reagent) are decolourised after the reaction with unsaturated compound. Unsaturation in alkyne or alkene in any organic compound is defected by reagents the organic compound with alkaline $KMnO_4$ or bromine water.

431. Which of the following is as per the definition of electron-affinity?

(a) $X_{2\,(g)} \xrightarrow{+2e} 2X^-_{\,(g)}$

(b) $X_{\,(g)} \xrightarrow{+e} X^-_{\,(g)}$

(c) $X^+_{\,(g)} \xrightarrow{+e} X_{(g)}$

(d) $X^-_{\,(g)} \xrightarrow{+e} X^{2-}_{\,(g)}$

J & K CET-(2001)

Ans. (b) : The electron affinity is the potential energy change of the atom when an electron is added to a neutral gaseous atom to form a negative ion.

So, $X(g) \xrightarrow{+e} X^-(g)$ is more favorable.

432. The electron affinities of halogens follow the order

(a) $F_2 > Cl_2 > Br_2 > I_2$
(b) $Cl_2 > F_2 > Br_2 > I_2$
(c) $Br_2 > Cl_2 > F_2 > I_2$
(d) $I_2 > Br_2 > Cl_2 > F_2$

Ans. (b) : Generally the electron affinity decrease down the group as the atomic size increases but F_2 has lower electron affinity compared to Cl_2 because the size of F_2 is very small and thus interelectronic repulsion is high.

7. Nomenclature of Elements with Atomic Number > 100

433. The IUPAC name of an element with atomic number 119 is

(a) ununoctium
(b) ununennium
(c) unnilennium
(d) unununnium

NEET-17.07.2022

Ans. (b) : Given, atomic No (Z) = 119

Nomenclature of elements with atomic number (Z) greater than 100 :

0 = nil, 1 = un, 2 = bi, 3 = tri, 4 = quad, 5 = pent, 6 = hex, 7 = sept, 8 = oct, 9 = enn.

Hence, the IUPAC name of element with

Z = 119 is ununennium
Z = 111 is unununnium
Z = 118 is ununoctium
Z = 109 is unnilennium

434. Identify the incorrect match

Number	**IUPAC official name**
(a) Unnilunium	**(i) Mendelevium**
(b) Unniltrium	**(ii) Lawrencium**
(c) Unnilhexium	**(iii) Seaborgium**
(d) Unununnium	**(iv) Darmstadtium**

(a) (A), (i)
(b) (B), (ii)
(c) (C), (iii)
(d) (D), (iv)

NEET-2020

Ans. (d) :

Number	**Atomic Number**	**IUPAC Name**
Unnilunium	101	Mendelevium
Unniltrium	103	Lawrencium
Unnilhexium	106	Seaborgium
Unununnium	111	Roentgenium

435. The atomic number of the element unnilennium is

(a) 109
(b) 102
(c) 108
(d) 119

(JEE Main 2020, 3 Sep Shift-I)

Ans. (a) : The atomic number of the element unnilennium is 109.

The name is derived directly from the atomic number of the element using the latin numerical roots are

Number	0	1	2	3	4
Root	nil	un	bi	tri	quad
Number	5	6	7	8	9
Root	pent	hex	sept	oct	enn

The atomic no. of element 109 is meitnerium (mt).

436. The IUPAC name of an element is Unbinilium. Its atomic number is

(a) 102
(b) 110
(c) 120
(d) 106
(e) 100

Kerala-CEE-2020

Ans. (c) : The IUPAC name for 120 is unbinilium and symbol is Ubn. According to IUPAC systematic nomenclature, the numeral roots for 1, 2, 0 are un, bi and nil respectively and then add suffix ium.

437. What is the name of the element with atomic number 105?

(a) Dubnium
(b) Holmium
(c) Kurchatovium
(d) Nobelium

UPTU/UPSEE-2012

Ans. (a) : The name of the element with atomic number 105 is Dubnium. Which means that there are 105 protons and 105 electrons in the atomic structure. The chemical symbol for dubnium is Db.

438. The name of the element with atomic number 100 was adopted in honour of

(a) Alfred Nobel
(b) Enrico Fermi
(c) Dimitri Mendeleef
(d) Albert Einstein

A.P.EAMCET 1995

Ans. (b) : The atomic number 100 element in the periodic table is Fermium is named in the honour of Enrico Fermi, a nuclear physicist. The symbol of Fermi is Fm. It is an actinide located in group 3 elements of the periodic table and in the 6 and 7 period.

@apna_pdf

04.

Chemical Bonding and Molecular Structure

1. Hybridization

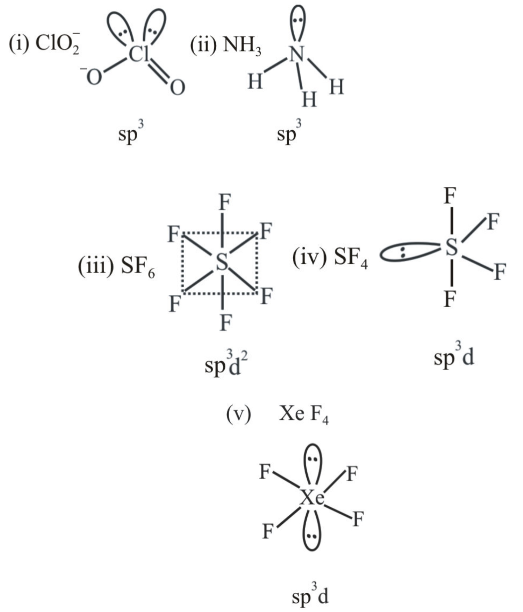
1. Among the following which are mismatched;

Molecule	**hybridization**
(A) ClO_2^-	**sp^3**
(B) NH_3	**sp^2**
(C) SF_6	**sp^3d^2**
(D) SF_4	**sp^3d**
(E) XeF_4	**sp**

(a) (A) and (C)
(b) (B) and (E)
(c) (C) and (E)
(d) (A) and (D)

CG PET-22.05.2022

Ans. (b) : The structure of given molecule are-



2. Match List-I with List-II

	List-I	**List-II**
(A)	**$[PtCl_4]^{2-}$**	**(i) sp^3d**
(B)	**BrF_5**	**(ii) d^2sp^3**
(C)	**PCl_5**	**(iii) dsp^2**
(D)	**$[Co(NH_3)_6]^{3+}$**	**(iv) sp^3d^2**

Choose the most appropriate answer from the options given below:

(a) (A)-(II), (B)-(IV), (C)-(I), (D)-(III)
(b) (A)-(III), (B)-(IV), (C)-(I), (D)-(II)
(c) (A)-(III), (B)-(I), (C)-(IV), (D)-(II)
(d) (A)-(II), (B)-(I), (C)-(IV), (D)-(III)

JEE Main-24.06.2022, Shift-I

Ans. (b)

List-I	**List-II**
$[PtCl_4]^{2-}$	dsp^2
BrF_5	sp^3d^2
PCl_5	sp^3d
$[Co(NH_3)_6]^{3+}$	d^2sp^3

3. Which one of the following reactions involves change from sp^2 to sp^3 hybridisation of the central atom?

(a) $CH_4 + 2Cl_2 \rightarrow CH_2Cl_2 + 2HCl$
(b) $NH_3 + H^+ \rightarrow NH_4^+$
(c) $AlCl_3 + Cl^- \rightarrow AlCl_4^-$
(d) $H_2O + H^+ \rightarrow H_3O^+$
(e) $PCl_3 + Cl_2 \rightarrow PCl_5$

Kerala CEE -03.07.2022

Ans. (c) :

(i) $CH_4 + 2Cl_2 \rightarrow CH_2Cl_2 + 2HCl$
sp^3 sp^3

(ii) $NH_3 + H^+ \rightarrow NH_4^+$
sp^3 sp^3

(iii) $AlCl_3 + Cl^- \rightarrow AlCl_4^-$
sp^2 sp^3

(iv) $H_2O + H^+ \rightarrow H_3O^+$
sp^3 sp^3

(v) $PCl_3 + Cl_2 \rightarrow PCl_5$
sp^3 sp^3d

4. Given below are two statements:

Statement I : $\left[Ni(CN)_4\right]^{2-}$ is square planar and diamagnetic complex, with dsp^2 hybridization for Ni but $\left[Ni(CO)_4\right]$ is tetrahedral, paramagnetic and with sp^3-hybridization for Ni.

Statement II : $\left[NiCl_4\right]^{2-}$ and $\left[Ni(CO)_4\right]$ both have same d-electron configuration, have same geometry and are paramagnetic.

In light of the above statements, chose the correct answer from the options given below:

(a) Both Statement I and Statement II are true
(b) Both Statement I and Statement II are false
(c) Statement I is correct but Statement II is false
(d) Statement I is correct but Statement II is true

JEE Main-28.06.2022, Shift-I

Ans. (b) : In $[Ni(CN)_4]^{2-}$
Ni^{+2} = [Ar] $3d^8$ $4s^0$ = dsp^2 (Square planar) and diamagnetic
For $[Ni(CO)_4)$
Ni = [Ar] $3d^8$ $4s^2 \Rightarrow sp^3$ (Tetrahedral) and diamagnetic.
For $[NiCl_4]^{2-}$
Ni^{+2}=[Ar] $3d^8$ $4s^0 \Rightarrow sp^3$ (Tetrahedral) and paramagnetic

@apna_pdf

5. The types of hybrid orbitals of nitrogen in NO_2^+, NO_3^- and NH_4^+ respectively are

(a) sp, sp^3, sp^2 (b) sp, sp^2, sp^3
(c) sp^2, sp, sp^3 (d) sp^2, sp^3, sp

(JEE Main 2021, 20 July Shift-II)
AP EAMCET (Engg.) 17.09.2020, Shift-II
NEET-II 2016, Assam CEE-2014
AMU-2015, 2008

Ans. (b) : $NO_2^+ \Rightarrow O = \underset{sp}{\overset{\oplus}{N}} \rightarrow O$

$$H = \frac{1}{2}(V + M - C + A)$$

$$H = \frac{1}{2}(5 + 0 + 1 + 0) = 2(sp)$$

Where, H = number of hybrid orbitals
V = number of valence electrons
M = number of monovalent atoms/groups
C = number of cationic or positive charge
A = number of anionic or negative charge

$NO_3^- \Rightarrow$ 
$$H = \frac{1}{2}(5 + 0 - 0 + 1) = 3(sp^2)$$

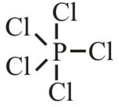
$NH_4^+ \Rightarrow$ 
$$H = \frac{1}{2}(5 + 4 - 1 + 0) = 4(sp^3)$$

6. The hybridization involved in PCl_5 is

(a) sp^3d (b) sp^3d^2
(c) d^2sp^2 (d) sp^3

J & K CET-(2011)
UPTU/UPSEE-2011
WB-JEE-2010

Ans. (a) : The structure of PCl_5 is



sp^3d

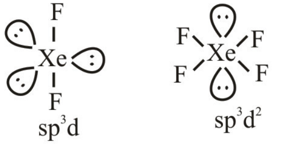
In PCl_5 molecule has phosphorous bonded with 5 chlorine in trigonal bipyramidal geometry. The hybridisation of PCl_5 is sp^3d.

7. Hybridisation in XeF_2 and XeF_4 are respectively ______.

(a) sp^2 and sp^3d^2 (b) sp^3d and sp^3d^2
(c) sp and sp^3 (d) sp^3d and sp^3

GUJCET-2022, AMU-2005

Ans. (b): The structure of XeF_2 and XeF_4 are-



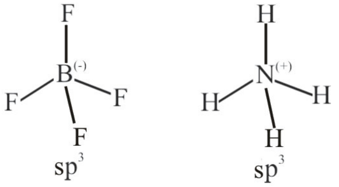
(linear) (square planar)

8. Which one of the following pairs is isostructural (i.e., having the same shape and hybridization)?

(a) [BCl_3 and $BrCl_3$] (b) [NH_3 and NO_3^-]
(c) [NF_3 and BF_3] (d) [BF_4^- and NH_4^+]

BITSAT-2014, NEET-2012

Ans. (d) : The structure of BF_4^- and NH_4^+ is-



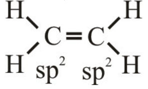
The species BF_4^- and NH_4^+ have same-same i.e tetrahedral and hybridization is Sp^3

9. Which of the following has sp^2-hybridisation?

(a) C_2H_6 (b) C_2H_4
(c) $BeCl_2$ (d) C_2H_2

JIPMER-2012
NEET-1996

Ans. (b) : in C_2H_6 both carbon has sp^3 hybridisation. In C_2H_4 both carbon has sp^2 hybridisation



In $BeCl_2$, beryllium has sp hybridisation.

$$\underset{sp}{Cl - Be - Cl}$$

In C_2H_2 each carbon has sp hybridisation.

$$H - \underset{sp}{C} \equiv \underset{sp}{C} - H$$

10. The 'd' orbital involved in the hybridisation in the PCl_5 molecule is

(a) $3d_{x^2-y^2}$ (b) $3d_{z^2}$
(c) $3d_{xy}$ (d) $4d_{x^2-y^2}$

J & K CET-(2009, 2005)

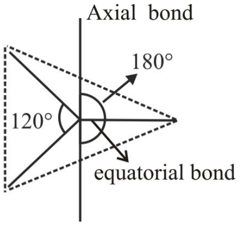
Ans. (b) : The hybridisation of PCl_5 molecule is sp^3d the hybridisation number should be 5. These five orbitals are degenerate, that is their energies are the sume but configuration are different.
In sp^3d hybridisation there are a total of s orbitals which are s, p_x, p_y, p_z. In case of d- subshell, the d_{z^2} orbital take part in hybridisation.

11. The geometrical shape of sp^3d hybridization is

(a) linear (b) trigonal bipyramid
(c) square planar (d) tetrahedral

J & K CET-(2007, 2002)

Ans. (b) : The geometrical shape of sp^3d hybridisation is trigonal bipyramid.



@apna_pdf

12. An sp^3-hybrid orbital contains

(a) $\frac{1}{4}$ s-character (b) $\frac{1}{2}$ s-character

(c) $\frac{2}{3}$ s-character (d) $\frac{3}{4}$ s-character

JIPMER-2011
NEET-1991

Ans. (a) : In sp^3 hybrid orbital, is formed by mixing of 1s and 3p-orbitals to form a equivalent sp^3 orbital's. Therefore sp^3 hybrid orbital has 25% s-character and 75% p-character. So, sp^3-hybrid orbital contains $\frac{1}{4}$ s-character.

Hybrid atomic orbital's do not exist and do not appropriately describe molecular bonding.

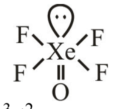
13. The type of hybridisation and number of lone pair(s) of electrons of Xe in XeOF$_4$, respectively, are

(a) sp^{3}d^2 and 1 (b) sp^{3}d and 2

(c) sp^3 and 1 (d) sp^{3}d^2 and 2

(JEE Main 2019, 10 Jan Shift-I)
UPTU/UPSEE-2015

Ans. (a) : The structure of XeOF$_4$ are –



The hybridisation is sp^{3}d^2.

Hybridisation = Bond pair + lone pair

= (4 + 1) +1

= 6 (sp^{3}d^2)

So, the hybridization of XeOF$_4$ is sp^{3}d^2 and lone pair is 1.

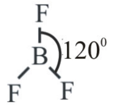
14. The planar structure of BF$_3$ can be explained by the fact that BF$_3$ is

(a) sp-hybridised (b) sp^2-hybridised

(c) sp^3-hybridised (d) sp^{3}d hybridised

J & K CET-(2017)
BCECE-2007

Ans. (b) : The structure of BF$_3$ is



sp^2 (triangular planar.)

In BF$_3$ has sp^2 hybridization due to three fluorine atom are arranged in a trigonal geometry.

15. Sulphur reacts with chlorine in 1 : 2 ratio and form X. Hydrolysis of X gives a sulphur compound Y. What is the hybridisation state of central atom in the anion of Y ?

(a) sp^3 (b) sp

(c) sp^2 (d) sp^{3}d

AP- EAPCET- 07-09-2021, Shift-I
AP-EAMCET (Engg.)-2004

Ans. (a) : When sulphur reacts with chlorine in 1 : 2 ratio then SCl$_4$ is obtained which one hydrolysis gives sulphurous acid (H$_2$SO$_3$).

$$S + 2Cl_2 \rightarrow \underset{\text{sulphur tetrachloride}}{SCl_4}$$

$$SCl_4 + 4H_2O \rightarrow \underset{\text{unstable}}{S(OH)_4} + 4HCl$$

$$S(OH)_4 \rightarrow \underset{\text{sulfurous acid}}{H_2SO_3} + H_2O$$

Hybridization of S in SO_3^{2-} is sp^3.

16. Which of the following is an octahedral molecule?

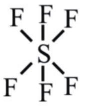
(a) SF$_6$ (b) BF$_4^-$

(c) PCl$_5$ (d) IF$_7$

J & K CET-(2017, 1998)

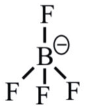
Ans. (a) : From the following molecule are –

(i) SF$_6$



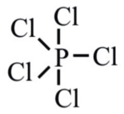
sp^{3}d^2 (Octahedral)

(ii) BF$_4^-$



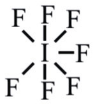
sp^3 (tetrahedral)

(iii) PCl$_5$



sp^{3}d (trigonal bipyramidal)

(iv) IF$_7$



sp^{3}d^3 (Pentagonal bi pyramidal)

SF$_6$ molecule has octahedral geometry.

17. The state of hybridization of 'B' in BCl$_3$ is:

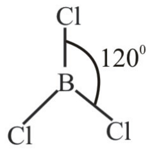
(a) sp^3 (b) sp^2

(c) sp (d) sp^{3}d^2

AP EAMCET (Medical) -1998
AP-EAMCET-1996

Ans. (b): The type of hybridization that occurs is BCl$_3$ is sp^2 hybridization. In BCl$_3$ molecule, boron will be the central atom which contains three bonded atom but no lone pair of electron.

The structure of BCl$_3$ is given below–



Hybridization = No. of bond pair + No. of lone pair

Hybridization = 3 + 0 = 3 (sp^2)

18. sp^{3}d hybridisation results in:

(a) A square planar molecule

(b) An octahedron molecule

(c) A trigonal bipyramidal molecule

(d) A tetrahedron molecule

UPTU/UPSEE-2005, 2004

Ans. (c) : The hybridisation of sp^{3}d is tirgonal bipyrmidal molecule. A sp^{3}d hybridisation includes 5 hybrid orbitals arranged in space so is to minimise the repulsion between them and the geometry which results from such an arrangement is trigonal bipyramidal.

@apna_pdf

19. Match List-I and List-II.

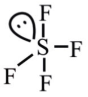
	List I (Species)		List II (Hybrid orbitals)
A	SF_4	i.	sp^3d^2
B	IF_5	ii.	d^2sp^3
C	NO_2^+	iii.	sp^3d
D	NH_4^+	iv.	sp^3
		v.	sp

	A	B	C	D
(a)	(i)	(ii)	(v)	(iii)
(b)	(ii)	(i)	(iv)	(v)
(c)	(iii)	(i)	(v)	(iv)
(d)	(iv)	(iii)	(ii)	(v)

(JEE Main 2021, 22 July Shift-II)

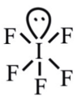
Ans. (c) :

(i) SF_4



sp^3d

(ii) IF_5



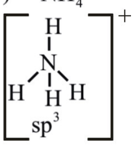
sp^3d^2

(iii) NO_2^+

$O=\overset{+}{N}=O$

sp

(iv) NH_4^+



Therefore, the SF_4 has sp^3d hybrid orbital IF_5 has sp^3d^2, NO_2^+ has sp and NH_4^+ has sp^3 hybrid orbital.

20. XeF_6 on partial hydrolysis gives a compound X, which has square pyramidal geometry 'X' is

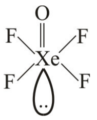
(a) XeO_3 (b) XeO_4

(c) $XeOF_4$ (d) XeO_2F_2

Kerala-CEE-29.08.2021

Ans. (c) : XeF_6 on partial hydrolysis gives a compound $XeOF_4$ which has square pyramidal geometry which is given as follows -

$$XeF_6 + H_2O \rightarrow XeOF_4 + 2HF$$



(Square pyramidal)

21. Match the following

Column – I	Column – II
Compound	**Hybridization**
(A) SF_6	(I) dsp^2
(B) PCl_5	(II) d^2sp^3
(C) $[PtCl_4]^{2-}$	(III) sp^3d^2
	(IV) sp^3
	(V) sp^3d

The correct match is

	A	B	C
(a)	III	I	V
(b)	III	V	I
(c)	IV	V	I
(d)	II	V	I

TS EAMCET 10.08.2021, Shift-II

Ans. (b) :

Species	Hybridization	Geometry
SF_6	sp^3d^2	PCl_5	sp^3d	$[Pt(Cl_4)]^{2-}$	dsp^2	
22. Consider the reaction $BCl_3 + NH_3 \rightarrow BCl_3 . NH_3$. The geometries of BCl_3 and $BCl_3 . NH_3$ respectively are ______

(a) Trigonal planar & Tetrahedral

(b) Tetrahedral & square planar

(c) Tetrahedral & Trigonal bipyramidal

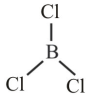
(d) Square planar & Trigonal pyramidal

AP EAPCET 23-08-2021 Shift-I

Ans. (a) : Given reaction is-

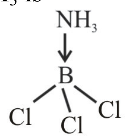
$$BCl_3 + NH_3 \rightarrow BCl_3 . NH_3$$

Structure of BCl_3 is-



The geometries of BCl_3 is trigonal planar.

Structure of $BCl_3 . NH_3$ is-



The geometries of $BCl_3.NH_3$ is tetrahedral.

23. In which of the following molecules/ ions the central atom is sp^2 hybridized?

BF_3, NO_2^-, NH_2^-, & H_2O

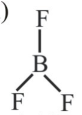
(a) NH_2^- & H_2O (b) NO_2^- & H_2O

(c) BF_3 & NO_2^- (d) NO_2^- & NH_2^-

AP EAPCET 19-08-2021 Shift-I

Ans. (c) : Formula = lone pair + Bond pair.

(i)

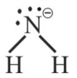


Hybridization
= 0 + 3
= 3 (sp^2)

(ii)

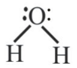
H.B = 1 + 2
= 3 (sp^2)

(iii)



H.B = 2 + 2
= 4 (sp^3)

(iv)



H.B = 2 + 2
= 4 (sp^3)

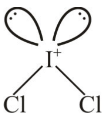
24. The hybridization of the central atom in the species ICl_2^+ is ____

(a) sp^3d^2 (b) sp

(c) sp^2 (d) sp^3

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (d): The structure of the ICl_2^+ is–



Hybridisation = No. of bond pair + No. of lone pair
= 2+2
= 4
i.e, sp^3

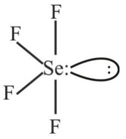
@apna_pdf

25. **The hybridization of Se in SeF_4 and its geometry respectively are________**

(a) sp^3d, see-saw shaped (b) sp^3d^2, octahedral
(c) sp^3d^3, trigonal planar (d) sp^3d^2, square planar

AP EAPCET 20.08.2021 Shift-II

Ans. (a): Structure of SeF_4 is–



Hybridization of SeF_4 is sp^3d and geometry is see-saw shaped.

26. **Match List-I (species) with List-II (hybridisation) and select the correct code given below :**

List-I	List-II
(A) XeF_4	(1) dsp^2
(B) H_2O	(2) sp^3
(C) PCl_5	(3) sp^3d^2
(D) $[Pt(NH_3)_4]^{2+}$	(4) sp^3d

Codes :

	A	B	C	D
(a)	3	2	4	1
(b)	1	4	2	3
(c)	3	4	2	1
(d)	1	2	4	3

Manipal-2020

Ans. (a) :

Species	Hybridization
XeF_4	sp^3d^2
H_2O	sp^3
PCl_5	sp^3d
$[pt(NH_3)_4]^{2+}$	dsp^2

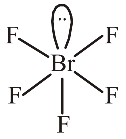
27. **Which one of the following molecules is formed by sp^3d hybridisation?**

(a) BrF_5 (b) PF_5
(c) SF_6 (d) $[Co(NH_3)_6]^{3+}$
(e) $[Pt(Cl)_4]^{2-}$

Kerala-CEE-2020

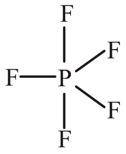
Ans. (b) :

(i) BrF_5



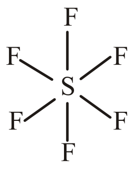
(sp^3d^2)

(ii) PF_5



(sp^3d)

(iii) SF_6



(sp^3d^2)

28. **The percentage of s-character in the hybrid orbitals of nitrogen in NO_2^+, NO_3^- and NH_4^+ respectively are**

(a) 33.3%, 50%, 25% (b) 33.3%, 25%, 50%
(c) 50%, 33.3%, 25% (d) 25%, 50%, 33.3%

Karnataka-CET-2020

Ans. (c) : The structure of NO_2^+ NO_3^- and NH_4^+

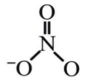
(i) NO_2^+

$O=\overset{+}{N}=O$

sp

The percentage of s-character is 50% and p- character is 50%

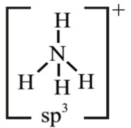
(ii) NO_3^-



sp^2

The percentage of s-character is 33.3% and p-character is 66.6%

(iii) NH_4^+



sp^3

The percentage of s-character is 25% and p-character is 75%.

Hence, the percentage of s-character in the hybrid orbital of nitrogen in NO_2^+ is 50%, NO_3^- is 33.3% and NH_4^+ and is 25% respectively.

29. **The linear shape of CO_2 is due to.......**

(a) sp^3 -hybridisation of carbon
(b) sp-hybridisation of carbon
(c) $p\pi$ - $d\pi$ bonding between carbon and oxygen
(d) sp^2 -hybridisation of carbon

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) : The geometry of CO_2 is linear. As there are no non-bonding pairs, the space is not even distorted or bent and remain a perfect 180° angle. This is due to the overlapping of s and p.

Orbitals of both atoms to form sp hybrid and $p\pi - p\pi$ bonding between carbon and oxygen.

30. **The reaction in which the hybridisation of the underlined atom is affected is**

(a) $\underline{Xe}F_4 + SbF_5 \rightarrow$
(b) $H_2\underline{S}O_4 + NaCl \xrightarrow{420k}$
(c) $H_3\underline{P}O_2 \xrightarrow{\text{Disproportionation}}$
(d) $\underline{N}H_3 \xrightarrow{H^+}$

(JEE Main 2020, 4 Sep Shift-II)

Ans. (a) : (i) $\underset{sp^3d^2}{XeF_4} + SbF_5 \longrightarrow \underset{sp^3d}{(XeF_3)}(SbF_6)^-$

(ii) $\underset{sp^3}{H_2SO_4} + NaCl \xrightarrow{420k} \underset{sp^3}{NaHSO_4} + HCl$

(iii) $\underset{sp^3}{H_3PO_2} \xrightarrow{\text{Disproportionation}} \underset{sp^3}{PH_3} + \underset{sp^3}{H_3PO_4}$

(iv) $\underset{sp^3}{NH_3} \xrightarrow{H^+} \underset{sp^3}{NH_4^+}$

@apna_pdf

31. What is the hybridisation of Be in BeF_2 molecule ?

(a) dsp^2 (b) sp^2d
(c) sp (d) sp^3

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (c) : Hybridisation state of Be in BeF_2 is sp.

F—Be—F

$$H = \frac{1}{2}(V + M - C + A)$$

$$= \frac{1}{2}(2 + 2 - 0 + 0) = 2(sp)$$

Where, V = number of valence electrons of Be = 2
H = number of monovalent F atom = 2
C = number of cationic charge = 0
A = number of anionic charge = 0

So, the hybridisation of Be in BeF_2 molecule is sp.

32. The types of hybridisation on the five carbon atoms from left to right in pent-1-en-4-yne are

(a) sp^2, sp^2, sp^3, sp, sp (b) sp, sp, sp^3, sp^2, sp^2
(c) sp^2, sp^3, sp, sp, sp^3 (d) sp^2, sp, sp^3, sp, sp^2

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (a) : $\underset{\underset{sp^2}{\uparrow}}{\overset{1}{C}H_2} = \underset{\underset{sp^2}{\uparrow}}{\overset{2}{C}H} — \underset{\underset{sp^3}{\uparrow}}{\overset{3}{C}H_2} — \underset{\underset{sp}{\uparrow}}{\overset{4}{C}} \equiv \underset{\underset{sp}{\uparrow}}{\overset{5}{C}H}$

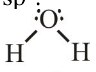
(Pent-1-ene-4-yne)

33. What is hybridization of O in H_2O?

(a) sp (b) sp^3
(c) sp^2 (d) No hybridisation

JIPMER-2019

Ans. (b) : The structure of H_2O is V-shaped or bent shaped because two lone pair present on oxygen atom to repel each other and two bonded hydrogen atom. The hybridization of H_2O is sp^3.



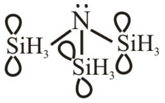
sp^3

34. The hybridization and geometry in $N(SiH_3)_3$, respectively, are

(a) sp^3, tetrahedral (b) sp^3, pyramidal
(c) sp^2, triangular planar (d) sp^3d, T-shaped.

AMU-2019

Ans. (c) : In trisilylamine, N atom is sp^2 hybridised which results in planar geometry There is $p\pi - d\pi$ bonding because Si has vacant d–orbitals.



sp^2 (triangular planar.)

35. Match the Xenon compounds in Column-I with its structure in Column-II and assign the correct code.

Column-I		Column-II	
(A)	XeF_4	(i)	Pyramidal
(B)	XeF_6	(ii)	Square planar
(C)	$XeOF_4$	(iii)	Distorted octahedral
(D)	XeO_3	(iv)	Square pyramidal

	A	B	C	D
(a)	(iii)	(iv)	(i)	(ii)
(b)	(i)	(ii)	(iii)	(iv)
(c)	(ii)	(iii)	(iv)	(i)
(d)	(ii)	(iii)	(i)	(iv)

(NEET 2019, NEET-I 2016)

Ans. (c) :

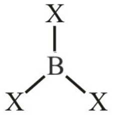
Column-I	Column-II
XeF_4	Square planar
XeF_6	Distorted octahedral
$XeOF_4$	Square pyramidal
XeO_3	Pyramidal.

36. The hybridization state of boron in its trihalides is

(a) sp^2 (b) sp3
(c) sp (d) sp^3d

J & K CET-(2019)

Ans. (a) : The hybridization state of boron in its trihalides is sp^2 because boron bonded with three halides to a trigonal planar geometry.



sp^2 hybridisation

Where, X = Halide group.

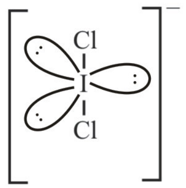
37. The ion that has sp^3d^2 hybridisation for the central atom, is

(a) $[IC\ell_2]^-$ (b) $[BrF_2]^-$
(c) $[IC\ell_4]^-$ (d) $[IF_8]^-$

(JEE Main 2019, 8 April Shift-II)

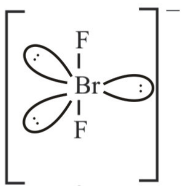
Ans. (c) : The structure of the following molecule-

(i) $[ICl_2]^-$



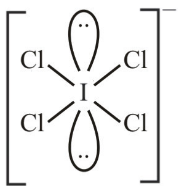
sp^3d

(ii) $[BrF_2]^-$



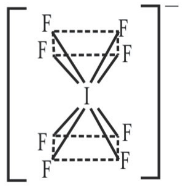
sp^3d

(iii) $[ICl_4]^-$



sp^3d^2

(iv) $[IF_8]^-$



sp^3d^4

Thus $[ICl_4]^-$ ion has sp^3d^2 hybridisation.

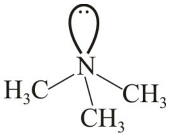
38. Type of hybridization of N and C – N – C bond angle in $(CH_3)_3N$ are ______ and respectively?

(a) $sp^3, 108^o$ (b) $sp^2, 120^o$
(c) $sp^3, 109^o28'$ (d) $sp^2, 117.5^o$

GUJCET-2019

@apna_pdf

Ans. (a) :



Nitrogen has 3 bonds pairs, 1 lone pair. Hence, by VSEPR theory, it is sp^3 hybridised and bond angle is 108°.

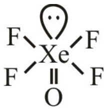
39. The number of lone pair of electron and hybridisation in $XeOF_4$ is

(a) 0,sp^3 (b) 1,sp^3d

(c) 1,sp^3d^2 (d) 2,sp^3d^2

CG PET -2019

Ans. (c) : For $XeOF_4$



The number of lone pair of electron is 1 and hybridization is sp^3d^2.

Hybridisation = Bond pair + lone pair.

= (4 + 1) + 1

= 6 (sp^3d^2).

40. A molecule is square plannar with no lone pair. What type of hybridization is associated with it?

(a) sp^3d (b) sp^3d^2

(c) dsp^3 (d) dsp^2

COMEDK-2019

Ans. (d) : dsp^2 hybridisation leads to square planar geometry and no lone pair.

41. Specify the coordination geometry and hybridization of N and B atoms in a 1:1 complex of BF_3 and NH_3.

(a) N: tetrahedral, sp^3; B: tetrahedral, sp^3

(b) N: pyramidal, sp^3; B: pyramidal , sp^3

(c) N: pyramidal, sp^3, B: planar, sp^2

(d) N: pyramidal, sp^3, B: tetrahedral, sp^3

COMEDK–2018

Ans. (a) : NH_3 and BF_3 have sp^3 (pyramidal) and sp^2 (planar) hybridization respectively, having one lone pair of electron on N atom which is responsible for pyramidal shape of NH_3 inspite of sp^3 hybridisation. However, as soon as it is coordinated to BF_3, both attain tetrahedral geometry and acquire sp^3 hybridisation.

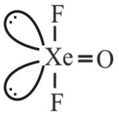
42. In $XeOF_2$ molecule, the hydridisation of Xe orbital is–

(a) sp^3d^3 (b) sp^3d^2

(c) sp^3d (d) sp^3

BCECE-2018

Ans. (c) : The structure of $XeOF_2$ is



The hybridization of $XeOF_2$ is sp^3d

Hybridisation = bond pair + lone pair

= (2 + 1) + 2

= 5 (sp^3d)

43. What is the structure of $XeOF_4$?

(a) Square pyramidal

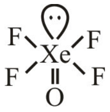
(b) Trigonal bipyramidal

(c) Pyramidal

(d) Square bipyramidal

GUJCET-2018

Ans. (a) : The structure of $XeOF_4$ is –



According to VSEPR theory, Xe bonded with four fluorine atom and one doubly bonded oxygen atom, and present one lone pair. The hybridisation of $XeOF_4$ is sp^3d^2 and structure is square pyrimdal.

44. The state of hybrid orbitals of carbon in CO_2, CH_4 and CO_3^{2-} respectively is

(a) sp^3, sp^2 and sp (b) sp^3, sp and sp^2

(c) sp, sp^3 and sp^2 (d) sp^2, sp^3 and sp

Karnataka-CET-2018

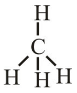
Ans. (c) : The structure of CO_2, CH_4 and CO_3^{2-} is

(i) CO_2

O=C=O

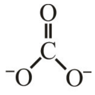
sp

(ii) CH_4



sp^3

(iii) CO_3^{2-}



sp^2

Therefore, the hybrid orbital's of carbon in CO_2, CH_4 and CO_3^{2-} is sp, sp^3 and sp^2 respectively.

45. formation of PCl_3 is explained on the basis of what hybridisation of phosphorus atom?

(a) sp^2 (b) sp^3

(c) sp^3d (d) sp^3d^2

MHT CET-2018

Ans. (b) : Hybridisation of an atom can be determined by the formula.

$$\text{Hybridisation} = \frac{1}{2}[V + Y - C + A]$$

Where, V = Valence electron

Y = Monovalent atom

C = Cationic charge

A = Anionic charge

For PCl_3 , V=5, Y= 3, C = 0, A = 0

$$\text{So,} \quad \text{hybridisation} = \frac{1}{2}\,[5 + 3 - 0 + 0]$$

$$= \frac{1}{2} \times 8$$

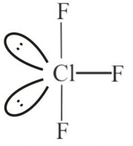
4 (sp^3)

46. In the structure of ClF_3, the number of lone pairs of electrons on central atom 'Cl' is

(a) one (b) two (c) four (d) three

NEET-2018

Ans. (b) : The structure of ClF_3 is -



sp^3d (T- shaped)

@apna_pdf

In ClF_3 molecule three fluorine atoms is bonded to chlorine and two lone pairs are present in central atom of Cl. The hybridization of ClF_3 is sp^3d and shape is T-shaped.

47. Sulphur reacts with chlorine in 1:2 ratio and forms X. Hydrolysis of X gives a sulphur compound Y. The hybridisation of central atom in the anion Y is

(a) sp^3 (b) sp^2
(c) sp^3d (d) sp

JIPMER-2017

Ans. (a) : When sulphur reacts with chlorine in 1 : 2. The ratio of the SCl_4 is obtained which on hydrolysis gives H_2SO_4. Therefore, the compound X is SCl_4 and Y is H_2SO_4

$$\underset{}{S+2Cl_2 \longrightarrow \underset{(X)}{SCl_4}}$$

$$SCl_4 + 4H_2O \longrightarrow \underset{\text{(unstable)}}{S(OH)_4} + 4HCl$$

$$S(OH)_4 \longrightarrow H_2SO_4 + H_2O$$

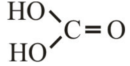
Hence, the hybridisation of sulphur in SO_4^{3-} is sp^3.

48. Among the following compounds, which compound is polar as well as well as exhibit sp^2 –hybridisation by the central atom

(a) H_2CO_3 (b) SiF_4
(c) BF_3 (d) $HClO_3$

JIPMER-2017

Ans. (a) : The structure of H_2CO_3 is –



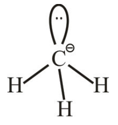
So, the geometry is trigonal planar and hybridization is sp^2.
Now, H_2CO_3 and BF_3 are central atom C and B are sp^2 hybridised. In H_2CO_3 is dipole moment is not zero.
Hence, H_2CO_3 molecule is polar as well as exhibit sp^2 hybridisation.

49. Hybridisation of carbon in CH_3^-

(a) sp^2 (b) sp^3
(c) sp^3d (d) sp^3d^2
(e) sp^2d^3

Kerala-CEE-2017

Ans. (b) : The structure of CH_3^- is



sp^3

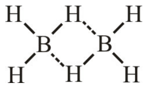
The hybridisation of CH_3^- is sp^3 due to three hydrogen atom is bonded to carbon and one lone pair is present so the hybrisation is sp^3.

50. Hybridisation of boron in diborone (B_2H_6) is–

(a) sp (b) sp^2
(c) sp^3 (d) sp^3d

BCECE-2016

Ans. (c) : The structure of diborane (B_2H_6) is-



Each boron atom in diborane is sp^3 hybridisation in the structure of diborane four H–atoms two are left and right, known as terminal hydrogen and in different environment two hydrogen atom which known as bridging atoms.

51. For the following pattern of hybridisation shown by the central atom.
sp, sp^2, sp^3, sp^3d
(1) (2) (3) (4)
which of the following will represent the correct sequence of hybridisation, i.e. according to the sequence mentioned above?

(a) H_2O, CO_2, BF_3, PCl_5
(b) CO_2, H_2O, BF_3, PCl_5
(c) CO_2, BF_3, H_2O, PCl_5
(d) H_2O, CO_2, PCl_5, BF_3

JCECE - 2016

Ans. (c) : The orbitals of the central atom that goes for hybridisation are:
(a) Orbitals used for a σ bond formation.
(b) Orbitals contain l.p. (lone pair) of electrons.
(c) If required empty orbitals.
Note: Orbitals involved in π-bond formation and having odd electron will not get hybridised.

Molecule	**Hybridisation**	**No. of σ bonds + l.p.**
CO_2	sp	$\begin{pmatrix}\text{no. of } \sigma \text{ bonds} = 0\\ \text{no. of lp of electrons} = 0\end{pmatrix}$
BF_3	sp^2	$\begin{pmatrix}\text{no. of } \sigma \text{ bonds} = 3\\ \text{no. of lp of electrons} = 0\end{pmatrix}$
H_2O	sp^3	$\begin{pmatrix}\text{no. of } \sigma \text{ bonds} = 2,\\ \text{no. of lp of electrons} = 2\end{pmatrix}$
PCl_5	sp^3d	$\begin{pmatrix}\text{no. of } \sigma \text{ bonds} = 5\\ \text{no. of lp of electrons} = 0\end{pmatrix}$

52. The hybridization of C in diamond, graphite and ethyne is in the order.

(a) sp^3, sp, sp^2 (b) sp^3, sp^2, sp
(c) sp, sp^2, sp^3 (d) sp^2, sp^3, sp

Karnataka-CET-2016

Ans. (b) : A diamond has a tetrahedral structure in which all C-atoms are bonded by 4σ - bonds with 4 neighbouring C-atoms. Thus it has sp^3 hybridisation.
Graphite forms a hexagonal in which each carbon is bonded by 3σ - bonds with 3-C atoms in the same plane. Thus, the graphite has sp^2 hybridisation.
In Ethyne $CH \equiv CH$ in which one C-atom is bonded with other C-atom through only one σ -bond (2π bonds do not take part in hybridization). So, ethyne has sp hybridization.
Thus, the correct order is sp^3, sp^2, sp,

53. The hybridised state of Al^{3+} in the complex ion formed when $AlCl_3$ is treated with aqueous acid is

(a) sp^3 (b) dsp^2
(c) sp^3d^2 (d) sp^2d
(e) sp^2

Kerala-CEE-2016

@apna_pdf

Ans. (c) : Al^{3+} ions give a complex ion in which Al^{3+} ion form six coordinate covalent bonds with six H_2O molecules.

Al^{3+} + aqueous acid $\rightarrow [Al(H_2O)_6]^{3+}$

Hence, it shows sp^3d^2 hybridisation

54. The correct geometry and hybridization for XeF_4 are

(a) octahedral sp^3d^2

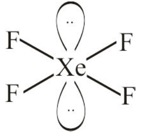
(b) trigonal bipyramidal, sp^3d

(c) planar triangle, sp^3d^3

(d) square planar, sp^3d^2

NEET-II 2016

Ans. (a) : The geometry of XeF_4 is



The geometry of XeF_4 is octahedral. It has sp^3d^2 hybridisation.

55. Amongst $NO_3^-, AsO_3^{3-}, CO_3^{2-}, ClO_3^-, SO_3^{2-}$, and BO_3^{30} the non-planar species are

(a) NO_3^-, CO_3^{2-} and BO_3^{3-}

(b) SO_3^{2-}, ClO_3^-, and BO_3^{3-}

(c) CO_3^{2-}, SO_3^{2-}, and BO_3^{3-}

(d) AsO_3^{3-}, CO_3^{2-} and SO_3^{2-}

UPTU/UPSEE-2016

Ans. (b) : (i) NO_3^- has sp^2 hybridisation and its geometry is trigonal planar with no lone pair.

(ii) AsO_3^{3-} has sp^3 hybridisation and its geometry is pyramidal with one lone pair.

(iii) CO_3^{2-} has sp^2 hybridisation and its geometry is trigonal planar with zero lone pair.

(iv) ClO_3^- has sp^3 hybridisation and its geometry is pyramidal with one lone pair.

(v) SO_3^{2-} has sp^3 hybridisation and its geometry is pyramidal with one lone pair.

(vi) BO_3^{3-} has sp^2 hybridisation and its geometry is tirgonal planar with zero lone pair.

Therefore AsO_3^{3-}, ClO_3^- and SO_3^{2-} have non-planar species as their geometry is pyramidal.

56. In which one of the following pairs the two species have identical shape, but differ in hybridsation?

(a) $I_3^-, BeCl_2$ (b) NH_3, BF_3

(c) XeF_2, I_3^- (d) NH_4^+, SF_4

AP-EAMCET (Engg.) 2015

Ans. (a) : I_3^- has sp^3d hybridisation and linear shape. $BeCl_2$ has sp hybridisation and linear shape.

The structure of I_3^- and $BeCl_2$ are –

I_3^- $BeCl_2$

$[I - \ddot{\underset{..}{I}} - I]^-$, Cl – Be – Cl

(linear) (linear)

57. Which one of the following does not have sp^3 hybridisation?

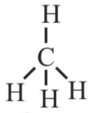
(a) CH_4 (b) XeF_4

(c) H_2O (d) NH_3

J & K CET-(2015)

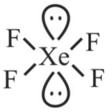
Ans. (b) : The structure of the following are-

(i) CH_4



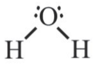
sp^3(tetrahedral)

(ii) XeF_4



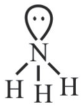
sp^3d^2 (distorted Octahedral)

(iii) H_2O



sp^3 (V-shaped/ bent shaped)

(iv) NH_3



sp^3 (tetrahedral)

In XeF_4 molecule has sp^3d^2 hybridisation but another are all sp^3 hybridisaton.

58. The hybridized state of bromine in bromine pentafluoride is

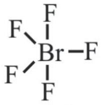
(a) sp^3d (b) dsp^3

(c) d^2sp^3 (d) sp^2d

(e) sp^3d^2

Kerala-CEE-2015

Ans. (e) : The structure of bromine pentafluoride is-



(sp^3d^2)

The hybridization state of bromine in bromine pentafluoride is sp^3d^2.

59. The angular shape of ozone molecule (O_3) consists of.

(a) 1 sigma and 2 pi bonds

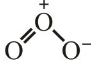
(b) 2 sigma and 2 pi bonds

(c) 1 sigma and 1 pi bonds

(d) 2 sigma and 1 pi bonds

JIPMER-2014

Ans. (d) : The structure O_3 is bent. The central atom has one double bond and one single bond with its neighbouring Oxygen molecules which keeps interchanging their positions and Ozone molecule has 2 sigma bond and one pi bond.



60. In which one of the following the central atom is sp^3 hydridised?

(a) NH_4^+ (b) BF_3

(c) SF_6 (d) PCl_5

(e) XeF_4

Kerala-CEE-2014

@apna_pdf

Ans. (a) : Molecule/ion	**Hybridisation**
NH_4^+	sp^3
BF_3	sp^2
SF_6	sp^3d^2
PCl_5	sp^3d
XeF_4	sp^3d^2

61. What is the hybridization of carbon atom '2' in the following compound?

$$\overset{1}{C}H_2=\overset{2}{C}=\overset{3}{C}H-\overset{4}{C}H_3$$

(a) sp^3 (b) sp^2
(c) sp (d) sp^3d

S. C. R. A - 2014

Ans. (c) : In the given compound,

$$\underset{sp^2}{\overset{1}{C}H_2}=\underset{sp}{\overset{2}{C}}=\underset{sp^2}{\overset{3}{C}H}-\underset{sp^3}{\overset{4}{C}H_3}$$

Hence, the hybridization of carbon atom '2' in is sp.

62. The number of electrons is the valence shell of the central atom of a molecule is 8. The molecule is

(a) BCl_3 (b) BeH_2
(c) SCl_2 (d) SF_6

AP-EAMCET (Engg.) - 2014

Ans. (c) : The number of electrons in the valence shell of SCl_2 of the central atom of a molecule is 8.
In SCl_2 valence electron = 6+2 = 8

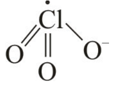
63. Which of the following is not correctly matched?

(a) $ClO_3^- - sp^2$ hybridised
(b) $SO_3 - sp^2$ hybridised
(c) $NH_3 - sp^3$ hybridised
(d) $PCl_5 - sp^3d$ hybrodised

UP CPMT-2014

Ans. (a) : $ClO_3^- \Rightarrow 3bp + 1/p \Rightarrow sp^3$hybridised

pyramidal geometry



64. The hybridisation of central atoms in case of diamond and carborundum respectively are

(a) sp^2, sp^3 (b) sp^3, sp^2
(c) sp^2, sp (d) sp^3, sp^3

UP CPMT-2014

Ans. (d) : In diamond and carborundum (SiC) both the central atoms (i.e.,C and Si) are sp^3 hybridised.

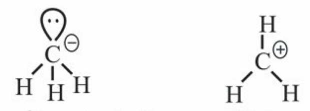
65. Which of the following species has a trigonal planar shape?

(a) $:CH_3^-$ (b) CH_3^+
(c) BF_4^- (d) SiH_4

J & K CET-(2013)

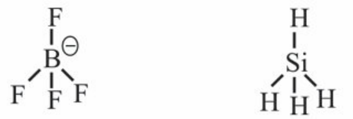
Ans. (b) : The shape of the following species are-

(i) CH_3^- (ii) CH_3^+



sp^3(tetrahedral) sp^2(trigonal planar)

(iii) BF_4^- (iv) SiH_4



sp^3 (tetrahedral) sp^3 (tetrahedral)

In the CH_3^+ molecule has trigonal planar shape.

66. In which of the following pairs of molecules/ions, the central atoms have sp^2 hybridisation?

(a) BF_3 and NH_2^- (b) NO_2^- and NH_3
(c) BF_3 and NO_2^- (d) NH_2^- and H_2O

JCECE - 2013

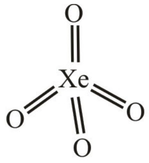
Ans. (c) : BF_3 and NO_2^- are sp^2 hybridised while NH_2^-, NH_3 and H_2O are sp^3 hybridised.

67. Identify the incorrect statement, regarding the molecule XeO_4

(a) XeO_4 molecule is square planar
(b) There are four pπ-d, π-bonds
(c) There are four sp^3-p, σ-bonds
(d) XeO_4 molecule is tetrahedral

(Karanakata, NEET 2013)

Ans. (a) : The XeO_4 molecule is tetrahedral. The geometry of molecule is-



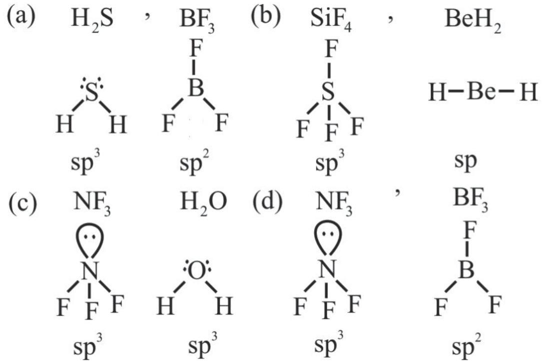
sp^3 (Tetrahedral)

68. In which of the following a pair both the species have sp^3 hybridization?

(a) H_2S, BF_3 (b) SiF_4, BeH_2
(c) NF_3, H_2O (d) NF_3, BF_3

AIIMS 25 May 2019 (Evening)
Karnataka NEET-2013

Ans. (c):



69. In which of the following pair both the species have sp^3 hybridisation?

(a) SiF_4, BeH_2 (b) NF_3, H_2O
(c) NF_3, BF_3 (d) H_2S, BF_3

KARNATAKA NEET 2013

Ans. (b) : NF_3 and H_2O have sp^3- hybridization.

@apna_pdf

70. The outer orbitals of C in ethene molecule can be considered to be hybridized to give three equivalent sp^2 orbitals. The total number of sigma (σ) and pi (π) bonds in ethene molecule is

(a) 3 sigma (σ) and 2 pi (π) bonds

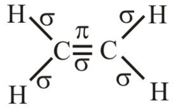
(b) 4 sigma (σ) and 1 pi (π) bonds

(c) 5 sigma (σ) and 1 pi (π) bonds

(d) 1 sigma (σ) and 2 pi (π) bonds

KARNATAKA NEET 2013

Ans. (c) : The structure of ethene is–



5 σ-bond and 1 π-bond

71. In which of the following pairs (of molecules/ions) the central atom has the same hybridisation?

(a) XeF_4 and ClO_4^- (b) $BeCl_2$ and SO_2

(c) BH_3 and ClF_3 (d) NH_3 and NH_4^+

SRMJEEE – 2012

Ans. (d) :

Hybridisation of Xe = lone pair + bond pair

(a) In XeF_4, Hybridisation of Xe = 2 + 4 = 6(sp^3d^2)

In ClO_4^-, Hybridisation of Cl = 0 + 4 = 4 (sp^3)

(b) In $BeCl_2$, Hybridisation of Be = 0 + 2 = 2 (sp)

In SO_2, Hybridisation of S = 1 + 2 = 3 (sp^2)

(c) In BH_3, Hybridisation of B = 0 + 3 = 3(sp^2)

In ClF_3, Hybridisation of Cl = 2 + 3 = 5 (sp^3d)

(d) In NH_3, Hybridisation of N = 1 + 3 = 4 (sp^3)

In NH_4^+, Hybridisation of N = 0 + 4 = 4 (sp^3)

Hence, NH_3 and NH_4^+ have the same hybridisation.

72. The hybridization of carbon in molecular CO_2 is

(a) sp (b) sp^2

(c) sp^3 (d) sp^3d

J & K CET-(2012)

Ans. (a) : In the CO_2 molecule the structure is

$$\underset{sp}{O=C=O}$$

In CO_2 molecule carbon bonded with two oxygen by double bond. It is linear geometry and hybridisation is sp.

73. The percentage of p-character of the hybrid orbitals in graphite and diamond are respectively

(a) 50 and 75 (b) 67 and 75

(c) 33 and 75 (d) 33 and 25

Karnataka-CET-2012

Ans. (b) : Graphite forms a hexagonal sheet like structure in which each carbon is bonded by 3 σ bonds. So, the hybridization of graphite is sp^2. The percentage of p- character is 66.67 ≈ 67%.

Diamond is a tetrahedral structure in which all C-atoms are bonded by 4 σ - bond with neighbouring C-atoms. So, the hybridisation of diamond is sp^3. The percentage of p-character is 75%.

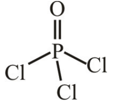
74. The state of hybridization of the central atom and the number of lone pairs over the central atom in $POCl_3$ are

(a) sp,0 (b) sp^2,0

(c) sp^3,0 (d) dsp^2,1

WB-JEE-2012

Ans. (c) : The structure of $POCl_3$ is



The state of hybridisation of the central atom is sp^3 and the number of lone pairs is zero.

75. The hybrid state of C in charcoal is–

(a) sp^3 (b) sp^2

(c) sp (d) No specific state

BCECE-2011

Ans. (d) : Charcoal is an amorphous form of carbon. Thus, the hybrid state of C in charcoal is not specific.

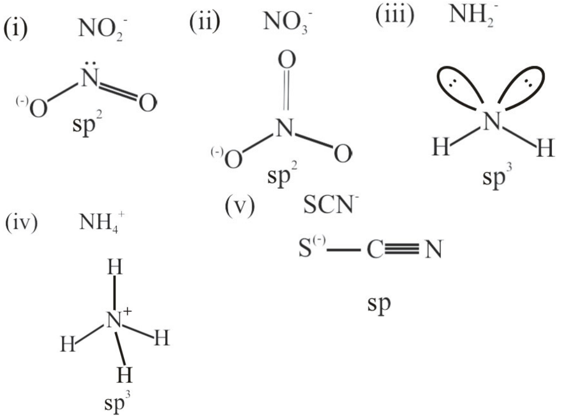
76. Which of the two ions from the list given below that have the geometry that is explained by the same hybridization of orbitals, NO_2^-, NO_3^-, NH_2^-, NH_4^+, SCN^-?

(a) NO_2^- and NO_3^- (b) NH_4^+ and NO_3^-

(c) SCN^- and NH_2^- (d) NO_2^- and NH_2^-

NEET-2011

Ans. (a) : The following in have the structure



Since, both ions NO_2^- and NO_3^- have the same Hybridisation. When compared to all ions. The Hybridisation is sp^2 in NO_2^- and NO_3^-.

77. Which of the following statements is/are true about the P–Cl bonds in PCl_5?

(a) Three bonds are of one type and two of another type

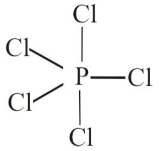
(b) Two bonds are of one type and three of another type

(c) All the bonds are of the same type

(d) Each P–Cl bonds is unique

UPTU/UPSEE-2011

Ans. (a) : In PCl_5 Structure is



@apna_pdf

In PCl_5 , three bonds are one type is equitorial bond and two of another type is Axial bond.
Hence, option (a,b) both are correct.

78. The sp^3d^2 hybridization of central atom of a molecule would lead to.
(a) Square planar geometry
(b) Tetrahedral geometry
(c) Trigonal bipyramidal geometry
(d) Octahedral geometry

WB-JEE-2011

Ans. (d) : The sp^3d^2 hybridisation of central atom of a molecule would lead to octahedral geometry. In sp^3d^2 orbital one s-orbital, three p-orbital and two d-orbital i.e. d_{z^2} and $d_{x^2-y^2}$ are intermixed to form a new 6 new sp^3d^2 hybrid orbital.

79. In CO_2, CH_4 and CH_3^+ the hybridisation of carbon atoms are
(a) sp^2, sp^3 and sp^2 respectively
(b) sp, sp^3 and sp^2 respectively
(c) sp, sp^3 and sp respectively
(d) sp^2, sp^3 and sp respectively

J & K CET-(2010)

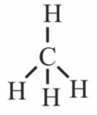
Ans. (b) :

(i) CO_2

$O=C=O$

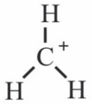
sp(linear)

(ii) CH_4



sp^3 (tetrahedral)

(iii) CH_3^+



sp^2(trigonal planar)

In CO_2 , CH_4 and CH_3^+, the hybridisation of carbon atom are sp, sp^3 and sp^2 respectively.

80. The AsF_5 molecule is trigonal bipyramidal. The hybrid orbitals used by the As atoms for bonding are
(a) $d_{x^2-y^2}, d_{z^2}, s, p_x, p_y$
(b) d_{xy}, s, p_x, p_y, p_z
(c) $s, p_x, p_y, p_z, d_{z^2}$
(d) $d_{x^2-y^2}, s, p_x, p_y$

JCECE - 2010

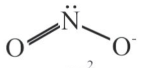
Ans. (c) : The geometry of AsF_5 molecule is trigonal bipyramidal, it is sp^3d hybridised. Thus, s, p_x, p_y, p_z and d_{z^2} orbitals are utilised by As atom for bonding.

81. In which of the following pairs of molecules/ ions, the central atoms have sp^2 hybridisation?
(a) NO_2^- and NH_3
(b) BF_3 and NO_2^-
(c) NH_2^- and H_2O
(d) BF_3 and NH_2^-

NEET-2010

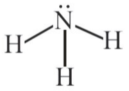
Ans. (b) :

(i) NO_2^-



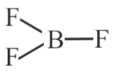
sp^2

(ii) NO_3



sp^2

(iii) BF_3



sp^2

(iv) NO_2^-

sp^2

(v) NH_2^-

sp^3

(vi) H_2O

sp^3

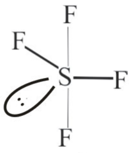
Since, BF_3 and NO_2^- molecules have sp^2 hybridized central atoms.

82. In which one of the following species the central atom has the type of hybridization which is not the same as that present in the other three?
(a) SF_4
(b) I_3^-
(c) $SbCl_5^{2-}$
(d) PCl_5

NEET-2010

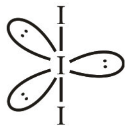
Ans. (c) : The structure of the molecule is-

(i) SF_4



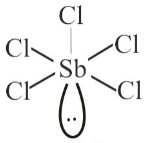
sp^3d

(ii) I_3^-



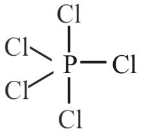
sp^3d

(iii) $SbCl_5^{2-}$



sp^3d^2

(iv) PCl_5



sp^3d

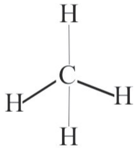
Hence, $SbCl_5^{2-}$ has sp^3d^2 hybridisation which is not same as the other three species.

83. In which of the following molecules the central atom does not have sp^3 hybridization?
(a) CH_4
(b) SF_4
(c) BF_4^-
(d) NH_4^+

NEET-2010

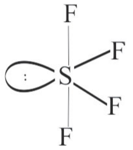
Ans. (b) : The structure of the following compound-

(i) CH_4



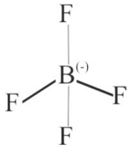
sp^3

(ii) SF_4



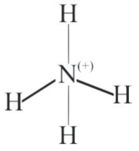
sp^3d

(iii) BF_4^-



sp^3

(iv) NH_4^+



sp^3

In SF_4 has sp^3d hybridisation other has sp^3 hybridisation.

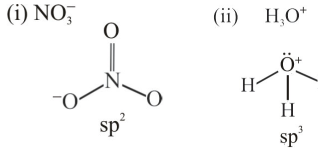
@apna_pdf

84. Some of the properties of the two species, NO_3^- and H_3O^+ are described below. Which one of them is correct?

(a) Dissimilar in hybridization for the central atom with different structures
(b) Isostructural with same hybridization for the central atom.
(c) isostructural with different hybridization for the central atom.
(d) Similar in hybridization for the central atom with different structures.

NEET-2010

Ans. (a) :



(i) NO3−
O
N
−O
O
sp2
(ii) H3O+
O+
H
H
H
sp3

In NO_3^- and H_3O^+ has dissimilar in hybridization.

sp^2 hybridasition in NO_3^- and sp^3 hybridisation in H_3O^+ with the different structures.

85. The compound which is non-linear :

(a) CO_2
(b) CS_2
(c) $HgCl_2$
(d) H_2O

MPPET- 2009

Ans. (d) : The shape of a molecules depends on the number of lone pairs and bond pairs present around the central atom.

CO_2, CS_2 and $HgCl_2$ is a linear and sp hybridisation but H_2O is V- shaped structure.

- In H_2O the central atom oxygen is sp^3 hybridized. Oxygen has 2 bond pairs and 2 lone pairs, so the geometry is tetrahedral. The shape of H_2O is bent due to the presence of 2 lone pairs.

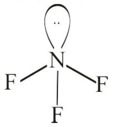
 therefore, H_2O is not linear molecule.

86. Hybridisation of central atom in NF_3 is

(a) sp^3
(b) sp
(c) sp^2
(d) dsp^2

WB-JEE-2009

Ans. (a) : The structure of NF_3 is



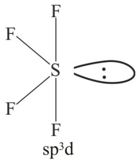
The structure of NF_3 is pyramidal and hybridization is sp^3.

87. The state of hybridization of S in SF_4 is

(a) sp^3 and has a lone pair of electron
(b) sp^2 and has tetrahedral structure
(c) sp^3d and has a trigonal bipyramidal structure
(d) sp^3d^2 and has an octahedral structure.

AMU – 2009

Ans. (c) : The structure of SF_4 is–



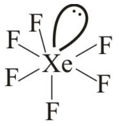
The state of hybridization of SF_4 is sp^3d and has a trigonal bipyamidal structure.

88. In XeF_6 oxidation state and state of hybridisation of Xe, and shape of the molecule are, respectively

(a) +6, sp^3d^3, distroted octahedral
(b) +4, sp^3d^2, square planar
(c) +6, sp^3, pyramidal
(d) +6, sp^3d^2, square pyramidal.

AMU – 2009

Ans. (a) : The structure of XeF_6 is–



Distorted Octahedral

Oxidation state of XeF_6 has

$$x + 6(-1) = 0$$
$$x = +6$$

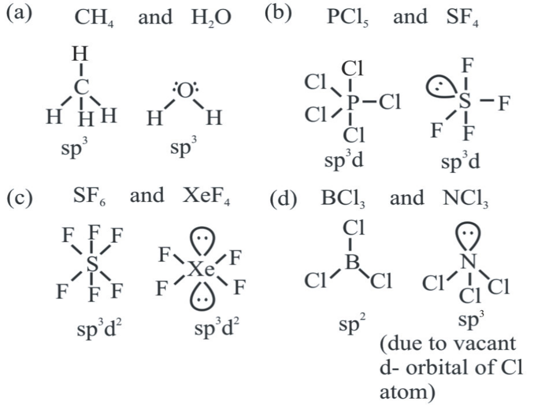
and hybridization XeF_6 is sp^3d^3

89. In which of the following pairs both molecules do not possess same type of hybridisation?

(a) CH_4 and H_2O
(b) PCl_5 and SF_4
(c) SF_6 and XeF_4
(d) BCl_3 and NCl_3

CG PET -2009

Ans. (d) : The structure of following molecule–



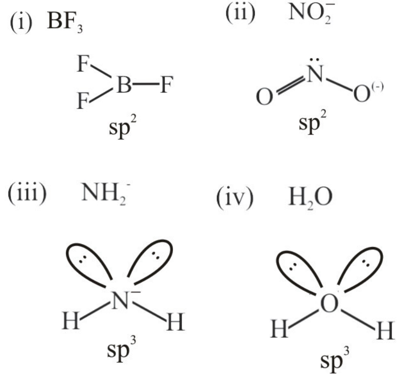
(a) CH4 and H2O
(b) PCl5 and SF4
H
C
H H H
sp3
O
H H
sp3
Cl
Cl
P
Cl
Cl
Cl
sp3d
F
S
F
F
F
sp3d
(c) SF6 and XeF4
(d) BCl3 and NCl3
F F F
S
F F F
sp3d2
F
Xe
F
F
F
sp3d2
Cl
B
Cl
Cl
sp2
N
Cl
Cl
Cl
sp3
(due to vacant d- orbital of Cl atom)

90. In which of the following molecules/ions BF_3, NO_2^-, NH_2^- and H_2O, the central atom is sp^2 hybridised?

(a) NH_2^- and H_2O
(b) NO_2^- and H_2O
(c) BF_3 and NO_2^-
(d) NO_2^- and NH_2^-

NEET-2009

Ans. (c) : The structure of the following molecules are-



(i) BF3
(ii) NO2−
F
B
F
F
sp2
N
O
O(-)
sp2
(iii) NH2−
(iv) H2O
N−
H
H
sp3
O
H
H
sp3

Hence, BF_3 and NO_2^- has sp^2 hybridisation.

@apna_pdf

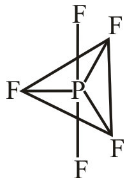
91. Hybridization of the central atom in PF_5 involves the mixing of atomic orbitals

(a) d_{xy}, s, p_x, p_y, p_z (b) s, p_x, p_y, p_z, d_{z^2}

(c) $d_{x^2-y^2}$, s, p_x, p_y, p_z (d) s, p_x, p_y, p_z, $d_{x^2-y^2}$

AMU – 2008

Ans. (b) :



Trigonal bipyramidal structure (sp^3d)

PF_5 molecule has tringonal bipyramidal geometry and all the bond angles in triagonal bipyramidal geometry are not equvalent. The hybridised orbitals involved are

s + 3p + d
s (p_x, p_y, p_z) (d_{z^2})

92. An octahedral complex is formed when hybrid orbitals of the following type are involved

(a) sp^3 (b) dsp^2

(c) d^2sp^3 (d) sp^2d^2

KARNATAKA-CET, 2008

Ans. (c) :

Hybridisation	**Geometry of Complex**
sp^3	tetrahedral
dsp^2	square planar
d^2sp^3	octahedral
sp^2d^2	not possible

93. Which of the following is not tetrahedral?

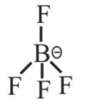
(a) BF_4^- (b) NH_4^+

(c) CO_3^{2-} (d) SO_4^{2-}

AP EAMCET (Engg.) -2007

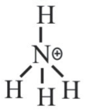
Ans. (c) : The structure of the following molecules are–

(i) For BF_4^-



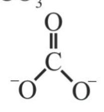
Tetrahedral

(ii) NH_4^+



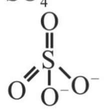
Tetrahedral

(iii) CO_3^{2-}



Trigonal planar

(iv) SO_4^{2-}



Tetrahedral

Hence, the CO_3^{2-} is not tetrahedral.

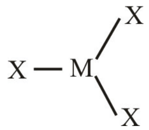
94. If a molecule MX_3 has the dipole moment zero, then the sigma (σ) bonding orbitals used by M(Z < 21) is

(a) sp^2-hybridised (b) pure p-orbitals

(c) sp^3-hybridised (d) sp-hybridised.

SRMJEEE – 2007

Ans. (a) : The molecule MX_3 has zero dipole moment, the σ-bonding orbitals used by M (Z < 21) are sp^2 hybridized. In this case, planar triangular geometry results in the cancellation of the dipole moments of individual M–X bonds.



95. Assertion (A) : CO_2 is linear

Reason (R) : It is not in sp-hybridized state

The correct answer is

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)

(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)

(c) (A) is true and (R) is not true

(d) (A) is not true and (R) is true

AP - EAMCET (Medical) - 2007

Ans. (c) : CO_2 is linear because it has sp hybridisation. The structure of CO_2 is–

$$\ddot{O}=C=\ddot{O}$$

Hybridization = Bond pair + Lone pair

Hybridization = 2 + 0 = 2(sp) (linear)

It is sp hybridized which is illustrated above.

96. The hybridisation state of carbon in fullerene is

(a) sp (b) sp^2

(c) sp^3 (d) sp^3d

JCECE - 2007

Ans. (b) : In fullerene, all the carbon atoms are equal. Fullerene consists of 20 hexagonal and 12 pentagonal rings as the basis of an icosahedral symmetry closed cage structure. Each carbon atom is bonded to three others and the hybridization is sp^2. Fullerenes are the third allotropic form of carbon after graphite and diamond.

97. Which of the following set of properties belongs to PCl_5?

(a) sp^3, tetrahedral, 4 valence shell pairs of electrons

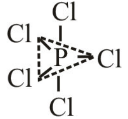
(b) sp^3d, trigonal bipyramidal, 5 valence shell pairs of electrons

(c) sp^3d^2, octahedral, 6 valence shell pairs of electrons

(d) sp^3d, square planar, 4 valence shell pairs of electrons

J & K CET-(2006)

Ans. (b) : The geometry of PCl_5 is trigonal bipyramidal



In PCl_5 molecule has sp^3d hybridisation. Its geometry is trigonal bipyramidal and it has 5 valence shell pairs of electrons.

98. In SO_2 hybridisation is :

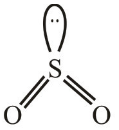
(a) sp (b) sp^3

(c) dsp^2 (d) sp^2

JCECE - 2006

@apna_pdf

Ans. (d) : In SO_2 hybridisation is sp^2



sp^2 (V-shaped)

Hybridisation of SO_2 = Bond pair + lone pair
= 2 + 1
= 3 (sp^2)

99. Consider the following molecules or ions:

(i) H_2O **(ii) NH_4^+**
(iii) SO_4^{2-} **(iv) ClO_4^-**
(v) NH_3

sp^3 hybridization is involved in the formation of:

(a) (i), (ii), (v) only
(b) (i), (ii) only
(c) (ii) only
(d) (i), (ii), (iii), (iv) Only
(e) (i), (ii), (iii), (iv) and (v)

Kerala-CEE-2006

Ans. (e) :

Molecule/ion	**Hybridisation**
H_2O	sp^3
NH_4^+	sp^3
SO_4^{2-}	sp^3
ClO_4^-	sp^3
NH_3	sp^3

100. The correct order regarding the electronegativity of hybrid orbitals of carbon is

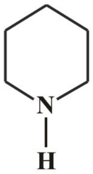
(a) $sp < sp^2 < sp^3$ (b) $sp > sp^3 > sp^2$
(c) $sp > sp^2 > sp^3$ (d) $sp < sp^2 > sp^3$

NEET-2006

Ans. (c) : The electronegativity of hybrid orbitals of carbon is depend on the s-character percentage s-character is increase then the electronegativity is increase percentage s-character in sp, sp^2 and sp^3 are 50%, 33.3%, and 25% respectively.

Hence, the electronegativity of hybrid carbon is
$sp > sp^2 > sp^3$

101. In piperidine



, the hybrid state assumed by N is

(a) sp (b) sp^2
(c) sp^3 (d) dsp^2

BITSAT 2005

Ans. (c) : Hybridisation of N = $\frac{1}{2}[5 + 3 + 0 - 0]$
= 4 (sp^3)

Or Hybridisation = Bond pair + Lone pair
= 3 + 1
= 4 (sp^3)

So, the hybridisation of piperidine is sp^3.

102. Which of the following is a linear molecule ?

(a) $BeCl_2$ (b) H_2O
(c) SO_2 (d) CH_4

AP-EAMCET/2005

Ans. (a):

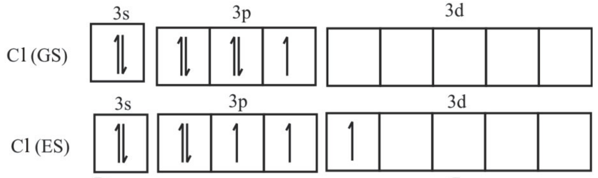
Molecule	**Structure**	**Hybridization /Shape**
$BeCl_2$	Cl–Be–Cl	sp(Linear)
H_2O		sp^3(V-shaped)
SO_2		sp^2(Angular)
CH_4		sp^3(Tetrahedral)

103. Hybridization present in ClF_3 is

(a) sp^2 (b) sp^3
(c) dsp^2 (d) sp^3d

UP CPMT-2005

Ans. (d) : The configuration of chlorine to find hybridisation.



sp^3d hybridisation

∴ ClF_3 has sp^3d hybridisation and T-shaped geometry (due to presence of two lone pairs electrons).

104. Hybridisation involves

(a) Addition of an electron pair
(b) Mixing up of atomic orbitals
(c) Removal of an electron pair
(d) Separation of orbitals

CG PET -2004

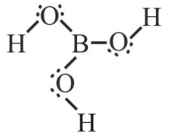
Ans. (b) : Hybridisation is defined as the mixing of atomic orbitals to form new hybrid orbitals with same energies, same shape etc. there is minimum repulsion between these hybridized orbital's.

105. The states of hybridisation of boron and oxygen atoms in boric acid (H_3BO_3) are respectively

(a) sp^2 and sp^2 (b) sp^2 and sp^3
(c) sp^3 and sp^2 (d) sp^3 and sp^3

(AIEEE-2004)

Ans. (b) : The structure of boric acid (H_3BO_3) is –



The hybridisation of boron is sp^2 and hybridization of oxygen is sp^3. Boric acid (H_3BO_3) is triangular planar structure.

106. The maximum number of 90° angles between bond pair-bond pair of electrons is observed in

@apna_pdf

(a) dsp^3 hybridisation (b) sp^3d hybridisation
(c) dsp^2 hybridisation (d) sp^3d^2 hybridisation

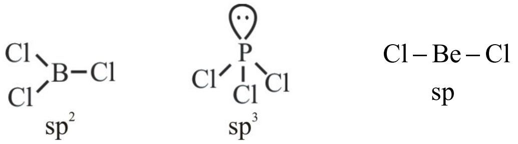
(AIEEE-2004)

Ans. (d) : sp^3d^2 hybridisation has octahedral geometry 90° angles between bond pair-bond pair of electrons. This molecule is made up of 6 equally spaced sp^3d^2 hybrid orbital's arranged at 90° angles.
In square pyramidal geometry contains five bond pair and one lone pair of electrons. Thus square pyramidal geometry contains four bond has 90°.

107. Which of the following has sp^3–hybridization?
(a) BCl_3 (b) PCl_3
(c) $BeCl_2$ (d) None of these

JIPMER-2004

Ans. (b) : The structure the following-
(i) BCl_3 (ii) PCl_3 (iii) $BeCl_2$



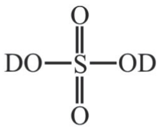
Hence, PCl_3 molecule has sp^3 hybridsation.

108. Sulphur trioxide is dissolved in heavy water to form a compound X. The hybridization state of sulphur in X is
(a) sp^2 (b) sp^3
(c) sp (d) dsp^2

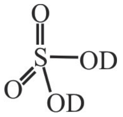
AP EAMCET- 2003

Ans. (b) : When sulphur trioxide is dissolved in heavy water then form the D_2SO_4.

$$SO_3 + D_2O \longrightarrow \underset{'X'}{D_2SO_4} \equiv$$



Hybridization = Bond Pair + Lone pair
= 4 + 0 = 4 (sp^3)



109. What is the number of free electrons present on each carbon atom in graphite?
(a) Zero (b) 3
(c) 2 (d) 1

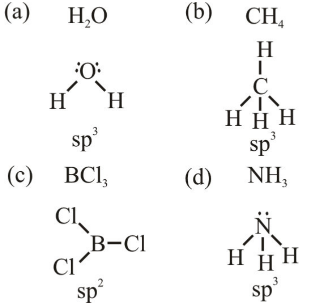
AP-EAMCET (Medical), 2003

Ans. (d) : Graphite has a two dimensional structure. In this case, only three of the four valence electron of each carbon atom are involved in bonding. Thus, each carbon atom make use of sp^2-hybrid orbitals.
Hence, the fourth valence of each carbon atom remains unsatisfied i.e. the fourth valence electrons remains unpaired or free. This free electron can easily move from one carbon to another under the influence of applied potential. So, in structure of graphite only one electron is free on each carbon atom.

110. sp^3-hybridisation is not found in :
(a) H_2O (b) CH_4
(c) BCl_3 (d) NH_3

BCECE-2003

Ans. (c) : The structure of the compound is-

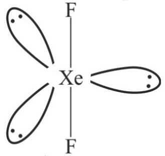


Hence, the option (c) has not sp^3 hybridisation.

111. Which one of the following is a correct pair with respect to molecular formula of Xenon compound and hybridization state of xenon in it?
(a) XeF_4, sp^3 (b) XeF_2, sp
(c) XeF_2, sp^3d (d) XeF_4, sp^2

AP EAMCET- 2002

Ans. (c) : Xenon difluoride has the two bond pair and three lone pair due to which they have sp^3d hybridization with linear shape.



sp^3d(linear)

113. The hybridisation present IF_3 is
(a) sp^3d (b) sp^3
(c) sp^3d^2 (d) sp^3d

UP CPMT-2002

Ans. (a) :

Species	Bond pair + Loan pair	Hybridisation
CO_2	2	sp
BCl_3	3	sp^2
CH_4	4	sp^3
IF_3	3 + 2	sp^3d

114. Hybridisation of the underline atom changes in
(a) $\underline{Al}H_3$ changes to AlH_4^-
(b) $H_2\underline{O}$ changes to H_3O^+
(c) NH_3 changes to NH_4^+
(d) In all cases

(AIEEE-2002)

Ans. (a) :

(a) $AlH_3 \xrightarrow{H^+} AlH_4^-$
sp^2 sp^3

(b) $H_2O \xrightarrow{O} H_3O^+$
sp^3 sp^3

(c) $NH_3 \xrightarrow{H^+} NH_4^+$
sp^3 sp^3

Thus, the hybridization of the underline atom AlH_3 changes to AlH_4^-.

@apna_pdf

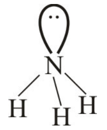
115. What is the hybridization state of the central atom in the conjugate base of NH_4^+ ion?

(a) sp (b) sp^3

(c) sp^2 (d) d sp^2

AP-EAMCET/2002

Ans. (b): The conjugate base of NH_4^+ is NH_3 because it donates an H^+ ion to the water. It then becomes ammonia (NH_3) which would be the conjugate base of NH_4^+.



The central atom of NH_3 is N and its hybridization state is sp^3.

116. Which compound has planar structure?

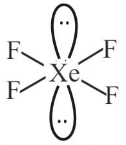
(a) XeF_4 (b) $XeOF_2$

(c) XeO_2F_2 (d) XeO_4

(NEET-2000)

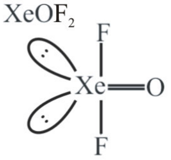
Ans. (a) : The structure of the compound is-

(i) XeF_4



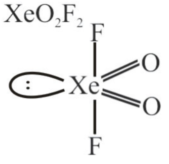
Square planar (sp^3d^2)

(ii) $XeOF_2$

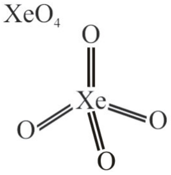


T- shaped (sp^3d)

(iii) XeO_2F_2



(iv) XeO_4



Sew-saw (sp^3d) Tetrahedral (sp^3)

117. When the hybridisation state of carbon atom changes from sp^3 to sp^2 and finally to sp, the angle between the hybridised orbitals

(a) decreases gradually

(b) decreases considerably

(c) is not affected

(d) increases progressively.

NEET-1993

Ans. (d) : When the hybridisation state of carbon atom changes from sp^3 to sp^2 and finally to sp, the angle between the hybridised orbitals increase progressively. The bond angles in sp^3 hybridisation is 109°, sp^2 is 120° and sp hybridisation is 180° respectively.

118. Linear combination of two hybridised orbitals belonging to two atoms and each having one electron leads to the formation is

(a) Sigma bond

(b) Double bond

(c) Co-ordinate covalent bond

(d) Pi bond

NEET-1990

Ans. (a) : Linear combinations of two hybridized orbitals belonging to two atoms and each having one electron leads to the formation is sigma bond.

119. In which one of the following molecules the central atom can be said to adopt sp^2 hybridization?

(a) BeF_2 (b) BF_3

(c) C_2H_2 (d) NH_3

NEET-1989

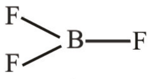
Ans. (b) : The structure of the following compound-

[i] BeF_2

F—Be—F

sp

[ii] BF_3



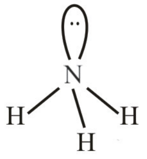
sp^2

[iii] C_2H_2

H—C≡C—H

sp sp

[iv] NH_3



sp^3

So, the molecules BF_3 has sp^2 hybridisation.

120. Equilateral shape has

(a) sp hybridization (b) sp^2 hybridization

(c) sp^3 hybridization (d) dsp^3 hybridization

NEET-1988

Ans. (b) : Atomic orbital are mixed with formed a new hybridised orbital, in sp^2 hybridisation, one s- orbital and two p- orbital overlap each other to form hybridised sp^2 orbital. In sp^2, p- character is 67% and s- character is 33% in triangular planar structure minimize the maximum repulsion and have energetically stable geometrical structure. Thus the equilateral shape has sp^2 hybridization.

2. Vsepr Theory

121. Given below are two statements: one is labeled as Assertion (A) and the other is labelled as Reason (R).

Assertion (A): ICI is more reactive than I_2.

Reason (R): I-Cl bond is weaker than I-I bond

In the light of the above statements choose the most appropriate answer from the options given below:

(a) Both (A) and (R) are correct but (R) is not the correct explanation of (A).

(b) (A) is correct but (R) is not correct

(c) (A) is not correct but (R) is correct

(d) Both (A) and (R) are correct but (R) is the correct explanation of (A)

NEET-17.07.2022

@apna_pdf

Ans. (d) : Inter halogen compound are more reactive than halogen compound and they break easily due to weak bond. Therefore, I-Cl is more reactive than I_2 because of weaker I-Cl bond then I-I bond.
Both A and R are true and R is correct explanation of A

122. Based upon VSEPR theory, match the shape (geometry) of the molecules in List-I with the molecules in List – II and select the most appropriate option.

	List – I (Shape)		**List – II (Molecules)**
(A)	**T-shaped**	**(I)**	**XeF_4**
(B)	**Trigonal planar**	**(II)**	**SF_4**
(C)	**Square planar**	**(III)**	**ClF_3**
(D)	**See-saw**	**(IV)**	**BF_3**

(a) (A)-(I), (B)-(II), (C)-(III), (D)-(IV)
(b) (A)-(III), (B)-(IV), (C)-(I), (D)-(II)
(c) (A)-(III), (B)-(IV), (C)-(II), (D)-(I)
(d) (A)-(IV), (B)-(III), (C)-(I), (D)-(II)

JEE Main-27.06.2022, Shift-I

Ans. (b) :

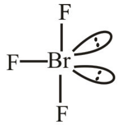
List-I (Molecules)	**List-II (Shape)**
XeF_4	Square planar
SF_4	See - Saw.
ClF_3	T - shaped
BF_3	Trigonal planar

123. Number of lone pair(s) of electrons on central atom and the shape of BrF_3 molecule respectively, are

(a) 0, triangular planar
(b) 1, pyramidal
(c) 2,bent T-shape
(d) 1, bent T-shape

JEE Main-29.06.2022, Shift-II

Ans. (c) : The structure of the BrF_3 is -



Bent T-shape

In BrF_3, two lone pair of electron on central atom and the shape of molecule is bent T-shape.

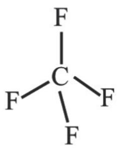
124. Pair of species having identical shape for molecule is:

(a) CF_4, SF_4
(b) BF_3, PCl_3
(c) XeF_2, CO_2
(d) PF_5, IF_5

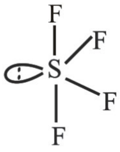
CG PET-22.05.2022

Ans. (c) : The structure of the following molecule are-

(i) CF_4 , SF_4

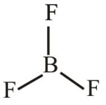


Tetrahedral

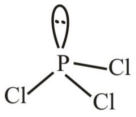


Sec-saw

(ii) BF_3 , PCl_3

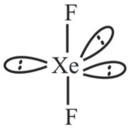


Trigonal planar



Pyramidal

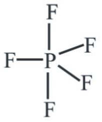
(iii) XeF_2, CO_2



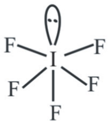
linear

linear

(iv) PF_5 , IF_5



Trigonal bipyramidal



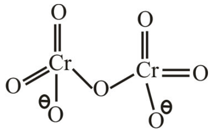
Square Pyramidal

125. In the dichromate dianion $(Cr_2O_7)^{2-}$

(a) 4 Cr – O bonds are equivalent
(b) 6 Cr – O bonds are equivalent
(c) All Cr – O bonds are equivalent
(d) All Cr – O bonds are not equivalent

CG PET-22.05.2022

Ans. (b) : The structure of the dichromate dianion $(Cr_2O_7)^{2-}$ is -



In dichromate dianion $(Cr_2O_7)^{2-}$ has 6 Cr – O bonds are equivalent due to resonance.

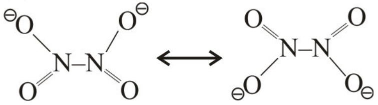
126. Among the given oxides of nitrogen; N_2O, N_2O_3, N_2O_4 and N_2O_5 the number of compound/(s) having N – N bond is :

(a) 1 (b) 2 (c) 3 (d) 4

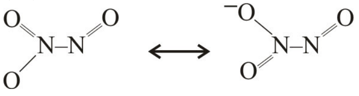
JEE Main-28.06.2022, Shift-II

Ans. (c) : (i) $N_2O \Rightarrow \bar{N} = \overset{+}{N} = O \leftrightarrow N \equiv \overset{+}{N} - \bar{O}$

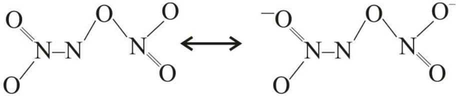
(ii) $N_2O_4 \Rightarrow$



(iii) $N_2O_3 \Rightarrow$



(iv) $N_2O_5 \Rightarrow$



Hence, the number of compound having N – N bond is 4.

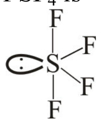
@apna_pdf

127. In the structure of SF_4 the lone pair of electrons on S is in.

(a) Equatorial position and there are two lone pair-bond pair repulsion at 90°
(b) Equatorial position and there are three lone pair bond pair repulsion at 90°
(c) Axial position and there are three lone pair-bond pair repulsion at 90°
(d) Axial position and there are two lone pair bond pair repulsion at 90°

JEE Main-28.06.2022, Shift-II

Ans. (a) : In structure of SF_4 is



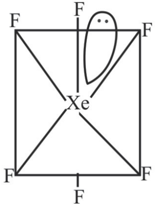
Lone pair at equatorial position with two lone pair – bond pair repulsion at 90.

128. The shape of XeF_6 is

(a) Pentagonal bipyramidal
(b) Square planar
(c) Octahedral
(d) Distorted octahedral

WB JEE-2014
JIPMER-2011
Karnataka CET-2016
AP- EAMCET(Medical) -2010
AMU-2007, 2004, 2003

Ans. (d): For XeF_6, the hybridization will be-
hybridization = lone pair +bond pair
hybridization = 1+6 =7 (sp^3d^3)



Due to one lone pair, the geometry of XeF_6 will be distorted octahedral.

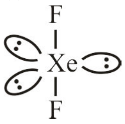
129. In XeF_2, XeF_4, XeF_6 the number of lone paris on Xe are respectively

(a) 2, 3, 1
(b) 1, 2, 3
(c) 4, 1, 2
(d) 3, 2, 1

BITSAT-2021, AMU-2015
Assam CEE-2014, AIEEE-2011, 2002

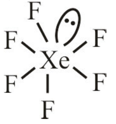
Ans. (d) : The structure of the following is –

(i) XeF_2



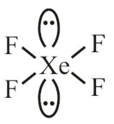
2 bond pair + 3 lone pair

(iii) XeF_6



6 bond pair + 1 lone pair

(ii) XeF_4



4 bond pair + 2 lone pair

In XeF_2, XeF_4 and XeF_6, the number of lone pairs on Xe are 3, 2, 1 respectively.

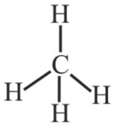
130. In which molecule are all atoms coplanar?

(a) CH_4 (b) BF_3 (c) PF_3 (d) NH_3

WB JEE-2016, JIPMER-2007
CG PET -2005, J&K CET-2001, 1999

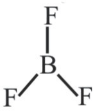
Ans. (b) : The molecule which have in same plane is called coplanar.

(i) CH_4



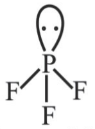
(Td)

(ii) BF_3



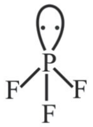
(Planar)

(iii) PF_3



(Pyramidal)

(iv) NH_3



(linear)

In BF_3 has trigonal planar structure it is coplanar all atom. Other are non planar.

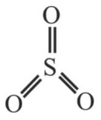
131. The species having pyramidal shape among the following is

(a) SO_3 (b) NO_3^- (c) $PC\ell_3$ (d) CO_3^{2-}

(JEE Main 2021, 27 Aug. Shift-II)
JIPMER-2007
JCECE-2006
J&K CET-1998

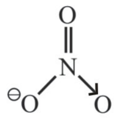
Ans. (c) : The structure of the following molecule are

(i) SO_3



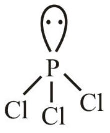
Trigonal planar

(ii) NO_3^-



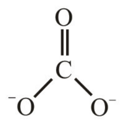
Trigonal planar

(iii) ACl_3



Pyramidal

(iv) CO_3^{2-}



Trigonal planar

So, the PCl_3 molecule has pyramidal shape.

132. Molecular shapes of SF_4, CF_4 and XeF_4 and the number of lone pairs on the central atom are respectively

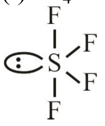
(a) the same, with 1,2 and 1
(b) the same, with 1, 0 and 1
(c) different, with 0, 1 and 2
(d) different, with 1, 0 and 2
(e) the same, with 0, 0 and 1

Kerala-CEE-2013, 2004
JCECE - 2008
UPTU/UPSEE-2007
(AIEEE-2005)

@apna_pdf

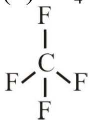
Ans. (d) : The structure of the following are –

(i) SF_4



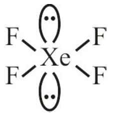
1 lone pair +
4 bond pair
(See-saw)

(ii) CF_4



0 lone pair +
4 bond pair
(Tetrahedral)

(iii) XeF_4



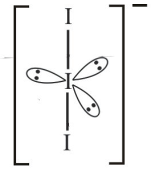
2 lone pair +
4 bond pair
(Square planar)

133. The number of lone pairs of electrons possessed by the central atom in the anionic species I_3^- is

(a) one (b) two
(c) three (d) all are bond pairs.

AMU – 2008
(JEE Main 2021, 20 July Shift-I)
MHT CET-2012, JCECE - 2011

Ans. (c) : There are two bond pairs and three lone pairs in the outer shell of central atom.

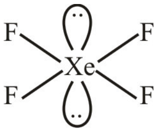


134. Shape of XeF_4 molecule is :

(a) Pyramidal (b) Square Planar
(c) Triangular Planar (d) Linear

HP CET-2018, AMU-2015
J&K CET-2005
AIIMS-1998

Ans. (b): The shape of XeF_4 is square planer. In Xe, four fluorine atom is bonded by σ bond and two lone pairs is present. The hybridisation of XeF_4 is sp^3d^2.
Shape of XeF_4 molecule.



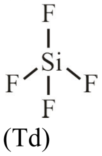
135. Among the following, the pair in which the two species are not isostructure, is

(a) SiF_4 and SF_4 (b) IO_3^- and XeO_3
(c) BH_4^- and NH_4^+ (d) PF_6^- and SF_6

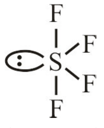
AMU-2016
UPTU/UPSEE-2007
NEET-2004

Ans. (a) : The structure of the following species –

(a) SiF_4 and SF_4

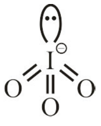


(Td)

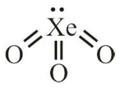


(see-saw)

(b) IO_3^- and XeO_3

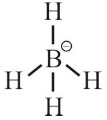


(Pyramidal)

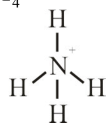


(Pyramidal)

(c) BH_4^- and NH_4^+

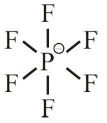


(Td)

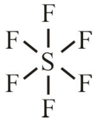


(Td)

(d) PF_6^- and SF_6



(Oh)



(Oh)

Hence, the SiF_4 and SF_4 are not iso-structural.

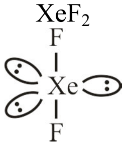
136. Which of the following pairs is iso-structural?

(a) XeF_2, IF_2^- (b) NH_3,BF_3
(c) CO_3^{2-} , SO_3^{2-} (d) PCl_5,ICl_5

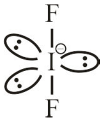
Tripura JEE-2019
AIEEE-2003
NEET-2001

Ans. (a) : The following pairs are iso-structural.

XeF_2



Linear



Linear

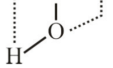
In XeF_2 and IF_2^- both pair have iso-structural shape i.e linear and geometry is trigonal bipyramidal. The hybridisation of pair of species is sp^3d.

137. The structure of H_2O_2 is

(a) planar (b) non-planar
(c) spherical (d) linear

AMU-2013, JCECE - 2005, NEET-2003

Ans. (b) : The structure of H_2O_2 is non-planar. One O – O bond lying in a plane and two O – H bonds lying in different plane. H_2O_2 has open book type structure.

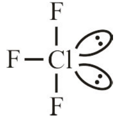


138. The shape of ClF_3 molecule is

(a) triangular planar (b) pyramidal
(c) T-shape (d) trigonal bipyramidal

Kerala CEE-2016, BCECE-2011
J&K CET-2010

Ans. (c) : The shape of ClF_3 is T-shaped.



In ClF_3 has 3 bond pair and two lone pair. The hybridisation is sp^3d. The shape is trigonal bipyramidal but two lone pairs repel to each other the shape became T-shape.

139. Which of the following statements is/are true?

1. **PH_5 and $BiCl_5$ do not exist.**
2. **pπ – dπ bond is present in SO_2.**
3. **I_3^+ has bent geometry.**
4. **SeF_4 and CH_4 have same shape.**

@apna_pdf

(a) 1, 2, 3 (b) 1, 3
(c) 1, 3, 4 (d) 1, 2, 4

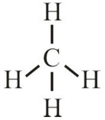
NEET-II-2016
BITSAT 2010

Ans. (a) : (i) PH_5 and $BiCl_5$ do not exist due to 'H' is less electronegative, so it can't exrt charge contraction in 'p'. Hence, it does not extend its valency to 5.

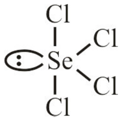
(ii) pπ – dπ bond is present in SO_2 due to sulphur is belong to 3rd period element.

(iii) I_3^+ has bent geometry.

(iv) CH_4 has tetrahedral and $SeCl_4$ has see-saw shape.



sp^3 (Td)

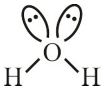


see-saw

140. The shape of water molecule according to VSEPR theory, is
(a) octahedral
(b) distorted tetrahedral
(c) trigonal planar
(d) trigonal bipyramidal

MHT CET-2018
CG PET -2008

Ans. (b) : The shape of water molecule according to the VSEPR theory is distorted tetrahedral due to in water molecule two lone pair are present and repeal to each other.



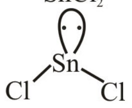
Distorted tetrahedral

141. CO_2 in isostructural with
(a) $SnC1_2$ (b) SO_2
(c) $HgC1_2$ (d) All of these

CG PET -2005
NEET-1992

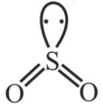
Ans. (c) : CO_2 is a linear molecule which has sp hybridisation. The given compound are –

(i) $SnCl_2$



V–Shaped

(ii) SO_2



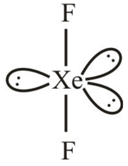
V–Shaped

(iii) H_gCl_2
Cl—Hg—Cl
liner

142. XeF_2 is isostructural with :
(a) ICl_2^- (b) $SbCl_3$
(c) $BeCl_2$ (d) TeF_2

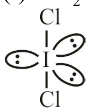
Manipal-2019
NEET-2013

Ans. (a) : The structure of XeF_2 is



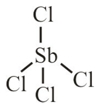
Trigonal bipyramidal (sp^3d)

(i) ICl_2^-



Trigonal bipyramidal (sp^3d)

(ii) $SbCl_3$



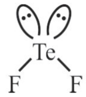
Trigonal planar (sp^2)

(iii) $BeCl_2$

Cl – Be – Cl

Linear (sp)

(iv) TeF_2



V-shaped (sp^3)

143. Shape and hybridisation of SO_2 are
(a) V shape, sp^3 (b) triangular planar, sp^2
(c) V shape, sp^2 (d) tetrahedral, sp^3

UP CPMT-2012, 2010

Ans. (c): In SO_2, the number of hybrid orbitals

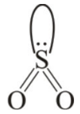
$$H = \frac{1}{2}[V + Y - C + A]$$

Where, V = number of valence electrons
Y = monovalent species
C and A = positive and negative charge over species

$$\therefore \quad H = \frac{1}{2}[6 + 0 - 0 + 0] = 3$$

Thus, hybridization is sp^2.

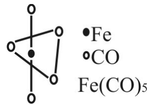
Since, SO_2 contains one lone pair of electrons its geometry becomes V shape.



144. The shape of $Fe(CO)_5$ molecule is
(a) octaheral (b) trigonal bipyramidal
(c) trigonal (d)tetrahedral.

AMU-2004, BCECE-2012

Ans. (b) : The shape of $Fe(CO)_5$ molecule is trigonal bipyramidal.



Hybridised orbitals: dsp^3

145. Which one of the following conversion involve change in both by hybridisation and shape?
(a) $CH_4 \longrightarrow C_2H_6$ (b) $NH_3 \longrightarrow NH_4^+$
(c) $BF_3 \longrightarrow BF_4^-$ (d) $H_2O \longrightarrow H_3O^+$

Karnataka CET-2015
BCECE-2014

Ans. (c) : $\underset{sp^3}{CH_4} \rightarrow \underset{sp^3}{C_2H_6}$

CH_4 and C_2H_6 both have sp^3 hybridisation and tetrahedral shape.

(ii) $\underset{sp^3}{NH_3} \rightarrow \underset{sp^3}{NH_4^+}$

NH_3 and NH_4^+ have sp^3 hybridisation. But the shape of NH_3 is pyramidal and shape of NH_4^+ is tetrahedral.

@apna_pdf

(iii) $\underset{sp^2}{BF_3} \rightarrow \underset{sp^3}{BF_4^-}$

BF_3 is sp^2 hybridisation and BF_4^- has sp^3 hybridisation

BF_3 is trigonal planar and BF_4^- has tetrahedral.

(iv) $\underset{sp^3}{H_2O} \rightarrow \underset{sp^3}{H_3O^+}$

H_2O and H_3O^+ both have sp^3 hybridisation. H_2O is bent shaped and H_3O^+ is pyramidal.

146. Among the following species, correct set of iso structural pairs are : $NF_3, NO_3^-, BF_3, H_3O^+$

(a) (NF_3, NO_3^-) and (BF_3, H_3O^+)

(b) (NF_3, H_3O^+) and (NH_3, BF_3)

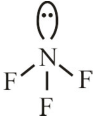
(c) (NF_3, H_3O^+) and (NO_3^-, BF_3)

(d) (NF_3, NH_3) and (NH_3^-, H_3O^+)

BCECE-2017, J&K CET-2000

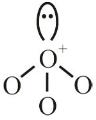
Ans. (c) : The structure of the following is–

(i) NF_3



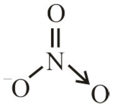
Pyramidal

(ii) H_3O^+



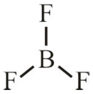
Pyramidal

(iii) NO_3^-



Trigonal planar

(iv) BF_3



Trigonal planar

The correct set of iso-structural pairs are (NF_3, H_3O^+) and (NO_3^-, BF_3).

147. Which of the following exhibits square pyramidal geometry?

(a) XeF_6 (b) XeO_3

(c) BrF_5 (d) XeF_4

MHT CET-03.05.2019, SHIFT-I

AMU – 2010

Ans. (c) : XeF_6 – Distorted octahedral

XeO_3 – Pyramidal

BrF_5 – Octahedral (Square pyramidal)

XeF_4 – Square planar

148. According to VSEPR theory, the geometry of ammonia and water molecules will, respectively, be

(a) pyramidal and bent

(b) tetrahedral and pyramidal

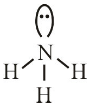
(c) bent and pyramidal

(d) pyramidal and tetrahedral.

AMU-2019, J&K CET-2012

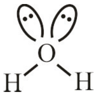
Ans. (a) : The geometry of ammonia (NH_3) and water (H_2O) molecule are pyramidal and bent. Both have sp^3 hybridisation.

(i) NH_3



Pyramidal

(ii) H_2O



Bent

149. Molecular structures of XeO_3 and $XeOF_4$ respectively are

(a) trigonal planar and octahedral

(b) pyramidal and square pyramidal

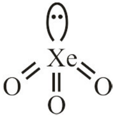
(c) pyramidal and trigonal bipyramidal

(d) both have imperfect tetrahedral shape.

BCECE-2017, AMU-2015

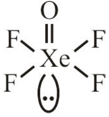
Ans. (b) : The structure of the following are –

(i) XeO_3



Pyramidal

(ii) $XeOF_4$



Square pyramidal

The central atom Xe both have one lone pair. In XeO_3, has pyramidal and $XeOF_4$ has square pyramidal.

150. In which of the following pairs of molecules/ions both the species are not likely to exists?

(a) H_2^+, He_2^{2-} (b) H_2^-, He_2^{2-}

(c) H_2^{2+}, He_2 (d) H_2^-, He_2^{2+}

Odisha NEET-2019, JEE Main-2013

Ans. (c) : For $H_2^+ = \sigma 1s^1$, $\text{B.O.} = \frac{1-0}{2} = 0.5$

For $H_2^{2+} = \sigma 1s^0$, $\text{B.O.} = \frac{0-0}{2} = 0$

For $H_2^- = \sigma 1s^2, \sigma^* 1s^1$, $\text{B.O.} = \frac{2-1}{2} = 0.5$

For $He_2^{2+} = \sigma 1s^2$, $\text{B.O.} = \frac{2-0}{2} = 1$

For $He_2 = \sigma 1s^2, \sigma^* 1s^2$, $\text{B.O.} = \frac{2-2}{2} = 0$

For $He_2^{2-} = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2$, $\text{B.O.} = \frac{4-2}{2} = 1$

Thus, the bond order of H_2^{2+} and He_2 are zero. Both pairs of molecules/ions are not likely to exist.

151. The number of species below that have two lone pairs of electrons in their central atom is ... (Round off to the nearest integer)

$SF_4, BF_3^-, ClF_3, AsF_3, PCl_5, BrF_5, XeF_4, SF_6$

(a) 4 (b) 3

(c) 2 (d) 5

(JEE Main 2021, 18 March Shift-II)

J&K CET-2011

Ans. (c) :

Species	Bond pair	Lone pair
SF_4	4	1
BF_3^-	3	1
ClF_3	3	2
AsF_3	3	1
PCl_5	5	0
BrF_5	5	1
XeF_4	4	2
SF_6	6	0

The two lone pair of electrons in their central atom is two.

@apna_pdf

152. Which of the following statements is correct?

(a) All carbon to carbon bonds contain a sigma bond and one of more pi bonds
(b) All carbon to hydrogen bonds are pi bonds
(c) All oxygen to hydrogen bonds are hydrogen bonds
(d) All carbon to hydrogen bonds are sigma bonds

UPTU/UPSEE-2015, JCECE - 2005

Ans. (d) : Carbon and hydrogen form only σ-bond between them, hence, the all carbon to hydrogen bonds are sigma bonds.

153. The shape of gaseous $SnCl_2$ is

(a) tetrahedral (b) linear
(c) angular (d) T-shape

JIPMER-2017
MHT CET-2011

Ans. (c) : The central atom Sn has 4 valence electron two are bonded with chlorine and one lone pair is present. The three atomic orbitals of tin undergo hybridisation to form three degenerate hybrid orbital. The geometry of molecule is bent or angular.

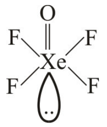
154. XeF_6 on partial hydrolysis gives a compound X, which has square pyramidal geometry 'X' is

(a) XeO_3 (b) XeO_4
(c) $XeOF_4$ (d) XeO_2F_2

Kerala-CEE-29.08.2021
Karnataka-CET-2021

Ans. (c) : XeF_6 on partial hydrolysis gives a compound $XeOF_4$ which has square pyramidal geometry which is given as follows -

$$XeF_6 + H_2O \rightarrow XeOF_4 + 2HF$$



(Square pyramidal)

155. The incorrectly matched pair, among the following is

	Molecule	**Shape**
(a)	BrF_5	Trigonal bipyramidal
(b)	SF_4	See saw
(c)	ClF_3	T-shape
(d)	NH_4^+	Tetrahedral
(e)	NH_3	Trigonal pyramidal

Kerala-CEE-2014, 2012

Ans. (a) :

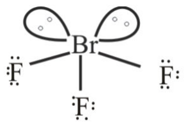
Molecule	**Shape**
BrF_5	Square pyramidal
SF_4	See-saw
ClF_3	T-shaped
NH_4^+	Tetrahedral
NH_3	Trigonal pyramidal

156. According to VSEPR theory, the molecular shape of BrF_3 is

(a) Trigonal bipyramid (b) Triangular
(c) Bent T-shape (d) Pyramidal

TS EAMCET 10.08.2021, Shift-I
AMU-2017

Ans. (c) :



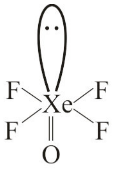
Fluorine atoms will be bent towards away from lone pair to minimize the lone pair lone pair repulsions. Thus Shape would be that of a slightly bent T-Shape.

157. The structure of $XeOF_4$is

(a) Trigonal bipyramidal
(b) Square planar
(c) Square pyramidal
(d) Pyramidal

J&K CET-2018
AP EAMCET (Engg.) -2014

Ans. (c) : The structure of $XeOF_4$ is square pyramidal



(Square Pyramidal)

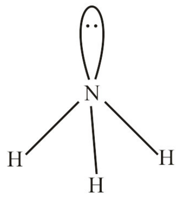
The hybridisation of $XeOF_4$ is sp^3d^2

158. Which one of the following is a planar molecule?

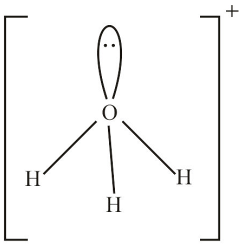
(a) NH_3 (b) H_3O^+
(c) BCl_3 (d) PCl_3

NEET-2005
AP-EAMCET (Medical), 2003

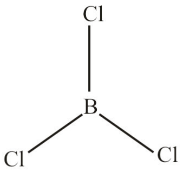
Ans. (c) : The molecule's are NH_3, H_3O^+,BCl_3 and PCl_3.



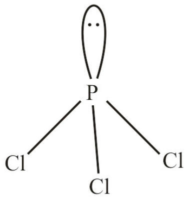
Hybridisation→ sp^3
Geometry→ pyramidal



sp^3
pyramidal



sp^2
Trigonal planar



sp^3
pyramidal

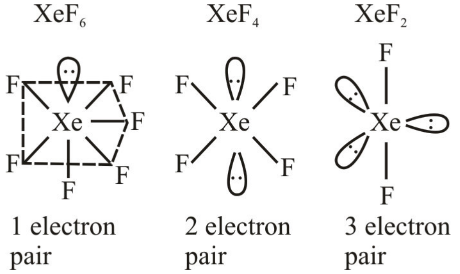
159. Number of non-bonding electron pair on Xe in XeF_6, XeF_4 and XeF_2 respectively will be ....

(a) 6, 4, 2 (b) 1, 2, 3
(c) 3, 2, 1 (d) 0, 3, 2

AMU-2013
GUJCET-2011

@apna_pdf

Ans. (b): The structure is given as-



160. For N_3^- which statement is wrong:

(a) Isoelectronic with CO_2
(b) NH_2OH and N_3^- have same O.N. on nitrogen atom.
(c) N-N bond length are same.
(d) HN_3 have linear shape.

JEE Main-17.03.2021, Shift-II
AIIMS-27 May,2018 (M)

Ans. (d): The structure of N_3^- is–

$$\overset{-}{N} = \overset{+}{N} = \overset{-}{N}$$

(i) N_3^- is isoelectronic with CO_2.
(ii) NH_2OH and N_3^- have same O.N on nitrogen atom.
(iii) N–N bond length are same.
(iv) HN_3 have bent structure.

161. Match List I and List II and pick out correct matching codes from the given choices:

List -I Compound	**List- II Structure**
A. ClF_3	**1. Square planar**
B. PCl_5	**2. Tetrahedral**
C. IF_5	**3. Trigonal bipyramidal**
D. CCl_4	**4. Square pyramidal**
E. XeF_4	**5. T- shaped**

Codes

(a) A-5, B-4,C-3,D-2,E-1
(b) A-5,B-3,C-4,D-2,E-1
(c) A-5,B-3,C-4,D-1,E-2
(d) A-4,B-3,C-5,D-2,E-1

AIIMS-2015
Kerala-CEE-2006

Ans. (b):

Compound	**Structure**
A. ClF_3	T- shaped
B. PCl_5	Trigonal bipyramidal
C. IF_5	Square pyramidal
D. CCl_4	Tetrahedral
E. XeF_4	Square planar

162. Which one of the following is a correct set?

(a) H_2O, sp^3, angular
(b) BCl_3, sp^3, angular
(c) NH_4^+, dsp^2, square planar
(d) CH_4, dsp^2, tetrahedral

AP-EAMCET/2008, 2003

Ans. (a):

Molecule	**Hybridization**	**Shape**
H_2O	sp^3	 (Angular)
BCl_3	sp^2	 (Trigonal planar)
NH_4^+	sp^3	 (Tetrahedral)
CH_4	sp^3	 (Tetrahedral)

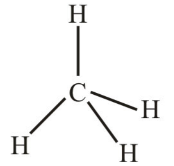
163. A pair of molecules with see-saw shape and linear shape, respectively, is

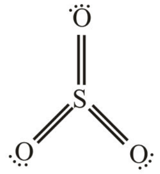
(a) CH_4 and SO_3
(b) XeF_4 and CS_2
(c) SF_4 and C_2H_2
(d) CCl_4 and CO_2

TS-EAMCET (Engg.), 07.08.2021 Shift-II
J&K CET-2015

Ans. (c) :

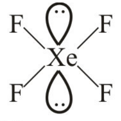
(a) CH_4 and SO_3





sp^2(Planer)

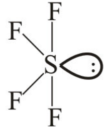
(b) XeF_4 and CS_2



sp^3d^2 (square planer)

$:\!\ddot{S}=C=\ddot{S}\!:$
sp (linear)

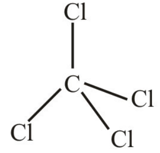
(c) SF_4 and C_2H_2



sp^3d (see-saw)

H–C≡C–H
sp (linear)

(d) CCl_4 and CO_2



sp^3(Tetrahedral)

$:\!\ddot{O}=C=\ddot{O}\!:$
sp (linear)

Hence, correct option is (c).

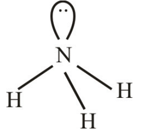
164. The shape of NH_3 molecule is:

(a) Tetrahedral
(b) Trigonal planar
(c) Trigonal pyramidal
(d) Linear

MHT-CET-2007
AIIMS-2001

@apna_pdf

Ans. (c): The shape of NH_3 (ammonia) is trigonal pyramidal. In ammonia hydrogen atom is bonded with nitrogen by 3σ bond and one lone pair present on nitrogen. The hybridisation of NH_3 is sp^3.



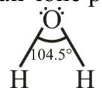
The shape of NH_3 molecule.

165. H–O–H bond angle in H_2O is 104.5° and not 109° 28' because of:

(a) Lone pair-lone pair repulsion
(b) Lone pair-bond pair repulsion
(c) Bond pair-bond pair repulsion
(d) High electronegative of oxygen

AP-EAMCET (Medical), 2006
UP CPMT-2008

Ans.(a): According to the VSEPR theory-The interactions of lone pair-lone pair> lone pair-bond pair > bond pair-bond pair. In H_2O molecule, the bond angle decreases due to lone pair-lone pair repulsion.



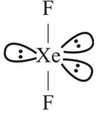
166. XeF_2, NO_2, HCN, ClO_2, CO_2
Identify the non-linear molecule-pair from the above mentioned molecules.

(a) XeF_2, ClO_2
(b) CO_2, NO_2
(c) HCN, NO_2
(d) ClO_2, NO_2

WB-JEE-30.04.2022

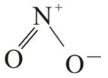
Ans. (d) : The structure of the following are-

(i) XeF_2



Linear

(ii) NO_2



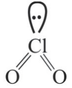
Bent

(iii) HCN

H–C≡N

Linear

(iv) ClO_2



Bent

(v) CO_2

O = C= O

Linear

Therefore NO_2 and ClO_2 have non-linear molecule-pair.

167. Molecular bromine on reaction with three moles of molecular fluorine produces an inter halogen compound. The total number of lone pairs at the central halogen atom is ———

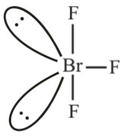
(a) 3
(b) 2
(c) 1
(d) 0

AP EAPCET 25.08.2021, Shift-II

Ans. (b) : Given, Molecular bromine is Br_2 and three moles molecular fluorine is $3F_2$ so the reaction is–

$$Br_2(g) + 3F_2(g) \rightarrow 2BrF_3$$

Structure of BrF_3 is



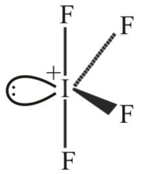
So the total number of lone pairs at the central halogen atom is 2.

168. That is the electronic geometry of IF_4^+?

(a) Tetrahedral
(b) Octahedral
(c) Trigonal bipyramidal
(d) Trigonal planar

TS EAMCET 10.08.2021, Shift-I

Ans. (c) : The geometry of IF_4^+



Note

lone Pair	Bond Pair	Geometry
0	5	Trigonal bipyramidal
1	4	See – saw

169. Match the following :-

Molecule	Geometry
(A) XeF_2	(i) Trigonal Pyramidal
(B) XeO_3	(ii) Distorted octahedral
(C) XeF_6	(iii) Linear
(D) $XeOF_4$	(iv) Square pyramidal

(a) (A – iii), (B – i), (C – ii), (D – iv)
(b) (A – iv), (B – iii), (C – ii), (D – i)
(c) (A – iii), (B – i), (C – iv), (D – ii)
(d) (A – iv), (B – iii), (C – ii), (D – i)

AP EAPCET 24.08.2021, Shift-I

Ans. (a) :

	Molecule	Hybridization	Structure
(a)	XeF_2	sp^3d	 (Linear)
(b)	XeO_3	sp^3	 (Trigonal pyramidal)
(c)	XeF_6	sp^3d^2	 (Distorted octahedral)
(d)	$XeOF_4$	sp^3d^2	 (Square pyramidal)

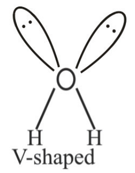
@apna_pdf

170. Incorrect matching amongst the following is____(according to geometry of molecules)

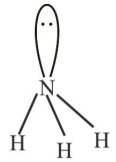
(a) H_2O, NH_3 (b) $BeCl_2$, CO_2
(c) SF_4, $TeCl_4$ (d) ClF_3, ICl_3

AP EAPCET 20.08.2021 Shift-II

Ans. (a): H_2O is V-shaped geometry and NH_3 is pyramidal geometry.



V-shaped



pyramidal

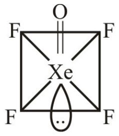
$BeCl_2$ and CO_2 are linear geometry, SF_4 are trigonal bipyramidal geometry and ClF_3, ICl_3 are trigonal pyramid geometry.

171. The structure of $XeOF_4$ and XeO_3, respectively, are

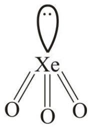
(a) Square pyramidal and pyramidal
(b) Pentagonal planar and pyramidal
(c) Pentagonal pyramidal and planar
(d) Pentagonal bipyramidal and planar

TS-EAMCET 09.08.2021, Shift-I

Ans. (a) : The molecular structure of $XeOF_4$ and XeO_3 are–



Square pyramidal



Pyramidal

172. The shapes of BrF_5 and XeF_4, respectively are

(a) square pyramid, square pyramid
(b) square planar, square planar
(c) square planar, square pyramid
(d) square pyramid, square planar

TS-EAMCET (Engg.), 06.08.2021

Ans. (d):

Molecule	**Hybridization**	**Shape**
BrF_5	sp^3d^2	 Square pyramidal
XeF_4	sp^3d^2	 Square planar

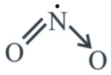
173. Amongst the following, the linear species is:

(a) N_3^- (b) NO_2
(c) O_3 (d) Cl_2O

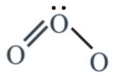
JEE Main 17.03.2021, Shift-II

Ans. (a) : The given species are N_3^-, NO_2, O_3, and Cl_2O.

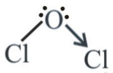
Linear
sp



V-shaped
sp^2



V-shaped
sp^2



V-shaped
sp^3

174. Identify the incorrect statements among the following?

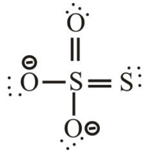
(i) SF_6 does not react with water
(ii) SF_6 is sp^3d hybridized
(iii) $S_2O_3^{2-}$ is a linear ion
(iv) There is no π - bonding in S_4^{2-} ion

(a) (ii), (iii) & (iv) only (b) (i), (ii) & (iii) only
(c) (i) & (ii) only (d) (iii) & (iv) only

AP EAPCET 19-08-2021, Shift-II

Ans. (a) : SF_6 is unreactive towards water because the sulfur atom is shielded by six fluorine atom.

SF_6 molecule has sp^3d^2 hybridisation.



Hence, the $S_2O_3^{2-}$ has a tetra hedral structure not a linear molecule.

There is $1-\pi$ bond in S_4^{2-}.

175. Match the following?

Molecule	**Geometry**
(a) $SnCl_2$	**(i) Angular (or) Bent**
(b) XeF_4	**(ii) See-saw**
(c) ClF_3	**(iii) Square pyramidal**
(d) IF_5	**(iv) T - shape**
	(v) Square - planar

(a) (a - i), (b - iii), (c - iv), (d - v)
(b) (a - iv), (b - v), (c - i), (d - iii)
(c) (a - i), (b - v), (c - iv), (d - iii)
(d) (a - iv), (b - iii), (c - ii), (d - ii)

AP EAPCET 19-08-2021, Shift-II

Ans. (c) :

Molecule	**Hybridization**	**Shape**
1. $SnCl_2$	sp^2	 (Bent)
2. XeF_4	sp^3d^2	 (Square Planer)
3. ClF_3	sP^3d	 (T-shaped)
4. IF_5	sp^3d^2	 (Square pyramidal)

@apna_pdf

176. Which of the following is not a correct statement?

(a) Every AB_5 molecule has square pyramidal structure

(b) Multiple bonds are always shorter than corresponding single bonds

(c) The electron deficient molecules act as Lewis Acids

(d) The canonical structure have no real existence

AP- EAPCET- 07-09-2021, Shift-I

Ans. (a) : The option (1) is not correct because AB_5 molecules have square pyramidal and triagonal bipyramidal structure and other option is correct.

177. In which of the following species, the central atom has the maximum number of lone pair of electrons?

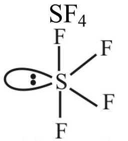
(a) SF_4 (b) XeF_4

(c) ClO_3^- (d) I_3^-

AP- EAPCET- 07-09-2021, Shift-I

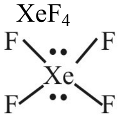
Ans. (d) : Structure of given compound is -

SF_4



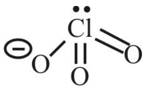
1 lone pair

XeF_4



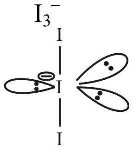
2 lone pair

ClO_3



1 lone pair

I_3^-



3 lone piar

So the option (d) is correct.

178. Which of the following are isostructural pairs?

A. SO_4^{2-} and CrO_4^{2-} **B. $SiC\ell_4$ and $TiC\ell_4$**

C. NH_3 and NO_3^- **D. $BC\ell_3$ and $BrC\ell_3$**

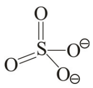
(a) A and B only (b) A and C only

(c) B and C only (d) C and D only

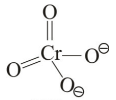
(JEE Main 2021, 24 Feb Shift-I)

Ans. (a) : The structure of the following are –

(a)



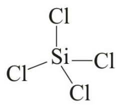
(Td)



(Td)

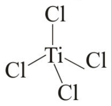
(b)

$SiCl_4$



(Td)

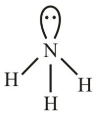
$TiCl_4$



(Td)

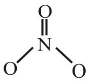
(c)

NH_3



Pyramidal

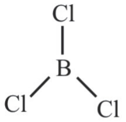
NO_3^-



Trigonal planar

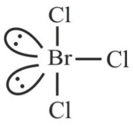
(d)

BCl_3



Trigonal planar

$BrCl_3$



T-shape

Hence, the option (a) is correct.

179. A central atom in a molecule has two lone pairs of electrons and forms three single bonds. The shape of this molecule is

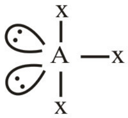
(a) see-saw (b) Planar triangular

(c) T-shaped (d) Trigonal pyramidal

(JEE Main 2021, 17 March Shift-I)

Ans. (c) : A central atom in a molecule has two lone pairs of electrons and forms three single bonds. The shape of this molecule is T-shaped.

For example –



sp^3d (T-shape)

180. Match List-I with List-II

	List- I		List-II
(A)	**PCl_5**	**(i)**	**Square pyramidal**
(B)	**SF_6**	**(ii)**	**Trigonal planar**
(C)	**BrF_5**	**(iii)**	**Octahedral**
(D)	**BF_3**	**(iv)**	**Trigonal bipyramidal**

Choose the correct answer from the options given below -

(a) (A) - (iv), (B) - (iii), (C) -(ii), (D) - (i)

(b) (A) - (iv), (B) - (iii), (C) -(i), (D) - (ii)

(c) (A) - (ii), (B) - (iii), (C) -(iv), (D) - (i)

(d) (A) - (iii), (B) - (i), (C) -(iv), (D) - (ii)

NEET-2021

Ans. (b) :

List-I	**List-II**
PCl_5	Trigonal bipyramidal
SF_6	Octahedral
BrF_5	Square pyramidal
BF_3	Trigonal planar

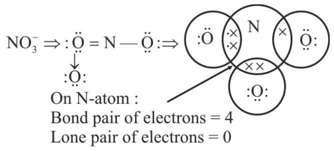
181. In NO_3^- ion, the number of bond pairs and lone pairs of electrons on nitrogen atom are

(a) 2, 2 (b) 3, 1

(c) 1, 3 (d) 4, 0

AP EAMCET (Engg.) 17.09.2020, Shift-II

Ans. (d) :



$NO_3^- \Rightarrow :\ddot{O} = N — \ddot{O}: \Rightarrow$
:Ö:
On N-atom :
Bond pair of electrons = 4
Lone pair of electrons = 0

182. In which of the following molecule/ion, all the bonds are not equal ?

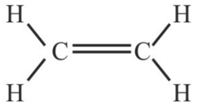
(a) XeF_4 (b) BF_4^-

(c) C_2H_4 (d) SF_4

AP EAMCET (Engg.) 17.09.2020, Shift-II

@apna_pdf

Ans. (c) : In XeF_4, BF_4^- and SF_4 only one type of covalent bonds are present, which are Xe—F, B—F and Si—F respectively.
In C_2H_4, two types of covalent bonds are present, which are C = C and C—H, which are not equal for any property.



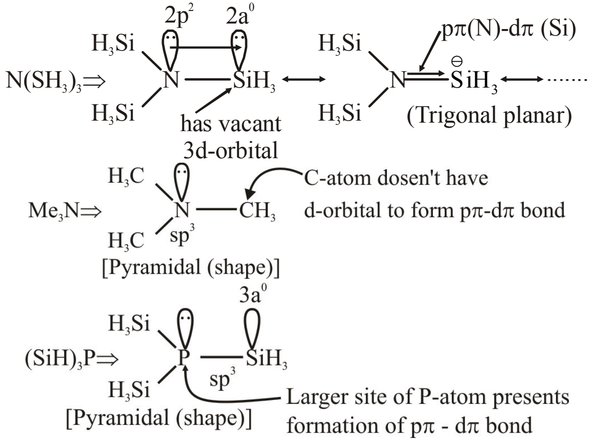
183. How many lone pairs of electrons are present in a hydroxyl ion ?
(a) Two pairs (b) Three pairs
(c) One pair (d) Four pairs
AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (b) : In hydroxyl ion, $OH^{\ominus}$

Number of lone pair of electrons = 3

184. The geometry with respect to the central atom of the molecules $N(SiH_3)_3$ - Me_3N, $(SiH_3)_3$ P respectively are
(a) Planar, pyramidal, planar
(b) planer, pyramidal, pyramidal
(c) pyramidal, pyramidal, pyramidal
(d) pyramidal, planar, pyramidal
AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (b) :



185. When SbF_5 reacts with XeF_4 to for an adduct, the shapes of cation and anion in the adduct respectively are
(a) square planar, trigonal bipyramidal
(b) T-shaped, octahedral
(c) square pyramidal, octahedral
(d) plane triangular, trigonal bipyramidal
AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (b) : In the reaction between XeF_4 and SbF_5, XeF_4 acts as flouride (F^-) donor.

$$XeF_4 + SbF_5 \rightarrow \underset{\text{Cation}}{\left[:\ddot{X}eF_3\right]^{\oplus}} \underset{\text{Anion}}{\left[SbF_6\right]^{\ominus}}$$

Hybridisation	sp^3d(Xe)	sp^3d^2 (Sb)
Geometry	Trigonal bipyramidal	octahedral
Shape	T-shaped	octahedral

186. Which of the following molecules can be represented as AB_2E_2, where A-central atom, B-bond pairs of electrons, E-lone pairs of electrons?
(a) SO_2 (b) H_2O_2
(c) H_2O (d) XeF_2
AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (c) :

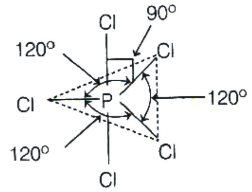
			Number of	
Molecule	**Type**	**A**	**B**	**E**
$:SO_2 \Rightarrow$	AB_2E	S	4	1
$H—\ddot{\underset{..}{O}}—OH \Rightarrow$	$A_2B_3E_4$	O (2 atom)	3	4
$\boxed{H_2\ddot{O}:} \Rightarrow$	$\boxed{AB_2E_2}$	O	2	2
$:\overset{..}{\underset{..}{Xe}}:F_2 \Rightarrow$	AB_2E_3	Xe	2	3

187. What is the shape of I_3^- ion ?
(a) Trigonal (b) Linear
(c) Bent (d) Trigonal planar
AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (b) : I_3^- molecular geometry is linear. While there are three iodine atoms, one of the atoms has a negative charge which further gives 3 lone pairs of electrons and 2 bond pairs.
Hence, the correct option is (b).

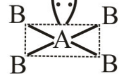
188. The number of 120º, Cl—P—Cl angles in phosphorus pentachloride are
(a) 3 (b) 6
(c) 9 (d) 1
AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (a) : Geometry and structure of phosphorus pentachloride (PCl_5) molecule is trigonal bipyramidal where P-atom is sp^3 d-hybridised.
The 3Cl-atoms are present at equatorial positions with Cl — P — Cl = 120º and two Cl - atoms are present at axial positions with Cl— P — Cl = 90º.



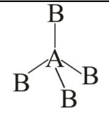
189. If AB_4, molecule is a polar molecule, a possible geometry of AB_4 is
(a) Square pyramidal (b) Square planar
(c) Rectangular planar (d) Tetrahedral
(JEE Main 2020, 2 Sep. Shift-I)

Ans. (a) : AB_4 has three type of structure.
(i) If AB_4 molecule is square pyramidal then it has one lone pair. It should be polar because dipole moment of lone pair.



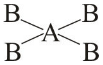
(Square pyramidal)
(ii) If AB_4 molecule has tetrahedral then it has no lone pair.

@apna_pdf



It is non polar due to symmetrical.

(iii) If AB_4 molecule is a square planar then it should be non polar because of vector sum of dipole moment is zero.



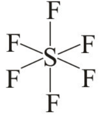
190. The molecular geometry of SF_6 is octahedral. What is the geometry of SF_4 (including lone pair(s) of electrons, if any)?

(a) Tetrahedral (b) Trigonal bipyramidal

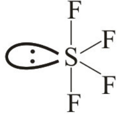
(c) Pyramidal (d) Square planar

(JEE Main 2020, 2 Sep. Shift-II)

Ans. (b) : The molecular geometry of SF_6 is octahedral. The geometry of SF_4 (including lone pair of electron) is trigonal bipyramidal.



(Octahedral)



(Trigonal bipyramidal)

191. The structure of PCl_5 in the solid state is

(a) Tetrahedral $[PC\ell_4]^+$ and octahedral $[PC\ell_6]^-$

(b) Trigonal bipyramidal

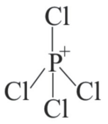
(c) Square planar $[PC\ell_4]^+$ and octahedral $[PC\ell_6]^-$

(d) Square pyramidal

(JEE Main 2020, 5 Sep. Shift-I)

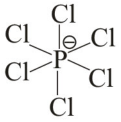
Ans. (a) : In solid PCl_5 exists as PCl_4^+ and PCl_6^- as the ionic bonding enhances the crystalline nature. PCl_4^+ is tetrahedral while PCl_6^- is octahedral which gives more stability to solid structure.

$[PCl_4]^+$



(Tetrahedral)

$[PCl_6]^-$



(Octahedral)

192. Incorrectly matched pair is

(a) XeO_3 pyramidal

(b) XeF_4 tetrahedral

(c) XeF_6 disorted octahedral

(d) $XeOF_4$ square pyramidal

Karnataka-CET-2020

Ans. (b) :

Molecule	**Geometry**
XeO_3	Pyramidal
XeF_4	Square planar
XeF_6	Disorted octahedral
$XeOF_4$	Square pyramidal

193. Assertion: BO_3^{3-} and SO_3^{2-} are not isostructural.

Reason: In SO_3^{2-} sulphur has one lone pair of electron.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

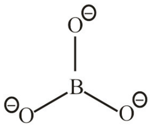
(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

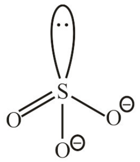
AIIMS 26 May 2019 (Evening)

Ans. (a): The structure of BO_3^{3-} and SO_3^{2-} is

(i) BO_3^{3-} (ii) SO_3^{2-}



sp² (Trigonal planar)



sp³ (Pyramidal)

BO_3^{3-} and SO_3^{2-} are not isostructural because SO_3^{2-} sulphur has one lone pair of electron.

194. Select the correct statement regarding shapes of PCl_5, BrF_5 & IF_7:

(a) All are square pyramidal.

(b) All are trigonal bipyramidal.

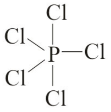
(c) One of the following is square pyramidal.

(d) One of the following is tetrahedral.

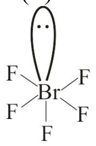
AIIMS 26 May 2019 (Evening)

Ans. (c): The structure of these molecules are –

(i) PCl_5 (ii) BrF_5

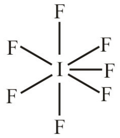


Trigonal bipyramidal



Square Pyramidal

(iii) IF_7



Pentagonal bipyramidal

Hence, BrF_5 molecule has square pyramidal shape.

195. When Ag^+ reacts with excess of sodium-thio sulphate then the obtained species having charge & geometry respectively will be?

(a) –3, Linear (b) –2, tetrahedral

(c) –1, square planer (d) –3, square planar

AIIMS 25 May 2019 (Morning)

Ans. (a): $AgBr + 2Na_2S_2O_3 \rightarrow Na_3[Ag(S_2O_3)_2] + NaBr$ the coordination number of Ag^+ is 2 it is sp hybridisation and shape is linear.

196. The number of species having zero lone pair at central atom is?

XeO_3, XeO_2F_2, XeO_4, XeO_3F_2

(a) 2 (b) 3

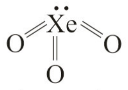
(c) 4 (d) Zero

AIIMS 25 May 2019 (Morning)

@apna_pdf

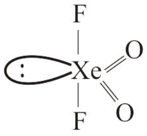
Ans. (a): The structure of the following species –

(i) XeO_3



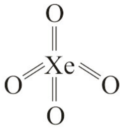
1 lone pair

(ii) $X_eO_2F_2$



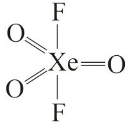
1 lone pair

(iii) XeO_4



zero lone pair

(iv) XeO_3F_2



zero lone pair

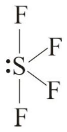
The molecule XeO_4 and XeO_3F_2 having zero lone pair at central atom and number of species are two.

197. **Assertion:** SF_4 molecule has see-saw geometry.
Reason: In SF_4 molecule sulphur has four bond pairs and one lone pair.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Morning)

Ans. (a): The structure of SF_4 molecule is –



SF_4 molecule has see-saw geometry and in SF_4 molecule sulphur has four bond pairs and one lone pair.

198. **Which of the following is incorrect about cyanogens gas?**

(a) It has bent structure
(b) It is psuedohalogen
(c) It's behaviour is similar to halides
(d) Both carbon are sp hybridized

AIIMS 26 May 2019 (Morning)

Ans. (a): The molecular formula of cyanogens gas is $(CN)_2$. The structure of $(CN)_2$ is

$$N \equiv \underset{sp}{C} - \underset{sp}{C} \equiv N$$

The hybridisation of cyanogen gas is sp . It has a bent structure.

199. **Which of the following is correct?**

(a) $SO_3^2 \Rightarrow$ Tetrahedral
(b) $NO_2^- \Rightarrow$ Trigonal planar
(c) $ClO_4^- \Rightarrow$ Tetrahedral
(d) $NH_3 \Rightarrow$ Trigonal planar

JIPMER-2019

Ans. (c) :

Molecule	Geometry
SO_3^{2-}	Pyramidal
NO_2^-	V-shaped
ClO_4^-	Tetrahedral
NH_3	Pyramidal

200. **Which of the following pair contains 2 lone pair of electrons on the central atom?**

(a) I_3^+, H_2O
(b) H_2O, NF_3
(c) XeF_4, NH_3
(d) SO_4^{2-}, H_2S

Karnataka-CET-2019

Ans. (a) :

Molecule	Bond pair	Lone pair
I_3^+	2	2
H_2O	2	2
NF_3	3	1
XeF_4	4	2
NH_3	3	1
SO_4^{2-}	4	0
H_2S	2	2

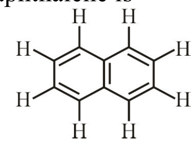
Therefore, I_3^+, H_2O pair contains 2 lone pair of electrons on the central atom.

201. **The number of π-bonds and σ-bonds present in naphthalene are respectively**

(a) 6, 19
(b) 5, 19
(c) 5, 11
(d) 5, 20

Karnataka-CET-2019

Ans. (b) :
The structure of naphthalene is



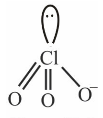
The number of π-bonds and σ-bond present in naphthalene are 5 π-bond and 19 σ-bond respectively.

202. **According to the VSEPR theory, the shape of ClO_3^- would be**

(a) Linear
(b) Triangular planar
(c) Pyramidal
(d) Square planar
(e) Angular

Kerala-CEE-2019

Ans. (c) : The shape of $Cl\,O_3^-$ would be pyramidal



Pyramidal

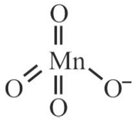
203. **What is the shape and magnetic nature of permanganate ion?**

(a) Pyramidal diamagnetic
(b) Tetrahedral, diamagnetic
(c) Tetrahedral, paramagnetic
(d) Planar, paramagnetic

MHT CET-03.05.2019, SHIFT-I

@apna_pdf

Ans. (b) : The shape of permanganate ion (MnO_4^-)



Tetrahedral (sp^3)

In permagnate ion there is no unpaired electron, it is diamagnetic.

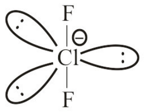
204. In ClF_2^- and ClF_4^- find out the number of lone pair and shape.

(a) 3-Linear, 2-Square planar
(b) 3-Squared planar, 2- Linear
(c) 0-Linear, 3-Square planar
(d) 2-Linear, 2-Square planar

AIIMS-27 May,2018 (M)

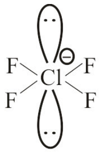
Ans. (a): The structure of the molecule is –

(i) ClF_2^-



3 lone pair and two bond pair (linear)

(ii) ClF_4^-



2 lone pair and four bond pair (Squar planar)

Hence, in ClF_2^- and ClF_4^- number of lone pair and shape are 3-linear, 2- square planar respectively.

205. Which contains alteast one e^- in $\sigma 2p$ bonding MO?

(a) O_2 (b) B_2
(c) C_2 (d) Li_2

AIIMS-26 May,2018 (E)

Ans. (a): (i) Molecular orbital of O_2 is

$=\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$

$\pi^* 2p_x^1 = \pi^* 2p_y^1$

(ii) MO of $B_2 = = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_y^1$

(iii) MO of $C_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2,$

(iv) MO of $Li_2 = = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2$

Therefore, O2 contains at least one e^- in σ_{2p} bonding MO.

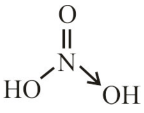
206. Structure anions of acids, HNO_3, H_3PO_4 and H_2SO_4 are respectively

(a) tetrahedral, tetrahedral and trigonal bipyramidal
(b) angular, tetrahedral and trigonal bipyramidal
(c) tetrahedral, tetrahedral and angular
(d) planar, tetrahedral and tetrahedral

AMU-2018

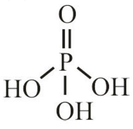
Ans. (d) : The structure of the following are –

(i) HNO_3



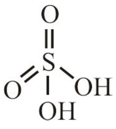
Trigonal planar

(ii) H_3PO_4



Tetrahedral

(iii) H_2SO_4



Tetrahedral

207. Which of the following is the correct according increasing order of lone pair of electrons on the central atom?

(a) $IF_7 < IF_5 < ClF_3 < XeF_2$
(b) $IF_7 < XeF_2 < ClF_2 < IF_5$
(c) $IF_7 < ClF_3 < XeF_2 < IF_5$
(d) $IF_7 < XeF_2 < IF_5 < ClF_3$

BITSAT 2018

Ans. (a) : The number of lone pairs of electrons on central atom in various given species are

Species	Number of lone pairs on central atom
IF_7	nil
IF_5	1
ClF_3	2
XeF_2	3

Thus the correct increasing order is

$$\underset{0}{IF_7} < \underset{1}{IF_5} < \underset{2}{ClF_3} < \underset{3}{XeF_2}$$

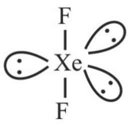
208. What is the hybridization and geometry off given species? The species are XeF_2 and ICl_2^-

(a) sp^3d and trigonal bipyramidal
(b) sp^3d^2 and square planar
(c) sp^3d and linear
(d) sp^3 and irregular tetrahcdron

J & K CET-(2018)

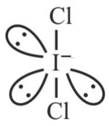
Ans. (a) : The given species are –

(i) XeF_2



(sp^3d)

(ii) ICl_2^-



(sp^3d)

The hybridisation = Bond pair + lone pair

For XeF_2, Hybridisation = 2 + 3 = 5 (sp^3d)

For ICl_2^-, Hybridisation = 2 + 3 = 5 (sp^3d)

The geometry of the given species is trigonal bipyramidal and the shape is linear.

209. What will be the geometry of the compound MB_4L_2? Here B is bond pair and L is lone pair.

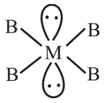
(a) Square planar (b) Octahedral
(c) Square pyramid (d) Tetrahedral

J & K CET-(2018)

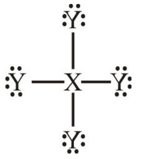
Ans. (a) : The given compound MB_4L_2.

Where, B = Bond pair
L = Lone pair

Geometry of the compound will be octahedral with two lone pairs. Hence, the structure is square planar.



210. For the dot structure shown, the most likely elements X = … and Y = … are



@apna_pdf

(a) carbon, flourine (b) carbon, hydrogen
(c) carbon, oxygen (d) oxygen, carbon

JIPMER-2018

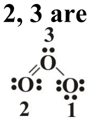
Ans. (a) : X is a tetravalent without lone pair, Y has three lone pairs and one bond pair. X is carbon can make maximum 4 bonds as its valency is 4 and Y has fluorine has total 7 electron in valence shell. Out of that 1 electron has gone for bonding.

211. Which of the following does not depend on the attraction of the bonding pair towards the nucleus ?
(a) The number of protons in the nucleus
(b) The repulsion by the electrons in the same valence shell
(c) The amount of sheieding by inner shell electron
(d) The distance from the nucleus

UPTU/UPSEE-2018

Ans. (b) : The repulsion by the electrons in the same valence shell does not depend on the attraction of the bonding pair towards the nucleus because of electrons are identical in charge. The repulsion is minimised if the two electron are far apart as possible.

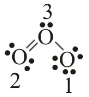
212. The Lewis structure for O_3 molecule is given below. The correct formal charges on oxygen atoms labeled 1, 2, 3 are respectively.



(a) – 1, 0, + 1 (b) + 1, 0, – 1
(c) + 1, – 1, 0 (d) 0, + 1, – 1

AP EAMCET-2017

Ans. (a):



Formal charge (F.C) = Number of valence electron-

$$[\text{no. of lone pair} + \frac{1}{2}\text{no. of bond pair}]$$

For $O_{(1)} = 6 - (6 + 1) = -1$
$O_{(2)} = 6 - (4 + 2) = 0$
$O_{(3)} = 6 - (2 + 3) = +1$

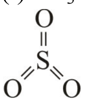
Hence option (a) is correct.

213. The species having pyramidal shape according to VSEPR theory is
(a) SO_3 (b) BrF_3
(c) SiO_3^{2-} (d) OSF_2

TS EAMCET-2017

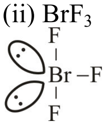
Ans. (d) : The structure of the species is –

(i) SO_3



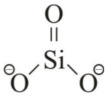
Trigonal planar

(ii) BrF_3



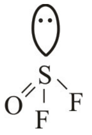
Trigonal bipyramidal

(iii) SiO_3^{2-}



Trigonal planar

(iv) OSF_2



Pyramidal

214. IF_7 is known to exist while BrF_7 does not exist the reason is.
(a) stability of higher oxidation state increases with the size
(b) Br is more electronegative than I
(c) Br cannot gain 7 electrons
(d) I can easily react with F.

J & K CET-(2017)

Ans. (a) : The size of halogen on moving down the group is increases. The interhalogen compound that is formed when there is large electronegativity difference between two halogens and also there is large difference between sizes of the halogens atoms. Seven small fluorine atoms are able to accommodate around a large iodine atom but seven fluorine atoms are not accommodate around a bromine atom due to electronic repulsion between the fluorine atoms and stability of higher oxidation state increases with the size.

215. Which of the following is correct electron dot structure of N_2O molecule?
(a) $:N = N = \ddot{O}:$ (b) $:N \equiv \overset{+}{N} - \underset{\cdot\cdot}{\ddot{O}}:$
(c) $:\ddot{N} = N = \underset{\cdot\cdot}{\ddot{O}}$ (d) $:\ddot{N} = N - \underset{\cdot\cdot}{\ddot{O}}$

Karnataka-CET-2017

Ans. (b) : N_2O is known as nitrous oxide. It commonly name is laughing gas. At room temperature it is a colourless non flammable gas and has a slightly sweet scent and taste. Nitrous oxide is a powerful oxidiser. The dot structure of N_2O molecule –

$$:N \equiv \overset{+}{N} - \underset{\cdot\cdot}{\ddot{O}}:$$

216. Which of the following structure of a molecule is expected to have three bond pairs and one lone pair of electrons?
(a) Octahedral (b) Trigonal planar
(c) Pyramidal (d) Tetrahedral

Karnataka-CET-2017

Ans. (c) : Pyramidal structure of a molecule is expected to have three bond pairs and one lone pair of electrons.
e.g.– NH_3 (ammonia) molecule one electron pair geometry is tetrahedral and molecular shape is pyramidal.

217. Which of the following pairs of compounds is isoelectronic and iso-structural?
(a) TeI_2, XeF_2 (b) IBr_2^-, XeF_2
(c) IF_3, XeF_2 (d) $BeCl_2$, XeF_2

NEET-2017

Ans. (b) : The compound IBr_2^- and XeF_2 are isostructural both have the same number of valence electrons. According to VSEPR geometry is trigonal bipyramidal but the shape are XeF_2 and IBr_2^- is linear.
Isoelectronic species have same number of electron.

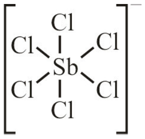
218. Which one of the following has (have) octahedral geometry?
(i) $SbCl_6^-$ (ii) $SnCl_6^{2-}$
(iii) XeF_6 (iv) IO_6^{5-}
(a) (i) (ii) and (iv) (b) (ii) (iii) and (iv)
(c) (i) (ii) and (iii) (d) All of these

UPTU/UPSEE-2017

@apna_pdf

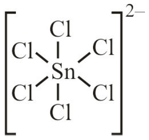
Ans. (a) The geometry of the following molecule –

(i) $SbCl_6^-$



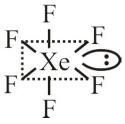
Octahedral

(ii) $SnCl_6^{2-}$



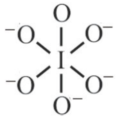
Octahedral

(iii) XeF_6



Distorted octahedral

(iv) IO_6^{5-}



Octahedral

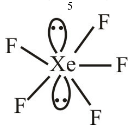
Hence, the $SbCl_6^-$, $SnCl_6^{2-}$ and IO_6^{5-} have the octahedral geometry.

219. The shape of XeF_5^- will be

(a) square pyramid
(b) trigonal bipyramidal
(c) planar
(d) pentagonal bipyramid

WB-JEE-2017

Ans. (c) : The shape of XeF_5^- is–



The XeF_5^- show Sp^3d^3 hybridisation and geometry is pentagonal bipyramidal .

Number of electron pair = $\frac{8+5+1}{2} = 7$

Number of bond pair is five and two lone pair. As lone pairs are present axially to minimize the repulsion Therefore, the shape is planar.

220. XeO_4 molecule is tetrahedral having:

(a) Two pπ–dπ bonds
(b) One pπ–dπ bonds
(c) Four pπ–dπ bonds
(d) Three pπ–dπ bonds

AIIMS-2016

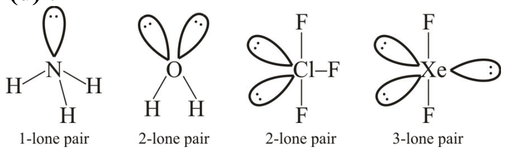
Ans. (c): XeO_4 molecule have tetrahedral structure and hybridization is sp^3. In the fourth excited state of xenon atom has 8 unpaired electrons. One s and three p–orbital undergoes sp^3 hybridisation. Four sp^3 hybrid orbitals form four σ bonds with oxygen atom. Four pπ– dπ bonds are also formed with oxygen atoms by the unpaired electron.

221. In which of the following molecules, maximum number of lone pairs is present on the central atom?

(a) NH_3
(b) H_2O
(c) ClF_3
(d) XeF_2

AP-EAMCET – 2016

Ans. (d) :



Thus, XeF_2 has maximum lone pair present on central atom.

222. Which of the following statements is false?

1. Non- bonding pairs occupy more space than bonding pairs.
2. The bonding orbitals in trigonal bipyramidal molecule are described
3. $SnCl_2$ has linear shape.
4. PCl_4^+ and $AlCl_4^-$ are isoelectronic.

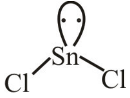
(a) 1
(b) 2
(c) 3
(d) 4

CG PET- 2016

Ans. (c) : (i) Non-bonding pairs occupy more space than bonding pairs.

(ii) The bonding orbitals in trigonal bipyramidal molecule.

(iii) $SnCl_2$ is V-shaped.



(iv) PCl_4^+ and $AlCl_4^-$ are isoelectronic.

223. The central atom of which one of the following molecules, has 3 bond pairs and 2 lone pairs of electrons in its valence shell?

(a) Boron trifluoride
(b) Phosphorous trichloride
(c) Chlorine trifluoride
(d) Xenon trioxide

J & K CET-(2016)

Ans. (c) :

Molecule	Bond pair	Lone pair
Boron trifluoride (BF_3)	3	0
Phosphorous trichloride (PCl_3)	3	1
Chlorine trifluride (ClF_3)	3	2
Xenon trioxide (XeO_3)	3	1

224. Which of the following pairs of ions is isoelectronic and is isostructural?

(a) CO_3^{2-}, NO_3^-
(b) ClO_3^-, CO_3^{2-}
(c) SO_3^{2-}, NO_3^-
(d) ClO_3^-, SO_3^{2-}

NEET-II 2016

Ans. (a) :

Ion	No. of electron	Structure
CO_3^{2-}	32	Trigonal planar
NO_3^-	32	Trigonal planar
ClO_3^-	42	Pyramidal
SO_3^{2-}	58	Pyramidal

Note : ClO_3^- and SO_3^{2-} is isostructural but not isoelectronic.

225. The molecule C_3O_2 has a linear structure, This compound has

(a) 2σ and 3π bonds
(b) 3σ and 4π bonds
(c) 4σ and 4π bonds
(d) 3σ and 2π bonds

UPTU/UPSEE-2016

Ans. (c) : The molecule C_3O_2 has a linear. The structure of the compound are –

@apna_pdf

$O=\underset{sp}{C}=\underset{sp}{C}=\underset{sp}{C}=O$

In C_3O_2 have 4σ and 4π bond, and hybridisation of each carbon has sp and angle is 180^0.

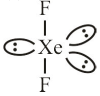
226. The structure of XeF_2 and NH_3 respectively are

(a) linear, see-saw (b) bent, see-saw
(c) bent, tetrahedral (d) linear, pyramidal

UPTU/UPSEE-2016

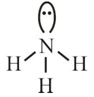
Ans. (d) : The structure of XeF_2 and NH_3 are –

(i) XeF_2



Linear (sp^3d)

(ii) NH_3



Pyramidal (sp^3)

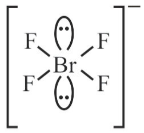
227. The number of lone pair (s) of electrons on the central atom in $[BrF_4]^-$, XeF_6 and $[SbCl_6]^{3-}$ are, respectively

(a) 2, 1 and 1 (b) 2, 1 and 0
(c) 2, 0 and 1 (d) 1, 0 and 0

UPTU/UPSEE-2016

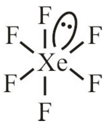
Ans. (a) : The structure of the compound are –

(i) $[BrF_4]^-$



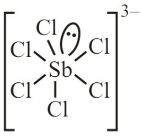
2 lone pair +
4 bond pair
(Square planar)

(ii) XeF_6



1 lone pair +
6 bond pair
(Distorted octohedral)

(iii) $[SbCl_6]^{3-}$

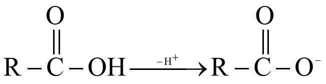


1 lone pair +
6 bond pair
(Distorted octahedral)

228. The structure of carboxylate ion is best represented as

(a) 
(b) 
(c) 
(d) 
UPTU/UPSEE-2016

Ans. (d): The name carboxyl comes from the fact that a carbonyl and hydroxyl group are attached to the same carbon. In carboxylic acid hydrogen is removed then form carboxylate ion.



$$R-\overset{\overset{O}{\|}}{C}-OH \xrightarrow{-H^+} R-\overset{\overset{O}{\|}}{C}-O^-$$

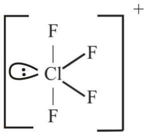
The hybridization of carbon in carboxylate ion is sp^2

229. The geometry around the central atom in ClF_4^+ is

(a) Octahedral (b) Trigonal bipyramidal
(c) Square planar (d) Square pyramidal

UPTU/UPSEE-2016

Ans. (b): The geometry around the central atom in ClF_4^+ is trigonal bipyramidal.



230. Match the following.

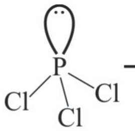
	List I		List II
(A)	PCl_3	(I)	Square planar
(B)	BF_3	(II)	T-shape
(C)	ClF_3	(III)	Trigonal pyramidal
(D)	XeF_4	(IV)	See-saw
		(V)	Trigonal planar

	(A)	(B)	(C)	(D)
(a)	(IV)	(II)	(I)	(III)
(b)	(III)	(V)	(II)	(IV)
(c)	(III)	(V)	(II)	(I)
(d)	(II)	(IV)	(III)	(V)

TS-EAMCET-2016

Ans. (c) :

PCl_3=

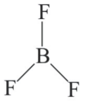


⟶ Trigonal pyramidal

Hybridisation = Bond pair + Lone pair
= 3 + 1 = 4(sp^3)

Similarly,

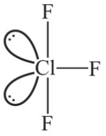
BF_3 =



⟶ Trigonal planer

Hybridisation = 3 + 0 = 3(sp^2)

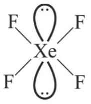
ClF_3=



⟶ T-shaped

Hybridisation = 3 + 2 = 5(sp^3d)

XeF_4=



⟶ Square planer

Hybridisation = 4 + 2 = 6(sp^3d^2)

231. Assertion: Lone pair- lone pair repulsive interaction are greater than lone pair- bond pair and bond pair- bond pair interactions.

Reason: The space occupied by lone pair electrons is more as compared to bond pair electrons.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect
(d) If both the Assertion and Reason are incorrect

AIIMS-12016

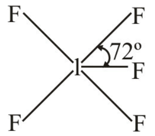
Ans. (a): Lone pair are localised on the central atom, each bonded pair is shared between two atoms. As a result, the lone pair electrons in a molecule occupy more space as compare to the bonding pairs of electrons.

Hence, the greater repulsion between lone pairs-lone pair of electron as compared to lone pair-bond pair and bond pair-bond pair repulsions.

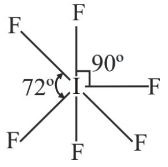
@apna_pdf

232. The structure of IF_5 can be described as

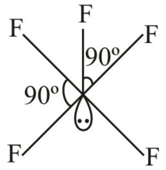
(a)



(b)



(c)

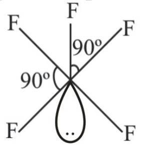


(d) None of these

JCECE - 2015

Ans. (c) : Number of hybrid orbitals
= number of bp + number of lp
= 5 + 1 = 6

Thus, hybridisation is sp^3d^2 but geometry due to the presence of one lone pair is square pyramidal.



233. Number of oxygen atoms shared per SiO_4^{4-} tetrahedron is

I. two dimensional sheet structured silicates
II. cyclic silicates and
III. single strand chain silicates respectively are

(a) 3, 3, 2
(b) 3, 2, 2
(c) 4, 3, 1
(d) 4, 3, 2

JIPMER-2015

Ans. (b) : In two dimensional sheet silicate three oxygens of each SiO_4^{4-} units are shared. Therefore, it contains $(Si_2O_5)_n^{2-}$ type anion. Cyclic silicates are obtained by sharing of two oxygen atoms of each SiO_4^{4-} tetrahedron. Chain silicates are also formed by the sharing of two oxygen atom of each SiO_4^{4-} unit.

234. Which of the following will be able to show geometrical isomerism?

(a) MA_3B – square planar
(b) MA_2B_2–tetrahedral
(c) MABCD–square planar
(d) MABCD– tetrahedral

Karnataka-CET-2015

Ans. (c) : In tetrahedral and square planar arrangements, only the square planar arrangement will be able to show geometrical isomerism. In MA_3B all the arrangement will be same. Therefore, it will show no geometrical isomerism. Square planar complex MABCD type form three isomers i.e. two cis and one trans.

Note : Tetrahedral complexes do not show geometrical isomerism because ligand are attached to central metal atom are same with respect to each other.

235. In which of the following pairs, both the species are not isostructral?

(a) Diamond, silicon carbide
(b) NH_3, PH_3
(c) XeF_4, XeO_4
(d) $SiCl_4$, PCl^+_4

NEET-2015

Ans. (c) :

- Diamond and silicon carbide both are iso structural because their central atom is sp^3 hybridised and tetrahedral geometry.
- NH_3 and PH_3 both the isostructural because central atom is sp^3 hybridised and pyramidal shape.
- XeF_4 has sp^3d^2 hybridisation while XeO_4 has sp^3 hybridisation. So, XeF_4 and XeO_4 are not isostructural.
- $SiCl_4$ and PCl_4^+ both have isostructural and central atom is sp^3 hybridised and shape is tetrahedral.

236. The number of lone pairs of electrons on the central atoms of H_2O, $SnCl_2$, PCl_3 and XeF_2 respectively, are

(a) 2, 1, 1, 3
(b) 2, 2, 1, 3
(c) 3, 1, 1, 2
(d) 2, 1, 2, 3

WB-JEE-2015

Ans. (a) :

Species	Bond pair	Lone Pair
H_2O	2	2
$SnCl_2$	2	1
PCl_3	3	1
XeF_2	2	3

237. What are the shapes of ethyne and methane?

(a) Square planar and linear
(b) Tetrahedral and trigonal planar
(c) Linear and tetrahedral
(d) Trigonal planar and linear

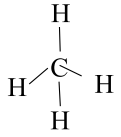
AP EAMCET (Engg.) -2014

Ans. (c) : The shape of ethyne and methane are linear and tetrahedral respectively.

(i) Ethyne (C_2H_2) (ii) Methane (CH_4)

$H-C\equiv C-H$

(linear)



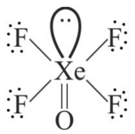
(Tetrahedral)

238. The structure of $XeOF_4$ is

(a) trigonal bipyramidal
(b) square planar
(c) square pyramidal
(d) pyramidal

AP-EAMCET (Engg.) - 2014

Ans. (c) : Hybridisation of $XeOF_4$ is sp^3d^2. Structure of $XeOF_4$ is given below–



The central Xe atom has 1 lone pair of electrons and 5 bonding domains. It undergoes sp^3d^2 hybridization the electron pair geometry is octahedral and the molecular shape is square pyramid.

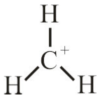
239. The structure of CH_3^+ is

(a) tetrahedral
(b) linear
(c) planar
(d) pyramidal

Assam CEE-2014

@apna_pdf

Ans. (c) : The structure of CH_3^+ is –



Trigonal planar

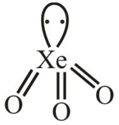
In CH_3^+ the structure is trigonal planar and hybridisation is sp^2 and the bond angle is 120°.

240. What is the geometrical shape of XeO_3 ?

(a) Planar triangular (b) Trigonal pyramidal
(c) Square planar (d) Tetrahydral

GUJCET-2014

Ans. (b) : The structure XeO_3 is –



The geometrical shape of XeO_3 is trigonal pyramidal. The hybridisation of XeO_3 is sp^3.

241. The pair of compounds having identical shapes for their molecules is

(a) CH_4, SF_4 (b) BCl_3, ClF_3
(c) XeF_2, $ZnCl_2$ (d) SO_2, CO_2

Karnataka-CET-2014

Ans. (c) :

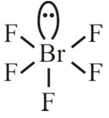
Molecule	**Shape**
CH_4	Tetrahedral
SF_4	See-saw
BCl_3	Trigonal planar
ClF_3	T-shaped
XeF_2	Linear
$ZnCl_2$	Linear
SO_2	V-shaped
CO_2	Linear

242. What is the geometry of molecule of bromine penta fluoride?

(a) Square planar (b) Trigonal bipyramidal
(c) Squre pyramidal (d) Octahedral

MHT CET-2014

Ans. (d) : The geometry of bromine pentafluoride (BrF_5) is octahedral–



The bromine pentafluride 5 are bond pair and one lone pair present so, the shape is square pyramidal.

243. Which one of the following species has planar triangular shape?

(a) N_3^- (b) NO_3^-
(c) NO_2^- (d) CO_2

NEET-2014

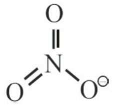
Ans. (b) : The structure of the following are –

(i) N_3^-

$\overset{-}{N}-\overset{+}{N}\equiv N$

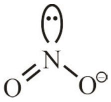
Linear

(ii) NO_3^-



Triangular shape

(iii) NO_2^-



Bent

(iv) CO_2

$O=C=O$

Linear

It the sp^2 hybridisation are triangular planar shape. In NO_3^- has sp^2 hybridised with no lone pair of electron on the central atom.

244. Which of the following molecules possesses linear geometry?

(a) XeF_2 (b) XeF_4
(c) $XeOF_4$ (d) XeF_6

UP CPMT-2014

Ans. (a) : $XeF_2 \Rightarrow$2bp+4*l*p Thus, geometry linear.

$XeF_4 \Rightarrow$ 4bp+2*l*p square planar

$XeOF_4 \Rightarrow$ 5bp+1*l*p square pyramid

$XeF_6 \Rightarrow$ 6bp + 1*l*p distorted octahedral

245. Identify the correct set.

	Molecule	Hybridi-sation	Shape	Number of lone pairs of electrons
(a)	XeO_4	sp^3d^2	pyramidal	1
(b)	XeO_3	sp^3	pyramidal	1
(c)	XeF_4	sp^3d^2	planar	3
(d)	XeF_2	sp^3d	linear	2

AP EAMCET (Medical) - 2013

Ans. (b) : The chemical compounds are XeO_4, XeO_3, XeF_4 and XeF_2.

				Hybridisation	sp^3	sp^3	sp^3d^2	sp^3d
Shape	Tetrahedral	Pyramidal	Square planer	Linear
Lone pair	0	1	2	3

246. Among the following groups which represents the collection of isoelectronic species?

(a) $NO^+, C_2^{2-}, O_2^-, CO$ (b) N_2, C_2^{2-}, CO, NO
(c) CO, NO^+, CN^-, C_2^{2-} (d) NO, CN^-, N_2, O_2^-

AIIMS-2013

Ans. (c): Isoelectronic speices haring the same number of electrons.

$NO^+ = 7+7=14$

$C_2^{2-} = 2\times6+2=14$

$O_2^- = 2\times8+1=17$

$CO = 6+8 = 14$

$N_2 = 2\times7= 14$

$NO = 7 + 8 = 15$

$CN^- = 6 + 7 + 1 = 14$

$O_2= 2\times8=16$

Hence, the option (c) has isoelectronic species.

@apna_pdf

247.

	Molecule	Hybridisation of central atom	Shape
(a)	PCl_5	dsp^3	square pyramidal
(b)	$[Ni(CN)_4]^{2-}$	sp^3	tetrahedral
(c)	SF_6	sp^3d^2	octahedral
(d)	IF_3	dsp^3	pyramidal

Identify the correct set.

AP-EAMCET (Engg.) 2013

Ans. (c) :

Molecule	hybridisation of central atom	Shape
PCl_5	sp^3d	Trigonal bipyramidal
$[Ni(CN)_4]^{2-}$	dsp^2	Square planar
SF_6	sp^3d^2	Octahedral
IF_3	sp^3d	T-shaped

248. Which of the following will have the shape of a trigonal bipyramid?

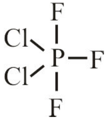
(a) PF_3Cl_2 (b) IF_5

(c) BrF_5 (d) SbF_5^{2-}

CG PET- 2013

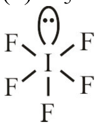
Ans. (a) : The shape of the following species is –

(a) PF_3Cl_2



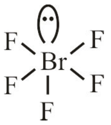
Trigonal bipyramidal

(b) IF_5



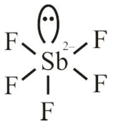
Square pyramidal

(c) BrF_5



Square pyramidal

(d) SbF_5^{2-}



Square pyramidal

So, PF_3Cl_2 has trigonal bipyramidal and other are square pyramidal.

249. d^2sp^3 hybridisation of the atomic orbitals gives

(a) square planer structure

(b) triangular structure

(c) tetrahedral structure

(d) octahedral structure

Karnataka-CET-2013

Ans. (d) : When one s and three p and two d-orbitals mixed together to form a six new equivalent sp^3d^2 or d^2sp^3 hybrid orbitals. The type of hybridisation d^2sp^3 or sp^3d. The structure atomic orbitals is octahedral.

250. Which one of the following have linear structure?

(I) I_3^- (II) NO_2^- (III) I_3^+ (IV) SO_2

(V) N_3^-

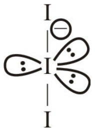
(a) I, II and III (b) I and V

(c) II, III and IV (d) All of these

UPTU/UPSEE-2013

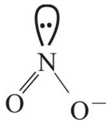
Ans. (b) : The structure of the following are-

(i) I_3^-



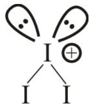
(Linear)

(ii) NO_2^-



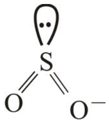
(Bent)

(iii) I_3^+



(Pyramidal)

(iv) SO_2



(Bent)

(v) N_3^-

$^{-}N = \overset{+}{N} = N^{-}$

Linear

Hence, I_3^- and N_3^- have linear structure.

251. Consider the following molecules/ions:

(1) NH_4^+ (2) H_3O^+

(3) NH_3 (4) $SiCl_4$

Which pair does not contain a lone pair ?

(a) 1 and 2 (b) 1 and 3

(c) 1 and 4 (d) 2 and 4

SCRA 2012

Ans. (c) : The molecules NH_4^+ and $SiCl_4$ does not contain a lone pair.

Molecules/ions	Lone pair
	0
	1
	1
	0

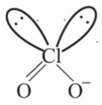
252. The shape of ClO_2^- according to valence shell electron pair repulsion (VSEPR) theory will be

(a) Planar triangle (b) Angular

(c) Tetrahedral (d) Square planar

AIIMS-2012

Ans. (b): The shape of ClO_2^-



The shape of ClO_2^- has angular according to valence shell electron pair repulsion (VSEPR) theory. The hybridization of ClO_2^- is sp^3.

@apna_pdf

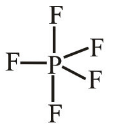
253. In which of the following pairs, the two species are not isostructural?

(a) CO_3^{2-} and NO_3^- (b) $PC\ell_4^+$ and $SiC\ell_4$

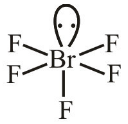
(c) PF_5 and BrF_5 (d) $A\ell F_6^{3-}$ and SF_6

(AIEEE-2012)

Ans. (c) : The two species are not isostructural is PF_5 and BrF_5. PF_5 is trigonal bipyramidal and BrF_5 square pyramidal structure.



(Trigonal Bipyramidal)



(Square Pyramidal)

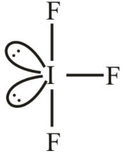
254. Which of the following molecules has trigonal planar geometry?

(a) IF_3 (b) PCl_3

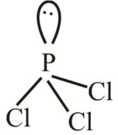
(c) NH_3 (d) BF_3

JCECE - 2012

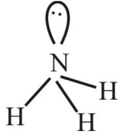
Ans. (d) : (a) IF_3 has bent-T geometry



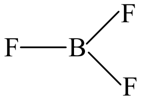
(b) PCl_3 has pyramidal geometry



(c) NH_3 has pyramidal geometry



(d) BF_3 has trigonal planer geometry



($\mu = 0$)

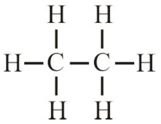
255. The C—H bond and C—C bond in ethane are formed by which of the following types of overlap?

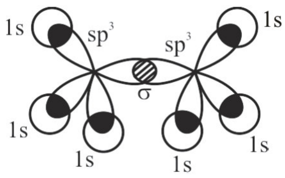
(a) sp^2 - s and sp^2-sp^2 (b) sp-s and sp-sp

(c) p-s and p-p (d) sp^3-s and sp^3- sp^3

Karnataka-CET-2012

Ans. (d) : In ethane the structure is –





In ethane C atom are sp^3 hybridised and attached with single sigma bond.

The H atoms are 1s to form σ-bond. The C–H bond and C–C bond in ethane are formed by sp^3–s and sp^3–sp^3 overlap.

256. Which one of the following statements regarding ammonia is not correct?

(a) NH_3 has sp^2 hybridization

(b) NH_3 acts as a Lewis base

(c) NH_3 gas is highly soluble in water

(d) NH_3 is pyramidal in shape

UP CPMT-2012

Ans. (a) : Ammonia molecule is sp^3 hybridised. It is trigonal pyramidal with the nitrogen atom at the apex. Due to the presence of one lone pair of electrons its shape becomes trigonal pyramidal from tetrahedral.

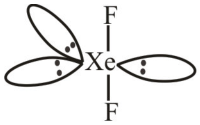
257. In which of the following pairs, the central atoms have the same number of lone pairs of electrons?

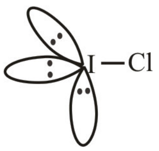
(a) PCl_5, BrF_5 (b) XeF_2, ICl

(c) XeF_4, ClO_4^- (d) SCl_4, CH_4

AP-EAMCET- (Engg.)-2011

Ans. (b) : XeF_2 and ICl have the central atoms are Xe and I respectively have the same number of lone pairs of electrons.





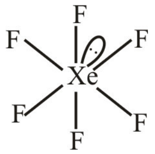
258. The hybridisation of Xe and the number of lone pairs of electrons on it in XeF_6 are

(a) $sp^3d^2, 1$ (b) $sp^3d^3, 2$

(c) $sp^3d^2, 2$ (d) $sp^3d^3, 1$

AP-EAMCET- (Engg.)-2011

Ans. (d) :



XeF_6

XeF_6 has distorted octahedral structure. The hybridisation of Xe is sp^3d^3 and present one lone pair.

259. A σ bonded molecule MX_3 is T-shaped. The number of non bonded pair of electrons is

(a) 0

(b) 2

(c) 1

(d) can be predicted only if atomic number is known

BITSAT 2011

Ans. (b) : For T-shape geometry the molecule must have 3 bonded pair and 2 lone pair of electrons.

260. Pick out the iso-electronic structures from the following

CH_3^+;	H_3O^+;	NH_3;	CH_3^-
I	II	III	IV

(a) I and II (b) I and II

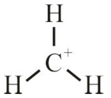
(c) I and IV (d) II,III and IV

CG PET- 2011

@apna_pdf

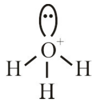
Ans. (d) : The structure of given compound are –

(i) CH_3^+



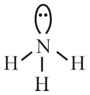
Trigonal planar

(ii) H_3O^+



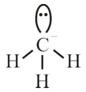
Pyramidal

(iii) NH_3



Pyramidal

(iv) CH_3^-



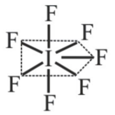
Pyramidal

Hence, the iso-electronic structures are H_3O^+, NH_3 and CH_3^-.

261. The structure of IF_7 is
(a) Square pyramid
(b) Trigonal bipyramid
(c) Octahedral
(d) Pentagonal bipyramidal

(AIEEE-2011)

Ans. (d) The structure of IF_7 is pentagonal bipyramidal. It has sp^3d^3 hybridisation and angle is 90°, 72°.



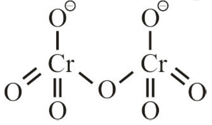
Pentagonal bipyramidal (sp^3d^3)

262. The bonds present in the structure of dichromate ion are
(a) four equivalent Cr—O bonds only
(b) six equivalent Cr—O bonds and one O—O bond
(c) six equivalent Cr—O bonds and one Cr—Cr bond
(d) eight equivalent Cr—O bonds
(e) six equivalent Cr—O bonds and one Cr—O—Cr bond

Kerala-CEE-2011

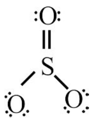
Ans. (e) : The dichromate ion $\left(Cr_2O_7^{2-}\right)$. There is –2 charge on overall molecule. In dichromate ion has two chromium atoms.

The 6 Cr–O bonds have equal length and the charge is on the overall molecule. The structure of the dichromate di-anion can be represented in two forms.

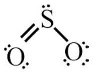


263. Which of the following structures is the most preferred and hence of lowest energy for SO_3?

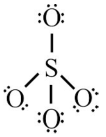
(a)



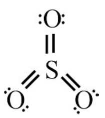
(b)



(c)



(d)

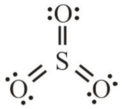


NEET-2011

Ans. (d) : Formal charge decided the lowest energy structure from a number of possible Lewis structure is given species.

Formal charge = Total no. of valence electron – non bonding e^- $-\frac{1}{2}\times$ bonding e^-

In SO_3,



Formal charge of S atom = $6-0-\frac{1}{2}\times 12=0$

Formal charge of O atom = $6-4-\frac{1}{2}\times 4=0$

Hence, the option (d) is most preferred and lowest energy of SO_3.

264. Structure of ICl_2^- is
(a) Trigonal
(b) Octahedral
(c) Square planar
(d) Distorted trigonal bipyramidal

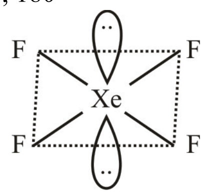
UP CPMT-2011

Ans. (d) : In ICl_2^-, I is sp^3d-hybridised. The structure of ICl_2^- is distorted trigonal bipyramidal due to the presence of lone pair of electrons.

265. XeF_4 has a shape of
(a) spherical (b) trigonal bipyramidal
(c) square planar (d) tetrahedral

CG PET- 2010

Ans. (c): XeF_4 (Xenon tetrafluoride) has a shape of square planar.
- Hybridization : sp^3d^2
- Bond angle : 90°, 180°



266. Match the following.

	Column I (Molecules)		**Column II (Number of lone pairs on central atom)**
A.	**NH_3**	**1.**	**Two**
B.	**H_2O**	**2.**	**Three**
C.	**XeF_2**	**3.**	**Zero**
D.	**CH_4**	**4.**	**Four**
		5.	**One**

	A	B	C	D
(a)	5	1	3	2
(b)	3	1	2	5
(c)	5	1	2	3
(d)	1	5	3	4

AP-EAMCET- (Engg.) - 2010

@apna_pdf

Ans. (c) :

Column –I (molecules)	**Column –II (no. of lone pairs on central atom)**
NH_3	 (1 lone pair)
H_2O	 (2 lone pair)
XeF_2	 (3 lone pair)
CH_4	 (0 lone pair)

267. Which one of the following conversions involve change in both hybridization and shape?

(a) $CH_4 \rightarrow C_2H_6$ (b) $NH_3 \rightarrow NH_4^+$

(c) $BF_3 \rightarrow BF_4^-$ (d) $H_2O \rightarrow H_3O^+$

KARNATAKA-CET, 2010

Ans. (c) :

(a) $\underset{\substack{4bp+0lp\\ \text{Hybridisation } sp^3\\ \text{Structure tetrahdral}}}{CH_4} \longrightarrow \underset{\text{tetrahdral}}{\underset{\substack{4bp\\ sp^3}}{CH_3} - \underset{\substack{4bp\\ sp^3}}{CH_3}}$

(b) $\underset{\substack{3bp+1lp\\ \text{Hybridisation } sp^3\\ \text{Structure pyramidal}}}{NH_3} \longrightarrow \underset{\substack{4bp\\ sp^3\\ \text{tetrahedral}}}{NH_4^+}$

(c) $\underset{\substack{3bp\\ \text{Hybridisation } sp^2\\ \text{Structure trigonal}\\ \text{planar}}}{BF_3} \longrightarrow \underset{\substack{4bp\\ sp^3\\ \text{tetrahedral}}}{BF_4^-}$

(d) $\underset{\substack{2bp+2lp\\ \text{Hybridisation } sp^3\\ \text{Structure angular}}}{H_2O} \longrightarrow \underset{\substack{3bp+1lp\\ sp^3\\ \text{pyramidal}}}{H_3O^+}$

Thus, conversion of BF_3 into BF_4^- involves change or both hybridisation and shape.

268. Which of the following statements is false?

(a) H_2 molecule has 1 σ bond

(b) HCl molecule has1 σ bond

(c) Water molecule has 2 σ bonds and two lone pairs

(d) Ethylene molecule has 5 σ bonds and 1π bond

(e) Acetylene molecule has 3π bonds and 3 σ bond

Kerala-CEE-2010

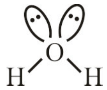
Ans. (e) : (i) H_2 molecule has 1 σ-bond.

H – H

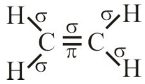
(ii) HCl molecule has 1 σ-bond.

H – Cl

(iii) Water molecule has 2 σ-bond and two lone pairs.



(iii) Ethylene molecule has 5 σ-bond and 1π-bond.



(iv) Acetylene (C_2H_2) molecule has 2π-bond and 3σ-bond.

$$H\overset{\sigma}{-}C\underset{2\pi}{\overset{\sigma}{\equiv}}C\overset{\sigma}{-}H$$

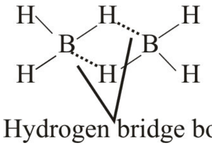
269. In which of the following molecules is hydrogen bridge bond present?

(a) Water (b) Inorganic benzene

(c) Diborane (d) Methanol

WB-JEE-2010

Ans. (c) : Diborane (B_2H_6) is the chemical compound consisting of boron and hydrogen with the formula B_2H_6. If is a colourless and highly unstable gas at room temperature with a repulsively sweet odour. Diborane mixed with air easily and forming explosive mixture.



Hydrogen bridge bond.

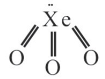
270. The number of pπ – dπ 'pi' bonds present in XeO_3 and XeO_4 molecules, respectively are

(a) 3, 4 (b) 4, 2

(c) 2, 3 (d) 3, 2

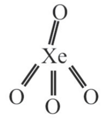
VITEEE- 2009

Ans. (a) : **Structure of XeO_3**



⇒ 3pπ-dπ bonds.

Structure of XeO_4



⇒ 4pπ-dπ bonds.

271. Which of the following specis in non-linear ?

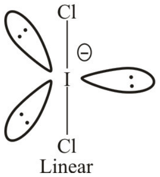
(a) ICl_2^- (b) I_3^-

(c) N_3^- (d) ClO_2^-.

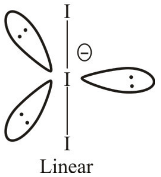
AMU – 2009

Ans. (d) :

(i) ICl_2^- (ii) I_3^-



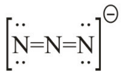
Linear



Linear

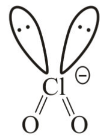
@apna_pdf

(iii) N_3^-



Linear

(iv) ClO_2^-



V-shaped (angular)

272. A compound has four sp^3 hybridised covalent bonds. Its shape is

(a) linear (b) square planar
(c) octahedral (d) tetrahedral

BCECE-2009

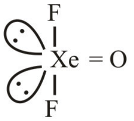
Ans. (d) : A compound has four sp^3 hybridised covalent bonds. It shape is tetrahedral.
When one s-orbital and 3p-orbitals belonging to the same shell of an atom mix together to form four new equivalent orbital, the type of hybridisation is called a tetrahedral and angle is 109°28'.

273. The shape of $XeOF_2$ on the basis of VESPR theory is

(a) See saw (b) V-shaped
(c) Trigonal planar (d) T-shaped

J & K CET-(2009)

Ans. (d) : The structure of $XeOF_2$ on the basis of VSEPR theory.



(sp^3d) (T-shaped)

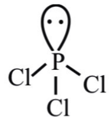
In $XeOF_2$ molecule the shape is T-shaped and hybridisation is sp^3d.

274. The shape of PCl_3 molecule is

(a) trigonal bipyramidal (b) tetrahedral
(c) pyramidal (d) square planar

JCECE - 2009

Ans. (c) : The shape of PCl_3 is trigonal pyramidal. The central atom P has one lone pair of electrons and three bond pairs of electron. The hydridisation of PCl_3 is sp^3.



Trigonal pyromidal

275. Which of the following represents the Lewis structure of N_2 molecule?

(a) ${}^{x}_{x}N \equiv N^{x}_{x}$

(b) ${}^{x}_{x}\overset{xx}{N} \equiv \overset{xx}{N}^{x}_{x}$

(c) ${}^{x}_{x}\overset{xx}{N} \equiv \underset{xx}{\overset{xx}{N}}^{x}_{x}$

(d) ${}^{x}_{x}\underset{xx}{\overset{xx}{N}} \equiv \underset{xx}{\overset{xx}{N}}^{x}_{x}$

JCECE - 2009

Ans. (a) : Diatomic nitrogen (N_2) molecule has a triple bond between the two atoms one σ bond from combining of $2p_z$ atomic orbitals and two π–bonds from the combination of $2p_x$ and $2p_y$ respectively. The lewis structure to N_2 molecule.

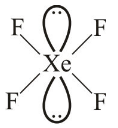
$${}^{x}_{x}N \equiv N^{x}_{x}$$

276. The shape of XeF_4 molecule and hybridization of xenon in it are

(a) tetrahedral and sp^3
(b) square planar and dsp^2
(c) square planar and sp^3d^2
(d) octahedral and sp^3d^2
(e) octahedral and d^2sp^3

Kerala-CEE-2009

Ans. (c) : The structure of XeF_4 is square planar–



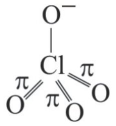
The shape of XeF_4 is square planar and the hybridisation is sp^3d^2.

277. The compound in which the number of dπ-pπ bonds are equal to those present in ClO_4^-, is:

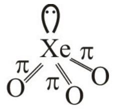
(a) XeF_4 (b) XeO_3
(c) XeO_4 (d) XeF_6

AP-EAMCET/2008

Ans. (b): The structure of ClO_4^-



It contain 3dπ – pπ bonds and XeO_3 contain 3dπ – pπ bonds as:

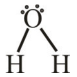


278. The  **bond angle in H_2O is 104.5°. This fact can be best explained with the help of**

(a) Valence Shell Electron Pair Repulsion (VSEPR) Theory
(b) Molecular Orbital Theory
(c) Presence of hydrogen bond
(d) Electronegativity difference between hydrogen and oxygen atoms.

MPPET-2008

Ans. (a) :



H_2O has sp^3 hybridisation and bond angle is 104.5°. It is explained with the help of Valence Shell Electron Pair Repulsion (VSEPR) theory.

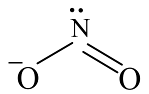
279. The actual geometry of NO_2^- is

(a) Planer (b) Linear
(c) V -shape (d) Tetrahedral

MPPET-2008

@apna_pdf

Ans. (c) : the geometry of NO_2^- is



V– shaped geometry.

280. Match the following

List-I	List-II
(A) BCl_3	(i) Linear
(B) $PdBr_4^{2-}$	(ii) Planar triangular
(C) SF_6	(iii) Tetrahedral
(D) I_3^-	(iv) Octahedral
	(v) Square planer

The correct match is

	A	B	C	D
(a)	(ii)	(iii)	(iv)	(i)
(b)	(v)	(iii)	(ii)	(i)
(c)	(ii)	(v)	(iv)	(i)
(d)	(v)	(iv)	(iii)	(ii)

AP-EAMCET (Medical), 2008

Ans. (c) :

	Compound	Hybridisation	Structure
(A)	BCl_3	sp^2	 Planar Triangular
(B)	$PdBr_4^{2-}$	dsp^2	 (Square planer)
(B)	$PdBr_4^{2-}$	dsp^2	 (Square planer)
(D)	I_3^-	sp^3d	 (Linear)

281. Which one of the following is a correct set with respect to molecule, hybridisation and shape?

(a) $BeCl_2$, sp^2, linear

(b) $BeCl_2$, sp^2, triangular planar

(c) BCl_3, sp^2, triangular planar

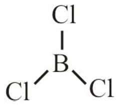
(d) BCl_3, sp^3, tetrahedral

BCECE-2008

Ans. (c) : The structure of the molecule –

Cl – Be – Cl

Linear (sp)



Triangular planar (sp^2)

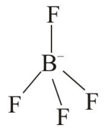
282. Which of the following is not tetrahedral ?

(a) BF_4^- (b) NH_4^+

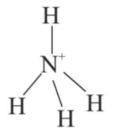
(c) CO_3^{2-} (d) SO_4^{2-}

AP-EAMCET/2007

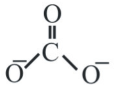
Ans. (c): The structure are given as :



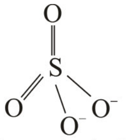
(Tetrahedral)



(Tetrahedral)



Trigonal Planar



(Tetrahedral)

Hence, CO_3^{2-} is a trigonal planar.

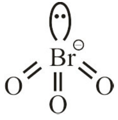
283. In which of the following pairs, the two species are iso-structural?

(a) SO_3^{2-} and NO_3^- (b) BF_3 and NF_3

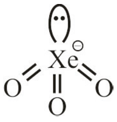
(c) BrO_3^- and XeO_3 (d) SF_4 and XeF_4

NEET-2007

Ans. (c) : The iso-structural species are –



and



Pyramidal Pyramidal

So, the two species BrO_3^- and XeO_3 both are iso-structural.

284. Among the following, the pair in which the two species are not isostructural is

(a) IO_3^- and XeO_3 (b) PF_6^- and SF_6

(c) BH_4^- and NH_4^+ (d) CO_3^{2-} and NO_2^-

(e) SiF_4 and SF_4

Kerala-CEE-2007

Ans. (d&e) :

Species	**Structure**
IO_3^-	Pyramidal
XeO_3	Pyramidal
PF_6^-	Octahedral
SF_6	Octahedral
BH_4^-	Tetrahedral
NH_4^+	Tetrahedral
CO_3^{2-}	Trigonal planar
NO_2^-	V-shaped
SiF_4	Tetrahedral
SF_4	See-saw

@apna_pdf

285. Match List-I with List-II and choose the correct matching codes from the choices given.

List-I	List-II
A. PCl_5	1. Linear
B. IF_7	2. pyramidal
C. H_3O^+	3. Trigonal bipyramidal
D. ClO_2	4. Tetrahedral
E. NH_4^+	5. Pentagonal bipyramidal
	6. Angular

Codes

(a) A-3, B-5, C-2, D-1, E-4
(b) A-3, B-5, C-4, D-1, E-2
(c) A-3, B-5, C-6, D-1, E-2
(d) A-3, B-5, C-2, D-6, E-4
(e) A-3, B-5, C-2, D-4, E-1

Kerala-CEE-2007

Ans. (d) :

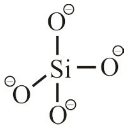
List-I	**List-II**
PCl_5	Trigonal bipyramidal
IF_7	Pentagonal bipyramidal
H_3O^+	Pyramidal
ClO_2	Angular
NH_4^+	Tetrahedral

286. Geometry of SiO_4^{4-} anion is

(a) tetrahedral (b) trigonal
(c) trihedral (d) pentagonal

MHT CET-2007

Ans. (a) : The structure of SiO_4^{4-} anion is –



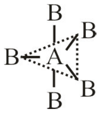
In SiO_4^{4-} has tetrahedral geometry and hybridisation is sp^3. In SiO_4^{4-} have four Si–O bond are present.

287. Which of the following is not a correct statement?

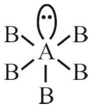
(a) Multiple bonds are always shorter than corresponding single bonds.
(b) The electron deficient molecules can act as Lewis acids
(c) The canonical structures have no real existence
(d) Every AB_5 molecule does in fact have square pyramid structure

NEET-2006

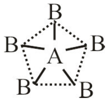
Ans. (d) : Generally AB_5 molecule have trigonal bipyramidal structure due to sp^3d hybridisation but AB_5 molecule have three possible geometries –



Trigonal bipyramidal



Square pyramidal



Planar pentagonal

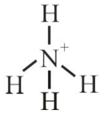
288. Which of the following is not iso-structural with $SiCl_4$?

(a) NH_4^+ (b) SCl_4
(c) SO_4^{2-} (d) PO_4^{3-}

NEET-2006

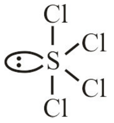
Ans. (b) : The geometry of $SiCl_4$ is tetrahedral and hybridisation is sp^3.

(i) NH_4^+



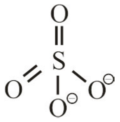
Td

(ii) SCl_4



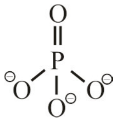
See-saw

(iii) SO_4^{2-}



Td

(iv) PO_4^{3-}



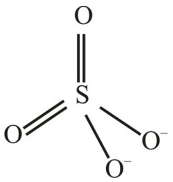
Td

289. The shape of sulphate ion is :

(a) square planar (b) trigonal
(c) trigonal planar (d) tetrahedral

BCECE-2006

Ans. (d) : The sulphate ion is SO_4^{2-} and the structure is



The shape of sulphate ion (SO_4^{2-}) is tetrahedral and hybridisation is sp^3.

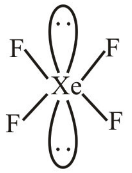
290. Among the following, the species having square planar geometry for central atom are
(i) XeF_4 (ii) SF_4 (iii) $[NiCl_4]^{2-}$ (iv) $[PtCl_4]^{2-}$

(a) (i) and (iv) (b) (i) and (ii)
(c) (ii) and (iii) (d) (iii) and (iv)

AIIMS-2006

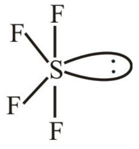
Ans. (a): The shape of the species are–

(i) XeF_4



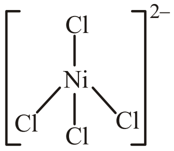
Square planar

(ii) SF_4



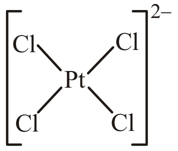
See–saw

(iii) $[NiCl_4]^{2-}$



Tetrahedral

(iv) $[PtCl_4]^{2-}$



Square planar

Hence, the species having square planar geometry for central atom are XeF_4, $[PtCl_4]^{2-}$

@apna_pdf

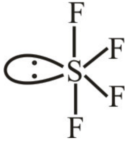
291. In which of the following molecules/ions, all the bonds are not equal?

(a) SF_4 (b) SiF_4

(c) XeF_4 (d) BF_4^-

(AIEEE-2006)

Ans. (a) : In geometry of SF_4 molecule is –



In SF_4 molecule has two type of bond two are axial and two are equatorial. In equatorial position bond length is small in comparison to axial bond length because axial bond has no hindrance (crowding) in environment. So, SF_4 has show two type of bond.

292. Which of the following molecule in its valence shell has three bond pairs of electrons and one lone pair of electron?

(a) NH_3 (b) H_2O

(c) BF_3 (d) CO_2

J & K CET-(2006)

Ans. (a) :

Molecule	Bond Pair	Lone pair
NH_3	3	1
H_2O	2	2
BF_3	3	0
CO_2	2	0

In NH_3 (ammonia) molecule in its valence shell has three bond pairs of electrons and one lone pair of electron.

293. Which is extremely stable?

(a) NF_3 (b) NCl_3

(c) NBr_3 (d) NH_3

JCECE - 2006

Ans. (a) : Nitrogen is belong to 2nd period and smaller in size due to which it can accommodate only atoms which are smaller in size. Fluorine being smaller in size can form a better bond with nitrogen because both belong to 2nd period element. Chlorine belongs to 3rd period element it can overlap is not better. So, NF_3 is a stable compound due to which same shell is involved in overlap.

294. Which of the following species has a linear shape?

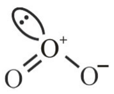
(a) O_3 (b) NO_2^-

(c) SO_2 (d) NO_2^+

NEET-2006

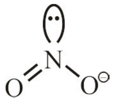
Ans. (d) : The shape of the following species –

(i) O_3



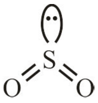
V-shape

(ii) NO_2^-



Bent

(iii) SO_2



V-shape

(iv) NO_2^+

$O=\overset{+}{N}=O$

Linear

295. Assertion: $SeCl_4$ does not have a tetrahedral structure.

Reason: Se in $SeCl_4$ has two lone pairs.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.

(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.

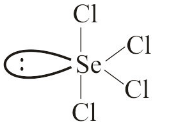
(c) If the Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2005

Ans. (c): $SeCl_4$ has see-saw geometry, which is regarded as a distorted trigonal bipyramidal structure, one lone pair of electron is equatorial position of trigonal bipyramidal $SeCl_4$ molecules arises due to sp^3d hybridisation of the central atom.



$SeCl_4$ molecule

296. Which of the following molecules has pentagonal bipyramidal shape?

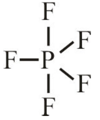
(a) PF_5 (b) SF_6

(c) XeF_6 (d) $[Fe(CN)_6]^{3-}$

AMU-2005

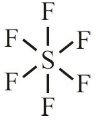
Ans. (c) : The shape of molecule are –

(i) PF_5



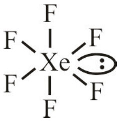
Trigonal bipyramidal

(ii) SF_6



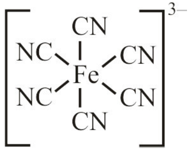
Octahedral

(iii) XeF_6



Pentagonal bipyramidal

(iv) $[Fe(CN)_6]^{3-}$



Octahedral

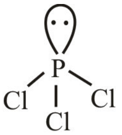
297. The molecule having a pyramidal shape out of the following is

(a) CO_2 (b) PCl_3

(c) SF_4 (d) NH_4^+

J & K CET-(2005)

Ans. (b) : PCl_3 has a pyramidal shape due to phosphorous atom is sp^3 hybridized with three bond pairs and one lone pair.



Pyramidal (sp^3)

@apna_pdf

298. The pair having similar geometry is

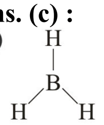
(a) BH_3, NH_3 (b) $BeCl_2$, H_2O

(c) CH_4, CCl_4 (d) IF_5, PF_5

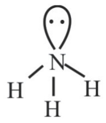
J & K CET-(2005)

Ans. (c) :

(a)



Trigonal Planar

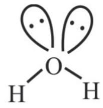


Pyramidal

(b)

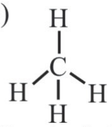
Cl–Be–Cl

linear

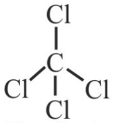


V-shaped

(c)

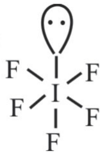


Tetrahedral

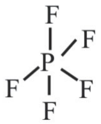


Tetrahedral

(d)



Square pyramidal



Trigonal bipyramidal

Hence, the option (a) and (c) both pair have similar geometry.

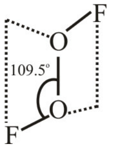
299. Shape of O_2F_2 is similar to that of;

(a) C_2F_2 (b) H_2O_2

(c) H_2F_2 (d) C_2H_2

AIIMS-2004

Ans. (b): The shape of O_2F_2 and H_2O_2 are similar. O_2F_2 and H_2O_2 are peroxides



In O_2F_2 and H_2O_2 , one O–O bond lying in a plane and two O–F bonds lying in different plane. H_2O_2 and O_2F_2 has non–linear and non–planar structure. O_2F_2 and H_2O_2 both have open book type structure.

300. Assertion: All F–S–F angle is SF_4 are greater than 90° but less than 180°,

Reason: The lone pair- bond pair repulsion is weaker than bond pair- bond pair repulsion.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.

(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.

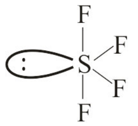
(c) If the Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2004

Ans. (d): In SF_4 molecule has see-saw structure in which bond angles are different between different S-F atoms. SF_4 molecule has sp^3d hybridisation and non-planar structure. According to VSEPR theory lone pair-lone pair > lone pair-bond pair > bond pair-bond pair repulsion.



SF_4 molecule

301. Identify the correct sequence of increasing number of a bonds in the structures of the following molecules :

I. $H_2S_2O_6$ II. H_2SO_3

III. $H_2S_2O_5$

(a) I < II < III (b) II < III < I

(c) II < I < III (d) I < III < II

AP-EAMCET (Engg.)-2004

Ans. (b) : The molecules are $H_2S_2O_6$(I), H_2SO_3(II) and $H_2S_2O_5$.

	Structure	Number of bonds
(i)	 (Dithionic acid)	9σ, 4π
(ii)	 (Sulfurous acid)	3σ, 1π
(iii)	 (Disulfurous acid)	8σ, 3π

Hence, the correct sequence of increasing number of a bonds is given as:- II < III < I.

302. Which one of the following has the regular tetrahedral structure?

(Atomic number : B = 5, S = 16, Ni = 28, Xe=54)

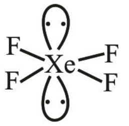
(a) XeF_4 (b) SF_4

(c) BF_4^- (d) $\left[Ni(CN)_4\right]^{2-}$

(AIEEE-2004)

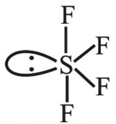
Ans. (c) : The structure of the species are –

(i) XeF_4



(Square planar

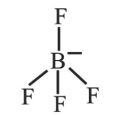
(ii) SF_4



(See- Saw)

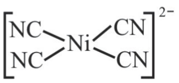
@apna_pdf

(iii) BF_4^-



(Tetrahedral)

(iv) $[Ni(CN)_4]^2$



(Square planar)

In BF_4^- has the regular tetrahedral structure.

303. Two oxides of nitrogen, NO and NO_2 react together at 253K and form a compound of nitrogen, X. X reacts with water to yield another compound of nitrogen, Y. The shape of the anion of Y molecule is

(a) Tetrahedral (b) Angular
(c) Square Planar (d) Pyramidal

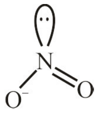
AP EAMCET- 2003

Ans. (b) : When NO and NO_2 react together at 253 K then N_2O_3 is formed. N_2O_3 (X) is react with H_2O to form the hyponitrous acid (HNO_2)

$$NO + NO_2 \xrightarrow{253K} \underset{'X'}{N_2O_3}$$

$$N_2O_3 + H_2O \rightarrow \underset{'Y'}{2HNO_2}$$

$$HNO_2 \rightarrow H^+ + NO_2^-$$



The shape of NO_2^- is shown in figure which is angular in shape.

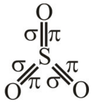
304. Compound X is anhydride of sulphuric acid. The number of σ-bonds and the number of π-bonds present in X are, respectively

(a) 3, 3 (b) 4, 2
(c) 2, 4 (d) 4, 3

AP EAMCET- 2003

Ans. (a) : Sulphuric acid decomposes to give sulphure trioxide, SO_3 and H_2O, thus SO_3 is regarded as anhydride of sulphuric acid

$$H_2SO_4 \xrightarrow[-H_2O]{} H_2O + SO_3$$



3σ and 3π are present in anhydride of H_2SO_4.

305. Which one of the following is a correct set with respect to molecule hybridisation and shape?

(a) $BeCl_2$, sp^2, linear
(b) $BeCl_2$, sp^2, triangular planar
(c) BCl_3, sp^2, triangular planar
(d) BCl_3, sp^3, tetrahedral

AP-EAMCET (Medical), 2003

Ans. (c) : The molecules are

$BeCl_2$	BCl_3
Cl–Be–Cl Hybridisation = sp Shape = linear	 Hybridisation = sp^2 Shape = Trigonal planer

306. The electronic theory of bonding was proposed by :

(a) Pauling (b) Lewis
(c) Bronsted (d) Mullikan

BCECE-2003

Ans. (b) : The electronic theory of bonding was proposed by Lewis. Pauling gave the scale of electro negativity, Bronsted gave the concept of acid and base. Mullikan gave the determination charge on electron.

307. The geometry of the molecule having s and p-characters equal to 25% and 75% respectively, is:

(a) trigonal (b) linear
(c) tetrahedral (d) octahedral

JCECE - 2003

Ans. (c): The geometry of molecule having S and P-character equal to 25% and 75% respectively is tetrahedral.

308. Which one of the following is the correct with reference to molecular formula, hybridisation of central atom and shape of the molecule?

(a) CO_2, sp^2, bent (b) H_2O, sp^2, bent
(c) $BeCl_2$, sp, linear (d) H_2O, sp^3, linear

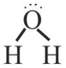
AP-EAMCET (Medical), 2002

Ans. (c) : (a) CO_2, $:\ddot{O} = C = \ddot{O}:$

Hybridisation = sp

Shape = linear

(b) H_2O,



Hybridisation = sp^3

Shape = Angular

(c) $BeCl_2$, Cl — Be — Cl

Hybridisation = sp

Shape = linear

Thus, the correct option is (c).

309. Assertion: Sigma (σ) is a strong bond, while pi (π) is a weak bond.

Reason: Atoms rotate freely about pi (π) bond.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2002

Ans. (c): Sigma (σ) bonding involves end to end overlapping of two atomic orbitals. eg. s and s, s and p and p and p orbitals.

π-bonding involves sidewise overlapping of the two atomic orbitals. eg. p and p orbital.

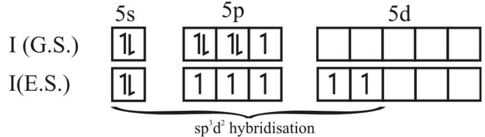
Hence, the overlapping of orbitals is more effective in σ bonding than in π-bonding due to lateral overolap in π- bonding atom cannot rotate freely in π-bond.

@apna_pdf

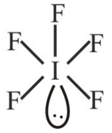
310. The shape of IF_5 is
(a) pentagonal bipyramidal
(b) square pyramidal
(c) octahedral
(d) trigonal planner

UP CPMT-2001

Ans. (b) : Hybridization and lone pair of electrons decide the geometry of molecule.



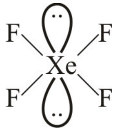
The hybridization in IF_5 molecule is sp^3d^2 but geometry is square pyramidal instead of octahedral due to presence of lone pair of electron in valence shell of iodine.



311. The number of lone pairs of electrons present on Xe in XeF_4 is :
(a) 3
(b) 4
(c) 1
(d) 2

AP EAMCET (Engg.) 2001

Ans. (d): The structure of XeF_4 is square planar:



Number of lone pairs of electrons present on Xe in XeF_4 is 2. The hybridization of Xe is sp^3d^2.

312. Which of the following is the correct pair?
(a) $BeCl_2$ – linear
(b) NH_3 – linear
(c) CO_2 – Tetrahedral
(d) BF_3 – octahedral

AP-EAMCET/2000

Ans. (a):

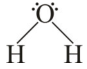
Molecule	Hybridization	Geometry/Shape
$BeCl_2$	sp	Linear
NH_3	sp^3	Pyramidal
CO_2	sp	Linear
BF_3	sp^2	Trigonal planer

Hence, option (a) is correct.

313. According to VSEPR theory the shape of the water molecule is:
(a) linear
(b) planar triangle
(c) V-shaped
(d) octahedral

AP EAMCET (Medical) -1998

Ans. (c): The structure of H_2O–

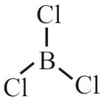


The hybridisation of water molecule is sp^3. There is two lone pair electron present on oxygen atom due to which they acquire the V-shaped.

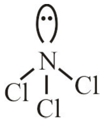
314. The BCl_3 is a planar molecule whereas NCl_3 is pyramidal because
(a) nitrogen atom is smaller than boron atom
(b) BCl_3 has no lone pair but NCl_3 has a lone pair of electrons
(c) B – Cl bond is more polar than N – Cl bond
(d) N – Cl bond is more covalent than B – Cl bond

NEET-1995

Ans. (b) : BCl_3 is planar molecule where as NCl_3 is pyramidal because BCl_3 has no lone pair but NCl_3 has a lone pair of electron.



Trigonal planar



Pyramidal

315. d^2sp^3 hybridization represents which of the following configurations?
(a) Tetrahedral
(b) Square planar
(c) Linear
(d) Octahedral

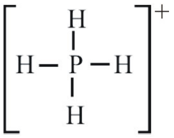
AP-EAMCET/1992

Ans. (d) : Molecule having d^2sp^3 hybridization of central atom is octahedral geometry. This type of hybridization forms the inner orbital complexes.

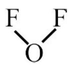
- Tetrahedral geometry has the sp^3 type of hybridization.
- The hybridization of square planer geometry is dsp^2.
- The linear geometry has 180° bond angle with sp hybridization.

316. Which one of the following formulae does not correctly represents the bonding capacities of the two atoms involved?

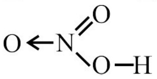
(a)



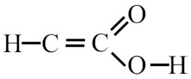
(b)



(c)

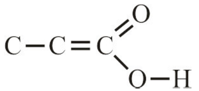


(d)



NEET-1990

Ans. (d) : The structure,



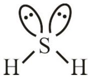
does not correctly represent the bonding capacities of atom because the valency of carbon is four but one carbon has three bonds attached and other carbon have five bond attached.

317. Which of the following molecules does not have a linear arrangement of atoms?
(a) H_2S
(b) C_2H_2
(c) BeH_2
(d) CO_2

NEET-1989

Ans. (a) : The structure of given molecule –

(i) H_2S



V-shaped

(ii) C_2H_2

$\mathrm{H-\underset{sp}{C}\equiv\underset{sp}{C}-H}$

Linear

(iii) BeH_2

$\mathrm{H-\underset{sp}{Be}-H}$

Linear

(iv) CO_2

$\mathrm{O=\underset{sp}{C}=O}$

Linear

H_2S molecule does not have a linear arrangement of atom.

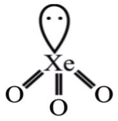
@apna_pdf

318. Among the following molecule
(i) XeO_3 (ii) $XeOF_4$ (iii) XeF_6
Those having same number of lone pairs on Xe are
(a) (i) and (ii) only (b) (i) and (iii) only
(c) (ii) and (iii) only (d) (i), (ii) and (iii)

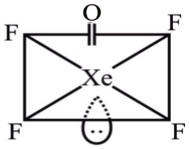
VITEEE 2019

Ans. (d) :

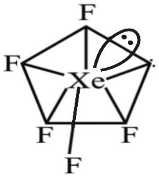
(i) XeO_3



(ii) $XeOF_4$



(iii) XeF_6



All molecule have same number of lone pairs on Xe.

319. Which of the following molecules/ions does not contain unpaired electrons?
(a) O_2^{2-} (b) B_2
(c) N_2^+ (d) O_2

AIEEE 2008

Ans. (a) : According to molecular orbital diagram –

(i) For $O_2^{2-} = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2$
$= \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^2$

O_2^{2-} molecules/ions does not contain unpaired electrons.

(ii) For $B_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_y^1$

B_2 molecules/ions contain two unpaired electron.

(iii) For $N_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2$
$= \pi 2p_y^2, \sigma 2p_y^1$

N_2^+ molecule/ions contain one unpaired electron.

(iv) For $O_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2$
$= \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$

O_2 molecule/ions contain two unpaired electron.

3. Magnetic behavior of Molecules

320. The spin–only magnetic moment value of the most basic oxide of vanadium among V_2O_3, V_2O_4 and V_2O_5 is _____ B.M. (Nearest integer)

JEE Main-26.06.2022, Shift-I

Ans. (3) : V_2O_3 is most basic oxide. Total number of unpaired electron in V^{+3} is n = 2.
Hence, the spin only magnetic moment

$$\mu_s = \sqrt{n(n+2)}$$
$$\mu_s = \sqrt{2(2+2)} = \sqrt{8} = 2.87 \text{ BM}$$
$$\approx 3 \text{ BM.}$$

321. which of the following is paramagnetic?
(a) NO^+ (b) CO
(c) CN (d) O_2

Odisha NEET-2019, NEET-2013
JIPMER-2004, AMU–2001

Ans. (d) : Oxygen is a paramagnetic molecule. Its molecular orbital configuration is

$O_2 = (\sigma 2s)^2(\sigma^* 2s)^2(\sigma^* 2p_z)^2(\pi 2p_x^2 = \pi 2p_y^2)$
$(\pi^* 2p_x^1 = \pi^* 2p_y^1)$

O_2 molecule has unpaired electron its show paramagnetic.

322. N_2 and O_2 are converted into monocations, N_2^+ and O_2^+ respectively. Which of the following statements is wrong
(a) In N_2^+, the N–N bond weakens.
(b) In O_2^+, the O–O bond order increases.
(c) In O_2^+, paramagnetism decreases.
(d) N_2^+ becomes diamagnetic.

AIIMS-2013, Kerala CEE-2010
NEET-1997

Ans. (d): Molecular orbital configuration of these are -

(i) $N_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

$$B.O = \frac{10-6}{2} = 3$$

(ii) $O_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1$
$= \pi^* 2p_y^1$

$$B.O = \frac{10-6}{2} = 2$$

(iii) $N_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^1$

$$B.\ O = B.O = \frac{9-4}{2} = 2.5$$

(iv) $O_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2$
$= \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y$

$$B.O = \frac{10-5}{2} = 2.5$$

$\therefore$ Bond order $\propto$ Bond strength.
If bond order increase then bond strength also increase
Thus, N_2^+ is paramagnetic so, the option (d) is correct according to the question.

323. The molecule NO is
(a) paramagnetic
(b) diamagnetic
(c) ferromagnetic
(d) an even electron molecule.

J & K CET-(2012)
CGPET-2010, NEET-1995

@apna_pdf

Ans. (a) : The molecular orbital configuration is –
For,

$$NO = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2, = \pi 2p_y^2$$

$$\pi^* 2p_x^1 = \pi^* 2p_y$$

In NO has one unpaired electron, it show a paramagnetic.

324. Paramagnetism is shown by

(a) N_2 (b) O_2
(c) F_2 (d) CO_2

Manipal-2018
J & K CET-(2012)
UPTU/UPSEE-2004

Ans. (b) : The paramagnetirm is show by O_2 molecule because it has two unpaired electron. The molecular orbital configuration of

$$O_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^1, = \pi 2p_y^2$$

$$\pi^* 2p_x^1 = \pi^* 2p_y^1$$

325. The paramagnetic behaviour of B_2 is due to the presence of

(a) two unpaired electrons in π_b MO
(b) two unpaired electrons in π^* MO
(c) two unpaired electrons in σ^* MO
(d) two unpaired electrons in σ_b MO

WB-JEE-2012
UPTU/UPSEE-2004

Ans. (a) : The most electronic configuration to

$$B_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_{y,}^1$$

It is paramagnetic due to two unpaired electron on two unpaired electron π - molecular bonding orbital.

326. In which of the following ionization processes the bond energy increases and the magnetic behaviour changes from paramagnetic to diamagnetic?

(a) $O_2 \to O_2^+$ (b) $C_2 \to C_2^+$
(c) $NO \to NO^+$ (d) $O_2 \to O_2^+$

AP EAPCET 24.08.2021, Shift-I
Karnataka NEET-2013

Ans. (c) :

$$NO \longrightarrow NO^+ + e^\ominus$$

Total electron present in NO is 15. 'NO' is paramagnetic in nature because it have one electron (unparied electron) in 2px orbital. When we remove the one electron from NO we get the NO^+ which is in diamagnetic in nature because unpaired electron are not present.

327. KO_2 exhibits paramagnetic behaviour. This is due to the paramagnetic nature of

(a) KO^- (b) K^+
(c) O_2 (d) O_2^-

AP EAMCET (Engg.) -2014
AIIMS-2003

Ans. (d): KO_2 is a superoxide in which only one electron is released from the dioxygen atom and a superoxide ion is represented as O_2^-. In KO_2 the oxygen atoms bear $-\frac{1}{2}$ oxidation state and they also behave as a free radical species having an unpaired electron. KO_2 is paramagnetic due to presence of unpaired electrons.

328. The species analogous to paramagnetic behaviour like O_2 is

(a) monoclinic sulphur (b) rhombic sulphur
(c) colloidal sulphur (d) gaseous sulphur.

AMU-2019, 2014

Ans. (d) : The formula of gaseous sulphur exists as S_2. The S_2 molecule has two unpaired electron in the antibonding 3p orbital and hence the species analogous to paramagnetic behavior like O_2 is gaseous sulphur.

329. Which one of the following is not paramagetic?

(a) NO (b) N_2^+
(c) CO (d) O_2^-

BCECE-2012
NEET-2000

Ans. (c) : In CO, number of electron = 14
According to molecular orbital configuration is -

$$CO = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2P_z^2$$

In CO all electron are paired. Hence, it show diamagnetic not a paramagnetic.

330. Atomic number of Cr, Fe and Co are 24, 26 and 27 respectively. Which of the following inner orbital octahedral complexes are paramagnetic?

(a) $[Co(NH_3)_6]^{3+}$ (b) $[Co(CN)_3]^{3+}$
(c) $[Fe(CN)_6]^{4-}$ (d) $[Cr(CN)_6]^{3-}$

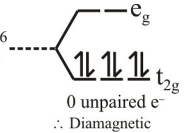
AP EAPCET 23-08-2021 Shift-I

Ans. (d) : All complexes are the inner orbital complexes because of availability of strong field ligand.

(i) $[Co(NH_3)_6]^{3+}$

Let, Oxidation state of Co is x
∴ $x + 6(0) = +3$
or $x = +3$

$Co^{3+} = [Ar]3d^6$ or d^6

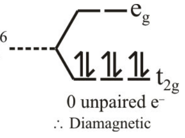


NH_3 show strong field ligand in Co^{+3}

(ii) $[Co(CN)_3]^{3+}$

Let, Oxidation state of Co is x
∴ $x + 3(0) = +3$
or $x = +3$

$Co^{3+} = [Ar]3d^6$ or d^6

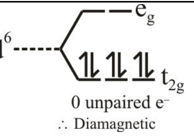


(iii) $[Fe(CN)_6]^{4-}$

Let, Oxidation state of Fe is x
∴ $x + 6(-1) = -4$
or $x = +2$

@apna_pdf

$Fe^{2+} = [Ar]3d^6$ or d^6



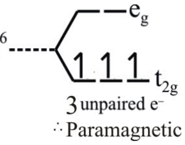
(iv) $[Cr(CN)_6]^{3-}$

Let, Oxidation state of Cr is x

∴ $x + 6(-1) = -3$

or $x = +3$

$Cr^{3+} = [Ar]3d^3$ or d^6



Hence, the correct option is (d).

331. Which of the following is not arranged in the correct sequence?

(a) MO, M_2O_3, MO_2, M_2O_5 – Decreasing basic nature
(b) Sc, V, Cr, Mn – Increasing number of oxidation states
(c) d^5, d^3, d^1, d^4 Increasing magnetic moment
(d) $Mn^{2+}, Fe^{2+}, Cr^{2+}, Co^{2+}$ decreasing stability

AP EAPCET 20.08.2021 Shift-I

Ans. (c) : Magnetic moment $(\mu) = \sqrt{n(n+2}$

Where n = number of 4n paired electro n.

So d^1 : $\mu = \sqrt{1(1+2)} = \sqrt{3} = 1.73\text{BM}$

$d^2 : \mu = \sqrt{2(2+2)} = \sqrt{8} = 2.83$ BM

$d^3 : \mu = \sqrt{3(3+2)} = \sqrt{15} = 3.88$ BM

$d^4 : \mu = \sqrt{4(4+2)} = \sqrt{24} = 4.90$ BM

$d^5 : \mu = \sqrt{5(5+2)} = \sqrt{35} = 5.92$ BM

So the increasing magnetic moment
$d^1 < d^2 < d^3 < d^4 < d^5$.

332. The bond order and magnetic behaviour of O_2^- ion are, respectively

(a) 1.5 and paramagnetic
(b) 1.5 and diamagnetic
(c) 2 and diamagnetic
(d) 1 and paramagnetic

(JEE Main 2021, 26 Aug. Shift-II)

Ans. (a) : The molecular orbital configuration is –

For $O_2^- = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2, = \pi 2p_y^2$

$\pi^* 2p_x^2 = \pi^* 2p_y^1$

It is a paramagnetic

$$\text{B.O.} = \frac{\text{No.of bonding } e^- - \text{No.of anti bonding } e^-}{2}$$

$$= \frac{10-7}{2} = \frac{3}{2} = 1.5$$

333. The spin-only magnetic moment value of B_2^+ species is .... × 10^{-2} BM. (Nearest integer) [Given, $\sqrt{3} = 1.73$]

(a) 100 (b) 120
(c) 173 (d) 160

(JEE Main 2021, 1 Sep Shift-II)

Ans. (c) : The molecular orbital configuration is –

$B_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1, = \pi 2p_y$

Number of unpaired electron in $B_2^+ = 1$

∴ Magnetic moment $(\mu) = \sqrt{n(n+2)}$

$= \sqrt{1(1+2)}$

$= \sqrt{3} = 1.73$ BM

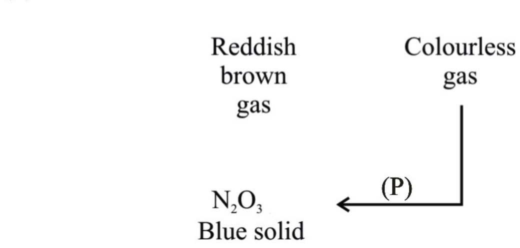
$= 173 \times 10^{-2}$ BM.

334. A colourless, neutral, paramagnetic oxide of nitrogen 'P' on oxidation gives reddish brown gas Q, Q on cooling gives colourless gas R. R on reaction with P gives blue solid S. Identify P, Q, R, S respectively

(a) N_2O, NO, NO_2, N_2O_5
(b) N_2O, NO_2, N_2O_4, N_2O_3
(c) NO, NO_2, N_2O_4, N_2O_3
(d) NO, NO, N_2O_4, N_2O_5

Karnataka-CET-2021

Ans. (c) :



335. The bond order and the magnetic characteristics of CN^- are

(a) 3, diamagnetic (b) $2\frac{1}{2}$, Paramagnetic
(c) 3, paramagnetic (d) $2\frac{1}{2}$, diamagnetic

(JEE Main 2020, 7 Jan. Shift-II)

Ans. (a) : The molecular orbital configuration is–

$CN^- = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_x^2 = \pi 2p_y^2, \pi 2p_z^2$

$$\text{Bond order} = \frac{\text{No. of bonding } e^- - \text{No.of antibonding } e^-}{2}$$

$$= \frac{10-4}{2} = 3$$

The magnetic characteristic of CN^- is diamagnetic.

336. If the magnetic moment of a dioxygen species is 1.73 BM, it may be:

(a) O_2, O_2^- or O_2^+ (b) O_2^- or O_2^+
(c) O_2 or O_2^- (d) O_2 or O_2^+

(JEE Main 2020, 9 Jan. Shift-II)

Ans. (b) : The molecular orbital configuration is–

For $O_2^{1-} = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$

$\sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^1$

The no. of unpaired e^- in $O_2^- = 1$

Magnetic moment $(\mu) = \sqrt{n(n+2)}$

@apna_pdf

$$=\sqrt{1(1+2)}=\sqrt{3}=1.732$$

For $O_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2 \sigma 2p_z^2$

$$\pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y$$

The no. of unpaired e^- in $O_2^+ = 1$

Magnetic moment $(\mu) = \sqrt{n(n+2)}$

$$=\sqrt{1(1+2)}=\sqrt{3}=1.732\,BM$$

337. Which of the compounds among N_2O, NO, N_2O_3, NO_2, N_2O_4, N_2O_5 are diamagnetic ?

(a) NO, NO_2, N_2O_3

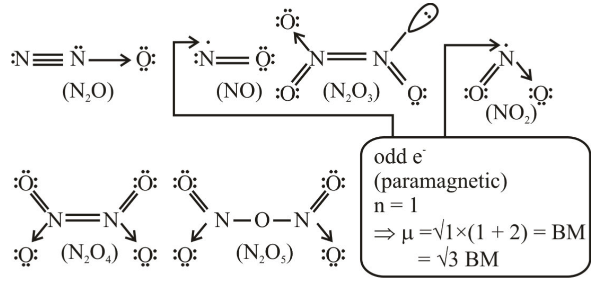
(b) N_2O, N_2O_3, N_2O_4, N_2O_5

(c) NO, NO_2

(d) N2O_4, N_2O_5

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (b) : Let us draw the structure of nitrogen oxides.



N_2O, N_2O_3, N_2O_4, N_2O_5 do not have unpaired electrons (n = 0). So, they are diamagnetic (μ = 0).

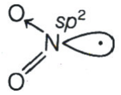
338. The magnetic property of NO_2 is ....

(a) Ferromagnetic (b) Diamagnetic

(c) Non-magnetic (d) Paramagnetic

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (d) : Magnetic property of NO_2 (g) is paramagnetic due to the presence of unpaired electron on N-atom of NO_2.



339. Assertion: In vapour state, S_2 molecule shows paramagnetic behaviour.

Reason: S_2 molecule has two paired electrons in the antibonding t_{2g} orbital like O_2.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

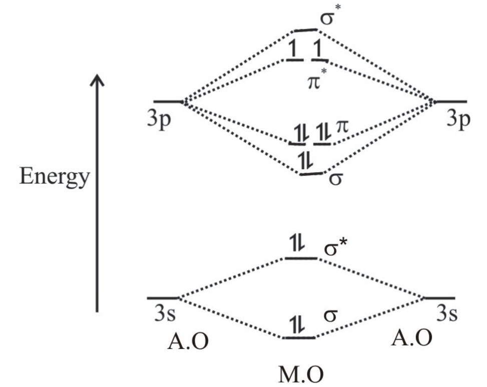
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Evening)

Ans. (c): : In ordinary condition sulphur exists as S_8 in solid state. In vapour state sulphur partly exists as S_2 molecule. In S_2 molecule has two unpaired electrons in the antibonding π^* orbitals.



340. Assertion: Ferromagnetic compound is more attracted in magnetic field.

Reason: Because all electron are aligned in same direction.

(a) If both Assertion and Reason are correct and Reason is the correct explanation for Assertion.

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation for Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Morning)

Ans. (a): Ferromagnetic compound is more attracted in magnetic field due to all electron are aligned in same direction.

Magnetic linear force is imaginary in the sense it cannot be seen as a live around the magnet but lines of force are not non-physical in the sense their presence can be detected experimentally.

341. MnO is:

(a) Ferromagnetic (b) Antiferromagnetic

(c) Ferrimagnetic (d) Diamagnetic

AIIMS 26 May 2019 (Morning)

Ans. (b): Mn has a 5 electrons in the d-subshell which make its orbital half-filled. So it has maximum magnetic moment amond 3d elements and has the value of magnetic susceptibility greater than zero. The magnetic susceptibility is greater than magnitude and the electrons are aligned such that they cancel the effects of each other due to opposite direction. Hence, MnO is shown antiferro-magnetism.

Note- Metal like Fe, Co, Ni show ferromagnetism

342. Among the following molecules/ions,

$$\mathbf{C_2^{2-}, N_2^{2-}, O_2^{2-}, O_2}$$

Which one is diamagnetic and has the shortest bond length ?

(a) C_2^{2-} (b) O_2

(c) O_2^{2-} (d) N_2^{2-}

(JEE Main 2019, 8 April Shift-II)

Ans. (a) : The molecular orbital configuration is –

(i) $C_2^{2-} = \sigma 1s^2, \sigma * 1s^2, \sigma 2s^2, \sigma * 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

It is a diamagnetic.

Bond order $= \dfrac{10-4}{2} = 3$

@apna_pdf

(ii) $N_2^{2-} = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2$

$\pi^* 2p_x^1 = \pi^* 2p_y^1$

It is a paramagnetic

Bond order $= \frac{10-6}{2} = 2$

(iii) $O_2^{2-} = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2$

$= \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^2$

It is a diamagnetic

Bond order $= \frac{10-8}{2} = 1$

(iv) $O_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2$

$= \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$

It is a paramagnetic

Bond order $= \frac{10-6}{2} = 2$

$\therefore \boxed{\text{Bond order} \propto \frac{1}{\text{Bond length}}}$

When bond order increase then bond length decrease.

Hence, C_2^{2-} has diamagnetic and shortest bond length.

343. Which of these species will have non-zero magnetic moment?

(a) Na^+ (b) Mg
(c) F^- (d) Ar^+

WB-JEE-2019

Ans. (d) : Ar^+ contain unpaired electron having configuration [Ne] $3s^2 3p^5$. All other species do not have unpaired electron.

344. In 3d-series as we move from scandium to zinc, the paramagnetism:

(a) increases
(b) decreases
(c) first increases to a maximum and then decreases
(d) first decreases to a minimum and the increases.

COMEDK 2018

Ans. (c) : In 3d-series, as we move from scandium to manganese, the paramagnetism increases due to increasing the number of unpaired electron but after manganese, the paramagnetic character decreases due to the decreasing number of unpaired electron.

345. Which of the following is the correct order for the theoretical magnetic moment?

(a) $Cr^{3+} > Mn^{2+} = Fe^{3+}$
(b) $Cr^{3+} = Mn^{2+} < Fe^{3+}$
(c) $Cr^{3+} < Mn^{2+} = Fe^{3+}$
(d) $Cr^{3+} < Mn^{2+} < Fe^{3+}$

GUJCET-2017

Ans. (c) : For $Cr^{3+} = \boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\ }\boxed{\ }$

n=3 (unpaired electron)

Magnetic moment $= \sqrt{3(3+2)} = \sqrt{15} = 3.83\,\text{BM}$

For $Mn^{2+} = \boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}$

n=5 (unpaired electron)

Magnetic moment $= \sqrt{5(5+2)} = \sqrt{35} = 5.92\,\text{BM}$

For $Fe^{3+} = \boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}$

n=5 (unpaired electron)

Magnetic moment $= \sqrt{5(5+2)} = \sqrt{35} = 5.92\,\text{BM}$

Hence, the order of theoretical magnetic moment is $Cr^{3+} < Mn^{2+} = Fe^{3+}$

346. The ground state magnetic property of B_2 and C_2 molecules will be:

(a) B_2 paramagnetic and C_2 diamagnetic
(b) B_2 diamagnetic and C_2 paramagnetic
(c) Both are dimagnetic
(d) Both are paramagnetic

WB-JEE-2017

Ans. (a) : The molecular orbital configuration is –

(i) $B_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_{y,}^1$

It is a paramagnetic due to two unpaired electron in B_2 molecule.

(ii) $C_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_{y,}^2$

It is a diamagnetic due to zero unpaired electron.

347. A transition elements with atomic number 24 will have its magnetic moment

(a) 5.92 B.M.
(b) 6.93 B.M.
(c) it will be diamagnetic
(d) it will be more than 8 B.M.

COMEDK 2015

Ans. (b) : A transition metal element with atomic number 24 is chromium. The electronic configuration of Cr is $[Ar]3d^5 4s^1$. There are six unpaired electron present in outer shell orbit. Hence, The spin only magnetic moment is $\sqrt{6(6+2)} = 6.93\text{BM}$

348. Which one is diamagnetic molecule/ion?

(a) O_2^+ (b) O_2^-
(c) O_2^{2-} (d) O_2

SRMJEEE – 2014

Ans. (c)

(a) $O_2^+ (15) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2 \sigma 2p_z^2$

$\pi 2p_x^2 = \pi 2p_y^2, \pi_2^* p_x^1$

(b) O_2^- (17) $= \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$

$\sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^1$

unpaired electron = 1 (Paramagnetic)

(c) O_2^{2-} (18) $= \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$

$\sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^2$

unpaired electron = 0 (diamagnetic)

(d) O_2 (16) $= \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$

$\sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$

unpaired electron = 2 (paramagnetic)

Hence, the correct option is C.

349. The highest magnetic moment is shown by the transition metal ion with the configuration

(a) $3d^2$ (b) $3d^5$
(c) $3d^7$ (d) $3d^9$

SRMJEEE – 2014

@apna_pdf

Ans. (b) : The number of unpaired electrons increase, magnetic moment increases.

$\mu = \sqrt{n(n+2)}$ BM

Where n = No. of unpaired electron

(i) $3d^2 \Rightarrow n = 2, \mu = 2.82$ BM

(ii) $3d^5 \Rightarrow n = 5, \mu = 5.92$ BM

(iii) $3d^7 \Rightarrow n = 3, \mu = 3.87$ BM

(iv) $3d^9 \Rightarrow n = 1, \mu = 1.73$ BM

Hence, configuration $3d^5$ has highest magnetic moment.

350. The ratio of magnetic moment (spin only value) between $[FeF_6]^{3-}$ and $[Fe(CN)_6]^{3-}$ is approximately

(a) 4 (b) 2

(c) 5 (d) 3

AMU-2014

Ans. (d) : In $[FeF_6]^{3-}$ and $[Fe(CN)_6]^{3-}$ both have Fe^{3+} In $[FeF_6]^{3-}$, F^- being a weak field ligand. In $[Fe(CN)_6]^{3-}$, CN^- being a strong field ligand.

$[FeF_6]^{3-} = Fe^{3+} = \boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}\boxed{\upharpoonleft}$

n = 5 (unpaired electron)

$$\text{Magnetic moment } (\mu_1) = \sqrt{n(n+2)} = \sqrt{5(5+2)} = \sqrt{5\times7} = \sqrt{35} = 5.9\text{BM}$$

$[Fe(CN)_6]^{3-} = Fe^{3+} = \boxed{\upharpoonleft\downharpoonright}\boxed{\upharpoonleft\downharpoonright}\boxed{\upharpoonleft}\boxed{}\boxed{}$

n = 1 (unpaired electron)

$$\text{Magnetic moment } (\mu_2) = \sqrt{n(n+2)} = \sqrt{1(1+2)} = \sqrt{3} = 1.73\text{BM}$$

So, Ratio of μ_1 and $\mu_2 = \frac{\mu_1}{\mu_2} = \frac{5.9}{1.73} = 3.41 \simeq 3$

351. Paramagnetism is exhibited due to which one of the following reason?

(a) Presence of unpaired electrons

(b) Presence of completely shell electronic subshell

(c) By non-transition element

(d) By elements with noble gas configuration

J & K CET-(2014)

Ans. (a) : Paramagnetism is exhibited due to presence of unpaired electron.

Paramagnetism refers to the magnetic state at an atom with one or more unpaired electron. The unpaired electron are attracted by a magnetic field due to the electron magnetic dipole moment.

352. The diamagnetic molecule among the following is :

(a) O_2 (b) N_2

(c) N_2^- (d) O_2^-

UP CPMT-2014

Ans. (b) : Molecules having no unpaired electrons are diamagnetic in nature.

$N_2(14) = \sigma1s^2, \sigma^*1s^2, \sigma2s^2, \sigma^*2s^2,$

$\pi2p_x^2 = \pi2p_y^2, \sigma2p_z^2$

No unpaired electron is present, so it is a diamagnetic species.

353. Which one of the following molecules is expected to exhibit diamagnetic behaviour?

(a) C_2 (b) N_2

(c) O_2 (d) S_2

Karnataka-CET-2013

Ans. (a, b) : The molecular orbital configuration are–

(i) $C_2 = \sigma1s^2, \sigma^*1s^2, \sigma2s^2, \sigma^*2s^2, \pi2p_x^2 = \pi2p_y^2$

It is diamagnetic

(ii) $N_2 = \sigma1s^2, \sigma^*1s^2, \sigma2s^2, \sigma^*2s^2, \pi2p_x^2, = \pi2p_y^2, \sigma2p_z^2$

It is a diamagnetic

(iii) $O_2 = \sigma1s^2, \sigma^*1s^2, \sigma2s^2, \sigma^*2s^2, \sigma2p_z^2, \pi2p_x^1, = \pi2p_y^2$

$\pi^*2p_x^1 = \pi^*2p_y^1$

It is paramagnetic.

(iv) $S_2 = \ldots\ldots\ldots\; 3p_z^2, \pi3p_x^2, = \pi3p_y^2, \pi^*3p_x^1, = \pi^*3p_y^1$

It is paramagnetic.

354. For simple molecules NO_2 and S_2, Which one of the following statements is correct?

(a) Both are diamagnetic.

(b) NO_2 is diamagnetic while S_2 is paramagnetic.

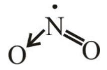
(c) S_2 is diamagnetic while NO_2 is paramagnetic.

(d) Both are paramagnetic.

SCRA 2012

Ans. (d) : Total valence electrons in NO_2 = 17

NO_2 has a free unpaired electron -It is an odd electron molecule. Therefore it is paramagnetic



Diatomic sulphur (S_2) is paramagnetic in nature like as O_2 molecule.

355. The spin only magnetic moment of Ni^{2+} (in B.M) in aqueous solution will be

(a) 1.73 (b) 2.82

(c) 3.42 (d) 2.25

COMEDK-2012

Ans. (b) : The electronic configuration of Ni^{2+} is $[Ar]3d^8$. The number of unpaired electron is 2. Hence the spin only magnetic moment will be $\sqrt{2(2+2)} = 2.8$ B.M

356. Among the following ions, which has the highest spin magnetic moment?
(At. No: Ti = 22; Mn = 25; Ni = 28; Cu = 29)

(a) Cu^{2+} (b) Ti^{3+}

(c) Ni^{2+} (d) Mn^{2+}

SRMJEEE – 2012

Ans. (d) : Magnetic moment is directly proportional to the number of unpaired electrons

(i) Cu^{2+} : n = 1

(ii) Ti^{3+} : n = 1

(iii) Ni^{2+} : n = 2

(iv) Mn^{2+} : n = 5

Therefore Mn^{2+} is highest spin magnetic moment.

@apna_pdf

357. The paramagnetic oxides of nitrogen are

(a) dinitrogen monoxide and nitrogen monoxide
(b) nitrogen monoxide and nitrogen dioxide
(c) nitrogen dioxide and dinitrogen trioxide
(d) dinitrogen trioxide and dinitrogen tetraoxide

J & K CET-(2011)

Ans. (b) : Nitrogen monoxide (nitric oxide) is paramagnetic in nature due to one unpaired electron. It can be represented by the following resonance structure. Nitrogen dioxide is also paramagnetic due to one unpaired electron.

358. The pairs of species of oxygen and their magnetic behaviour are noted below. Which of the following presents the correct description?

(a) O_2^-, O_2^{2-} -both diamagnetic
(b) O^+, O_2^{2-} -both diamagnetic
(c) O_2^+, O_2 -both paramagnetic
(d) O, O_2^{2-} -both paramagnetic

NEET-2011

Ans. (c) : The molecular orbital configuration is –

(i) $O_2^+ = (15e^-) \Rightarrow \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2,$

$\pi 2p_x^2 = \pi 2p_y^2, \pi^*2p_x^1 = \pi^*2p_y$

It is a paramagnetic and one unpaired electron.

Magnetic moment $(\mu) = \sqrt{1(1+2)} = \sqrt{3} = 1.73\,BM.$

(ii) $O_2 = (16\ e^-) \Rightarrow \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2,$

$\pi 2p_x^2 = \pi 2p_y^2, \pi^*2p_x^1 = \pi^*2p_y^1$

It is a paramagnetic due to two unpaired electron.

Magnetic moment $(\mu) = \sqrt{2(2+2)} = \sqrt{8} = 2.83\,BM.$

359. Which of the O_2^-, O_2^{2-}, BN and NN is/are paramagnetic?

(a) NN (b) O_2^{2-}
(c) BN (d) O_2^-

UPTU/UPSEE-2011

Ans. (d) : According to molecular orbital electronic configuration is –

(i) $O_2^- = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2,$

$\pi 2p_x^2 = \pi 2p_y^2,\ \pi^*2p_x^2 = \pi^*2p_y^1$

It is a paramagnetic due to 1 unpaired electron.

(ii) $O_2^{2-} = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2,$

$\pi 2p_x^2 = \pi 2p_y^2,\ \pi^*2p_x^2 = \pi^*2p_y^2$

It is a diamagnetic due to zero unpaired electron

(iii) $BN = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2,$

$\pi 2p_x^2 = \pi 2p_y^2$

It is a diamagnetic due to zero unpaired electron

(iv) $N_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2,$

$\pi 2p_x^2 = \pi 2p_y^2,\ \sigma 2p_z^2$

It is a diamagnetic due to zero unpaired electron

360. Which one of the following species does not exist under normal conditions?

(a) Be_2^+ (b) Be_2
(c) B_2 (d) Li_2

NEET-2010

Ans. (b) : According to molecular orbital configuration

(i) $Be_2^+ = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^1$

$$\text{Bond order} = \frac{4-3}{2} = 0.5$$

(ii) $Be_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2$

$$\text{Bond order} = \frac{4-4}{2} = 0$$

Thus Be_2 does not exist under normal condition.

(iii) $B_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \pi 2p_x^1 = \pi 2p_y^1$

$$\text{Bond order} = \frac{6-4}{2} = 1$$

(iv) $Li_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2$

$$\text{Bond order} = \frac{4-2}{2} = 1$$

Hence, Be_2 does not exist under normal condition because bond order is zero.

361. Which one of the following sets correctly represents the increase in the paramagnetic property of the ions?

(a) $Cu^{2+} > V^{2+} > Cr^{2+} > Mn^{2+}$
(b) $Cu^{2+} < Cr^{2+} < V^{2+} < Mn^{2+}$
(c) $Cu^{2+} < V^{2+} < Cr^{2+} < Mn^{2+}$
(d) $V^{2+} < Cu^{2+} < Cr^{2+} < Mn^{2+}$

AP EAMCET (Engg.)-2009

Ans. (c): Paramagnetic property depend on the number of unpaired electron. Maximum the number of unpaired higher the paramagnetic properties.

$Cu^{2+} = [Ar]3d^9$, No. of unpaired $e^- = 1$

$V^{2+} = [Ar]3d^3$, No. of unpaired $e^- = 3$

$Cr^{2+} = [Ar]3d^4$, No. of unpaired $e^- = 4$

$Mn^{2+} = [Ar]3d^5$, No. of unpaired $e^- = 5$

Therefore, the order is -

$Cu^{2+} < V^{2+} < Cr^{2+} < Mn^{2+}$

362. Which one of the following molecules is paramagnetic?

(a) F_2 (b) B_2
(c) Li_2 (d) N_2

J & K CET-(2009)

Ans. (b) : The molecular orbital configuration is –

(i) $F_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2, \pi 2p_x^2, = \pi 2p_y^2$

$\pi^*2p_x^2 = \pi^*2p_y^2$

It is a diamagnetic

(ii) $B_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \pi 2p_x^1, = \pi 2p_y^1$

It is a paramagnetic

(iii) $Li_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2$

It is a diamagnetic

(iv) $N_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \pi 2p_x^2, = \pi 2p_y^2, \sigma 2p_z^2$

It is a diamagnetic

@apna_pdf

363. **When oxyhaemoglobin changes to de-oxyhaemoglobin, Fe^{2+} ion changes from**

(a) diamagnetic to paramagnetic
(b) paramagnetic to diamagnetic
(c) diamagnetic to ferromagnetic
(d) paramagnetic to ferromagnetic

AP - EAMCET (Medical) - 2007

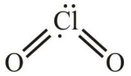
Ans. (a) : When oxyhaemoglobin changes to deoxyhaemoglobin, Fe^{2+} ion changes from diamagnetic to paramagnetic.

364. **Which one of the following oxides is expected to exhibit paramagnetic behavior?**

(a) CO_2 (b) SO_2
(c) ClO_2 (d) SiO_2

JIPMER-2007

Ans. (c) : The structure of ClO_2 is –



In ClO_2 has unpaired electron its show paramagnetic

365. **The transition metals mostly are**

(a) Diamagnetic
(b) Paramagnetic
(c) neither diamagnetic nor paramagnetic
(d) both diamagnetic and paramagnetic

CG PET -2006

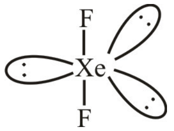
Ans. (b) : Transition metal mostly are show paramagnetic behavior paramagnetism is a property which is shown by the elements having unpaired electrons. In transition metals (n–1) d-orbitals are unpaired electron increases from one of five, the paramagnetic character increases.

366. **The number of paired electrons is Xe atom of XeF_2 is**

(a) 3 (b) 5
(c) 4 (d) 2

CG PET -2006

Ans. (a) : The structure of $XeFe_2$ is–



In XeF_2, the number of lone pair (paired electron) on Xe is three and bond pair is two. The geometry of XeF_2 is trigonal bipyramidol and shape is linear.

367. **The magnetic moment of lanthanide ions is determined from which one of the following relation?**

(a) $\mu = \sqrt{n(n+2)}$ (b) $\mu = g\sqrt{J(J+1)}$
(c) $\mu = g\sqrt{n(n+1)}$ (d) $\mu = 2\sqrt{n(n+1)}$

VITEEE- 2006

Ans. (b) : In case of lanthanoids, 4f–orbitals lie too deep and hence the magnetic effect of the motion of the electron in its orbital is not quenched out. Here spin contribution (S) and orbital contribution (L) couple together to give a new quantum number 'J'.

Thus magnetic moment of lanthanoids is given by,

$\mu = g\sqrt{J(J+1)}$

Where J = L – S when the shell is less than half fill

J = L + S when the shell is more than half fill

and $g = 1\frac{1}{2} + \frac{S(S+1) - L(L+1)}{2J(J+1)}$

368. **Assertion: B_2 molecule is diamagnetic.**
Reason: The highest occupied molecular orbital is of σ type.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2005

Ans. (d): Molecular orbital diagram of B_2 is-

$B_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_y^1$

In B_2 it has two unpaired it is paramagnetic and the highest occupied molecular orbital is π-type.

369. **Assertion: Ozone is a powerful oxidising agent in comparison to O_2.**
Reason: Ozone is diamagnetic but O_2 is paramagnetic.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2005

Ans. (b): Ozone (O_3) is a powerful oxidizing agent in comparison to O_2 due to decomposes readily under normal condition.

$O_3 \xrightarrow{\text{decompose}} O_2 + [O]$ nascent oxygen

O_2 is a paramagnetic due to presence of two unpaired electron, while O_3 is diamagnetic.

370. **Electrons in a paramagnetic compound are:**

(a) Shared (b) Unpaired
(c) Donated (d) Paired

UPTU/UPSEE-2004

Ans. (b) : A paramagnetic electrons is an unpaired electron. An atom is considered paramagnetic if even one orbital has a net spin. An atom could have ten diamagnetic electrons but as long as it also has one paramagnetic electron it is still considered as paramagnetic atom.

@apna_pdf

371. Assertion: Water is liquid but H_2S is a gas.
Reason : Oxygen is paramagnetic.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-1999

Ans. (b): Water is liquid but H_2S is gas due to which hydrogen bond in water.
Gaseous oxygen is paramagnetic because oxygen molecule has two unpaired electron Thus, reason does not justify assertion so, option (b) is correct.

372. Of the species H_2^+, He_2^+, and O_2^+, all are

(a) diamagnetic (b) paramagnetic
(c) stable (d) unstable

J & K CET-(1997)

Ans. (b) : The molecular orbital configuration are
(i) $H_2^+ = \sigma 1s^1$
It is a paramagnetic due to one unpaired electron.
(ii) $He_2^+ = \sigma 1s^2, \sigma^* 1s^1$
It is a paramagnetic due to one unpaired electron.
(iii) $O_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 =$
$\pi 2p_y^2, = \pi^* 2p_x^1 = \pi^* 2p_y$
It is a paramagnetic due to one unpaired electron.
Hence, the species H_2^+, He_2^+ and O_2^+ are all paramagnetic

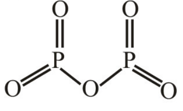
373. Which of the following molecules is paramagnetic?

(a) P_2O_5 (b) NO_2
(c) $H_2S_2O_7$ (d) N_2O_5

AIIMS-1996

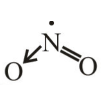
Ans. (b) : The structure of the following are-

(i) P_2O_5



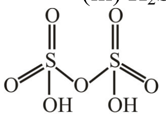
Diamagnetic

(ii) NO_2



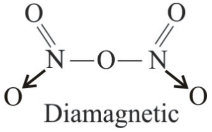
Paramagnetic

(iii) $H_2S_2O_7$



Diamagnetic

(iv) N_2O_5



Diamagnetic

In NO_2 molecule has one paired electrons its paramagnetic in nature.

374. Which of the following species exhibits diamagnetic behavior?

(a) O_2^{2-} (b) O_2^+
(c) O_2 (d) NO

AIEEE 2007

Ans. (a) : The molecular orbital configuration are–
(i) $O_2^{2-} = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$
$\sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^2$
It is diamagnetic.
(ii) $O_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2 \sigma 2p_z^2$
$\pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y$
It is paramagnetic.
(iii) $O_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$
$\sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$
It is paramagnetic
(iv) $NO = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^1, = \pi 2p_y^2$
$\pi^* 2p_x^1 = \pi^* 2p_y$
It is paramagnetic

375. Among the following species, the diamagnetic molecule is

(a) CO (b) B_2
(c) NO (d) O_2

JEE Main 2019

Ans. (a) : The molecular orbital configuration are–
(i) $CO = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2P_z^2$
It is a diamagnetic
(ii) $B_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_y^1$
It is a paramagnetic
(iii) $NO = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^1, = \pi 2p_y^2$
$\pi^* 2p_x^1 = \pi^* 2p_y$
It is paramagnetic
(iv) $O_2 = (\sigma 2s)^2(\sigma^* 2s)^2(\sigma^* 2p_z)^2(\pi 2p_x^2 = \pi 2p_y^2)$
$(\pi^* 2p_x^1 = \pi^* 2p_y^1)$
It is a paramagnetic

4. Bond Order, Bond Length, Bond Angle, Bond Energy

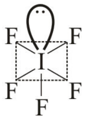
376. Amongst the following which one will have maximum 'lone pair-lone pair' electron repulsions?

(a) IF_5 (b) SF_4
(c) XeF_2 (d) ClF_3

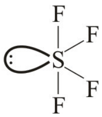
NEET-17.07.2022

Ans. (c) :

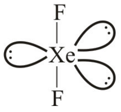
(i) IF_5



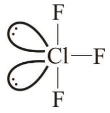
(ii) SF_4



(iii) XeF_2



(iv) ClF_3



In XeF_2 has 3 lone pair and have maximum lone pair-lone pair electron repulsion.

@apna_pdf

377. Which amongst the following is incorrect statement?

(a) C_2 molecule has four electrons in its two degenerate π molecular orbital's.

(b) H_2^+ ion has one electron.

(c) O_2^+ ion is diamagnetic.

(d) The bond orders of O_2^+, O_2, O_2^- and O_2^{2-} are 2.5, 2, 1.5 and 1, respectively.

NEET-17.07.2022

Ans. (c) : O_2^+ is a paramagnetic due to electron are unpaired.

For $O_2^+ = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$

$\pi^*2p_x^1 = \pi^*2p_y$

$$\text{Bond order} = \frac{\text{No. of bonding } e^- - \text{No. of antibonding } e^-}{2}$$

$$= \frac{10-5}{2}$$

$$= 2.5$$

Hence, O_2^+ is paramagnetic in nature.

378. The correct order of bond orders of C_2^{2-}, N_2^{2-}, O_2^{2-} is respectively

(a) $C_2^{2-} < N_2^{2-} < O_2^{2-}$

(b) $O_2^{2-} < N_2^{2-} < C_2^{2-}$

(c) $C_2^{2-} < O_2^{2-} < N_2^{2-}$

(d) $N_2^{2-} < C_2^{2-} < O_2^{2-}$

JEE Main-24.06.2022, Shift-II

Ans. (b) :

(i) $C_2^{2-} = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \ \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

(ii) $N_2^{2-} = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2$

$\pi 2p_x^2 = \pi 2p_y^2, \pi^*2p_x^1 = \pi^*2p_y^1$

$$\text{Bond order} = \frac{10-6}{2} = 2$$

(iii) $O_2^{2-} = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2,$

$\pi 2p_x^2 = \pi 2p_y^2, \pi^*2p_x^2 = \pi^*2p_y^2$

$$\text{Bond order} = \frac{10-8}{2} = 1$$

Hence, the bond order is

$C_2^{2-} > N_2^{2-} > O_2^{2-}$

379. Consider the following reaction:

$$2HSO_4^-(aq) \xrightarrow[\text{(2) Hydrolysis}]{\text{(1) Electrolysis}} 2HSO_4^- + 2H^+ + A$$

The dihedral angle in product A in its solid phase at 110 K is:

(a) 104°

(b) 111.5°

(c) 90.2°

(d) 111.0°

JEE Main-26.06.2022, Shift-I

Ans. (c) : The electrolysis and hydrolysis of given reaction is as given below–

$$2HSO_4^-(aq) \xrightarrow{\text{electrolysis}} HO_3SOOSO_3H\,(aq)$$

$$\downarrow \text{Hydrolysis}$$

$$2HSO_4^- + 2H^+ + \underset{(A)}{H_2O_2}(aq)$$

Hence, the dihedral angle of (A) is 90.2^0

380. According to molecular orbital theory, bond order in increasing order will be

(a) $O_2^{2+} < O_2 < O_2^- < O_2^{2-}$

(b) $O_2^{2-} < O_2^- < O_2 < O_2^{2+}$

(c) $O_2 < O_2^{2-} < O_2^- < O_2^{2+}$

(d) $O_2 < O_2^{2+} < O_2^- < O_2^{2-}$

JEE Main-26.06.2022, Shift-I
CG PET -2009
(JEE Main 2021, 25 July Shift-II)
Karnataka-CET-2016
NEET-2015, cancelled
Tripura JEE-2021

Ans. (b) : The given species are O_2^{2+}, O_2, O_2^- and O_2^{2-}.

Total number of e^- in $O_2^{2+} = 14$

$\therefore$ MO configuration $= (\sigma 1s)^2 (\sigma^*1s)^2 (\sigma 2s)^2 (\sigma^*2s)^2$

$(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z)^2$

$$\text{Bond Order} = \frac{\text{No of Bonding } e^- - \text{No of Antibonding } e^-}{2}$$

$$\text{Bond Order} = \frac{10-4}{2} = 3$$

Total number of e^- in $O_2 = 16$

$\therefore$ MO configuration $= (\sigma 1s)^2 (\sigma^*1s)^2 (\sigma 2s)^2 (\sigma^*2s)^2$

$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^*2p_x^1 = \pi^*2p_y^1)$

$$\text{Bond Order} = \frac{10-6}{2} = 2$$

Total number of e^- in $O_2^- = 17$

$\therefore$ MO configuration $= (\sigma 1s)^2 (\sigma^*1s)^2 (\sigma 2s)^2 (\sigma^*2s)^2$

$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^*2p_x^2 = \pi^*2p_y^1)$

$$\text{Bond Order} = \frac{10-7}{2} = 1.5$$

Total number of e^- in $O_2^{2-} = 18$

Similarly,

$$\text{Bond order} = \frac{10-8}{2} = 1$$

Hence, the order of bond order will be–

$O_2^{2-} < O_2^- < O_2 < O_2^{2+}$

@apna_pdf

381. The decreasing order of bond angle is

(a) $NO_2 > NO_2^+ > NO_2^-$

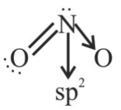
(b) $NO_2^- > NO_2 > NO_2^+$

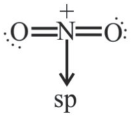
(c) $NO_2^+ > NO_2 > NO_2^-$

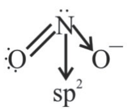
(d) $NO_2^+ > NO_2^- > NO_2$

NEET-2015, cancelled
WB-JEE-2013
NEET-2008
J & K CET-(2004)

Ans. (c) : The species are NO_2, NO_2^+ and NO_2^-







As well as % s character increases, the bond angle of central atom with surrounding atom is also increases. Thus, the decreasing order of bond angle will be–

$NO_2^+ > NO_2 > NO_2^-$

382. The correct order of bond angles (smallest first) in H_2S, NH_3, BF_3, and SiH_4 is

(a) $H_2S < SiH_4 < NH_3 < BF_3$

(b) $NH_3 < H_2S < SiH_4 < BF_3$

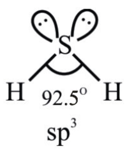
(c) $H_2S < NH_3 < SiH_4 < BF_3$

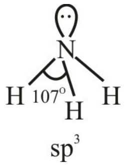
(d) $H_2S < NH_3 < BF_3 < SiH_4$

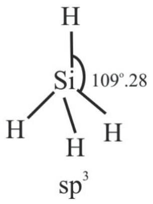
AMU-2016
Assam CEE-2014
AIEEE-2004

Ans. (c) : The structure of the following species –

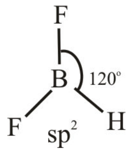
(i) H_2S (ii) NH_3 (iii) SiH_4







(iv) BF_3



Hence, the increasing order of bond angles
$H_2S < NH_3 < SiH_4 < BF_3$

383. The correct bond length order is

(a) $O_2 < O_3 < O_2^{2-}$

(b) $O_2 < O_2^{2-} < O_3$

(c) $O_2^{2-} < O_3 < O_2$

(d) $O_2 = O_2^{2-} > O_3$

BCECE-2018
AIIMS-2017, 2007

Ans. (a): : The MOT electronic configuration is –

$O_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2pz^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^*2p_x^1 = \pi^*2p_y^1$

Bond order $= \dfrac{10-6}{2} = 2$

$O_2^{2-} = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^*2p_x^2 = \pi^*2p_y^2$

Bond order $= \dfrac{10-8}{2} = 1$

In O_3 no. of bonds between the atoms is 3. The number of canonical forms of O_3 is 2.

Bond order $= \dfrac{3}{2} = 1.5$

Thus, the increasing order of bond order is

$O_2^{2-} < O_3 < O_2$

Since, bond order inversely proportional to bond length then the order is $O_2^{2-} > O_3 > O_2$

384. The ONO angle is maximum is:

(a) NO_3^-

(b) NO_2^-

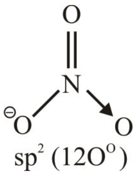
(c) NO_2

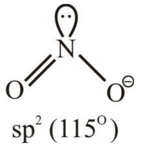
(d) NO_2^+

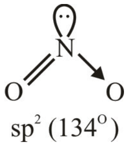
Assam CEE-2014
BCECE-2010
AIIMS-2004

Ans. (d): The bond angle is maximum in NO_2^+ is 180°. It is a linear geometry.

(i) NO_3^- (ii) NO_2^- (iii) NO_2







(iv) NO_2^+

$O = \overset{+}{N} = O$

sp (180°)

385. Which of the following stability order is correct?

(a) $O_2^{2-} > O_2^- > O_2 > O_2^+$

(b) $O_2^+ > O_2 > O_2^- > O_2^{2-}$

(c) $O_2^+ > O_2 > O_2^- > O_2^{2-}$

(d) $O_2 > O_2^+ > O_2^{2-} > O_2^-$

AMU-2014, 2005
BITSAT-2007

Ans. (b) : Bond order is higher it mean that atom are held together more tightly. Therefore the stability is increase.

(i) $O_2^+ = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2,$
$\pi 2p_x^2 = \pi 2p_y^2, \pi^*2p_x^1 = \pi^*2p_y$

Bond order $\dfrac{10-5}{2} = 2.5$

(ii) $O_2 = \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2,$
$\pi 2p_x^2 = \pi 2p_y^2, \pi^*2p_x^1 = \pi^*2p_y^1$

Bond order $\dfrac{10-6}{2} = 2$

@apna_pdf

(iii) $O_2^- = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2,$

$\pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$

Bond order $\frac{10-7}{2} = 1.5$

(iv) $O_2^{2-} = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2,$

$\pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^2$

Bond order $\frac{10-8}{2} = 1$

Hence, the stability order is –

$O_2^+ > O_2 > O_2^- > O_2^{2-}$

386. The correct order of C – O bond length among CO, CO_3^{2-} ,CO_2 is

(a) $CO < CO_2 < CO_3^{2-}$ (b) $CO_2 < CO_3^{2-} < CO$

(c) $CO < CO_3^{2-} < CO_2$ (d) $CO_3^{2-} < CO_2 < CO$

BCECE-2016
CG PET- 2015
AMU-2013

Ans. (a) : A bond length is the average distance between the centers of nuclei of two bonded atom. Double or triple bond is always shorter than the corresponding single bond.

In CO_3^{2-} , C–atom is sp^2 hybridised. The bond length in C – O is 133 pm

In CO_2 , C–atom is sp hybridised. The bond length in C–O is 122 pm.

In CO , C–atom is sp hybridised and bond length is 110 pm.

So, the order of C – O bond length is

$CO < CO_2 < CO_3^{2-}$

387. The pair of species that has the same bond order in the following is

(a) CO, NO^+ (b) NO^-,CN^-

(c) O_2, N_2 (d) O_2, B_2

AIIMS-2016
Karnataka NEET-2013

Ans. (a) : CO = 6+8=14 electrons

NO^+= 7+8–1=14 electrons

Both have same electronic configuration is:

$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2$

So both have bond order = $\frac{10-4}{2} = 3$

388. Assertion: Bond angle of H_2S is smaller than H_2O
Reason: Electronegativity of the central atom increases, bond angle decrease.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion

(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect

(d) If both the Assertion and Reason are incorrect

AIIMS-2013, 2011

Ans. (c): Bond angle of H_2S is 92° and H_2O is 104° 31. As the electronegativity of central atom decreases bond angle decreases. In case of sulphur is less electronegative than oxygen. Thus the bond pair in H_2S are more away from the central atom than in H_2O Since, repulsive force between bond pairs are smaller bond angle.

389. Assertion: Molecular nitrogen is less reactive than molecular oxygen.
Reason: The bond length of N_2 is shorter than that of oxygen.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.

(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.

(c) If the Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2007, 2006

Ans. (a): Molecular nitrogen is less reactive than molecular oxygen because molecular nitrogen to gain octet by 3 electron but molecular oxygen to gain octet by 2 electron. The bond length of N_2 is shorter than oxygen because molecular nitrogen has triple bond between nitrogen atom.

390. In $Fe(CO)_5$, the Fe–C bond possesses

(a) ionic character

(b) σ-character only

(c) π-character only

(d) bond σ and π-character

AMU-2013
AIEEE-2006

Ans. (d) : In metal carbonyl compound possess both σ and π character. In $Fe(CO)_5$, dπ–pπ metal to ligand back bonding in Fe – C bond of $Fe(CO)_5$.

391. Which of the following has the largest bond length?

(a) O_2^+ (b) O_2

(c) O_2^- (d) O_2^{2-}

AMU-2004, 2003

Ans. (d) : Bond order in $O_2^+ = 2.5$

Bond order in $O_2 = 2$

Bond order in $O_2^- = 1.5$

Bond order in $O_2^{-2} = 1$

$\therefore$ O_2^{-2} has the largest bond length.

392. What is the correct sequence of bond order?

(a) $O_2^+ > O_2^- > O_2$ (b) $O_2 > O_2^- > O_2^+$

(c) $O_2^+ > O_2 > O_2^-$ (d) $O_2^- > O_2^+ > O_2$

TS-EAMCET-04.08.2021, Shift-I
AMU 2002

Ans. (c): The species are O_2^+, O_2^- and O_2. The molecular electronic configuration is given below-

O_2^+(Total electron 15)

@apna_pdf

$= \sigma 1s^2\, \sigma^* 1s^2\, \sigma 2s^2\, \sigma^* 2s^2\, \sigma 2p_z^2\, \pi 2p_x^2 = \pi 2p_y^2\, \pi^* 2p_x^1$

Bond order $= \dfrac{10-5}{2} = 2.5$

Similarly, O_2^- (Total electron = 17)

Bond order $= \dfrac{10-7}{2} = 1.5$

and O_2 (Total electron)= 16

Bond order $= \dfrac{10-6}{2} = 2$

Thus, the correct sequence of bond order is $O_2^+ > O_2 > O_2^-$.

393. Of the species, NO, NO^+, NO^{2+} and NO^-, the one with minimum bond strength is

(a) NO^+ (b) NO
(c) NO^{2+} (d) NO^-

(JEE Main 2020, 5 Sep. Shift-I)
J & K CET-(2017)

Ans. (d) : As we know, bond order is directly proportional to the bond strength of the molecule. Firstly, we calculate the bond order i.e.

NO (Total e^- = 15) ⇒ B.O.$\dfrac{10-5}{2} = 2.5$

NO^+ (Total e– = 14) ⇒ B. O. $= \dfrac{10-4}{2} = 3$

NO^{2+} (Total e^- = 13) ⇒ B. O. $= \dfrac{9-4}{2} = 2.5$

NO^- (Total e^- = 16) ⇒ B. O. $= \dfrac{10-6}{2} = 2$

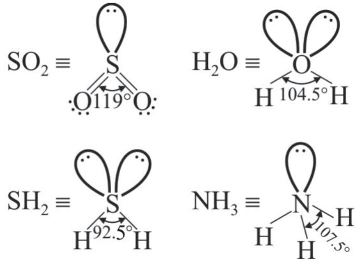
Greater is the bond order, smaller is the bond length. As the bond order increases, the bond strength increases as atoms in bonding come closer to each other. Hence, NO^- has minimum bond strength.

394. Which one of the following compounds has the smallest bond angle ?

(a) SO_2 (b) H_2O
(c) SH_2 (d) NH_3

(AIEEE-2003)
JCECE - 2008

Ans. (c) : The species are given below–



According to the VSEPR theory– SH_2 has two lone pair with two bond pair repulsion due to which they get minimize the angle (S has greater size than oxygen).

395. Increasing order of carbon-carbon bond length for the following is

C_2H_4	C_2H_2	C_6H_6	C_2H_6
(A)	**(B)**	**(C)**	**(D)**

(a) C < B < A < D (b) B < C < A < D
(c) D < C < A < B (d) B < A < C < D

Karnataka-CET-2011
NEET-1992

Ans. (d) : In C_2H_6, carbon-carbon bond is single (1.54 Å).
In C_6H_6, carbon-carbon bond is partially double (1.39 Å).
In C_2H_4, carbon-carbon bond is double (1.34 Å)
In C_2H_2, carbon-carbon bond is triple (1.20 Å)

396. Arrange the following in the increasing order of their bond order

O_2, O_2^+, O_2^- and O_2^{2-} :

(a) $O_2^{2-}, O_2^-, O_2, O_2^+$ (b) $O_2^{2-}, O_2^-, O_2^+, O_2$
(c) $O_2^+, O_2, O_2^-, O_2^{2-}$ (d) $O_2, O_2^+, O_2^-, O_2^{2-}$

Manipal-2019
Karnataka-CET, 2009

Ans. (a) :

Species :	O_2^{2-}	O_2^-	O_2	O_2^+
Bond Order :	1	1.5	2	2.5

397. The calculated bond order of superoxide ion O_2^- is

(a) 2.5 (b) 2
(c) 1.5 (d) 1

J & K CET-(2015)
Karnataka-CET, 2008

Ans. (c) : The MO configuration of superoxide ion is–

$$O_2^- \text{ (total } e^- = 17) = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$$
$$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^2 = \pi^* 2p_y^1)$$

Bond order $= \dfrac{N_b - N_a}{2} = \dfrac{10-7}{2} = \dfrac{3}{2} = 1.5$

398. The sequence that correctly describes the relative bond strength pertaining to oxygen molecule and its cation or anions is:

(a) $O_2^{2-} > O_2^- > O_2 > O_2^+$
(b) $O_2 > O_2^+ > O_2^- > O_2^{2-}$
(c) $O_2^+ > O_2 > O_2^{2-} > O_2^-$
(d) $O_2^+ > O_2 > O_2^- > O_2^{2-}$
(e) $O_2 > O_2^- > O_2^{2-} > O_2^+$

Manipal-2018
Kerala-CEE-2006

Ans. (d) : Bond strength or stability of the molecule or ion depends on the bond order. Bond order is directly proportional to the bond strength. The higher is the bond order, the higher will be bond strength or stability of ion.

Molecule / ions	**Bond order**
O_2^{2-}	1
O_2^-	1.5
O_2	2
O_2^+	2.5

Thus, the order of bond strength of the given species will be –

$O_2^+ > O_2 > O_2^- > O_2^{2-}$

@apna_pdf

399. Which of the following pair have identical bond order?

(a) CN^- and NO^+ (b) $CN^-$and O_2^-

(c) $CN^-$and CN^+ (d) $NO^+$and O_2^-

(e) O_2^- and CN^+

Kerala-CEE-2017, 2009

Ans. (a) : The molecule which have same number of total electron having the identical bond order.

(a) CN^- and NO^+

$$CN^- \text{ (total } e^- = 14) = (\sigma1s)^2 (\sigma^*1s)^2 (\sigma2s)^2 (\sigma^*2s)^2 (\pi2p_x^2 = \pi2p_y^2)(\sigma2p_z)^2$$

$$\text{Bond order} = \frac{6-4}{2} = 2$$

$$NO^+ \text{ (total } e^- = 14) = \frac{6-4}{2} = 1$$

(b) CN^- (total e^- = 14) (c) CN^- (total e^- = 14)

O_2^- (total e^- = 17) CN^+ (total e^- = 12)

(d) NO^+ (total e^- = 14) (e) O_2^- (total e^- = 17)

O_2^- (total e^- = 17) CN^+ (total e^- = 12)

400. H–O–O bond angle in H_2O_2 is

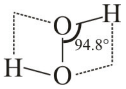
(a) 90° (b) 180°

(c) 109.5° (d) 94.8°

UP CPMT-2005

MHT CET-02.05.2019, SHIFT-II

Ans. (d):



∴ H–O–O bond angle in H_2O_2 is 94.8°.

401. Which among the following species has unequal bond lengths?

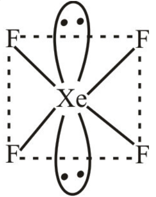
(a) XeF_4 (b) SiF_4

(c) SF_4 (d) BF_4^-

(JEE Main 2021, 25 Feb Shift-II)

Ans. (c) : The Species has regular geometry when there are no any lone pair present on the central atom. The structure of the given species is as under–

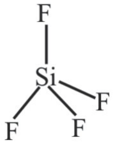
(a) $XeF_4 \equiv$



Hybridisation = 4 + 2 = 6 (sp^3d^2)

All Xe – F bonds are equal due to regular geometry

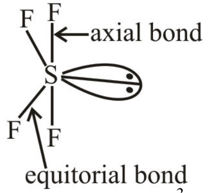
(b) $SiF_4 \equiv$



Hybridisation = 4 + 0 = 4 (sp^3)

All Si–F bonds are equal.

(c) $SF_4 \equiv$



Hybridisation = 4 + 1 = 5 (sp^3d)

The two S – F bond (axial bond) are longer than the two S – F bond (equitorial bond) due to the bond pair – bond pair repulsion. Hence, SF_4 has unequal bond length.

(d) The structure of BF_4^- is same with the SiF_4. Hence, both have regular geometry with same bond length.

402. Given below are two statement : one is labelled as Assertion (A) and the other is labelled as Reason (R).

Assertion (A) : The H—O—H bond angle in water molecule is 104.5°.

Reason (R) : The lone pair-lone pair repulsion of electrons is higher than the bond pair - bond pair repulsion.

(a) A is false but R is true.

(b) Both A and R are true, but R is not the correct explanation of A.

(c) A is true but R is false.

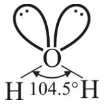
(d) Both A and R are true, and R is the correct explanation of A.

(JEE Main 2021, 16 March Shift-I)

Ans. (d) : The water molecule molecule has two lone pair electron on own central atom. According to the VSEPR theory– the repulsion between two lone pair reduces the bond angle between them i.e. 104.5°. The repulsive interaction of electron pairs decreases in the order.

Lone pair-Lone pair > Lone pair–Bond pair > Bond pair-Bond pair.

Hence, both assertion (A) and reason (R) are true and R is the correct explanation of A.



403. The correct shape and I—I—I bond angles respectively in I_3^-, ion are

(a) Distorted trigonal planar, 135° and 90°

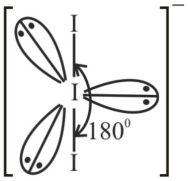
(b) T-shaped, 180° and 90°

(c) Trigonal planar, 120°

(d) Linear, 180°

(JEE Main 2021, 24 Feb Shift-II)

Ans. (d) : The given ions is I_3^-. The hybridization of I_3^- is sp^3d. The geometry of the molecule is linear with 180° bond angle.



@apna_pdf

404. Match List-I with List-II.

List-I (Molecule)	List-II (Bond order)
(a) Ne_2	(i) 1
(b) N_2	(ii) 2
(c) F_2	(iii) 0
(d) O_2	(iv) 3

Choose the correct answer from the options given below:

(a) $(a)\to(i),(b)\to(ii),(c)\to(iii),(d)\to(iv)$

(b) $(a)\to(iv),(b)\to(iii),(c)\to(ii),(d)\to(i)$

(c) $(a)\to(ii),(b)\to(i),(c)\to(iv),(d)\to(iii)$

(d) $(a)\to(iii),(b)\to(iv),(c)\to(i),(d)\to(ii)$

JEE Main 26.02.2021,Shift-II

Ans. (d) : According to molecular orbital theory electrons in a molecule are not assigned to individual chemical bonds between atoms.

Molecule	Bond order
Ne_2	0
N_2	3
F_2	1
O_2	2

Note-Bond order is a measurement of the number of electrons involved in bonds between two atoms in a molecule.

405. The molecule which has the maximum bond enthalpy is?

(a) N_2 (b) HF

(c) F_2 (d) CO

TS-EAMCET 09.08.2021, Shift-I

Ans. (d) :

Molecule		Bond Enthalpy (kJ/mol.)
N_2	—	945
HF	—	565
F_2	—	159
CO	—	1070

406. The order of the average bond length of the given bonds is

(a) $C=O<C=N<C\equiv C<N-O$

(b) $C\equiv C<C=O<C=N<N-O$

(c) $C\equiv C<C=O<N-O<C=N$

(d) $C=N<C=O<N-O<C\equiv C$

TS-EAMCET (Engg.), 06.08.2021

Ans. (c): Bond length is defined as the average distance between nuclei of two bonded atoms in a molecule.

$$\therefore \text{ Bond length} \propto \frac{1}{\text{bond order}}$$

So, $\xrightarrow[\text{increasing order of bond length}]{C\equiv C<C=O<N-O<C=N}$

Bond	Bond length
$C\equiv O$	1.20
$C=O$	1.23
$N-O$	1.36
$C=N$	1.38

407. Assertion (A) : The bond dissociation energy increases from F_2 to Cl_2 and then decreases to I_2

Reason (R) : The low bond energy of fluorine is due to the repulsion between the lone pairs of electrons in two fluorine atoms.

The correct option among the following is :

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)

(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)

(c) (A) is true but (R) is false

(d) (A) is false but (R) is true

TS EAMCET 05.08.2021, Shift-I

Ans. (a) : The bond dissociation energy increases from F_2 to Cl_2 and then decreases to I_2

The bond energy of Fluorine is due to the repulsion between the lone pair of electrons in two fluorine atoms. Hence, A and R is true and (R) is the correct explanation for (A).

408. Given below are two statements: one is labeled as Assertion A and the other is labeled as Reason R:

Assertion A : The H–O–H bond angle in water molecule is 104.5^0.

Reason R : The lone pair-lone pair repulsion of electrons is higher than the bond pair -bond pair repulsion.

In the light of the above statements, choose the correct answer from the options given below:

(a) Both A and R are true, and R is the correct explanation of A

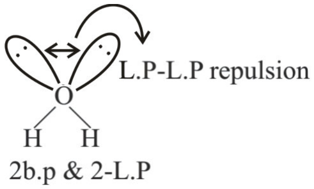
(b) Both A and R are true, but R is not the correct explanation of A

(c) A is true but R is false

(d) A is false but R is true

JEE Main 16.03.2021, Shift-I

Ans. (a) : The given assertion and reason both are true. The H–O–H bond angle in water molecule is 104.5^o because of lone pair-lone pair repulsion the bond angle decreases from 109.5^0 to 104.5^0.



In water O-atom is sp^3 hybridized with 2B.P & 2L.P

409. Which among the following species has unequal bond lengths ?

(a) XeF_4 (b) SiF_4

(c) SF_4 (d) BF_4^-

JEE Main 25.02.2021, Shift-II

Ans. (c) : (i) The hybridisation of

XeF_4 = No. of b.p + No. of l.p

$= 4 + 2 = 6(sp^3d^2)$

Octahedral geometry

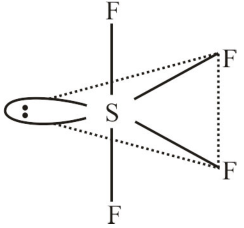
(ii) SiF_4 = No. of bond pair

$= 4(sp^3)$ hybridisation

@apna_pdf

(iii) SF_4 = No. of bond pair + No. of lone pair

= 4+1 = 5(sp^3d)



See–saw shape and axial bond length is more than equatorial bond length.

(iv) BF_4^- = sp^3 i.e, Tetrahedral shape

410. How many among the given species have a bond order of 0.5?

H_2^+. He_2^+. He_2^-. B_2^+. F_2^-. Be_2^{2-}

(a) 2 (b) 3

(c) 1 (d) 4

AP EAPCET 19-08-2021, Shift-II

Ans. (d) : Given species - $H_2^+, He_2^+, He_2^-, B_2^+, F_2^-, Be_2^{2-}$

Total valence electron is written as -

$H_2^+ = 1$, $He_2^+ = 4-1 = 3$, $He_2^- = 4+1 = 5$, $B_2^+ = 6-1 = 5$,

$F_2^- = 14+1 = 15$, $Be_2^{2-} = 4+2 = 6$

Formula -

$$\text{Bond order} = \frac{\text{No.of bonding e}^- - \text{No.of antibonding e}^-}{2}$$

$$\therefore \quad H_2^+ = \frac{1-0}{2} = \frac{1}{2} \qquad B_2^+ = \frac{3-2}{2} = \frac{1}{2}$$

$$He_2^+ = \frac{2-1}{2} = \frac{1}{2} \qquad Fe_2^- = \frac{11-4}{2} = 3.5$$

$$He_2^- = \frac{3-2}{2} = \frac{1}{2} \qquad Be_2^{2-} = \frac{4-2}{2} = 1$$

411. Which of the following is the correct sequence of bond-energies?

(a) (O – O) > (S – S) > (Se – Se) > (Te – Te)

(b) (Te – Te) > (Se – Se) > (S – S) > (O – O)

(c) (S – S) > (Se – Se) > (O – O) > (Te – Te)

(d) (Te – Te) > (O – O) > (Se – Se) > (S – S)

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c) : Bond energy is defined is measure of the bond strength of a chemical bond. So the order is -

S – S > Se – Se > O – O > Te – Te

412. How many among the given species have a bond order of 3?

CO, NO^+, C_2^{2-}, O_2^{2+}, CN^-, NO

(a) 1 (b) 3

(c) 5 (d) 4

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c) : Bond order is the number of chemical bonds between a pair of atoms,

$$\text{Bond order} = \frac{\text{No.of bonding e}^- - \text{No.of anti bonding e}^-}{2}$$

So, CO, NO^+, C_2^2, O_2^{2+}, CN^- has bond order is 3 and NO. has bond order 2.5

413. Which of the following represents the correct order of Cl–O bond lengths in $ClO^-, ClO_2^-, ClO_3^-, ClO_4^-$?

(a) $ClO_4^- = ClO_3^- = ClO_2^- = ClO^-$

(b) $ClO^- < ClO_2^- < ClO_3^- < ClO_4^-$

(c) $ClO_4^- < ClO_3^- < ClO_2^- < ClO^-$

(d) $ClO_3^- < ClO_4^- < ClO_2^- < ClO^-$

[BITSAT-2021]

Ans. (c) : Bond order $\propto \frac{1}{\text{Bond length}}$

When bond order is increase then the bond length decrease,

For ClO^-, ClO_2^-, ClO_3^-, and ClO_4^-, the bond order are 1, 1.5, 1.66 and 1.75 respectively

Therefore, the order of bond length is

$ClO_4^- < ClO_3^- < ClO_2^- < ClO^-$

414. The difference between bond orders of CO and $NO^\oplus$ is x/2 where x = ...

(Round off to the nearest integer).

(a) 1 (b) 2

(c) 3 (d) 0

(JEE Main 2021, 27 July Shift-I)

Ans. (d) : As we know that CO and NO^+ have equal no of total electron so they have same bond order i.e.

Total e^- = 14

$$\therefore \text{MO configuration} = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\pi 2p_x^2 = \pi 2p_y^2)^2 (\sigma 2P_z)^2$$

$$\text{B.O.} = \frac{10-4}{2} = 3$$

According to the question–

Difference between bond order of CO and NO^+ $= \frac{x}{2}$

or $3-3 = \frac{x}{2}$

or $0 = \frac{x}{2}$

or $x = 0$

415. The amount of energy required to break a bond is same as the amount of energy released when the same bond is formed. In gaseous state, the energy required for homolytic cleavage of a bond is called Bond Dissociation Energy (BDE) or Bond Strength. BDE is affected by s-character of the bond and the stability of the radicals formed. Shorter bonds are typically stronger bonds. BDEs for some bonds are given below :

$H_3C–H(g) \rightarrow H_3C^\bullet(g) + H^\bullet(g)$ ΔH° = 105 kcal mol^{-1}

$Cl–Cl(g) \rightarrow Cl^\bullet(g) + Cl^\bullet(g)$ ΔH° = 58 kcal mol^{-1}

$H_3C–Cl(g) \rightarrow H_3C^\bullet(g) + Cl^\bullet(g)$ ΔH°=85 kcal mol^{-1}

$H–Cl(g) \rightarrow H^\bullet(g) + Cl^\bullet(g)$ ΔH° = 103 kcal mol^{-1}

@apna_pdf

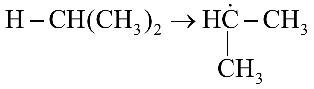
Correct match of the C–H bonds (shown in bold) in Column J with their BDE in Column K is

Column J Molecule	Column K BDE (kcal mol^{-1})
(P) $H-CH(CH_3)_2$	**(i) 132**
(Q) $H-CH_2Ph$	**(ii) 110**
(R) $H-CH=CH_2$	**(iii) 95**
(S) $H-C\equiv CH$	**(iv) 88**

(a) P – iii, Q – iv, R – ii, S – i
(b) P – i, Q – ii, R – iii, S – iv
(c) P – iii, Q – ii, R – i, S – iv
(d) P – ii, Q – i, R – iv, S – iii

JEE advance 2021

Ans. (a) :



$$H-CH(CH_3)_2 \rightarrow H\dot{C}(CH_3)-CH_3$$

$$H-CH_2Ph \rightarrow \dot{C}H_2-Ph$$

$$H-CH=CH_2 \longrightarrow \dot{C}H=CH_2$$

$$H-C\equiv CH \rightarrow \dot{C}\equiv CH$$

Order of stability of free radical is Q > P > R > S

Stability of free radical $\propto \frac{1}{\text{Bond energy}}$

$\therefore$ Order of bond energy– S > R > P > Q

416. Which of the following set contains same bond angle around central atom?

(a) CH_4, SF_4 NH_3
(b) NF_3, BCl_3, NH_3
(c) BF_3, BCl_3, BBr_3
(d) BF_3, NF_3, $AlCl_3$

TS EAMCET 10.08.2021, Shift-I

Ans. (c) : Bond angle depend on hybridization on central atom.

Species	Hybridization
BF_3	sp^2
BCl_3	sp^2
BBr_3	sp^2

417. How many among the given species have the highest bond order? CN^-, CO, NO^+, O_2^+, O_2, N_2

(a) 5
(b) 2
(c) 3
(d) 4

TS EAMCET 10.08.2021, Shift-I

Ans. (d) : Bond Order =

$$\frac{\text{No.of bonding } e^- - \text{No.antibonding } e^-}{2}$$

Species	No. of e-	Bond order
CN^-	14	3
CO	14	3
NO^+	14	3
O_2^+	15	2.5
O_2	16	2.0
N_2	14	3.0

Bond order represent number of bond between two atom.

418. The correct order of Sulphur oxygen bond order in SO_3, $S_2O_3^{2-}$ and SO_4^{2-} are

(a) $SO_4^{2-} < S_2O_3^{2-} < SO_3$
(b) $SO_4^{2-} < SO_3 < S_2O_3^{2-}$
(c) $S_2O_3^{2-} < SO_4^{2-} < SO_3$
(d) $S_2O_3^{2-} < SO_3 < SO_4^{2-}$

AP EAPCET 20.08.2021 Shift-I

Ans. (c) : Bond order is the number of chemical bonds between a pair of atoms.

$SO_3 = 2$

$SO_4^{2-} = 1.5$

$S_2O_3^{2-} = 1.33$

So decreasing order $SO_3 > SO_4^{2-} > S_2O_3^{2-}$

419. Bond order is an inverse measure of —

(a) Bond-length
(b) Bond-angle
(c) Bond dissociation energy
(d) Stability

AP EAPCET 20.08.2021 Shift-I

Ans. (a) : Bond order is the number of chemical bonds between a pair of atoms.

$$\boxed{\text{Bond order} \propto \frac{1}{\text{bond length}}}$$

Since the bond order increases bond length decreases.

420. Assuming AB is an ionic compound and r_c, r_a are the ionic radii of A^+ and B^- respectively. The lattice energy of the compound AB is proportional to:

(a) $\frac{r_c}{r_a}$

(b) $\frac{1}{r_c + r_a}$

(c) $\frac{r_a}{r_c}$

(d) $\sqrt{(r_c + r_a)}$

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (b) : According to Coulomb's law, Lattice energy is inversely proportional to the internuclear distance of the given ionic solid.

$$\text{Lattice energy (U)} \propto \frac{q_c \cdot q_a}{r_c + r_a}$$

The lactic energy of the compound AB is proportional to

$$\Rightarrow \boxed{U \propto \frac{1}{r_c + r_a}}$$

421. The compound that has the largest H—M—H bond angle (M = N, O, S, C) is

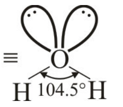
(a) H_2O
(b) NH_3
(c) H_2S
(d) CH_4

(JEE Main 2020, 5 Sep Shift-II)

@apna_pdf

Ans. (d)

(a) $H_2O \equiv$

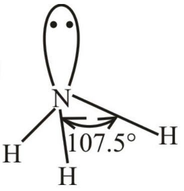


Hybridisation = Bond pair + Lone pair

= 2 + 2

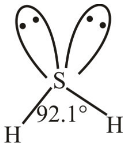
= 4 (sp^3)

(b) $NH_3 \equiv$



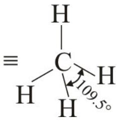
Hybridisation = 3 + 1 = 4 (sp^3)

(c) $H_2S \equiv$



Hybridisation = 2 + 2 = sp^3 (4)

(d) $CH_4 \equiv$

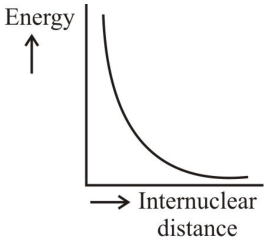


Hybridisation = 4 + 0 = 4 (sp^3)

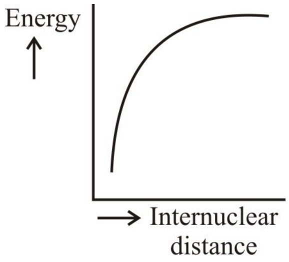
Hence, CH_4 has the largest H–M–H bond angle.

422. The potential energy curve for the H_2 molecule as a function of internuclear distance is

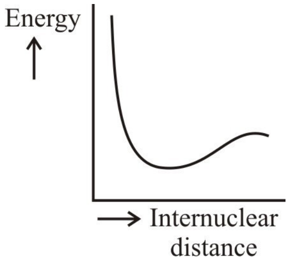
(a)



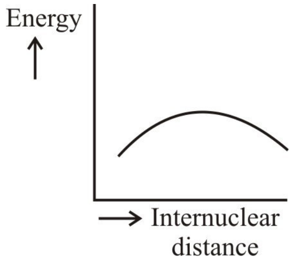
(b)



(c)

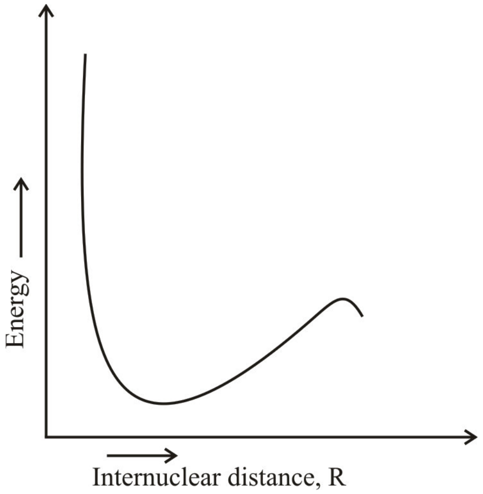


(d)



(JEE Main 2020, 5 Sep. Shift-I)

Ans. (c) : The potential energy curve for the diatomic molecule i.e. H_2 as a function of internuclear distance which is expressed by the Born–Oppenheimer approximation.



423. Arrange the following bonds according to their average bond energies in descending order

C—Cl, C—Br, C—F, C—I

(a) C—F > C—Cl > C—Br > C —I

(b) C—Br > C —I > C —Cl > C — F

(c) C—I > C—Br > C — Cl > C — F

(d) C — Cl > C — Br > C — I > C — F

(JEE Main 2020, 8 Jan. Shift-II)

Ans. (a) : As we move down on the halogen group the electronegativity decreases and size of element increases due to which the average bond energy is also decreases.

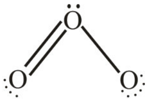
Bond	**Bond enthalpies / $kJmol^{-1}$**
C – F	452
C – Cl	351
C – Br	293
C – I	234

424. The formal charge on central oxygen atom in ozone is

(a) –1
(b) 0
(c) +2
(d) +1

Karnataka-CET-2020

Ans. (d) : The Lewis structure of O_3 may be drawn as :



@apna_pdf

$$\text{Formal charge} = \begin{bmatrix}\text{Total no of valence}\\ \text{electrones in the}\\ \text{Free atom}\end{bmatrix} - \begin{bmatrix}\text{Total no. of non -}\\ \text{bonding electron}\end{bmatrix} - 1/2\begin{bmatrix}\text{Total no. of}\\ \text{bonding electron}\end{bmatrix}$$

$$\text{Formal charge} = 6-2-\frac{1}{2}\times 6 = 6-2-3 = +1$$

The Formal charge on central oxygen atom in ozone is +1.

425. Bond angle in PH_4^+ is more than that of PH_3. This is because

(a) lone pair-bond pair repulsion exists in PH_3

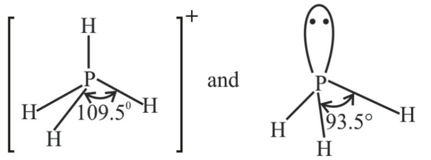
(b) PH_4^+ has square planar structure

(c) PH_3 has planar trigonal structure

(d) hybridisation of P change when PH_3 is converted to PH_4^+.

Karnataka-CET-2020

Ans. (a) : According to the VSEPR theory, the structure of PH_4^+ and PH_3 are drawn below–



Due to the absence of lone pair-bond pair repulsion and presence of four identical bond pair-bond pair interactions, PH_4^+ assumes tetrahedral with 109.5° bond angle whereas PH_3 has lone pair repulsion and it's interaction reduces the angle i.e. 93.5°.

426. The correct order of bond energy (in kJ/mol) of the following molecules is

(a) $O_2<B_2<C_2<N_2$

(b) $B_2<C_2<O_2<N_2$

(c) $C_2<O_2<B_2<N_2$

(d) $B_2<O_2<C_2<N_2$

(e) $B_2<O_2<N_2<C_2$

Kerala-CEE-2020

Ans. (d) : Bond energy is directly proportional to bond order. Here, N_2 has highest bond order equal to 3 and B_2 has lowest bond order equal to 1. So, order will be, $B_2<O_2<C_2<N_2$

427. Which of the following sets of species have similar bond order ?

(a) N_2, O_2^{2-}, NO^+

(b) N_2, F_2, O_2^{2-}

(c) N_2, N_2^-, O_2^-

(d) N_2, CO, NO^+

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (d) : Bond order, $BO = \frac{N_b - N_a}{2}$

$N_2(14e^-) : BO = \frac{10-4}{2} = 3$

$O_2^{2-}(18e^-) : BO = \frac{10-8}{2} = 1$

$NO^+(14e^-) : BO = \frac{10-4}{2} = 3$

$F_2(18e^-) : BO = \frac{10-8}{2} = 1$

$N_2^{2-}(16e^-) : BO = \frac{10-6}{2} = 2$

$O_2^-(17e^-) : BO = \frac{10-7}{2} = 1.5$

$CO(14e^-) : BO = \frac{10-4}{2} = 3$

So, (N_2, CO, NO^+) have similar bond order, 3.

428. Which among the following represents the correct order of variation of bond angles in the given molecules ?

(a) $NH_3 > NF_3 > PCl_3 > BF_3$

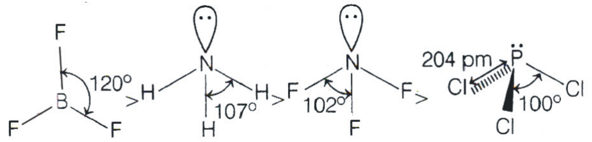
(b) $BF_3 > PCl_3 > NH_3 > NF_3$

(c) $BF_3 > NH_3 > PCl_3 > NF_3$

(d) $BF_3 > NH_3 > NF_3 > PCl_3$

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (d) : Bond angle in BF_3 (120°), NH_3(107°), NF_3(102°) and PCl_3(100°).



Hence, the correct option is (d).

429. The relationship between the dissociation energy of N_2 and N_2^+ is

(a) dissociation energy of N_2 = dissociation energy of N_2^+

(b) dissociation energy of N_2 can either be lower or higher than the dissociation energy of N_2^+

(c) dissociation energy of N_2> dissociation energy of N_2^+

(d) dissociation energy of N_2^+> dissociation energy of N_2.

COMEDK 2019

Ans. (c) : N_2 ($14e^-$) =

$$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$$

B.O. of N_2>B.O. of N_2^+

Thus, dissociation energy of N_2> Dissociation energy of N_2^+.

430. The correct order of S-S bond length in following oxyanions is:

(I) $S_2O_4^{2-}$ (II) $S_2O_5^{2-}$ (III) $S_2O_6^{2-}$

(a) I > II > III

(b) I > III > II

(c) III > II > I

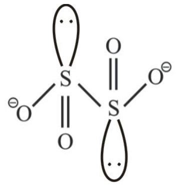
(d) III > I > II

AIIMS 25 May 2019 (Evening)

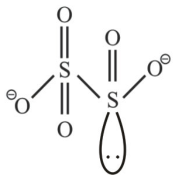
@apna_pdf

Ans. (a): The structure of the following are

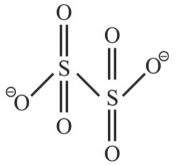
(i) $S_2O_4^{2-}$



(ii) $S_2O_5^{2-}$



(iii) $S_2O_6^{2-}$



2 (lone pair – lone pair) 2 (bond pair – bond pair Repulsion)

1 (lp–lp) 2 (bp – bp)

All (bp –bp) (repulsion)

According to the bent rule repulsion is maximum then bond length is maximum

Hence, the order is I > II > III.

431. Assertion: H_2^+ and H_2^- ions have the same bond order

Reason: H_2^+ is less stable than H_2^-.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 26 May 2019 (Evening)

Ans. (c): The molecular orbital electronic configuration is –

(i) $H_2^+ = \sigma 1s^1$

It has 1 electron on σ bonding molecular orbital.

Bond order =

$$\frac{\text{No. of bonding } e^- - \text{No. of antibonding } e^-}{2}$$

$$= \frac{1-0}{2} = 0.5$$

(ii) $H_2^- = \sigma 1s^2, \sigma^* 1s^1$

Bond order $= \dfrac{2-1}{2} = 0.5$

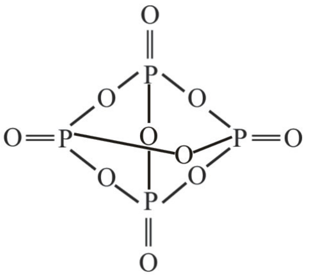
Thus, the bond order for both H_2^+ and H_2^- is same but H_2^+ is more stable than H_2^- due to absence of electron in antibonding orbital of H_2^+.

432. In dimer of phosphorus pentaoxide, in what order number of P – P, P = O & P – O – P bonds are there?

(a) P – O – P > P = O > P – P
(b) P = O > P – O – P > P – P
(c) P – O – P > P – P > P = P
(d) P = O > P – P > P – O – P

AIIMS 26 May 2019 (Evening)

Ans. (a): The structure of dimmer phosphorous penta oxide.



Total no. of P– O – P bond = 6
Total no. of P = O bond = 4
Total no. of P–P bond = O

433. What is the correct order of bond dissociation energy?

(a) $Br_2 > Cl_2$ (b) $F_2 > Cl_2$
(c) $I_2 > F_2$ (d) $F_2 > I_2$

AIIMS 25 May 2019 (Morning)

Ans. (d): Fluorine has a small atomic size and 2p subs bell is compact and close to the nucleus.

On moving down the halogen family and dissociation energy decrease. But in case of fluorine bond dissociation energy of fluorine is lower than chlorine and bromine due to inter electronic repulsion present in the small atom of fluorine

Therefore, the order is –
$Cl_2 > Br_2 > F_2 > I_2$.

434. NO^+ has bond order

(a) 2 (b) 2.5
(c) 3 (d) 3.5
(e) 4

Kerala-CEE-2019

Ans. (c) : In NO^+ total no. of e^- is 14

Bond order$= \dfrac{\text{No of bonding } e^- - \text{No. of antibonding } e^-}{2}$

Bond order $= \dfrac{10-4}{2} = 3$

435. Bond angle is minimum for

(a) H_2O (b) H_2S
(c) H_2Se (d) H_2Te

COMEDK 2018

Ans. (d) : The bond angle of hydride of 16 group elements decreases on increasing the size of elements. Hence, TeH_2 has the least bond angle.

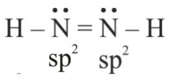
436. % s- character of N- H bonds is maximum in:

(a) N_2H_2 (b) N_2H_4
(c) NH_3 (d) NH_4^+

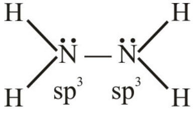
AIIMS-27 May,2018 (E)

Ans. (a): The structure of the following are –

(i) N_2H_2



(ii) N_2H_4

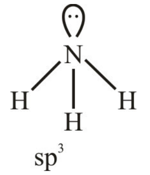


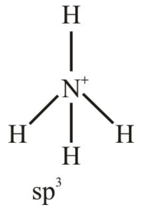
% s – character = 33 %

% s – character = 25%

@apna_pdf

(ii) NH_3 (ii) NH_4^+





% s – character = 25 % % s – character = 25%
So, % s-character of N–H bonds is maximum in N_2H_2.

437. Which pair of diatomic species do not have same bond order?

(a) B_2^-, C_2 (b) O_2^-, B_2^-
(c) N_2^+, O_2^+ (d) O_2^-, C_2

AIIMS-27 May,2018 (M)

Ans. (a): The MOT electronic configuration of the following is –

$B_2^- = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \ \pi 2p_x^2 = \pi 2p_y^1$

Bond order $= \frac{7-4}{2} = \frac{3}{2} = 1.5$

$C_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \ \pi 2p_x^2 = \pi 2p_y^2$

Bond order $= \frac{8-4}{2} = 2$

Hence, B_2^- and C_2 pair of diatomic species do not have same bond order.

438. Among the following species, which has zero bond order?

(a) H_2 (b) H_2^+
(c) He_2 (d) He_2^+

Manipal-2018

Ans. (c) : (a) H_2 (total $e^- = 2$) $= (\sigma 1s)^2$

Bond order $= \frac{2-0}{2} = 1$

(b) H_2^+ (total $e^- = 1$) $= (\sigma 1s)^1$

Bond order $= \frac{1-0}{2} = 0.5$

(c) He_2 (total $e^- = 4$) $= (\sigma 1s)^2 \ (\sigma^* 1s)^2$

Bond order $= \frac{2-2}{2} = 0$

(d) He_2^+ (total $e^- = 3$) $= (\sigma 1s)^2 \ (\sigma^* 1s)^1$

Bond order $= \frac{2-1}{2} = 0.5$

Hence, He_2 has the zero bond order.

439. The bond length (pm) of F_2, H_2, Cl_2 and I_2, respectively is

(a) 144, 74, 199, 267 (b) 74, 144, 199, 267
(c) 74, 267, 199, 144 (d) 144, 74, 267, 199

TS EAMCET-2017

Ans. (b) : The size of halogen atom increase on the down the group then the bond length (X-X) of molecule also increase.

440. Which of the following is not a true statements about ozone?

(a) Both the O – O bonds in O_3 are of equal length
(b) Bond order lie in between 1 and 2
(c) O — O — O bond angle in O_3 is approximately 116^0.
(d) Essential for breathing

BCECE-2017

Ans. (d) : In ozone, three oxygen-atoms are arranged in a bent shape. The central oxygen-atom makes one single bond with of the terminal oxygen atom and double bond with the other terminal oxygen atom

(i) Both the O–O bond are equal length.
(ii) Bond order lies between 1 and 2
(iii) O–O–O bond angle is O_3 is approximately 116^o .

441. The bond order in CN^- ion is

(a) 2.5 (b) 3
(c) 2 (d) 3.5

CG PET -2017

Ans. (b) :

Bond Order $= \frac{\text{No of Bonding } e^- - \text{No of Antibonding } e^-}{2}$

Total number of electrons in CN^- ions
$= 6 + 7 + 1 = 14$

MO configuration $= (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$
$\left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\sigma 2p_z^2\right)$

Number of bonding electrons = 10
Number of anti-bonding electrons = 4

$\therefore$ Bond order $= \frac{10-4}{2} = 3$

442. There are two statements, one labelled as Assertion (A) and the other as Reason (R). Examine both the statements carefully and mark the correct choice.

(A) The H– O–H bond angle in H_2O is greater than H–S–H bond angle in H_2S.
(R) Due to larger size of S, hydrogen bonding does not occur in H_2S.

(a) Both (A) and (R) are correct and (R) is the correct explanation of (A).
(b) Both (A) and (R) are correct but (R) is not the correct explanation of (A).
(c) (A) is correct but (R) is wrong.
(d) (A) is wrong but (R) is correct.

J & K CET-2017

Ans. (b) : H_2O and H_2S both have sp^3 hybridisation. Sulphur is in more atomic size than O. As the size of central atom increases, electronegativity decreases and less repulsion occure between bond pair and lone pair. That's way H_2S has less bond angle than pair H_2O.

443. What will be the correct order of the C–F bond distance among the following?
CHF_3, CF_4, CH_3F and CH_2F_2

(a) $CH_3F < CH_2F_2 < CHF_3 < CF_4$
(b) $CH_2F_2 > CH_3F > CHF_3 > CF_4$
(c) $CH_3F > CH_2F_2 > CHF_3 > CF_4$
(d) $CH_3F > CHF_3 > CF_4 > CH_2F_2$

J & K CET-2017

@apna_pdf

Ans. (c) : As the number of F atoms increases, the partial positive charge on the C atom increases. Hence, it more strongly attracts the bond pair of electrons. Hence, the bond strength increases and the bond length decreases. Thus, the correct order of C – F bond length will be– $CH_3F > CH_2F_2 > CHF_3 > CF_4$

444. The common features among CO, CN^- and NO^+ are

(a) Bond order three and isoelectronic.
(b) Bond order three and weak field ligands.
(c) Bond order two and π-acceptors.
(d) Bond order three and π-donors.
(e) Isoelectronic and strong field ligands.

Kerala-CEE-2017

Ans. (a) :

$$CO\ (\text{total } e^- = 14) = (\sigma 1s)^2(\sigma^*1s)^2(\sigma 2s)^2(\sigma^*2s)^2(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z^2)$$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

$$CN^-\ (\text{total } e^- = 14) \Rightarrow \text{Bond order} = \frac{10-4}{2} = 3$$

$$NO^+\ (\text{total } e^- = 14) \Rightarrow \text{Bond order} = \frac{10-4}{2} = 3$$

All species have 3 bond order. It is also have same electron. So, it is iso-electronic to each other.

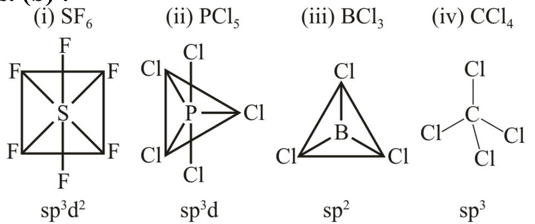
- All the ligand are π-acceptor.

445. In which of the following molecules, all bond lengths are not equal?

(a) SF_6
(b) PCl_5
(c) BCl_3
(d) CCl_4

AP-EAMCET – 2016

Ans. (b) :



In PCl_5, it shows sp^3d hybridisation. It form a 5 equivalent sp^3d orbitals. 3 chlorine atoms are corners of triangle and 2 chlorine atom are axial position.

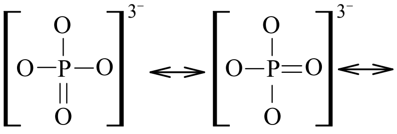
Bond length of axial bond is greater than the length of equatorial bond length. Hence, the correct option is (b).

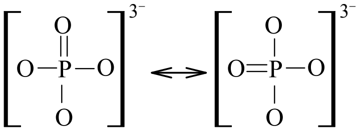
446. In PO_4^{3-}, the formal charge on each oxygen atom and the P – O bond order respectively are

(a) –0.75, 0.6
(b) –0.75, 1.0
(c) –0.75, 1.25
(d) –3, 1.25

BITSAT 2016

Ans. (c) :





$$\text{Bond order} = \frac{\text{Number of bonds}}{\text{Number of resonating structures}} = \frac{5}{4} = 1.25$$

Three unit negative charge is being shared by four O atoms.

Formal charge = –3/4 = –0.75.

447. The correct increasing order of bond order values for the concerned species is

(a) $O_2^- < O_2 < N_2^+ < N_2$
(b) $O_2^- < O_2 < N_2 < N_2^+$
(c) $O_2 < O_2^- < N_2^+ < N_2$
(d) $O_2 < O_2^- < N_2 < N_2^+$

J & K CET-2016

Ans. (a) : The molecules are O_2^-, O_2, N_2^+, N_2.

$$N_2\ (\text{Total } e^- = 14) = (\sigma 1s)^2(\sigma^*1s)^2(\sigma 2s)^2(\sigma^*2s)^2(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z)^2$$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

$$N_2^+(\text{total } e^- = 13) = (\sigma 1s)^2(\sigma^*1s)^2(\sigma 2s)^2(\sigma^*2s)^2(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z)^1$$

$$\Rightarrow \text{B.O.} = \frac{9-4}{2} = 2.5$$

$$O_2\ (\text{Total } e^- = 16) = (\sigma 1s)^2(\sigma^*1s)^2(\sigma 2s)^2(\sigma^*2s)^2(\sigma 2p_z)^2(\pi 2p_x^2 = \pi 2p_y^2)(\pi^*2p_x^1 = \pi^*2p_y^1)$$

$$\text{Bond order} = \frac{10-6}{2} = 2$$

Similarly,

$$O_2^-(\text{Total } e^- = 17) = \frac{10-7}{2} = 1.5$$

Hence, the correct increasing order of bond order is–

$$O_2^- < O_2 < N_2^+ < N_2$$

448. Highest bond energy for a single bond among the following is of

(a) F – F
(b) O – O
(c) C – C
(d) N – N

JCECE-2016

Ans. (c) : C—C bond energy is maximum as–

(a) Carbon shows maximum catenation.

(b) During catenation, all the 4 valence electrons of carbon are used in bond formation, thus has no lone pair.

Hence, C—C bond shows maximum bond energy.

449. Consider the following molecules:

(1) CH_3NH_2
(2) CH_3OH
(3) CH_3SH
(4) $CH_3P(CH_3)_2$

Which one of the following bonds has the longest bond length in the above molecules?

(a) C–N
(b) C–O
(c) C–S
(d) C–P

SCRA-2015

@apna_pdf

Ans. (c): C–S bonds have the longest bond because bond length of C–S is 182 Å and other is lower.

450. Consider the nitrogen-oxygen bond lengths in NO_2^+, NO_2^- and NO_3^-. The increasing order of N–O bond length is

(a) $NO_2^+ < NO_2^- < NO_3^-$ (b) $NO_2^+ < NO_3^- < NO_2^-$

(c) $NO_3^- < NO_2^- < NO_2^+$ (d) $NO_3^- < NO_2^+ < NO_2^-$

SCRA-2015

Ans. (c): Bond length is defined as the average distance between nuclei of two bonded atom in a molecule.

$$\text{Bond length} \propto \frac{1}{\text{Bond order}}$$

i.e. Bond length is increased then bond order is decreased.

Bond order of NO_2^+ is 2, NO_2^- is 1.5 and NO_3^- is 1.33

So, the increasing order of N–O bond length is $NO_2^+ > NO_2^- > NO_3^-$.

451. Pick the incorrect statement among those given below.

(a) Multiple covalent bonds are shorter than single covalent bonds between same set of atoms.

(b) Bond strength varies inversely with bond length.

(c) Bond order of isoelectronic species will be same.

(d) Bond enthalpy increases with increasing bond length.

COMEDK 2015

Ans. (d) : Bond enthalpy decreases with increasing bond length.

452. The bond length of Br – Br in Br_2 molecule is equal to

(a) 0.74 Å (b) 1.54 Å

(c) 1.98 Å (d) 2.28 Å

SRMJEEE – 2015

Ans. (d) : The bond length of Br-Br in Br_2 molecule is equal to 2.28 Å

453. The structure of NO_3^- ion is

(a) triangle (b) tetrahedral

(c) equilateral triangle (d) planar.

SRMJEEE – 2015

Ans. (d) : The given molecule is NO_3^-

Hybridisation = number of bond pair + number of lone pair

Hybridisation = 3 + 0 = 3 (sp^2)

The hybridisation of given molecule is sp^2. Hence, the structure is trigonal planar.

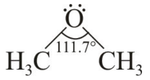
454. The bond angle of bond in methoxy methane is:

(a) 111.7° (b) 109°

(c) 108.9° (d) 180°

AP-EAMCET (Engg.) 2015

Ans. (a) : Methoxy methane and ethanol are functional isomers as they have molecular formula C_2H_6O. But they differ in functional group. The bond angle of methoxy methane is 111.7° and the geometry is V-shaped.



455. Which of the following does not have triple bond between the atoms?

(a) N_2 (b) CO

(c) NO (d) C_2^{2-}

AP-EAMCET (Engg.) 2015

Ans. (c) :

$N_2 \Rightarrow N \equiv N$

$CO \Rightarrow \bar{C} \equiv O^+$

$NO \Rightarrow :N = \ddot{O}$

$C_2^{2-} \Rightarrow [C \equiv C]^{2-}$

Thus, nitric oxide (NO) has 15 electron and its bond order 2.5 and does not contain triple bond.

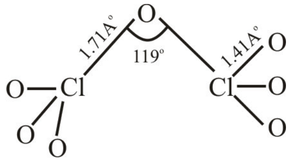
456. What is the bond angle between Cl – O – Cl in Cl_2O_7?

(a) 109° (b) 119°

(c) 108°25′ (d) 120°

BCECE-2015

Ans. (b) : Cl_2O_7 has a bent structure with a bridging O – atom. The terminal Cl–O bonds are substantially shorter than the bridge Cl–O bonds indicating double bonds character



457. The P–P–P angle in P_4 molecule and S–S–S angle in S_8 molecule is (in degree) respectively

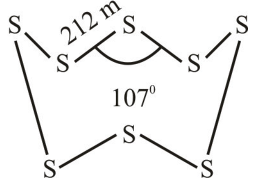
(a) 60^0, 107^0 (b) 107^0, 60^0

(c) 40^0, 60^0 (d) 60^0, 40^0

BITSAT 2015

Ans. (a) : In P_4 molecule, the four sp^3-hybridised phosphorous atoms lie at the corners of a regular tetrahedron with $\angle P - P - P = 60^0$.

In S_8 molecule S-S-S angle is 107^0 rings.



458. Which of the following changes in the respective bond order values are caused by removal of an electron from N_2 and F_2 molecules?

(a) Decrease by 0.5 in both

(b) Increase by 0.5 in both

(c) Increase by 0.5 in the former and decrease by 0.5 in the latter

(d) Decrease by 0.5 in the former and increase by 0.5 in the latter

(e) No change in both

Kerala-CEE-2015

@apna_pdf

Ans. (d)

N_2 (total e^- = 14) = $(\sigma 1s)^2(\sigma^*1s)^2(\sigma 2s)^2(\sigma^*2s)^2$
$(\pi 2p_x^2 = \pi 2p_y^2)\left(\sigma 2p_z^2\right)$

F_2 (total e^-=18)=$(\sigma 1s)^2\left(\sigma^*1s\right)^2(\sigma 2s)^2\left(\sigma^*2s\right)^2(\sigma 2p_z)^2$
$\left(\pi 2p_x^2 = \pi 2p_y^2\right)\left(\pi^*2p_x^2 = \pi^*2p_y^2\right)$

For N_2, the valence orbital is bonding molecular orbital and for F_2, it is antibonding molecular orbital. So, bond order decrease by 0.5 in the former and increase by 0.5 in the later.

459. Select a ferromagnetic material from the following.
(a) Dioxygen
(b) Chromium (IV) oxide
(c) Benzene
(d) Dihydrogen monoxide

MHT CET-2015

Ans. (b) :

	Substance		**Magnetic property**
(A)	Dioxygen	–	Paramagnetic
(B)	Chromium (IV) oxide	–	Ferromagnetic
(C)	Benzene	–	Diamagnetic
(D)	Dihydrogen monoxide	–	Diamagnetic

460. The bond order of H_2^+ is
(a) 1 (b) 0
(c) 0.5 (d) 2

S. C. R. A - 2014

Ans. (c) : Bond order –

$$B.O = \frac{1}{2}(N_b - N_a)$$

N_b = No. of bonding electron
N_a = No. of antibonding electron

$H_2^+ = 1s^1$

$N_b = 1,\ N_a = 0$

$$B.O. = \frac{1}{2}(1-0)$$

$$B.O = \frac{1}{2} = 0.5$$

461. The percentage of ionic character in HCl molecule which has dipole moment of 3.610 × 10^{-30} Coulomb metre and bond length of 123 pm, is
(a) 100% (b) 87%
(c) 24.2% (d) 17.3%

S. C. R. A - 2014

Ans. (d) : Given that-

Dipole moment $(\mu) = 3.6\times10^{-30}\,Cm$

$\text{Bond length} = 123pm = 123\times10^{-12}\,m$

$$\text{Now, Ionic character} = \frac{\mu}{\text{Bond length}\times\text{Charge}}\times100\%$$

$$\text{Ionic character} = \frac{3.6\times10^{-30}}{123\times10^{-12}\times1.69\times10^{-19}}\times100\%$$

Ionic character = 17.3 %

462. Which of these represents the correct order of their increasing bond order?
(a) $C_2^{2-} < He_2^+ < O_2^+ < O_2^-$
(b) $He_2^+ < O_2^- < O_2^+ < C_2^{2-}$
(c) $O_2^- < O_2^- < C_2^{2-} < He_2^+$
(d) $O_2^+ < C_2^{2-} < O_2^- < He_2^+$

COMEDK 2014

Ans. (b) : $He_2^+ : \sigma 1s^2, \sigma^*1s^1$

$$B.O. = \frac{1}{2}\left(N_b - N_a\right) = \frac{1}{2}(2-1) = \frac{1}{2} = 0.5$$

$C_2^{2-} : \sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

$$B.O. = \frac{1}{2}(10-4) = \frac{6}{2} = 3.0$$

$\sigma 1s^2, \sigma^*1s^2, \sigma 2s^2, \sigma^*2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$
$\pi^*2p_x^1$

$$B.O. = \frac{1}{2}(10-5) = \frac{5}{2} = 2.5$$

$\sigma^*1s^2, \sigma^*2s^2, \sigma 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$
$\pi^*2p_x^2 = \pi^*2p_y^1$

$$B.O. = \frac{1}{2}(10-7) = \frac{3}{2} = 1.5$$

Thus, the correct order of increasing bond order is $He_2^+ < O_2^- < O_2^+ < C_2^{2-}$.

463. Which one of the following has longest covalent bond distance?
(a) C — C (b) C — H
(c) C — N (d) C — O

AP-EAMCET (Engg.) - 2014

Ans. (a) : The average distance between the centre of nuclei of the two bonded atom in a molecule is known as bond length.

(i) C – C	(ii) C – H	(iii) C – N	(iv) C – O
1.53A°	1.03A°	1.48A°	1.43A°

So, C – C(1.53Å) has longest covalent bond distance.

464. The bond order between Ni-C bond in $Ni(CO)_4$ is
(a) one (b) two
(c) less than two (d) more than two

AMU-2014

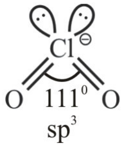
Ans. (c) : In $Ni(CO)_4$, there is a synergic bonding interaction between Ni and CO. As a result there is an increase in the strength of Ni–CO bond and decrease in the bond order. The bond order of Ni–C bond is more than one but less than two.

465. What is the bond angle in ClO_2^- (OClO)?
(a) 90^0 (b) 118^0
(c) 105^0 (d) 111^0

BCECE-2014

@apna_pdf

Ans. (d) : The bond angle of ClO_2^- is 111°. The central atom of Cl has 2 lone pair and Cl is also attached to the 2 sigma bond by oxygen atom the hybridisation of ClO_2^- is sp^3.



466. Which following is same for both hydrogen and deuterium molecules?
(a) Bond energy (b) Melting point
(c) Boiling point (d) Bond length

BCECE-2014

Ans. (d): Bond length is same for both hydrogen and deuterium molecules

Property	Hydrogen	deuterium
Bond length (pm)	74.14	74.14
Bond energy (kJ/mole)	435.88	443.35
Melting Point (K)	13.96	18.73
Boiling Point (K)	20.39	23.69

467. N_2 and O_2 are converted into mono anions N_2^- and O_2^- respectively. Which of the following statements is wrong?
(a) In N_2, the N–N bond weakens
(b) In O_2, the O–O bond order increases
(c) In O_2, bond length decreases
(d) N_2^- becomes diamagnetic

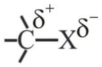
BITSAT 2014

Ans. (b) : We know that in O_2 bond, the order is 2 and in O_2^- bond, the order is 1.5. Therefore the wrong statements is (b).

468. Which of the following is the correct order for strength of C-X bond.
(a) $CH_3F > CH_3Cl > CH_3Br > CH_3I$
(b) $CH_3F > CH_3Br > CH_3I > CH_3F$
(c) $CH_3I > CH_3F > CH_3Cl > CH_3Br$
(d) $CH_3Cl > CH_3Br > CH_3I > CH_3F$

GUJCET-2014

Ans. (a) : Halogen atoms are more electronegative than carbon, therefore, carbon-halogen bond of alkyl halide is polarized, the carbon atom bears a partial positive charge whereas the halogen atom bears a partial negative charge.



As we know, bond length is inversely proportional to the bond strength. As we go down the group in the periodic table, the size of halogen atom increases. Fluorine atom is the smallest and iodine atom is the largest. Consequently the carbon-halogen bond length also increases from C–F to C–I and the bond strength of C–F to C–I decreases. Hence, the correct order for strength of C–X bond is–

$CH_3F > CH_3Cl > CH_3Br > CH_3I.$

469. The correct order of magnitude of bond angles among the compounds CH_4, NH_3 and H_2O is
(a) $CH_4 > H_2O < NH_3$ (b) $H_2O < NH_3 < CH_4$
(c) $NH_3 < CH_4 < H_2O$ (d) $NH_3 < H_2O < CH_4$

JIPMER-2014

Ans. (b) : The given species are CH_4, NH_3 and H_2O. The CH_4 molecule has regular geometry with 109°28' bond angle. Ammonia has one lone pair with 107.5° whereas H_2O has two lone pair with 104.5°. As we know, the availability of one lone pair on central atom, reduces the bond angle by 2.5°. Hence, the order of bond angle will be–

$H_2O < NH_3 < CH_4$.

470. Arrange the following species in the correct order of their stability
C_2, Li, O_2^+, He_2^+
(a) $Li_2 < He_2^+ < O_2^+ < C_2$
(b) $C_2 < O_2^+ < Li_2 < He_2^+$
(c) $He_2^+ < Li_2 < C_2 < O_2^+$
(d) $O_2^+ < C_2 < Li_2 < He_2^+$
(e) $C_2 < Li_2 < He_2^+ < O_2^+$

Kerala-CEE-2014

Ans. (c) : The stability of molecule depends upon the bond order i.e. Bond order is directly proportional to the stability of molecule.

C_2 (total $e^- = 12$) $\Rightarrow \text{Bond order} = \frac{8-4}{2} = 2$

Li_2 (total $e^- = 6$) $\Rightarrow \text{Bond order} = \frac{4-2}{2} = 1$

O_2^+ (total $e^- = 15$) $\Rightarrow \text{Bond order} = \frac{10-5}{2} = 2.5$

He_2^+ (total $e^- = 3$) $\Rightarrow \text{Bond order} = \frac{2-1}{2} = 0.5$

Thus, the order of stability will be–
$He_2^+ < Li_2 < C_2 < O_2^+$

471. Bond order of which among the following molecules is zero?
(a) F_2 (b) O_2
(c) Be_2 (d) Li_2

MHT CET-2014

Ans. (c) :

(a) F_2 (total $e^- = 18$) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$

$$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^2 = \pi^* 2p_y^2)$$

$$\text{Bond order} = \frac{10-8}{2} = 1$$

(b) O_2 (total $e^- = 16$) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$

$$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^1 = \pi^* 2p_y^1)$$

$$\text{Bond order} = \frac{10-6}{2} = 2$$

@apna_pdf

(c) Be_2 (total $e^- = 8$) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$

$$\text{Bond order} = \frac{4-4}{2} = 0$$

(d) Li_2 (total $e^- = 6$) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2$

$$\text{Bond order} = \frac{4-2}{2} = 1$$

Hence, Be_2 has zero bond order.

472. In which of the following ionization processes the bond energy increases and the magnetic behavior changes from paramagnetic to diamagnetic.

(a) $O_2 \to O_2^+$ (b) $C_2 \to C_2^+$
(c) $NO \to NO^+$ (d) $N_2 \to N_2^+$

KARNATAKA NEET 2013

Ans. (c) : Molecular orbital configuration of

$O_2 = \sigma 1s^2, \sigma * 1s^2, \sigma\, 2s^2, \sigma * 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$
$\pi * 2p_x^1 = \pi * 2p_y^1 {}^{2}$

It is paramagnetic.

$$\text{Bond order} = \frac{10-6}{2} = 2$$

$O_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma\, 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$
$\pi * 2p_x^1$

It is paramagnetic.

$$\text{Bond order} = \frac{10-5}{2} = 2.5$$

$C_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma * 2s^2, \pi 2p_x^2 = \pi 2p_y^2,$

It is paramagnetic.

$$\text{Bond order} = \frac{8-4}{2} = 2$$

$C_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma * 2s^2, \pi 2p_x^2 = \pi 2p_y^1,$

It is paramagnetic.

$$\text{Bond order} = \frac{7-4}{2} = 1.5$$

$NO = \sigma 1s^2, \sigma * 1s^2, \sigma 2s^2, \sigma * 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$
$\pi * 2p_x^1$

It is paramagnetic.

$$\text{Bond order} = \frac{10-5}{2} = 2.5$$

$NO^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma * 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$

It is diamagnetic.

$$\text{Bond order} = \frac{10-4}{2} = 3$$

$N_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma * 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

It is paramagnetic.

$$\text{Bond order} = \frac{10-4}{2} = 3$$

$N_2^+ = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma * 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^1$

It is paramagnetic.

$$\text{Bond order} = \frac{9-4}{2} = 2.5$$

Hence, the magnetic behavior changes form paramagnetic to diamagnetic is options (c).

473. The types of bonds between two carbon atoms in calcium carbide is

(a) one sigma, one pi (b) two sigma, one pi
(c) two sigma, two pi (d) one sigma, two pi

AMU-2013

Ans. (d) : Calcium carbide (CaC_2) is an ionic compound is $C^{2+}C_2^{2-}$. The calcium atom is bonded to the two carbon atoms through ionic bonding.

$[:C \equiv C:]^{2-}\, Ca^{2+}$

It has one sigma and two pi–bonds.

474. The bond order of N_2^+ on the basis of molecular orbital theory is [At. number of N = 7]

(a) 3 (b) 2.5
(c) 2 (d) 1.5

J & K CET-2013

Ans. (b) : N_2^+

Total no of $e^- = 13$

MO configuration of $N_2^+ = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$
$(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z^1)$

$$\text{Bond order} = \frac{9-4}{2} = 2.5$$

475. Which molecule has the shortest bond length?

(a) N_2 (b) O_2
(c) Cl_2 (d) Br_2

SCRA 2012

Ans. (a) : The experimental values of molecules given as –

Molecule	Bond length(Å)
N_2	1.09(Å)
O_2	1.21(Å)
Cl_2	1.98(Å)

476. Bond energy of Cl_2, Br_2 and I_2 follow the order

(a) $Cl_2 > Br_2 > I_2$ (b) $Br_2 > Cl_2 > I_2$
(c) $I_2 > Br_2 > Cl_2$ (d) $I_2 > Cl_2 > Br_2$

AP EAMCET (Engg.) 2012

Ans. (a) : When we move from top to bottom in halogen family the size of atom increases then the bond length also increases and bond energy decreases.

∴ The order of bond energy is–

$Cl_2 > Br_2 > I_2$.

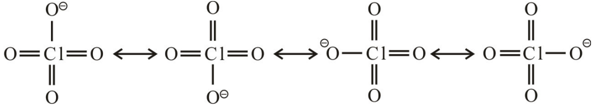
477. Cl-O bond order in perchlorate ion is

(a) 1.33 (b) 1.50
(c) 1.75 (d) 1.90

AMU-2012

@apna_pdf

Ans. (c) : The structure of per chlorate ion is



Total number of resonating structure = 4

$$\therefore \quad \text{Bond order} = \frac{\text{Total no. of bond}}{\text{Total no. of resonating structure}}$$

$$= \frac{7}{4} = 1.75$$

Hence, the bond order of perchlorate ion is 1.75.

478. The molecule having smallest bond angle is

(a) NCl_3 (b) $AsCl_3$

(c) $SbCl_3$ (d) PCl_3

(AIEEE-2012)

Ans. (c) : All the possible trihalides of N, P, As, Sb and Bi are known. The bond angle is decreases from NCl_3 to $SbCl_3$ because the electronegativity and the size of central atom decreases due to which $SbCl_3$ has the smallest bond angle.

479. The correct order of bond energy is

(a) $Cl_2 > Br_2 > F_2 > I_2$ (b) $Cl_2 > F_2 > Br_2 > I_2$

(c) $I_2 > Br_2 > Cl_2 > F_2$ (d) $I_2 > Br_2 > F_2 > Cl_2$

J & K CET-(2012)

Ans. (a) : The elements of halogen all form diatomic molecules. It would be expected that the bond energy in the X_2 molecules would decrease as the atoms become larger, since increased size results in less effective overlap of orbital's. Cl_2 Br_2 and I_2 show the expected trend but the bond energy for F_2 does not fit the expected trend. A reason for this anomaly is the relatively large electron-electron repulsion among the lone pairs in F_2 molecule where they are much closer to each other than in case of Cl_2

Molecules	**Bond Energy ($kJmol^{-1}$)**
F_2	158.8
Cl_2	242.6
Br_2	192.8
I_2	151.1

480. The C-H bond distance is the longest in

(a) C_2H_2 (b) C_2H_4

(c) C_2H_6 (d) $C_2H_2Br_2$

J & K CET-(2012)

Ans. (c) : As we know, if the s character of molecule is more then bonded pair electrons are held more closely, ensuring a smaller bond length and stronger a bond. So, sp has the least bond length and it is the strongest.sp^3 has longest bond distance. Hence, C–H has more bond distance in C_2H_6.

481. The correct order in which the O–O bond length increases in the following is

(a) $H_2O_2 < O_2 < O_3$ (b) $O_3 < H_2O_2 < O_2$

(c) $O_2 < O_3 < H_2O_2$ (d) $O_2 < H_2O < O_3$

JCECE-2012

Ans. (c) : Bond length of O — O in O_2 = 1.21Å

Bond length of O — O in O_3 = 1.278 Å

Bond length of O — O in H_2O_2 = 1.49 Å

Therefore, correct order of O — O bonds length is (bond order decrease in the same order)

$$O_2 < O_3 < H_2O_2$$

482. Which one of the following has the shortest bond length?

(a) C–H (b) C–N

(c) C–O (d) C–C

(e) C–F

Kerala-CEE-2012

Ans. (e) : The more electronegative atom polarize the bond length and the bond length go to decrease in size. In the given species, F is more electronegative atom. So it's electronegative power attract the share electron towards the F. Thus, the bond length getting to shortest.

483. Which of the following has least bond energy?

(a) N_2^{2-} (b) N_2^-

(c) N_2^+ (d) N_2

MHT CET-2012

Ans. (a) : The Bond energy of molecule is directly proportional to the bond order of the molecule.

$$\text{(a) } N_2^{2-} \ (\text{total } e^- = 16) = (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$$
$$(\sigma 2p_z)^2 \left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\pi^* 2p_x^1 = \pi^* 2p_y^1\right)$$

$$\text{Bond order} = \frac{10-6}{2} = 2$$

$$\text{(b) } N_2^- \ (\text{total } e^- = 15) = (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$$
$$(\sigma 2p_z)^2 \left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\pi^* 2p_x^1 = \pi * 2py\right)$$

$$\text{Bond order} = \frac{10-5}{2} = 2.5$$

$$\text{(c) } N_2^+ \ (\text{total } e^- = 13) = (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$$
$$\left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\sigma 2p_z^1\right)$$

$$\text{Bond order} = \frac{9-4}{2} = 2.5$$

$$\text{(d) } N_2 \ (\text{total } e^- = 14) = (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$$
$$\left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\sigma 2p_z^2\right)$$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

Hence, N_2^{2-} has least bond energy.

484. Which of the following species has highest bond energy?

(a) O_2^{2-} (b) O_2^+

(c) O_2^- (d) O_2

MHT CET-2012

Ans. (b) : The bond energy of diatomic molecule depends upon the bond order. Bond order is directly proportional to the bond energy.

$$\text{(a) } O_2^{2-} \ (\text{total } e^- = 18) \Rightarrow \text{Bond order} = \frac{10-8}{2} = 1$$

$$\text{(b) } O_2^+ \ (\text{total } e^- = 15) \Rightarrow \text{Bond order} = \frac{10-5}{2} = 2.5$$

@apna_pdf

(c) O_2^- (total e^- = 17) ⇒ Bond order = $\frac{10-7}{2} = 1.5$

(d) O_2 (total e^- = 16) ⇒ Bond order = $\frac{10-1}{2} = 2$

485. Bond order in nitrogen molecule is

(a) 1 (b) 2
(c) 3 (d) 4

COMEDK 2011

Ans. (c) :

$N_2(14): \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

Bond order = $\frac{8-2}{2} = 3$

486. Which of the following is correct comparison of the stability of the molecules?

(a) $CN < O_2^+$ (b) $CN = N_2$
(c) $N_2 < O_2$ (d) $H_2^+ > He_2^+$

VITEEE- 2011

Ans. (d) : If the bond order of two molecules are same then the stability of the molecules can be explain on the number of electron in antibonding molecular orbital, more the electron in antibonding, less be the stability of molecule.

$H_2^+(1) = \sigma 1s^1$

$$\text{Bond order} = \frac{\text{Bonding orbital } e^- - \text{Antibonding orbital } e^-}{2}$$

$$\text{Bond order} = \frac{1-0}{2} = 0.5$$

and $He_2^+(3) = \sigma 1s^2, \sigma^* 1s^1$

$$\text{Bond order} = \frac{2-1}{2} = 0.5$$

So, H_2^+ has the less electron in antibonding whereas He_2^+ has more electron in antibonding so the H_2^+ is more stable than He_2^+.

487. The value of Cl – Cl bond distance is found to be

(a) 1.98 Å (b) 0.99 Å
(c) 0.77 Å (d) 1.76 Å

SRMJEEE – 2011

Ans. (a) : The bond length of Cl – Cl is 1.98 Å

488. The correct bond order in the following species is :

(a) $O_2^{2+} < O_2^- < O_2^+$ (b) $O_2^+ < O_2^- < O_2^{2+}$
(c) $O_2^- < O_2^+ < O_2^{2+}$ (d) $O_2^{2+} < O_2^+ < O_2^-$

BITSAT 2011

Ans. (c) : O_2^+ ion – Total number of electrons (16 – 1) = 15 = $\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \sigma 2p_z^2$

$\pi 2p_x^2 = \pi 2p_y^2 \pi^* 2p_x^1 = \pi^* 2p_y$

Bond order $= \frac{N_b - N_a}{2} = \frac{10-5}{2} = \frac{5}{2} = 2\frac{1}{2}$

O_2^- (Super oxide ion): Total number of electrons (16 + 1) = 17 = $\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \sigma 2p_z^2$

$\pi 2p_x^2 = \pi 2p_y^2 \pi^* 2p_x^2 = x^* 2p_y^1$

Bond order $= \frac{(N_b - N_a)}{2} = \frac{10-7}{2} = \frac{3}{2} = 1\frac{1}{2}$

O_2^{2+} ion : Total number of electrons = (16 – 2) = 14

$\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \pi 2p_x^2 = \pi 2p_y^2 \sigma 2p_z^2$

Bond order $= \frac{(N_b - N_a)}{2} = \frac{10-4}{2} = \frac{6}{2} = 3$

So bond order : $O_2^- < O_2^+ < O_2^{2+}$

489. The bond order of C_2 molecule is

(a) 1 (b) 2
(c) 0 (d) 3

J & K CET-2011

Ans. (b) : The given diatomic molecule is C_2. C_2 has the 12 no. of electron. Now, the molecular orbital configuration is given below–

MO configuration= $(\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\pi 2p_x^2 = \pi 2p_y^2)$

Bond order $= \frac{N_b - N_a}{2}$

Where, N_b = no. of e^- in bonding orbital
N_a = no. of e^- in antibonding orbital

Bond order $= \frac{8-4}{2} = 2$

490. The correct statement with regard to H_2^+ and H_2^- is

(a) both H_2^+ and H_2^- are equally stable
(b) both H_2^+ and H_2^- do not exist
(c) H_2^- is more stable than H_2^+
(d) H_2^+ is more stable than H_2^-

JIPMER-2011

Ans. (d) : The species are H_2^+ and H_2^-.

H_2^+ (total e^- = 1) = $(\sigma 1s)^1$
$N_b = 1, N_a = 0$

and H_2^- (total e^- = 3) = $(\sigma 1s)^1$ $(\sigma^* 1s)^1$
$N_b = 2$, $N_a = 1$

According to the application of stability of MOT, H_2^+ has less electron on antibonding molecular orbital than the H_2^- molecule. So, H_2^+ is more stable than the H_2^-.

491. When O_2 is converted into O_2^+

(a) both paramagnetic character and bond order increase
(b) bond order decreases
(c) paramagnetic character increases
(d) paramagnetic character decreases and the bond order increases

Karnataka-CET-2011

@apna_pdf

Ans. (d) : (i) $O_2 = (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$

$$(\sigma 2p_z)^2 \left(\pi 2p_x^2 = \pi 2p_y^2\right)\left(\pi^* 2p_x^1 = \pi^* 2p_y^1\right)$$

$$\text{Bond order} = \frac{10-6}{2} = 2$$

O_2 molecule having 2 unpaired electron.

(ii) $O_2^+ = (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2 (\sigma 2p_z)^2$

$$\left(\pi 2p_x^2 = \pi 2p_y^2\right)\left(\pi^* 2p_x^1\right)$$

$$\text{Bond order} = \frac{10-5}{2} = 2.5$$

O_2^+ ion having only 1 unpaired electron.

Hence, when O_2 is converted into O_2^+ then paramagnetic character decrease and the bond order increases.

492. Which of the following is not correct with respect to bond length of the species?

(a) $C_2 > C_2^{2-}$ (b) $B_2^+ > B_2$

(c) $Li_2^+ > Li_2$ (d) $N_2^+ > N_2$

(e) $O_2 > O_2^-$

Kerala-CEE-2011

Ans. (e) : The bond order of molecule is inversely proportional to the bond length.

(a) C_2 (total $e^- = 12$) $\Rightarrow \text{Bond order} = \frac{8-4}{2} = 2$

C_2^{2-} (total $e^- = 14$) $\Rightarrow \text{Bond order} = \frac{10-4}{2} = 3$

(b) B_2^+ (total $e^- = 14$) $\Rightarrow \text{Bond order} = \frac{5-4}{2} = 0.5$

B_2 (total $e^- = 10$) $\Rightarrow \text{Bond order} = \frac{6-4}{2} = 1$

(c) Li_2^+ (total $e^- = 5$) $\Rightarrow$ $\text{Bond order} = \frac{3-2}{2} = 0.5$

Li_2 (total $e^- = 6$) $\Rightarrow$ $\text{Bond order} = \frac{4-2}{2} = 1$

(d) N_2^+ (total $e^- = 13$) $\Rightarrow \text{Bond order} = \frac{9-4}{2} = 2.5$

N_2 (total $e^- = 14$) $\Rightarrow \text{Bond order} = \frac{10-4}{2} = 3$

(e) O_2 (total $e^- = 16$) $\Rightarrow \text{Bond order} = \frac{10-6}{2} = 2$

O_2^- (total $e^- = 17$) $\Rightarrow \text{Bond order} = \frac{10-7}{2} = 1.5$

O_2 has maximum bond order than the O_2^-. So, O_2 has less bond length rather than the O_2^-. Thus, the statement is wrong.

493. The bond length of species O_2, O_2^+, and O_2^- are in the order of

(a) $O_2^+ > O_2 > O_2^-$ (b) $O_2^- > O_2 > O_2^+$

(c) $O_2 > O_2^+ > O_2^-$ (d) $O_2 > O_2^- > O_2^+$

UP CPMT-2011

Ans. (b) Bond length decreases, as bond order increases.

Bond order of $O_2 = 2$

Bond order of $O_2^+ = 2.5$

Bond order of $O_2^- = 1.5$

Hence, the order of bond length is

$$O_2^- > O_2 > O_2^+$$

494. The order of bond energies in halogen molecules is

(a) $F_2 < Cl_2 < Br_2 < I_2$ (b) $F_2 > Cl_2 > Br_2 > I_2$

(c) $Cl_2 > Br_2 > F_2 > I_2$ (d) $Cl_2 > F_2 > Br_2 > I_2$

AP- EAMCET(Medical) -2010

Ans. (c): As we know, bond length increases with decreasing of its bond dissociation energy. F_2 has smaller enthalphy of dissociation to that of Cl_2 whereas X–X bond dissociation enthalpies from chlorine onwards show the expected trend : Cl–Cl >Br–Br > I–I. The relatively large electron-electron repulsion among the lone pairs in F_2 molecule where they are much closer to each other them in case of Cl_2. Hence, the correct order will be –

$$Cl_2 > Br_2 > F_2 > I_2.$$

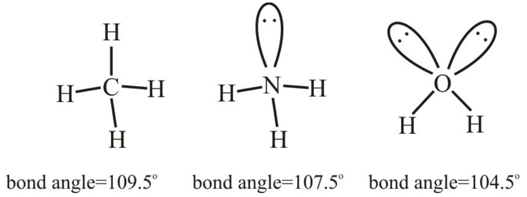
495. The correct order of magnitude of bond angles among the compounds CH_4, NH_3 and H_2O

(a) $CH_4 < H_2O < NH_3$ (b) $H_2O < NH_3 < CH_4$

(c) $NH_3 < CH_4 < H_2O$ (d) $NH_3 < H_2O < CH_4$

AP- EAMCET(Medical) -2010

Ans. (b): The given species are CH_4, NH_3 and H_2O. The structures of given compound are given as follows–



Hence, the correct order of bond angle will be $CH_4 > NH_3 > H_2O$.

496. Which of the following has the highest bond order?

(a) N_2 (b) O_2

(c) He_2 (d) H_2

JIPMER-2010

Ans. (a):

(a) N_2 (Total $e^- = 14$) $= (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$

$$\left(\pi 2p_x^2 = \pi 2p_y^2\right)\left(\sigma 2p_z^2\right)$$

$$\text{Bond Order} = \frac{10-4}{2} = 3$$

(b) O_2 (total $e^- = 16$) $= (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$

$$(\sigma 2p_z)^2 \left(\pi 2p_x^2 = \pi 2p_y^2\right)$$

$$\left(\pi^* 2p_x^1 = \pi^* 2p_y^1\right)$$

$$\text{Bond order} = \frac{10-6}{2} = 2$$

@apna_pdf

(c) He_2 (total $e^- = 4$) $= (\sigma 1s)^2 \, (\sigma^* 1s)^2$

$$\text{Bond order} = \frac{2-2}{2} = 0$$

(d) H_2 (Total $e^- = 2$) $= (\sigma 1s)^2$

$$\text{Bond order} = \frac{2-0}{2} = 1$$

Thus, N_2 has highest bond order.

497. The correct order towards bond angle is

(a) $sp^3 < sp^2 < sp$
(b) $sp < sp^2 < sp^3$
(c) $sp < sp^3 < sp^2$
(d) $sp^2 < sp^3 < sp$

JIPMER-2010

Ans. (a): As we know that the % s character is directly proportional to the bond angle of central atom of the molecule.

Hybridisation	**% s character**	**Bond angle**
sp	50	180°
sp^2	33.3	120°
sp^3	25	109°28'

498. Peroxide ion ....

(i) has five completely filled antibonding molecular orbits
(ii) is diamagnetic
(iii) has bond order one
(iv) is iso-electronic with neon

Which one of these is correct?

(a) (ii) and (iii)
(b) (i), (ii) and (iv)
(c) (i), (ii) and (iii)
(d) (i) and (iv)

KARNATAKA-CET, 2010

Ans. (a) : Peroxide ion is O_2^{2-}

$$O_2^{2-}(18) = (\sigma 1s)^2 \, (\sigma^* 1s)^2 \, (\sigma 2s)^2 \, (\sigma^* 2s)^2 \, (\sigma 2p_z)^2$$
$$(\pi 2p_x^2 = \pi 2p_y^2) \, (\pi * 2p_x^2 = \pi * 2p_y^2)$$

$$\text{Bond order} = \frac{10-8}{2} = 1$$

It contains four completely filled antibonding molecular orbitals. Since, all the electrons are paired, O_2^{2-} is diamagnetic.

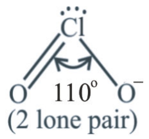
Peroxide ion is isolectronic with Argon, not with Neon.

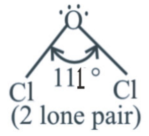
499. The correct order increasing bond angles in the following species is

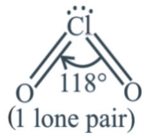
(a) $Cl_2O < ClO_2 < ClO_2^-$
(b) $ClO_2 < Cl_2O < ClO_2^-$
(c) $Cl_2O < ClO_2^- < ClO_2$
(d) $ClO_2^- < Cl_2O < ClO_2$

(NEET-2010)

Ans. (d) :







In ClO_2^-, there are two lone pairs of electrons which repel each other due to which two oxygen atom come closer leading to decrease in bond angle. Therefore, the angle in ClO_2^- is less than 118° which is bond angle in ClO_2^- which has less number of electrons on chlorine.

500. The bond angle in H_2O is 104.5° and in H_2S it is 92.5°. The difference is due to

(a) The smaller size of O atom compared to S atom minimizes electron repulsions and allows the bonds in H_2O to be purely p-type
(b) The larger size of S atom compared to atom minimizes electron repulsions and allows the bonds in H_2S to be purely p-type
(c) The bond pair-lone pair repulsions are large in H_2S
(d) The size of the atom increases and electro negativity decreases while moving from oxygen to sulphur as a result bond pairs closer to the central atom

SCRA - 2009

Ans. (b) : Bond angle is directly proportional to the electronegativity of the central atom.

As Oxygen has more electronegativity value as compared to sulphur. So, bond angle of H_2O is more than H_2S.

Another reason behind this i.e., the bond pair-bond pair resulsion is smaller in magnitude, still the b.p- b.p repulsion in case of H_2O molecule exist while in case of H_2O due to large size of S as compared to O is less and going to decreasing with increase the size of element. So, on moving from top to bottom bond angle decreases.

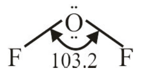
501. Fluorine reacts with dilute NaOH and forms a gaseous product A. The bond angle in the molecule of A is

(a) 104°40'
(b) 103°
(c) 107°
(d) 109°28'

VITEEE- 2009
AP EAMCET (Engg.)-2009

Ans. (b) : $2F_2 + 2\underset{\text{dilute}}{NaOH} \rightarrow 2NaF + \underset{(A)}{OF_2}\uparrow + H_2O$

The structure of 'A' (OF_2) is as



σ bonds made by O = 2

Due to repulsion between two lone pairs of electrons, its shape gets distorted. Therefore, the bond angle in the molecule is 103°.

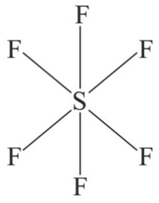
502. The bond angle and % of d-character in SF_6 are

(a) 120°, 20%
(b) 90°, 33%
(c) 109°, 25%
(d) 90°, 25%

AMU – 2009

@apna_pdf

Ans. (b) : For SF_6 molecule.



sp^3d^2 (Octahedral)

$$\% \text{ d character} = \frac{\text{No. of d orbitals involved in hybrid}}{\text{Total no. of orbital}} \times 100$$

$$= \frac{2\times1}{6\times1}\times100$$

$$= 33.3\%$$

503. Which of the following two are isostructural?

(a) XeF_2, IF_2^-
(b) NH_3, BF_3
(c) CO_3^{2-}, SO_3^{2-}
(d) PCI_5, ICI_5

BITSAT 2009

Ans. (a) : XeF_2 and IF_2^- both are linear and have hybridisation sp^3d.

504. **(i) H - C - H angle in CH_4**

(ii) Cl - B - Cl angle in BCl_3

(iii) F - I - F angle in IF_7 in a Plane

(iv) I - I - I angle in I_3^-

Increasing order of above bond angles is

(a) (i) < (ii) < (iii) < (iv)
(b) (ii) < (i) < (iii) < (iv)
(c) (iii) < (i) < (ii) < (iv)
(d) (iv) < (ii) < (i) < (iii)

CG PET -2009

Ans. (c) :

Molecule	**Hybridisation**	**Geometry**	**Bond Angle**
CH_4	sp^3	Tetrahedral	109.5°
BCl_3	sp^2	Trigonal planer	120°
IF_7	sp^3d^3	Pentagonal bipyramidal	72°
I_3^-	sp^3d	Linear	180°

505. H – O – H bond angle in H_2O is 104.5^o and not 109^o 28' because of

(a) lone pair-lone pair repulsion
(b) lone pair-bond pair repulsion
(c) bond pair-bond pair repulsion
(d) high electronegativity of oxygen

JIPMER-2009

Ans. (a) : According to the VSEPR theory, the repulsive interaction of electron pairs decrease in the order : Lone pair-Lone pair > Lone pair-Bond pair > Bond pair – bond pair. Due to the lone pair-lone pair repulsion, the bond angle is reduces from 109°28' to 104.5°.

506. According to MO theory which of the lists ranks the nitrogen species in terms of increasing bond order?

(a) $N_2^{2-} < N_2^- < N_2$
(b) $N_2 < N_2^{2-} < N_2^-$
(c) $N_2^- < N_2^{2-} < N_2$
(d) $N_2^- < N_2 < N_2^{2-}$

NEET-2009

Ans. (a)

(a) N_2 (total e^- = 14) $= (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$
$\left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\sigma 2p_z^2\right)$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

(b) N_2^{2-} (total e^- = 16) $= (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$
$(\sigma 2p_z)^2 \left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\pi^* 2p_x^1 = \pi^* 2p_y^1\right)$

$$\text{Bond order} = \frac{10-6}{2} = 2$$

Similarly,

(c) N_2^- (total e^- = 15) $\Rightarrow$ Bond order $= \dfrac{10-5}{2} = 2.5$

Thus, The bond order follow the following sequence

$N_2^{2-} < N_2^- < N_2$

507. Right order of dissociation energy N_2 and N_2^+ is

(a) $N_2 > N_2^+$
(b) $N_2 = N_2^+$
(c) $N_2^+ > N_2$
(d) None

NEET-2009

Ans. (a) $\boxed{\text{Bond order} \propto \text{Bond energy}}$

N_2 (total e^- = 14) $= (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$
$\left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\sigma 2p_z^2\right)$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

And

N_2^+ (total e^- = 13) $= (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2$
$\left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\sigma 2p_z^1\right)$

$$\text{Bond order} = \frac{9-4}{2} = 2.5$$

Hence, N_2 has the more bond dissociation energy than the N_2^+

508. The carbon-carbon bond distance in benzene is

(a) Longer than a C – C single bond
(b) Longer than a C = C double bond
(c) Sohrter than a C = C double bond
(d) Shorter than a $C \equiv C$ triple bond

MPPET-2008

Ans. (b) : All the carbon-carbon bond distance in benzene are 140 pm i.e. longer than a C = C double bond.

509. Assertion: Fluorine molecule has bond order one.
Reason: The number of electrons in the anti-bonding molecular orbitals is two less than that in bonding molecular orbitals.

@apna_pdf

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect
(d) If both the Assertion and Reason are incorrect

AIIMS-2008

Ans. (a): The molecular orbital configuration of

$F_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2$

$\pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^2$

Bond order $= \dfrac{10-8}{2} = 1$

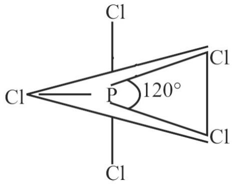
The number of electrons in the anti bonding molecular orbitals is two less than that in bonding molecular orbitals.

510. Cl - P -Cl bond angles in PCl_5 molecule are

(a) 120° and 90°
(b) 60° and 90°
(c) 60° and 120°
(d) 120° and 30°

VITEEE- 2008

Ans. (a) : In PCl_5, phosphorus undergoes sp^3d hybridization and has trigonal bipyramidal geometry. It has two axial chlorine atoms & three equatorial chlorine atoms bonded to the central P.
Hence bond angles for axial are 90°, Cl–P–Cl & for equatorial Cl–P–Cl it is 120°.



511. About the species O_2^+, O_2^{2-}, O_2, O_2^- which one of the following statements is correct?

(a) O_2^+ has the highest bond order and largest bond length.
(b) O_2 has the highest bond order.
(c) The bond order of O_2 equals the average bond orders of O_2^+ and O_2^-.
(d) The sum of bond orders of these species is 1.

SRMJEEE – 2008

Ans. (c) : $\text{B.O.} = \dfrac{N_B - N_A}{2}$

Where N_A and N_B are the number of electrons in antibonding and bonding molecule.

Bond order of $O_2^+ = \dfrac{10-5}{2} = 2.5$

Bond order of $O_2^{2-} = \dfrac{10-8}{2} = 1$

Bond order of $O_2 = \dfrac{10-6}{2} = 2$

Bond order of $O_2^- = \dfrac{10-7}{2} = 1.5$

Average Bond order of O_2^+ and $O_2^- = \dfrac{2.5+1.5}{2} = 2$

Which is equal to the bond order of O_2.

512. In the molecules NO, CO, O_2^- and O_2 the correct sequence of bond order is

(a) $NO = CO > O_2^- > O_2$
(b) $O_2^- > O_2 > NO > CO$
(c) $O_2 > O_2^- > NO > CO$
(d) $CO > NO > O_2 > O_2^-$

AMU – 2008

Ans. (d) : According to molecular orbital electronic configuration ,

$CO = \sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2\ \pi 2p_X^2 = \pi 2p_Y^2\ \sigma 2p_X^2$

$\text{B.O.} = \dfrac{N_b - N_a}{2} = \dfrac{10-4}{2} = 3$

$NO = \sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2\ \sigma 2p_z^2\ \pi 2p_X^2$

$= \pi 2p_y^2 \pi^* 2p_x^1$

$\text{B.O.} = \dfrac{N_b - N_a}{2} = \dfrac{10-5}{2} = 2.5$

$O_2^- = \sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2\ \sigma 2p_z^2\ \pi 2p_X^2$

$= \pi 2p_y^2 \pi^* 2p_x^2 = \pi^* 2p_y^1$

$\text{B.O.} = \dfrac{N_b - N_a}{2} = \dfrac{10-7}{2} = 1.5$

$O_2 = \sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \sigma 2p_z^2 \pi 2p_x^2 = \pi 2p_y^2 \pi^* 2p_x^1 = \pi^* 2p_y^1$

$\text{B.O.} = \dfrac{N_b - N_a}{2} = \dfrac{10-6}{2} = 2$

So, the correct sequence of B.O. is
$CO > NO > O_2 > O_2^-$.

513. From the molecular orbital theory, one can show that the bond order in F_2 molecule is

(a) 2
(b) 1
(c) 3
(d) 4

J & K CET-2008

Ans. (b) : Total number of electron in F_2 molecule = 18

$\therefore$ MO configuration $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$

$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2) (\pi^* 2p_x^2 = \pi^* 2p_y^2)$

Bond order $= \dfrac{10-8}{2} = 1$

514. What will be the bond angle C–O–H in alcohol if hybridisation of C and O atom possess sp^3 hybridisation?

(a) 109°28'
(b) 111°42'
(c) 109°
(d) 108°30'

GUJCET-2007

Ans. (a) : The given species is $C{-}\ddot{\underset{\cdot\cdot}{O}}{-}H$. The hybridisation of oxygen are sp^3. As we know that the bond angle of sp^3 hybridisation is 109°28'.

515. The strength of bonds formed by s-s, p-p, and s-p overlap is in the order of

(a) s-s < s-p < p-p
(b) s-s < p-p < s-p
(c) s-p < s-s < p-p
(d) p-p < s-s < s-p

SRMJEEE – 2007

@apna_pdf

Ans. (a) : The correct order of strength of bond is s–s>–s–p>p–p
The extent of overlap is higher for s orbital than for p orbital. Higher is the extent of overlap stronger is the bond formed.

516. The order of stability of O_2 and its various ionic species follows the sequence

(a) $O_2^{2-} > O_2^- > O_2 > O_2^+$ (b) $O_2 > O_2^+ > O_2^- > O_2^{2-}$

(c) $O_2^+ > O_2 > O_2^- > O_2^{2-}$ (d) $O_2^- > O_2^+ > O_2 > O_2^{2-}$

AMU – 2007

Ans. (c) **:** Bond order of O_2^+, O_2, O_2^-, O_2^{2-} are 2.5, 2, 1.5, 1 respectively. Thus their stability is in following order

$O_2^+ > O_2 > O_2^- > O_2^{2-}$

517. The bond length between C – C bond in sp^2 hybridised molecule is–

(a) 1.2 Å (b) 1.39 Å

(c) 1.33 Å (d) 1.54 Å

BCECE-2007

Ans. (b) : The bond length between C – C bond in sp^2 hybridised molecule is 1.39 $\overset{\circ}{A}$

518. For a stable molecule, the value of bond order must be

(a) there is no relationship between stability and bond order
(b) zero
(c) positive
(d) negative

Karnataka-CET-2007

Ans. (c) : Bond order ∝ Stability
Hence, for a stable molecule the value of bond order must be positive. When bond order is zero then molecule will not exist.

519. Which of the following paramagnetic with bond order 0.5?

(a) F_2 (b) H_2^+

(c) N_2 (d) O_2^-

(e) B_2

Kerala-CEE-2007

Ans. (b) :

(a) F_2 (total e^- = 18) = $(\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$

$$(\sigma 2p_z)^2 \left(\pi 2p_x^2 = \pi 2p_y^2\right) \left(\pi * 2p_x^2 = \pi * 2p_y^2\right)$$

$$\text{Bond order} = \frac{10-8}{2} = 1, n = 0\ (\text{diamagnetic})$$

(b) H_2^+ (Total e^- = 1) = $(\sigma 1s)^1$

$$\text{Bond order} = \frac{1-0}{2} = 0.5, n = 1\ (\text{paramagnetic})$$

(c) N_2 (Total e^- = 14) = $(\sigma 1s)^2\ (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$

$$(\pi 2p_x^2 = \pi 2p_y^2)\ (\sigma\, 2p_z)^2$$

$$\text{Bond order} = \frac{10-4}{2} = 3, n = o\ (\text{Diamagnetic})$$

Similary,

(d) O_2^- (total e^- =17)

$$\text{Bond order} = \frac{10-7}{2} = 1.5, n = 1\ (\text{paramagnetic})$$

(e) B_2 (total e^- =10)

$$\text{Bond order} = \frac{6-4}{2} = 1, n = 0\ (\text{Diamagnetic})$$

520. Sequence of bond length of the following

A. ethane **B. ethene**

C. ethyne

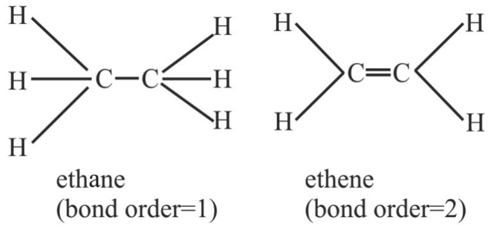
(a) A>B>C (b) B>A>C

(c) C>B>A (d) C>A>B

UP CPMT-2007

Ans. (a) : The bond length decrease with the multiplicity of the bond.

$$\text{Bond length} \propto \frac{1}{\text{Bond order}}$$



ethane
(bond order=1)

ethene
(bond order=2)

$$\underset{\text{ethyne (bond order=3)}}{H-C\equiv C-H}$$

As the bond order sequence is
ethane<ethene<ethyne

∴ The sequence of bond length is
Ethane > Ethene > Ethyne
Hence, A>B>C

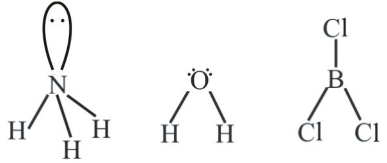
521. The bond angle in AsH_3 is greater than that in:

(a) NH_3 (b) H_2O

(c) BCl_3 (d) None of these

AP-EAMCET (Medical), 2006

Ans. (d) : The given species are: NH_3, H_2O and BCl_3.



Bond angle– 107.5° 104.5° 120°
Hybridization– sp^3 sp^3 sp^2

AsH_3 has the low bond angle due to large size of As. AsH_3 has sp^2 hybridization and having the 92° bond angle.

522. On comparison with H – C – H bond angle of methane, the C – N – C bond angle of trimethylamine is

(a) higher (b) no change

(c) not comparable (d) lower

VITEEE- 2006

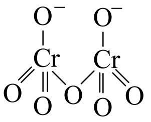
Ans. (b) : In both the cases carbon is sp^3 hybridised and bond angle is 109°28'.

@apna_pdf

523. In the dichromate dianion,
(a) 4 Cr – O bonds are equivalent
(b) 6 Cr – O bonds are equivalent
(c) all Cr – O bonds are equivalent
(d) all Cr – O bonds are nonequivalent

BITSAT 2006

Ans. (b) : The structure of $Cr_2O_7^{2-}$



There are six normal Cr–O bonds and two bridged Cr–O bond.
The six normal Cr–O bonds are expected to be equivalent and different from those of the bridged Cr–O bond.

524. Bond order of N_2 molecule is
(a) 3
(b) 2
(c) 1
(d) 0

CG PET -2006

Ans. (a) : Total number of e^- in N_2 = 14

$$\therefore \text{ MO configuration} = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\sigma\, 2p_z^2)$$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

Hence, the bond order of N_2 molecule is 3.

525. If the value of bond order is zero, then
(a) molecule will be stable
(b) molecule will be unstable
(c) molecule will be in ionic state
(d) None of the above

CG PET -2006

Ans. (b) : The value of bond order is zero it means the bonding influence and anti-bonding influence are equal and as a result there is no net force of attraction, so molecule will be unstable.

526. The decreasing values of bond angles from NH_3 (107°) to SbH_3 (91°) down group - 15 of the periodic table is due to
(a) Increasing bond pair - bond pair repulsion
(b) Increasing p-orbital character in sp^3
(c) Decreasing lone pair - bond pair repulsion
(d) Decreasing electronegativity

(AIEEE-2006)

Ans. (d) : All the elements of group 15 form hydrides of the type EH_3 where E = N, P, As, Sb or Bi. The bond angles from NH_3 to SbH_3 decreases because as we go down in the group 15 elements, the electronegativity decreases then bonded electron polarizes towards central atom less, so repulsion decreases and bond angle is also be decreases.

527. According to bond order concept, the correct order of stability of O_2, O_2^+ and O_2^- is
(a) $O_2 > O_2^+ > O_2^-$
(b) $O_2^- > O_2 > O_2^+$
(c) $O_2 > O_2^- > O_2^+$
(d) $O_2^+ > O_2 > O_2^-$

J & K CET-2006

Ans. (d) : The total number of electron on O_2, O_2^+ and O_2^- are 16, 15 and 17 respectively.

$$\text{(i) } O_2 \text{ (total } e^- = 16) = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^1 = \pi^* 2p_y^1)$$

$N_b = 10, N_a = 6$

$$\text{(ii) } O_2^+ \text{ (total } e^- = 15) = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^1 = \pi * 2py)$$

$N_b = 11, N_a = 5$

$$\text{(iii) } O_2^- \text{ (total } e^- = 17) = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^2 = \pi^* 2p_y^1)$$

$N_b = 10, N_a = 7$

According to the molecular orbital theory– the stability of molecule depends upon the number of electron in anti bonding molecular orbital (N_a). As well as N_a increases then the molecule goes to unstable. Hence, the correct order of stability will be–

$$O_2^+ > O_2 > O_2^-$$

528. Bond angle in H_2O is:
(a) $109^0 28'$
(b) $107^0 10'$
(c) 104.5^0
(d) 92^0

JCECE - 2006

Ans. (c) : H_2O has the sp^3 hybridisation with two lone pair electron. due to the lone pair– lone pair repulsion the bond angle reduces from 109°28' to 104.5°.

529. Which of the following gives correct arrangement of compounds involved based on their bond strength?
(a) HF > HCl > HBr > HI
(b) HI > HBr > HCl > HF
(c) HF > HBr > HCl > HI
(d) HCl > HF > HBr > HI

JIPMER-2006

Ans. (a) : The halogens atom react with hydrogen to given hydrogen halides but affinity for hydrogen decreases from fluorine to iodine because of increaseness of size of halogens. Thus, the correct order of bond strength of halogen halide is–

HF > HCl > HBr > HI

530. Identify the correct order in which the covalent radius of the following elements increases
I. Ti II. Ca III. Sc
(a) (I), (II), (III)
(b) (III), (II), (I)
(c) (II), (I), (III)
(d) (I), (III), (II)

AP-EAMCET-2005

Ans. (d) : Due to increase in effective nuclear charge (Z_{eff}) atomic size decrease in the following order.
Ca > Sc > Ti
or II > III > I

531. In the nitrogen family the H-M-H bond angle in the hydrides (MH_3) gradually becomes closer to 90° on going from N to Sb. This shows that
(a) the basic strength of hydrides increases
(b) the bond energies of M–H bonds increases

@apna_pdf

(c) almost pure p-orbitals are used for M–H bonding
(d) the bond pairs of electrons come nearer to the central atom

CG PET -2005

Ans. (c) : In the nitrogen family the H-M-H bond angle in the hydrides (MH_3) gradually becomes closer to 90º on going from N to Sb. This shows that almost pure p-orbitals are used for M–H bonding.

532. The angle between two covalent bonds is maximum in

(a) CH_4
(b) H_2O
(c) CO_2
(d) SO_2

CG PET -2005

Ans. (c) : As we know that the percent s character is directly proportional to the bond angle of molecule. The hybridization of molecule is given below–

Molecule	**Hybridisation**	**% S character**
CH_4	sp^3	25
H_2O	sp^3	25
CO_2	sp	50
SO_2	sp^2	33.33

Thus, CO_2 molecule has greater bond angle between two covalent bonds.

533. Which one of the following molecules has the smallest bond angle?

(a) NH_3
(b) PH_3
(c) H_2O
(d) H_2Se
(e) H_2S

Kerala-CEE-2005

Ans. (d) : As the electron density around the central atom decreases the repulsion between electron pair decreases. Hence, the bond angle decreases in the order–

$$NH_3 > PH_3 > H_2S > H_2Se$$

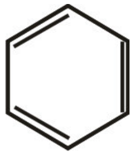
Therefore, H_2Se has the smallest bond angle.

534. Bond order in benzene is

(a) 1
(b) 2
(c) 1.5
(d) None of these

UP CPMT-2005

Ans. (c) : The structure of benzene shows it has 6-carbon-carbon single bonds and 3 carbon-carbon double bonds.



$$\text{Bond order} = \frac{\text{Total bonds}}{\text{Total C-atoms in molecule}} = \frac{9}{6}$$
$$= 1.5$$

535. If the mass defect of ^9_4X is 0.090 AMU then binding energy per nucleon is (1AMU=931.5 Mev)

(a) 9.315 Mev
(b) 931.5 Mev
(c) 83.0 Mev
(d) 8.38 Mev

J & K CET-(2004)

Ans. (a) : Given that,

Mass defect $(\Delta m) = 0.090$ amu
1 amu = 931.5 Mev

$\therefore$ Mass defect $(\Delta m) = 0.090 \times 931.5$ Mev
$\Delta m = 83.835$ Mev

Number of nucleon in given nucleus = 9

Thus, binding energy per nucleon $= \frac{83.835}{9}$
$= 9.315$ Mev

536. The bond-angle in AsH_3 is greater than that in:

(a) NH_3
(b) H_2O
(c) BCl_3
(d) none of these

JCECE - 2004

Ans. (d) : Bond angle of AsH_3 is 91.8° and that of NH_3 is 107.8° BCl_3 is trigonal planar, and therefore the bond angle is 120 whereas H_2O has bond angle of 104.5°. Hence, option (d) is correct.

537. The bond order of O_2^+ same as in

(a) N_2^+
(b) CN^-
(c) CO
(d) NO^+

UP CPMT-2004

Ans. (a) : Write the electronic configuration of each of the species according to the molecular orbital theory and then find bond order with its help.

$$O_2^+ \ (\text{total } e^- = 15) = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$$
$$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^1)$$

$$\text{Bond order} = \frac{10-5}{2} = 2.5$$

(a) $N_2^+ = (\text{total } e^- = 13) = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$
$$(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z^1)$$

$$\text{Bond order} = \frac{9-4}{2} = 2.5$$

(b) CN^- (total e^- = 14) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$
$$(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z^2)$$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

(c) CO (total e^- =14) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$
$$(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z^2)$$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

(d) NO^+ (total e^- =14) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$
$$(\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z^2)$$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

$\therefore$ Bond order of O_2^+ is same as that of N_2^+

@apna_pdf

538. The oxidation state of Xe and XeO_3 and the bond angle in it respectively, are :

(a) + 6, 109° (b) + 8, 103°
(c) + 6, 103° (d) + 8, 120°

AP-EAMCET/2003

Ans. (c): In XeO_3, let the Oxidation state of Xe is x

$$XeO_3$$
$$\therefore\ x + 3(-2) = 0$$
$$x = +6$$

In XeO_3 has sp^3 hybridization with bond angle is 103°.

539. Which of the following molecules is most stable?

(a) H_2 (b) F_2
(c) O_2 (d) N_2

AMU–2003

Ans. (d) : Bond order in H_2=1
Bond order in F_2=1
Bond order in O_2=2
Bond order in N_2= 3
Higher the bond order, more stable is the molecule.

540. N_2 and O_2 are converted to N_2^+ and O_2^+ respectively. Which of the following is not correct?

(a) In N_2^+, the N – N bond weakens.
(b) In O_2^+, O – O bond order increases.
(c) In O_2^+, paramagnetism decreases.
(d) N_2^+ becomes diamagnetic

J & K CET-2003

Ans. (d) : N_2 (Total e^- = 14) $=(\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2$

$$(\sigma^* 2s)^2 (\pi 2p_x^2 = \pi 2p_y^2) (\sigma 2p_z^1)^2$$

$$\text{Bond order of } N_2 = \frac{10-4}{2} = 3$$

O_2 (total e^- = 16) $=(\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$

$$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2) (\pi^* 2p_x^1 = \pi^* 2p_y^1)$$

$$\text{Bond order of } O_2 = \frac{10-6}{2} = 2 \qquad \text{unpaired } e^- = 2$$

Similarly,

$$\text{Bond order of } N_2^+ = \frac{9-4}{2} = 2.5, \qquad n = 1 \text{ (Paramagnetic)}$$

$$\text{Bond order of } O_2^+ = \frac{10-5}{2} = 2.5, \qquad \text{Unpaired } e^- = 1$$

According to the above explanations, only one statement is not true i.e. option (d) because N_2^+ becomes paramagnetic.

541. The bond order of O_2^+ is:

(a) 2 (b) 2.5
(c) 1.5 (d) 0.5

JCECE - 2003

Ans. (b): O_2^+

Total electron in O_2^+ = 15

MO configuration of

$$O_2^+ = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$$
$$(\sigma 2p_z)^2 (\pi 2p_x^2 = \pi 2p_y^2) (\pi^* 2p_x^1)$$

$$\text{Bond order of } O_2^+ = \frac{10-5}{2} = 2.5$$

Thus, bond order of O_2^+ is 2.5.

542. The bond energies (in kJ mol^{-1}) of P–H, As–H and N–H are respectively

(a) 247, 389 and 318 (b) 247, 318 and 389
(c) 318, 389 and 247 (d) 318, 247 and 389

AP EAMCET- 2002

Ans. (d) : Bond energy increase then the bond length decrease. As–H has bond length is maximum in comparison to N–H and P–H.
So the bond energy is less. The correct order of bond energy is– N – H > P – H > As – H

543. An element M reacts with chlorine to form a compound X. The bond angle in X is 120°. What is M?

(a) Be (b) B
(c) Mg (d) N

AP-EAMCET (Medical), 2002

Ans. (b) : When boron and nitrogen reacts with chlorine to form BCl_3, NCl_3 respectively. The bond angle in BCl_3 is 120° and bond angle in NCl_3 is 107° and hence, the M will be boron.

544. Which of the following molecule has highest bond energy?

(a) F–F (b) N–N
(c) C–C (d) O–O

AIIMS-2002

Ans. (b): The molecular orbital configuration of molecule is –

(i)$F_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$

$$\pi^* 2p_x^2 = \pi^* sp_y^2$$

$$\text{Bond order} = \frac{10-8}{2} = 1$$

(i) $N_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

$$\text{Bond order} = \frac{10-4}{2} = 3$$

(iii) $C_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2$

$$\text{Bond order} = \frac{8-4}{2} = 2$$

(iv) $O_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2$

$$= \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^1$$

$$\text{Bond order} = \frac{10-6}{2} = 2$$

$\therefore$ Bond order is directly proportional to bond energy hence, N_2 has maximum bond energies.

@apna_pdf

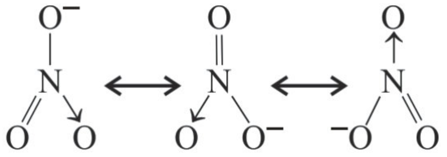
545. Bond order of N—O bonds in nitrate ion is

(a) 1.25 (b) 1.50

(c) 1.33 (d) 1.0

AMU 2002

Ans. (c) : The resonating structure of nitrate ion is given below-



$$\text{Bond order} = \frac{\text{Total number of bonds (N - O) in all resonating structure}}{\text{Number of resonating structure}}$$

$$\text{Bond order} = \frac{4}{3} = 1.33$$

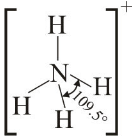
546. Bond angle of 109º28′ is found in

(a) NH_3 (b) H_2O

(c) $\overset{\oplus}{C}H_5$ (d) $\overset{\oplus}{N}H_4$

(AIEEE-2002)

Ans. (d) : Molecules which has regular geometry then they acquire the proper bond angle. Here, NH_4^+ has sp^3 hybridisation with zero lone pair.



Whereas NH_3 and H_2O has one and two lone pair respectively due to which they have less bond angle than NH_4^+.

547. The species containing shortest O – O bond length is

(a) O_2 (b) O_2^-

(c) O_2^{2-} (d) O_2^+

J & K CET-(2002)

Ans. (d) : O_2^+ has 15 e^-. Molecular orbital configuration can be written as–

$$O_2^+\ (15) = (\sigma 1s)^2 \left(\sigma^* 1s\right)^2 (\sigma 2s)^2 \left(\sigma^* 2s\right)^2 \left(\sigma 2p_z\right)^2 \left(\pi 2p_x^2 = \pi 2p_y^2\right)\left(\pi^* 2p_x^1\right)$$

$$\text{Bond order} = \frac{10-5}{2} = 2.5$$

$$\text{Similarly, Bond order of } O_2 = \frac{10-6}{2} = 2$$

$$\text{Bond order of } O_2^- = \frac{10-7}{2} = 1.5$$

$$\text{Bond order of } O_2^{2-} = \frac{10-8}{2} = 1$$

It is very well known that bond length is inversely proportional to the bond order of the molecules. Thus, O_2^+ has shortest bond length.

548. Which one of the following order is correct for the bond energies of halogen molecules?

(a) $I_2>Cl_2>Br_2$ (b) $Br_2>Cl_2>I_2$

(c) $Cl_2>Br_2>I_2$ (d) $I_2>Br_2>Cl_2$

AP EAMCET- 2001

Ans. (c) : On moving from top to down in a group of halogen family bond energies decrease due to distance b/w the electron and nuclei increases thereby decreasing the force of attraction.

∴ The order of bond energies is-

$$Cl_2 > Br_2 > I_2$$

549. The catenation tendency of C, Si and Ge is in the order Ge < Si < C. The bond energies (in kJ mol^{-1}) of C–C, Si–Si and Ge–Ge bonds, respectively, are:

(a) 167, 180, 348 (b) 180, 167,348

(c) 348, 167, 180 (d) 348, 180, 167

AP EAMCET- 2001

Ans. (d) : Catenation tendency ∝ Bond energy.

Hence, catenation tendency of Ge < Si < C is given so the bond energies of C–C, Si–Si and Ge–Ge will be 348, 180, 167 are respectively.

550. Which of the following statements is true?

(a) Hybridization of the central atom in NH_3 and CH_4 is sp^2

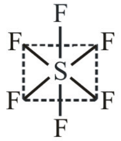
(b) $BeCl_2$ has V-shape while SO_2 is linear

(c) SF_6 is octahedral and F–S–F bond angle 90º

(d) CO_2 has dipole moment

AP-EAMCET/2001

Ans. (c): SF_6 has octahedral structure :



Be bond angle F – S – F is 90º. Statement is true.

- Hybridization of central atom in NH_3 and CH_4 is sp^3.
- $BeCl_2$ is linear and SO_2 is V-shaped structure.
- CO_2 has zero dipole moment.

551. Which of the following has the lowest bond angle?

(a) H_2O (b) CH_4

(c) H_2S (d) NH_3

AP-EAMCET/2000

Ans. (c): H_2S has the lowest bond angle i.e. 92.5º because sulphur has more in size than the oxygen.

Molecule		Bond angle
H_2O	–	104.5°
CH_4	–	109.5°
NH_3	–	107.5°

552. In which of the following compounds the angle between two covalent bonds is highest?

(a) CH_4 (b) NH_3

(c) H_2O (d) H_2O_2

AP-EAMCET (Med.)-1999

Ans. (a) : The hybridisation of CH_4 molecule is sp^3. There is no any lone pair present in the CH_4. Hence, the actual bond angle is 109^{0}28'. Whereas, NH_3, H_2O and

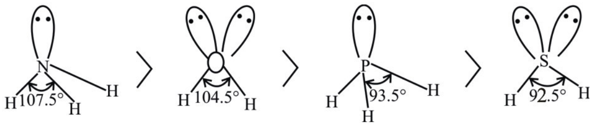
@apna_pdf

H_2O_2 contains the 1, 2 and 2 lone pair respectively. It are also have sp^3 hybridisation but due to the lone pair-lone pair repulsion bond angle reduces.
CH_4 bond angle is 109.28°
NH_3 bond angle is 107°
H_2O bond angle is 104.5°
H_2O_2 bond angle is 97°

553. The correct order of the bond angles is
(a) $NH_3 > H_2O > PH_3 > H_2S$
(b) $NH_3 > PH_3 > H_2O > H_2S$
(c) $NH_3 > H_2S > PH_3 > H_2O$
(d) $PH_3 > H_2S > NH_3 > H_2O$

J & K CET-(1997)

Ans. (a) : According to the VSEPR theory–the bond angle is inversely proportional to the electronegativity of the substituent and directly proportional to the size of central atom.



554. The bond angle of H_2X (where, X is a sixth group element), as one goes down the group,
(a) Increases (b) Decreases
(c) Does not change (d) Changes irregulary

AP EAMCET- 1996

Ans. (b) : The bond angle of H_2X (where, X is a sixth group element) decreases as we go down the group because of electronegativity decreases.

555. The effect of repulsion between the two lone pairs of electrons present on oxygen in water molecule is :
(a) no change in H–O–H bond angle
(b) increase in H–O–H bond angle
(c) decrease in H–O–H bond angle
(d) All atoms will be in one plane

AP-EAMCET/1996

Ans. (c): According to the Valence Bond Theory (VBT), the repulsion are working in following manner– Lone pair-lone pair > Lone pair-bond pair > Bond pair-bond pair. The repulsion decreases the bond angle. Water molecule which is sp^3 hybridized. It angle is 104.5º. This is due to the presence of two lone pairs of electrons.

556. Which of the following molecules has the highest bond order?
(a) O_2^- (b) O_2
(c) O_2^+ (d) O_2^{2-}

NEET-1994

Ans. (c)

(a) O_2^- (total e^-=17)$\Rightarrow$Bond order $= \frac{10-7}{2} = 1.5$

(b) O_2 (total e^-=16)$\Rightarrow$ Bond order $= \frac{10-6}{2} = 2$

(c) O_2^+ (total e^-=15)$\Rightarrow$ Bond order $= \frac{10-5}{2} = 2.5$

(d) O_2^{2-} (total e^-=18)$\Rightarrow$ Bond order $= \frac{10-8}{2} = 1$

Thus, O_2^+ has maximum bond order

557. Cyclic hydrocarbon 'A' has all the carbon and hydrogen atoms in a single plane. All the carbon-carbon bonds have the same length, less than 1.54 Å, but more than 1.34 Å. The bond angle will be
(a) $109^0 28'$ (b) 100^0
(c) 180^0 (d) 120^0

NEET-1989

Ans. (d) : The cyclic hydrocarbon 'A' is benzene because in benzene bond length is between single and double bond and all the carbon and hydrogen atoms i.e. in a single plane where each C atom is sp^2 hybridised so, C–C–C bond angle is 120°.

558. The Cl–C–Cl angle in 1, 1, 2, 2-tetrachloro-ethene and tetra-chloromethane respectively will be about
(a) 120^0 and 109.5^0 (b) 90^0 and 109.5^0
(c) 109.5^0 and 90^0 (d) 109.5^0 and 120^0

NEET-1988

Ans. (a) : In 1, 1, 2, 2 tetrachloroethene, each carbon is sp^2 hybridised, thus having bond angle 120° and in tetrachloromethane carbon is sp^3- hybridized, hence bond angle is 109.5°.

559. The bond angles of NH_3, NH_4^+ and NH_2^- are in the order
(a) $NH_2^- > NH_3 > NH_4^+$ (b) $NH_4^+ > NH_3 > NH_2^-$
(c) $NH_3 > NH_2^- > NH_4^+$ (d) $NH > NH_4^+ > NH_2^-$

VITEEE 2014

Ans. (b) : On increases the number of lone pairs of electrons, bond angle decreases. Therefore order of bond angle of these species is-

NH_4^+ >	NH_3 >	NH_2^-
↓	↓	↓
Zero lone pair	One lone pair	Two lone pair

560. Which one of the following pairs of species have the same bond order?
(a) CN^- and NO^+ (b) CN^- and CN^+
(c) O_2^- and CN^- (d) NO^+ and CN^+

Kerala CEE 2009, NEET 2017

Ans. (a) : The given species which have equal number of total electron then they have the same bond order. Only CN^- and NO^+ has the same no of total electron i.e. 14. Hence, they have same bond order.

561. Stability of the species Li_2, Li_2^- and Li_2^+ increases in the order of
(a) $Li_2 < Li_2^+ < Li_2^-$ (b) $Li_2^- < Li_2^+ < Li_2$
(c) $Li_2 < Li_2^- < Li_2^+$ (d) $Li_2^- < Li_2 < Li_2^+$

JEE Main 2013

@apna_pdf

Ans. (b) : The given species are Li_2, Li_2^+, and Li_2^-

Total no. of e^- in $Li_2(6) = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2$

$N_a = 2, N_b = 4$

Total no. of e^- in $Li_2^+ (5) = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^1$

$N_a = 2, N_b = 3$

Total no. of e^- in $Li_2^- (7)$

$= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^1$

$N_a = 3, N_b = 4$

If N_b is the number of electrons occupying bonding orbitals and N_a is the number of electron occupying the antibonding orbitals then the molecule is stable if N_b is greater than N_a. Hence, the correct order of stability is–

$Li_2^- < Li_2^+ < Li_2$.

562. In which of the following processes, the bond order has increased and paramagnetic character has changed to diamagnetic?

(a) $O_2 \to O_2^+$ (b) $N_2 \to N_2^+$

(c) $O_2 \to O_2^-$ (d) $NO \to NO^+$

JEE Main 2019

Ans. (d) : The species are given below–

(a) $\to O_2$ (Total $e^- = 16$) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma 2P_z)^2$ $(\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^1 = \pi^* 2p_y^1)$

$\Rightarrow B.O. = \frac{10-6}{2} = 2$ (paramagnetic)

$\to O_2^+$ (Total $e^- = 15$) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma 2P_z)^2$ $(\pi 2p_x^2 = \pi 2p_y^2)(\pi^* 2p_x^1)$

$\Rightarrow B.O. = \frac{10-5}{2} = 2.5$ (paramagnetic)

Similarly,

(b) $\to N_2$ (total $e^- = 14$) $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\pi 2p_x^2 = \pi 2p_y^2)(\sigma 2p_z)^2$

$\Rightarrow B.O. = \frac{10-4}{2} = 3$ (Diamagnetic)

$\to N_2^+$ (total $e^- = 13$) $= B.O. = \frac{9-4}{2} = 2.5$ (Paramagnetic)

(c) $\to O_2$ (Total $e^- = 16$) $= B.O. = \frac{10-6}{2} = 2$ (Paramagnetic)

$\to O_2^-$ (Total $e^- = 17$) $= B.O. = \frac{10-7}{2}$ 1.5 (Paramagnetic)

(d) $\to NO$ (Total $e^- = 15$) $= B.O. = \frac{10-5}{2} = 2.5$ (Paramagnetic)

$\to NO^+$ (Total $e^- = 14$) $= B.O. = \frac{10-4}{2} = 3$ (diamagnetic)

Hence, the correct option is (d).

563. Match List-I with List-II

	List-I (Molecule)		**List-II (Bond order)**
A	**Ne_2**	**(i)**	**1**
B	**N_2**	**(ii)**	**2**
C	**F_2**	**(iii)**	**0**
D	**O_2**	**(iv)**	**3**

Choose the correct answer from the options given below.

	A	B	C	D
(a)	(iii)	(iv)	(i)	(ii)
(b)	(i)	(ii)	(iii)	(iv)
(c)	(ii)	(i)	(iv)	(iii)
(d)	(iv)	(iii)	(ii)	(i)

JEE Main 05.03.2021

Ans. (a) :

Molecule	**N_a and N_b**	**Bond order**
Ne_2	$N_b=10, N_a=10$	$B.O. = \frac{N_b - N_a}{2} = \frac{10-10}{2} = 0$
N_2	$N_b=10, N_a=4$	$B.O. = \frac{10-4}{2} = 3$
F_2	$N_b=10, N_a=8$	$B.O. = \frac{10-8}{2} = 1$
O_2	$N_b=10, N_a=6$	$B.O. = \frac{10-6}{2} = 2$

564. The correct order of bond angles (smallest first) in H_2S, NH_3, BF_3 and SiH_4 is

(a) $H_2S < SiH_4 < NH_3 < BF_3$

(b) $NH_3 < H_2S < SiH_4 < BF_3$

(c) $H_2S < NH_3 < SiH_4 < BF_3$

(d) $H_2S < NH_3 < BF_3 < SiH_4$

AIEEE 2004

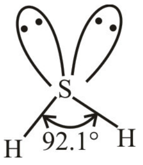
Ans. (c) : The bond angle of the molecules depends upon the hybridization of molecule as well as availability of lone pair of electron on central atom.

H_2S

Hybridisation = Bond pair + Lone pair

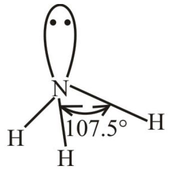
= 2 + 2

= 4 (sp^3)



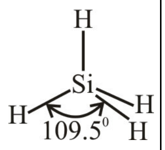
NH_3

Hybridisation = 3 + 1 = 4 (sp^3)



SiH_4

Hybridisation = 4 + 0 = (sp^3)



Hence, the correct order of bond angle is–

$SH_2 < NH_3 < SiH_4 < BF_3$.

@apna_pdf

5. Fajan's Rule

565. The correct order of acid strength is

(a) $HClO < HClO_2 < HClO_3 < HClO_4$
(b) $HClO_4 < HClO < HClO_2 < HClO_3$
(c) $HClO_2 < HClO_3 < HClO_4 < HClO$
(d) $HClO_4 < HClO_3 < HClO_2 < HClO$

JEE Main- 2014
BCECE-2010
JIPMER-2007
UP CPMT-2002

Ans. (a) : Oxygen is more electronegative element. The species which have more number of oxygen atoms attached with the chlorine get's more acidic character because oxygen atom pulls the bonding pair of electron due to which the strength of bond (H–X) get weaked and the removal of H easily takes place. Hence, the correct order of acidic strength is–

$HClO < HClO_2 < HClO_3 < HClO_4$

566. The correct sequence of increasing covalent character is represented by

(a) $LiCl < NaCl < BeCl_2$
(b) $BeCl_2 < NaCl < LiCl$
(c) $NaCl < LiCl < BeCl_2$
(d) $BeCl_2 < LiCl < NaCl$

JCECE - 2016, 2012
JIPMER-2007
NEET-2005

Ans. (c) : On the basis of Fajan's rule, lower the size of cation higher will be its polarising power and higher will be covalent character.

$$\therefore \text{ Polarising power} \propto \frac{1}{\text{Size of cation}}$$

Covalent character ∝ Polarising power
So, the correct order is $NaCl < LiCl < BeCl_2$
(The order of size of cation $Na^+ > Li^+ > Be^{2+}$)

567. The charge/size ratio of a cation determines its polarizing power. Which one of the following sequences represents the increasing order of the polarizing power of the cationic species, K^+, Ca^{2+}, Mg^{2+}, Be^{2+}?

(a) $Ca^{2+} < Mg^{2+} < Be^{2+} < K^+$
(b) $Mg^{2+} < Be^{2+} < K^+ < Ca^{2+}$
(c) $Be^{2+} < K^+ < Ca^{2+} < Mg^{2+}$
(d) $K^+ < Ca^{2+} < Mg^{2+} < Be^{2+}$

COMEDK 2017
JIPMER-2015
AIEEE-2007

Ans. (d) : The charge/size ratio of a cation determines its polarizing power. Higher is the charge and lower to size ratio and higher will be the polarizing power of the cation.
As the size of the given cations decreases as
$K^+ > Ca^{2+} > Mg^{2+} > Be^{2+}$
Hence, polarizing power increases as
$K^+ < Ca^{2+} < Mg^{2+} < Be^{2+}$

568. The correct Lewis acid order for boron halides is–

(a) $BBr_3 > BCl_3 > BI_3 > BF_3$
(b) $BI_3 > BF_3 > BBr_3 > BCl_3$
(c) $BF_3 > BCl_3 > BBr_3 > BI_3$
(d) $BI_3 > BBr_3 > BCl_3 > BF_3$

BCECE-2017, 2016

Ans. (d) : According to the Fajan's rule- acidity is directly proportional to the size of anion of the compound Here, I^- has the larger size than the Br, Cl and F.
Hence, the order of lewis acid will be–
$BI_3 > BBr_3 > BCl_3 > BF_3$

569. The correct decreasing order of solubility of the sulphates in water is–

(a) $BeSO_4 > MgSO_4 > CaSO_4 > SrSO_4 > BaSO_4$
(b) $BaSO_4 > SrSO_4 > CaSO_4 > MgSO_4 > BeSO_4$
(c) $BaSO_4 > SrSO_4 > CaSO_4 > MgSO_4 > BeSO_4$
(d) $BaSO_4 > SrSO_4 > MgSO_4 > CaSO_4 > BeSO_4$

Manipal-2020, BCECE-2015

Ans. (a) : With increase in radius of the cation down the group, ΔH_s becomes less and less negative Hence, the solubility decreasing down the group.
Hence, the decreasing order of solubility will be–
$BeSO_4 > MgSO_4 > CaSO_4 > SrSO_4 > BaSO_4$

570. Among Al_2O_3, SiO_2, P_2O_3 and SO_2, the correct order of acid strength is

(a) $SO_2 < P_2O_3 < SiO_2 < Al_2O_3$
(b) $SiO_2 < SO_2 < Al_2O_3 < P_2O_3$
(c) $Al_2O_3 < SiO_2 < SO_2 < P_2O_3$
(d) $Al_2O_3 < SiO_2 < P_2O_3 < SO_2$

Assam CEE-2014, AIEEE- 2004

Ans. (d) : While moving along a group from top to bottom, acidic nature of oxides decreases and along a period from left to right acidic nature increases. Thus, the increasing order will be:–
$Al_2O_3 < SiO_2 < P_2O_3 < SO_2$.

571. The correct order of the increasing basic nature of the given oxides is

(a) $MgO < K_2O < Al_2O_3 < Na_2O$
(b) $Na_2O < K_2O < MgO < Al_2O_3$
(c) $K_2O < Na_2O < Al_2O_3 < MgO$
(d) $Al_2O_3 < MgO < Na_2O < K_2O$

Assam CEE-2014
(AIEEE 2011)

Ans. (d) : According to the Fajan's rule–

$$\text{Polarization power} \propto \frac{1}{\text{Basicity}}$$

or $$\text{No. of cation} \propto \frac{1}{\text{Basicity}}$$

and

size of cation ∝ Basicity

The given compounds are MgO, K_2O, Al_2O_3 and Na_2O.

$$\overset{+2}{Mg}O \quad \overset{+1}{K_2}O \quad \overset{+3}{Al_2}O_3 \quad \overset{+1}{Na_2}O$$

Hence, the order will be-
$Al_2O_3 < MgO < Na_2O < K_2O$

@apna_pdf

572. Among LiCl, $BeCl_2$, BCl_3 and CCl_4, the covalent bond character follows the order

(a) $LiCl < BeCl_2 < BCl_3 < CCl_4$
(b) $BCl_3 < CCl_4 < BeCl_2 < LiCl$
(c) $BeCl_2 < LiCl < CCl_4 < BCl_3$
(d) $CCl_4 < BCl_3 < BeCl_2 < LiCl$

JIPMER-2013
NEET-1990

Ans. (a) : According to the Fajan's rule, covalent character is directly proportional charge on cation and inversaly proportional to the size of cation. Among LiCl, $BeCl_2$, BCl_3 and CCl_4 has the +1, +2, +3 and +4 change respectively. Thus, the increasing order of covalevt character will be–

$$LiCl < BeCl_2 < BCl_3 < CCl_4$$

573. Which one of the following has the highest Lewis acid strength?

(a) BI_3
(b) BBr_3
(c) BF_3
(d) BCl_3

Manipal-2016
J & K CET-(2009)

Ans. (a) : According to the Fajan's rule, size of ion is directly proportional to the acidic strength. In the given halogen of borons. I^- ion has large size due to which they have highest lewis acid strength.

574. Which of the following metal hydroxides is strong base ?

(a) $Mg(OH)_2$
(b) $Ca(OH)_2$
(c) $Sr(OH)_2$
(d) $Ba(OH)_2$

UP CPMT-2012
AMU-2007

Ans. (d) : The alkaline metal hydroxides are stronger bases and their basic strength increases from $Be(OH)_2$ to $Ba(OH)_2$ due to corresponding decrease in the ionization enthalpy of the metal as we move down the group. Thus $Ba(OH)_2$ is a strongest base.

575. The correct order of acidic strength is

(a) $K_2O > CaO > MgO$
(b) $Na_2O > MgO > Al_2O_3$
(c) $CO_2 > N_2O_5 > SO_3$
(d) $Cl_2O_7 > SO_2 > P_4O_{10}$

AMU-2012, 2001

Ans. (d) : On moving across the period, the acidic character of the oxides increases.

576. The bond length of HCl molecule is 1.275 Å and its dipole moment is 1.03 D. The ionic character of the molecule (in per cent) (charge of the electron = 4.8×10^{-10} esu) is :

(a) 100
(b) 67.3
(c) 33.66
(d) 16.83

AP-EAMCET/2008, 2003

Ans. (d): Given :

Bond length of HCl molecule = 1.275 Å

$= 1.275 \times 10^{-10}$m

$= 1.275 \times 10^{-8}$ cm.

Observed dipole moment = 1.03 D

Charge of electron $(e^-) = 4.8 \times 10^{-10}$ esu

Calculated dipole moment = e × d

$= 4.8 \times 10^{-10}$ esu $\times 1.275 \times 10^{-8}$ cm.

= 6.12 D

% Ionic character

$$= \frac{\text{Observed dipole moment}}{\text{Calculated dipole moment}} \times 100$$

$$= \frac{1.03}{6.12} \times 100 = 16.83$$

577. The correct set from the following in which both pairs are in correct order of melting point is

(a) LiF > LiCl, MgO > NaCl
(b) LiCl > LiF, NaCl > MgO
(c) LiF > LiCl, NaCl > MgO
(d) LiCl > LiF, MgO > NaCl

[JEE Main-2021, 24 Feb Shift-II]

Ans. (a) : The charge on cation is inversely proportional to the melting point of the compound.

$$\boxed{\text{Charge on cation} \propto \frac{1}{\text{Melting point}}}$$

$$\boxed{\text{Size of anion} \propto \frac{1}{\text{Melting point}}}$$

In the given set LiF and LiCl, F has less atomic size than Cl. Hence, LiF has higher melting point than LiCl.

	MgO	NaCl
Similarly,	Mg→2+	Na→+1
	O→2–	Cl→1–

MgO having +2 charge which is greater than NaCl(+1) charge. So, greater the charge on the ions greater will be lattice energy and hence, melting point order is MgO > NaCl.

578. Which is the most covalent ?

(a) $AlCl_3$
(b) AlI_3
(c) MgI_2
(d) NaI

AP EAPCET 24.08.2021, Shift-I

Ans. (b) : The given species are –

	$AlCl_3$	AlI_3	MgI_2	NaI
Charge –	+3	+3	+2	+1
Anion –	Cl^-	I^-	I^-	I^-

According to the Fajan's rule – the covalent character depends upon the charge of cation and size of anions. As the size of anion increases the covalent character will be also increases. So, AlI_3 have the more covalent character.

579. The correct order of boiling point in the following compounds is

(a) $HF > H_2O > NH_3$
(b) $H_2O > HF > NH_3$
(c) $NH_3 > H_2O > HF$
(d) $NH_3 > HF > H_2O$

Kerala-CEE-29.08.2021

Ans. (b) : Both H_2O and HF have electronegative atom are oxygen and fluorine respectively in their molecule. In fact, fluorine is more electronegative than oxygen, so technically, HF should engage in more hydrogen bonding than water but the scenario is different. Each water molecule has two hydrogen atoms. Whereas, each HF molecule has only one hydrogen atom and water molecule takes part in extensive and more hydrogen bonding than hydrofluoric acid. Water molecule through its extensive hydrogen bonding forms a bulky molecule and it is very difficult to break its bonds. A large amount of energy is required to break all its bonds. Thus, H_2O has a higher boiling point than HF and NH_3.

@apna_pdf

580. The correct decreasing order of the basic strength is

(a) $HS^- > CH_3^- > NH_2^- > CN^-$

(b) $HS^- > CN^- > NH_2^- > CN_3^-$

(c) $CH_3^- > NH_2^- > CN^- > HS^-$

(d) $NH_2^- > CN^- > CN_3^- > HS^-$

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (c) : Decreasing order of basicly is as follow,

$$CH_3^- > NH_2^- > CN^- > HS^-$$

To determine the basic strength of these anions we need to find out the acidic strength of the conjugate acids.

Conjugate acids of $CH_3^-, NH_2^-, CN^-, HS^-$ are CH_4, NH_3, HCN, H_2S respectively.

As we know that,

Acidity $\propto$ Electronegativity

On going from left to right in the period, electronegativity increases.

So, acidity order is $HS^- > CN^- > NH_2^- > CH_3^-$.

Hence, the basicity order of the conjugate acids are–

$$CH_3^- > NH_2^- > CN^- > HS^-$$

581. Which among the following is least covalent in nature?

(a) NF_3 (b) BiF_3

(c) PF_3 (d) SbF_3

AP EAPCET 23-08-2021 Shift-I

Ans. (b) : The covalent character is directly proportional to the no. of charge of cation and inversely proportional to the size of cation. Here, Bi has the more ionic radius due to which they shows the least covalent character.

582. How many of the following oxides are amphoteric?

BeO, ZnO, Sb_2O_3, CO, CaO, SO_2, SO_3

(a) 2 (b) 3

(c) 4 (d) 5

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (b) : Metal oxides which react with both acids as well as bases to produce salts and water are known as amphoteric oxides. Atom whose oxide show amphoteric nature is Zn, Al, Be, Ga, Pb, Sn, As, Sb and Bi. So, ZnO, Sb_2O_3 & BeO shows amphoteric nature because all three oxide react with both acid and bases.

583. A metal 'M' readily gives MSO_4, which is soluble in water. It forms its oxide MO which is amphoteric. It forms an insoluble hydroxide $M(OH)_2$, which is soluble in NaOH solution. The M is

(a) Be (b) Ba

(c) Ca (d) Mg

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (a) : Beryllium form Beryllium sulfate ($BeSO_4$) which is water soluble

- Beryllium form Beryllium hydroxide ($Be(OH)_2$) which is insoluble in water.
- Beryllium form Beryllium Oxide (BeO) which becomes inert on heating.
- $Be(OH)_2$ being amphoteric reacts with NaOH.
- Solubility of alkaline earth metal decreases as we move down in the periodic table.

584. The acidic oxide from below is

(a) CO (b) GeO

(c) SnO (d) PbO

TS EAMCET 10.08.2021, Shift-II

Ans. (b) : As we know down in group acidic nature of oxides decrease and basic nature increases.

So,

Neutral oxide – CO

Acidi oxide – GeO

Basic oxide – SnO, PbO

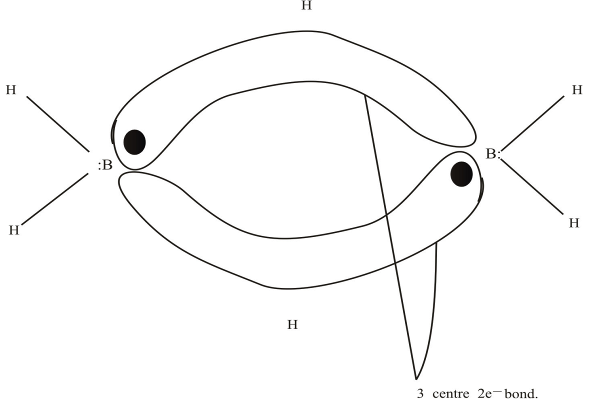
585. The Lewis acid in the following is

(a) PH_3 (b) H_2S

(c) C_2H_4 (d) B_2H_6

TS EAMCET 10.08.2021, Shift-II

Ans. (d) : B_2H_6 is laws acid. In diborane two e^- are Shared between three centers Boron centre is e^- deficient ,so it act as Lewis acid



586. Which of the following statement is incorrect?

(a) Tl^{3+} salts are oxidizing agents.

(b) Ga^+ salts are reducing agents.

(c) Pb^{4+} salts are better oxidizing agents

(d) As^{+5} salts are better oxidizing agents.

AP EAPCET 20.08.2021 Shift-I

Ans. (d) : As^{+5} cannot be reduced.

As^{+5} salts are not a good oxidizing agent.

$As^{+5} + 2e^- \longrightarrow As^{3+}$ (less stable)

587. How many oxides among the following are basic in nature ?

As_2O_3, Na_2O, MgO, Mn_2O_3, CaO, ZnO, N_2O, N_2O_5

(a) 4 (b) 5

(c) 3 (d) 6

AP EAPCET 24.08.2021, Shift-I

Ans. (c) :

Metal Oxide	Nature
As_2O_3	Weak acid
N_2O	Neutral
Na_2O	Basic
MgO	Basic
Mn_2O_3	Amphotric
CaO	Basic
ZnO	Amphoteric

@apna_pdf

588. Assertion (A): LiCl and $MgCl_2$ are soluble in ethanol.
Reason (R): Lithium and magnesium are harder than their respective group elements
The correct option among the following is
(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS-EAMCET (Engg.), 06.08.2021

Ans. (b): Ethanol form hydrogen bonding. It is covalent in nature and polar. LiCl and $MgCl_2$ are polar nature, so soluble in polar ethanol.
Both Li and Mg are quite hard. They are harder and lighter than other elements in their respective group.
So (A) is true, (R) is true but (R) is not the correct explanation for (A).

589. Highest covalent character is found in which of the following?
(a) CaF_2 (b) $CaCl_2$
(c) $CaBr_2$ (d) CaI_2

TS EAMCET 04.08.2021, Shift-I

Ans. (d) : According to Fajan's Rules "size of anion increases then covalent character also increases." The size of iodide is maximum than the other halogen atom. So, highest covalent character is found CaI_2.

590. Given below are two statements:
Statement I : Both $CaCl_26H_2O$ and $MgCl_2$ $8H_2O$ undergo dehydration on heating.
Statement II : BeO is amphoteric whereas the oxides of other elements in the same group are acidic.
In the light of the above statements, choose the correct answer from the options given below :
(a) Both statement I and statement II are true
(b) Both statement I and statement II are false
(c) Statement I is true but statement II is false
(d) Statement I is false but statement II is true

JEE Main 16.03.2021, Shift-I

Ans. (b) : The dehydration of $CaCl_2 \cdot 6H_2O$ and $MgCl_2 \cdot 8H_2O$ has been studied with heating.

(a) $CaCl_2 \cdot 6H_2O \xrightarrow{\Delta} \underset{(\text{Anhydrous})}{CaCl_2} + 6H_2O$

(b) $MgCl_2 \cdot 8H_2O \xrightarrow{\Delta} MgCl(OH) + 2HCl + 5H_2O$

Both statement I and statement II are false. BeO is amphoteric in nature and the oxides of same group are basic in nature.

591. Number of amphoteric compounds among the following is______.
1. BeO 2. BaO
3. $Be(OH)_2$ 4. $Sr(OH)_2$
(a) 2 (b) 3
(c) 1 (d) 4

JEE Main 24.02.2021, Shift-I

Ans. (a) : Both beryllium compounds BeO and $Be(OH)_2$ are amphoteric in nature (react with acid and bases) and compound BaO and $Sr(OH)_2$ are basic in nature, they form alkaline solution in water. Hence, BeO and $Be(OH)_2$ are amphoteric compounds.

592. Compound A used as a strong oxidizing agent is amphoteric in nature. It is the part of lead storage batteries. Compound A is:
(a) PbO (b) PbO_2
(c) Pb_3O_4 (d) $PbSO_4$

JEE Main 26.02.2021, Shift-I

Ans. (b) : PbO_2 is the amphoteric and strong oxidizing agent and also a component of lead storage batteries. In this oxidation state of Pb is +4. So it is always reduced and behaves as oxidizing agent.

593. Which pair of oxides is acidic in nature ?
(a) B_2O_3,CaO (b) B_2O_3, SiO_2
(c) N_2O, BaO (d) CaO, SiO_2

(JEE Main 2021, 26 Feb Shift-II)

Ans. (b) : According to the Fajan's rule, acidic character is directly proportional to the charge on ion.

(a)	B_2O_3	CaO
	$B\rightarrow+3$	$Ca\rightarrow+2$
(b)	B_2O_3	SiO_2
	$B\rightarrow+3$	$Si\rightarrow+4$
(c)	N_2O	BaO
	$N\rightarrow+1$	$Ba\rightarrow+2$
(d)	CaO	SiO_2
	$Ca\rightarrow+2$	$Si\rightarrow+4$

In the given set, B and Si has highest number of ions due to which they have highest acidic character.

594. The correct order of boiling points in the following compounds is
(a) $HF>H_2O>NH_3$ (b) $H_2O>HF>NH_3$
(c) $NH_3>H_2O>HF$ (d) $NH_3>HF>H_2O$

Karnataka-CET-2021

Ans. (b) : As we know that more the hydrogen bonding, higher will be boiling point. Each water molecule formed four hydrogen bonds with surrounding water molecule. Thus, H_2O has more boiling point than HF and NH_3. Due to more electronegativity of fluoride ion, the partial positive and negative charge generated and having the more boiling point than NH_3. Hence, The correct order of boiling point is – $H_2O > HF > NH_3$.

595. Amphoteric hydroxide from the following is
(a) $Al(OH)_3$ (b) $In(OH)_3$
(c) $B(OH)_3$ (d) $Tl(OH)_3$

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (a) :
$Al(OH)_3$ –Amphoteric
$In(OH)_3$– Much more basic than Acidic
$B(OH)_3$–Weak Acid
$Tl(OH)_3$ –Weak base
$Al(OH)_3$ is amphoteric in nature because it can react both acid and bases.
Reaction of $Al(OH)_3$ in acidic solution–

$$HCl_{(aq)} + Al(OH)_{3(aq)} \rightarrow AlCl_{3(aq)} + 3H_2O$$

Reaction of $Al(OH)_3$ in basic medium–

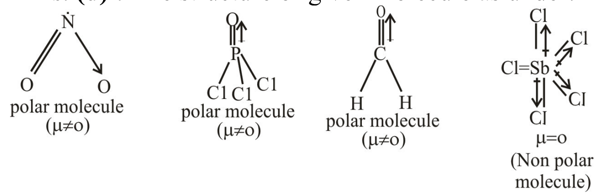
$$Al(OH)_3 + OH^- \rightarrow [Al(OH)_4]^-$$

596. Which of the following molecules is non-polar in nature?
(a) NO_2 (b) $POCl_3$
(c) CH_2O (d) $SbCl_5$

NEET-2021

@apna_pdf

Ans. (d) : The structure of given molecule as under:-



597. Among LiCl, $BeCl_2$, BCl_3 and CCl_4, the covalent bond character varies as

(a) $LiCl<BeCl_2> BCl_3> CCl_4$
(b) $BCl_3>BeCl_2>CCl_4>LiCl$
(c) $LiCl<BeCl_2<BCl_3<CCl_4$
(d) $LiCl>BeCl_2>BCl_3> CCl_4$

COMEDK 2020

Ans. (c) : More the charge density of cation (i.e, smaller size and high magnitude of charge) more is the covalent character.
Order of charge density the thus the covalent character is $CCl_4 >BCl_3>BeCl_2>LiCl$.

598. Which of the following is the correct order?

(a) Acidic strength :
$HClO_4, < HClO_3, < HClO_2, < HClO$
(b) Stability : $HI < HBr < HCl < HF$
(c) Ionic character : $MF < MCl < MBr < MI$
(d) Electron gain enthalpy: $I < Br < Cl < F$

GUJCET-2020

Ans. (b) :
(a) With increase in oxidation number of a particular atom, the acidic character of corresponding oxoacid increases. The increasing order of acidic strength is–
$HClO < HClO_2 < HClO_3 < HClO_4$
Hence, the given order of acidic strength is wrong.
(b) The stability of these halides decreases down the group due to decrease in bond (H–X) dissociation enthalpy in the order Hence, the stability order–
$HI < HBr < HCl < HF$
Hence, the given order is true.
(c) The ionic character of the halides increase in the order MI < MBr < MCl < MF. Where M is a monovalent atom. Hence, the given order is false.
(d) The electron gain enthalpy are of halogen atom in following manner–
$I < Br < F < Cl$.
Hence, the given order is false.

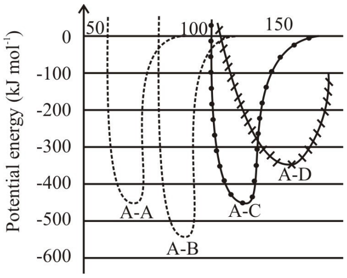
599. If the boiling point of H_2O is 373 K, the boiling point of H_2S will be

(a) less than 300 K
(b) equal to 373 K
(c) more than 373 K
(d) greater than 300 K but less than 373 K

(JEE Main 2020, 3 Sep. Shift-I)

Ans. (a) : Chemical formula of water is H_2O so at room temperature, water molecule is found in liquid because of hydrogen bonding but compound H_2S is found in gas because sulphur atoms don't show hydrogen bonding. Now you know as well, a gas has very low boiling point compare to liquid. Therefore, the boiling point of H_2S should be less than 300 K.

600. The intermolecular potential energy for the molecules A, B, C and D given below suggests that:



(a) A-B has the stiffest bond
(b) D is more electronegative than other atoms
(c) A-A has the largest bond enthalpy
(d) A-D has the shortest bond length

(JEE Main 2020, 4 Sep. Shift-I)

Ans. (a) : From the given graph, potential energy of A–B molecule is minimum. Thus A–B bond is most stable and have strongest bond amongst these.
B→Most electronegative
D→Least electronegative
A–B→ Shortest bond length.
A–B→Largest bond entholpy.

601. Which hydride amongst the following has the least boiling point?

(a) NH_3
(b) PH_3
(c) AsH_3
(d) SbH_3
(e) BiH_3

Kerala-CEE-2019

Ans. (b) : Boiling point depends on the molecular mass of the compound. As we go down the group molecular mass increase so does boiling point but due to presence of hydrogen bonding in H_2O and NH_3 they have exceptionally high boiling point. PH_3 have lowest boiling point among the hydride of group no. 15. NH_3 is higher boiling point due to excessive hydrogen bonding.

602. Which of the following metal halide is more covalent?

(a) $SnCl_2$
(b) $PbCl_2$
(c) $SbCl_3$
(d) $SbCl_5$

MHT CET-03.05.2019, SHIFT-I

Ans. (d) : Charge of cation is directly proportional to the covalent character.

$SnCl_2$	$PbCl_2$	$SbCl_3$	$SbCl_5$
Sn→+2	Pb→+2	Sb→+3	Sb→+5

The penta chloride of antimony has the maximum no. of cation due to which they has more covalent character.

603. Match the oxide given in column I with its property given in column II.

Column I	Column II
(i) Na_2O	A. Neutral
(ii) Al_2O_3	B. Basic
(iii) N_2O	C. Acidic
(iv) Cl_2O_7	D. Amphoteric

Which of the following options has all correct pairs?

(a) (i) -B, (ii)-A, (iii)-D, (iv)-C
(b) (i) -C, (ii)-B, (iii)-A, (iv)-D

@apna_pdf

(c) (i) -A, (ii)-D, (iii)-B, (iv)-C
(d) (i) -B, (ii)-D, (iii)-A, (iv)-C

NEET-Odisha 2019

Ans. (d) :

Compound

(i)	Na_2O	–	Basic
(ii)	Al_2O_3	–	Amphoteric
(iii)	N_2O	–	Neutral
(iv)	Cl_2O_7	–	Acidic

604. The melting points of (i) $BeCl_2$ (ii) $CaCl_2$ and (iii) $HgCl_2$ follows the order

(a) i < ii < iii
(b) iii < i < ii
(c) i < iii < ii
(d) ii < i < iii

WB-JEE-2019

Ans. (b) : According to the Fajan's rule-

$$\text{Polarization power} \propto \frac{1}{\text{Melting point}}$$

$BeCl_2$	$CaCl_2$	$HgCl_2$
$Be\rightarrow+2$	$Ca\rightarrow+2$	$Hg\rightarrow+2$

The covalent character will be $HgCl_2 > BeCl_2 > CaCl_2$

Thus, melting point will be $HgCl_2<BeCl_2<CaCl_2$ i.e. iii < i < ii.

605. Which of the following has correct increasing order of hydrolysis?

(a) $CCl_4 < MgCl_2 < AlCl_3 < SiCl_4 < PCl_5$
(b) $PCl_5 < MgCl_2 < AlCl_3 < SiCl_4 < CCl_4$
(c) $PCl_5 < SiCl_2 < MgCl_2 < AlCl_3 < CCl_4$
(d) None of these

[AIIMS-26 May, 2018 (E)]

Ans. (a): The increasing order of extent of hydrolysis is $CCl_4 < MgCl_2 < AlCl_3 < SiCl_4 < PCl_5$. As the number of chlorine atoms increases, the charge on the central metal atom increases and the tendency for the nucleophilic attack increases. Hence, the extent of hydrolysis increases.

606. Which of the following is least basic?

(a) NF_3
(b) NCl_3
(c) NBr_3
(d) NI_3

BCECE-2018

Ans. (a) : The size of anion is inversely proportional to the basicity. NF_3 has least tendency to donate a pair of electrons because of high electronegativity of F. The lewis base strength of the other trihalides increases as the electronegativity of halogen decreases.

607. Which one of the following is least covalent?

(a) VCl_2
(b) VCl_3
(c) VCl_4
(d) $VOCl_3$

BCECE-2018

Ans. (a) : The covalent character is directly proportional to charge on cation and inversely proportional to the size of cation.

The species given below–

$\overset{+2}{V}Cl_2$	$\overset{+3}{V}Cl_3$
$\overset{+4}{V}Cl_4$	$\overset{+5}{V}OCl_3$

In VCl_2, 'V' has the least charge on cation so this have the least covalent character.

608. If Na^+ ion is larger than Mg^{2+} ions and S^{2-}ion is larger than Cl^- ion, which of the following will be stable salt in water?

(a) Sodium chloride
(b) Sodium sulphide
(c) Magnesium sulphide
(d) Magnesium chloride

JIPMER-2018

Ans. (c) : The lattice energy of a salt gives a rough indication of the solubility of the salt in water because it reflects the energy needed to separate the positive and negative ions in a salt. Sodium and potassium salts are soluble in water because they have relatively small lattice energies. Magnesium and aluminum salts are often much less soluble because it takes more energy to separate the positive and negative ions in these salts.

609. Which of the following oxides is most acidic in nature?

(a) MgO
(b) BeO
(c) BaO
(d) CaO

NEET-2018

Ans. (b) : In metals moving down the group metallic character increases, so basic nature increases hence most acidic will BeO as Be is least metallic in group 2 element.

MgO	BeO	BaOCaO	
$Mg\rightarrow+2$	$Be\rightarrow+2$	$Ba\rightarrow+2$	$Ca\rightarrow+2$
$O\rightarrow-2$	$O\rightarrow-2$	$O\rightarrow-2$	$O\rightarrow-2$

Beryllium has less atomic size thus BeO has most acidic in nature.

610. Which of the following oxide is of acidic nature?

(a) B_2O_3
(b) Al_2O_3
(c) Ga_2O_3
(d) In_2O_3

UPTU/UPSEE-2018

Ans. (a) : According to the periodic trends in group 13, on moving down, the nature of oxide changes from acidic to basic. B_2O_3 is the acidic oxide: Acidic character of boron oxide may be explained on the basis of Fajan's rule i.e. small size of boron.

$$\left.B_2O_3\right\}\text{Acidic}$$

$$\left.\begin{matrix}Al_2O_3\\Ga_2O_3\end{matrix}\right\}\text{Amphotoric}$$

$$\left.\begin{matrix}In_2O_3\\Tl_2O_3\end{matrix}\right\}\text{Basic}$$

611. Which among the following is the strongest acid?

(a) HF
(b) HCl
(c) HBr
(d) HI

TS EAMCET-2017

Ans. (d) : As we move down the group, the size of halogen increases, bond length increases hence bond energy decreases. So, HI is releases H^+ ions easily than other. Hence, HI is the strongest acid.

612. Which of the following is the most basic oxide?

(a) SO_3
(b) SeO_3
(c) PoO
(d) TeO

TS EAMCET-2017

@apna_pdf

Ans. (c) : On going down the group 16, electronegativity decrease and basic nature of oxide increase. Hence PoO is the most basic oxide.

613. Which of the following substances has the least covalent character?

(a) Cl_2O (b) NCl_3
(c) $PbCl_2$ (d) $BaCl_2$

AIIMS-2017

Ans. (d): The no. of charge on cation is directly proportional to the covalent character and size of cation is inversely proportional to the covalent character.

$$\overset{+2}{Cl_2O} \qquad \overset{+3}{N}Cl_3$$

$$\overset{+2}{Pb}Cl_2 \qquad \overset{+2}{Ba}Cl_2$$

$PbCl_2$, Cl_2O and $BaCl_2$ having same charge so we move in to the size of cation. Barium (Ba) ion has the more size than the other so it has least covalent character.

614. Which of the following has highest hydration energy?

(a) $MgCl_2$ (b) $CaCl_2$
(c) $BaCl_2$ (d) $SrCl_2$

AMU-2017

Ans. (a) : As well as size of alkaline earth metal increases about down the group then the hydration energy is also be decreases. Thus, $MgCl_2$ has more hydration energy.

615. The correct increasing order for basic strength of the following species OH^-, NH_2^-, $H-C\equiv C^-$ and $CH_3CH_2^-$ are

(a) $OH^- < HC\equiv C^- < NH_2^- < CH_3CH_2^-$
(b) $OH^- < HC\equiv C^- < CH_3CH_2^- < NH_2^-$
(c) $CH_3CH_2^- < HC\equiv C^- < OH^- < NH_2^-$
(d) $CH_3CH_2^- < HC\equiv C^- < NH_2^- < OH^-$

BCECE-2017

Ans. (a) : The conjugate base of a strong acid is weaker while the conjugate base of a weak acid is stronger Hence, the correct order of strength of bases is:–

$$OH^- < HC\equiv C^- < NH_2^- < CH_3-CH_2^-$$

$CH_3CH_2^-$ is the conjugate base for ethane and $HC\equiv C^-$ is the conjugate base for ethyne. Since, ethyne has more s-character than ethane, it is more acidic. Thus, the conjugate base of ethyne will be less basic than the conjugate base of ethane.

616. In which of the following the oxidation number of oxygen has been arranged in increasing order?

(a) $BaO_2 < KO_2 < O_3 < OF_2$
(b) $OF_2 < KO_2 < BaO_2 < O_3$
(c) $BaO_2 < O_3 < OF_2 < KO_2$
(d) $KO_2 < OF_2 < O_3 < BaO_2$

JIPMER-2017

Ans. (a) : The given species are–BaO_2, KO_2, O_3 and OF_2. Let, all the oxygen species has x oxidation number.

∴ BaO_2 $\quad$ KO_2 $\quad$ O_3 $\quad$ OF_2
$+2+2x = 0$ $\quad$ $+1+2x=0$ $\quad$ $x = 0$ $\quad$ $x-2 = 0$
or $x = -1$ $\quad$ or $x = \frac{-1}{2}$ $\quad$ or $x = 2$

Hence, the increasing order of oxidation state of the molecule is given below–

$$BaO_2 < KO_2 < O_3 < OF_2$$

617. Which of the following is the correct order of stability for the given superoxides?

(a) $KO_2 < RbO_2 < CsO_2$
(b) $CsO_2 < RbO_2 < KO_2$
(c) $RbO_2 < CsO_2 < KO_2$
(d) $KO_2 < CsO_2 < RbO_2$

JIPMER-2017

Ans. (a) : The increasing stability of the peroxide or superoxide of alkali metal, as the size of metal increases stability of superoxide also increases. It is due to the stabilization of large anions by larger cations through lattice energy effect. Thus, the increasing, stability order of oxide is–

$$KO_2 < RbO_2 < CsO_2.$$

618. Which of the following statement is correct?

(a) BCl_3 and $AlCl_3$ are both Lewis acids and $AlCl_3$ is stronger than BCl_3
(b) BCl_3 and $AlCl_3$ are both equally strong Lewis acid
(c) Both BCl_3 and $AlCl_3$ are not Lewis acids
(d) $BCl_3$and $AlCl_3$ are both Lewis acids and BCl_3 is stronger than $AlCl_3$

UPTU/UPSEE-2017

Ans. (a) : According to the Fajan's rule, the acidity of molecule is directly proportional to the no. of charge and inversely proportional to the size of cation. The acidic character of halides of group 13 decreases down the group due to increase in size.

∴ BCl_3 and $AlCl_3$ both are Lewis acids and BCl_3 is stronger lewis acids than $AlCl_3$.

619. Which of the following compounds has lowest boiling point?

(a) KCl (b) CuCl
(c) $CuCl_2$ (d) CsCl

Manipal-2016

Ans. (c) : The boiling point of the compound is inversely proportional to the no. of charge on cation and directly proportional to the size of cation.

$$\underset{K\to+1}{KCl} \quad \underset{Cu\to+1}{CuCl} \quad \underset{Cu\to+2}{CuCl_2} \quad \underset{Cs\to+1}{CsCl}$$

The copper compound has the maximum no. of charge due to which they get the lowest boiling point.

620. Which one of the following forms a basic oxide?

(a) B (b) Tl
(c) Al (d) Ga

TS-EAMCET-2016

Ans. (b) : Element has more metallic character, more basic its oxide. All the given element are p-block and in p-block on down the group metallic character increase. So, Tl has more basic oxide.

621. The order of covalent character of KF, KI, KCl is

(a) KCl < KF < KI (b) KI < KCl < KF
(c) KF < KI < KCl (d) KF < KCl < KI

TS-EAMCET-2016

@apna_pdf

Ans. (d) : As we know, the covalent character is directly proportional to the polarization power and polarization is directly proportional to size of anion. Iodine has the largest size, therefore KI will have the most covalent character and fluorine has the smallest size, So KF will be least covalent. Therefore, the order of covalent character of KF, KI, KCl is KF < KCl < KI.

622. Among LiCl, RbCl, $BeCl_2$, $MgCl_2$ the compounds with greatest and least ionic character respectively are

(a) LiCl and RbCl
(b) RbCl and $BeCl_2$
(c) RbCl and $MgCl_2$
(d) $MgCl_2$ and $BeCl_2$

AMU-2016

Ans. (b) : The compounds are LiCl, RbCl, $BeCl_2$ and $MgCl_2$.

Covalent character ∝ No. of charge on cation

$$\frac{1}{\text{Ionic charcter}} \propto \text{No.of charge on cation}$$

$$\overset{+}{Li}Cl \quad \overset{+}{Rb}Cl \quad \overset{+2}{Be}Cl \quad \overset{+2}{Mg}Cl_2$$

$\overset{+}{Li}$ and $\overset{+}{Rb}$ has the equal number of cation so we distinguish by the size of cation. The size of cation is directly proportional to the ionic character. The size of Rb is more than the Li. So, RbCl has greatest ionic character.

The charge on Be and Mg are same. The metal which have less size having the least ionic character. Hence, $BeCl_2$ has the least ionic character.

623. Thermal stability of $BaCO_3$, $CaCO_3$ and $MgCO_3$ is–

(a) $BaCO_3 > CaCO_3 > MgCO_3$
(b) $BaCO_3 > MgCO_3 > CaCO_3$
(c) $CaCO_3 > MgCO_3 > BaCO_3$
(d) $MgCO_3 > CaCO_3 > BaCO_3$

BCECE-2016

Ans. (a) : Thermal stability is directly proportional to the size of cation. Thus, the temperature at which a given carbonate gets decomposed depends on the polarising power of the cation. Due to successive increase in the size of alkali earth metal, the thermal stability of these molecules increases as $BaCO_3 > CaCO_3 > MgCO_3$.

624. Which one has highest melting point?

(a) NaCl
(b) NaBr
(c) NaF
(d) NaI

BCECE-2016

Ans. (c) : The size of anion is inversely proportion to the melting point or boiling point. Fluoride ion has the less size then they have high melting point.

625. Correct sequence of acidic character is

(a) $N_2O_5 > CO_2 > CO > SO_2$
(b) $N_2O_5 > SO_2 > CO_2 > CO$
(c) $CO > CO_2 > SO_2 > N_2O_5$
(d) $SO_2 > CO_2 > CO > N_2O_5$

JCECE - 2016

Ans. (b) : (i) Higher be the positive oxidation value of non-metal oxide, higher be the acidic nature.

(ii) For same value of oxidation number, more electro negative element associated with oxygen shows more acidic nature.

Thus, correct order of acidic character is

$$N_2O_5 > SO_2 > CO_2 > CO$$
$$(+5) \quad (+4) \quad (+4) \quad (+2)$$

Note CO is a neutral oxide.

626. Reactivity order of halides for dehydrohalogenation is

(a) R–F > R–Cl > R–Br > R – I
(b) R–I > R – Br > R – Cl > R–F
(c) R–I > R –Cl > R–Br > R – F
(d) R–F > R – I > R – Br > R – Cl

Karnataka-CET-2016

Ans. (b) : As well as we move down on halogen group then size of halogens increases. If halogen group connected with any group, then the bond length also increases down the group, Here, reactivity of R–X depends upon bond length. More be the bond length, easier for the R–X to go for dehydrohalogenation. Thus, correct order is:

R–I > R–Br > R–Cl > R–F.

627. The correct order of increasing polarizing power of the cations in the following $AlCl_3$, $MgCl_2$, NaCl is

(a) $AlCl_3 < MgCl_2 < NaCl$
(b) $MgCl_2 < NaCl < AlCl_3$
(c) $NaCl < MgCl_2 < AlCl_3$
(d) $NaCl < AlCl_3 < MgCl_2$

AMU-2015

Ans. (c) : The cations are given as follows:-

$$AlCl_3 \quad MgCl_2 \quad NaCl$$

The polarizing power is directly proportional to the no. of charge and inversaly proportional to the size of cation.

$$\overset{+3}{Al}Cl_3 \quad \overset{+2}{Mg}Cl_2 \quad \overset{+}{Na}Cl$$

The increasing order of polarizing power is given below-

$NaCl < MgCl_2 < AlCl_3$

628. The solubility of fluorides of alkali metals in water is–

(a) LiF > NaF > KF > RbF > CsF
(b) CsF > RbF > KF > NaF > LiF
(c) LiF > KF > NaF > CsF > RbF
(d) CsF > KF > NaF > RbF > LiF

BCECE-2015

Ans. (b) : In the alkali metal, as well as move down the group then the size of metal increases and the solubility of fluoride is also increases.

$$\boxed{\text{Solubility} \propto \text{Size of cation}}$$

Hence, the decreasing order of solubility will be–

CsF > RbF > KF > NaF > LiF

629. The correct statement is

(a) BF_3 is the strongest Lewis acid among the other boron halides
(b) Bl_3 is the weakest Lewis acid among the boron halides
(c) there is maximum pπ-pπ back bonding in BF_3
(d) there is minimum pπ- pπ back bonding in BF_3

Karnataka-CET-2015

Ans. (c) : The molecular formula of boron trihalides are BF_3, BCl_3, BBr_3 and BI_3. The acidity of boron halide depends upon the charge on cation and size of anion.

@apna_pdf

$\boxed{\text{Size of anion} \propto \text{Acidic character}}$

The size of fluoride ion is small rather than other halogen due to which has least acidic character than the other halide. Hence, the statement (a) is false.

The size of iodine ion is greater than the other halide. Hence, BI_3 has more lewis and character.

The boron and fluorine atom belongs to the second period element it has the p orbital due to which $p\pi$–$p\pi$ back bonding occur. Hence, the statement is true.

630. The relative strength of trichlorides of boron group to accept a pair of electron is given by

(a) $GaCl_3 > AlCl_3 > BCl_3$
(b) $AlCl_3 < BCl_3 < GaCl_3$
(c) $AlCl_3 < GaCl_3 < BCl_3$
(d) $BCl_3 < AlCl_3 < GaCl_3$
(e) $GaCl_3 < BCl_3 < AlCl_3$

Kerala-CEE-2015

Ans. (d) : In the third group of boron family, the acidic strength of trichlorides of boron group decreases down the group i.e. $BCl_3 > AlCl_3 > GaCl_3$. Hence, strength of accepting electron is as follows:

$BCl_3 < AlCl_3 < GaCl_3$.

631. Which of one of the following is least covalent in nature?

(a) NF_3 (b) BiF_3
(c) PF_3 (d) SbF_3

AMU-2014

Ans. (b) : Compounds having less charge on cation are less covalent. The covalent character of the molecule is inversely proportional to the size of cation.

$$\text{Covalent character} \propto \frac{1}{\text{size of cation}}$$

The given species are NF_3, BiF_3, PF_3 and SbF_3.
All the compounds have same charge due to which we classify the covalent character from the size of cation. Bi^{3+} has more atomic size than other Thus, BiF_3 has less covalent character.

632. The correct sequence of increasing covalent character is represented by

(a) $LiCl < NaCl < BeCl_2$ (b) $BeCl_2 < NaCl < LiCl$
(c) $NaCl < LiCl < BeCl_2$ (d) $BeCl_2 < LiCl < NaCl$

Assam CEE-2014

Ans. (c) : According to the Fajan's rule, the no of charge on cation is directly proportional to the covalent character.

$$\overset{+1}{Li}Cl \quad \overset{+1}{Na}Cl \quad \overset{+2}{Be}Cl_2$$

$BeCl_2$ has more covalent character than the LiCl and NaCl because Be contains +2 cation whereas Li and Na contains +1 charge.

$$\text{Covalent character} \propto \frac{1}{\text{Size of cation}}$$

∴ The covalent character follow the following order:–

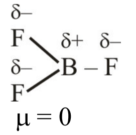
$NaCl < LiCl < BeCl_2$

633. The molecules BF_3 and NF_3 are both covalent compounds, but BF_3 is non polar whereas NF_3 is polar. The reason for this is :

(a) Atomic size of boron is larger than nitrogen
(b) Boron is metal while nitrogen is gas
(c) B–F bonds are non-polar while N–F bonds are plar
(d) BF_3 is planar but NF_3 is pyramidal

BITSAT 2014

Ans. (d) : The shape of BF_3 is trigonal planar. The structure is given below–



Hence, it is non polar.

The shape of NF_3 is pyramidal  and $\mu \neq 0$.

Hence, it is polar.

634. Which of following is the correct order of acidic strength?

(a) $CH_3COOH > ClCH_2COOH > Cl_2CHCOOH > Cl_3C.COOH$
(b) $Cl_3C.COOH > Cl_2CH.COOH > Cl.CH_2COOH > CH_3COOH$
(c) $CH_3COOH > Cl_3.COOH > Cl_2CH.COOH > Cl.CH_2.COOH$
(d) $CH_3COOH > ClCH_2COOH > Cl_2CH.COOH > Cl_3C.COOH$

GUJCET-2014

Ans. (b) : As well as no. of chlorine atom increases which is attached with the α–carbon of carboxylic group, the acidic character increases because Cl is highly electronegative atom and pulls the bonding pair of electron from which the hydrogen atom easily removed. Hence, the decreasing order of acidic character is–

$Cl_3CCOOH > Cl_2CHCOOH > ClCH_2COOH > CH_3COOH.$

635. Which of the following option is the correct order for the basic strength of metallic hydroxides?

(a) $Al(OH)_3 < Lu(OH)_3 < Ce(OH)_3 < Ca(OH)_2$
(b) $Ca(OH)_2 < Al(OH)_3 < Lu(OH)_3 < Ce(OH)_3$
(c) $Lu(OH)_3 < Ce(OH)_3 < Al(OH)_3 < Ca(OH)_2$
(d) $Lu(OH)_3 < Ce(OH)_3 < Ca(OH)_2 < Al(OH)_3$

GUJCET-2014

Ans. (a) : As we know that higher the electropositive character, higher will be basic strength. The order of size of given metallic elements is:

$Al^{3+} < Lu^{3+} < Ce^{3+} < Ca^{2+}$

Thus, the order of basic strength is:

$Al(OH)_3 < Lu(OH)_3 < Ce(OH)_3 < Ca(OH)_2$

636. For BCl_3, $AlCl_3$ and $GaCl_3$ the increasing order of ionic character is

(a) $BCl_3 < AlCl_3 < GaCl_3$
(b) $GaCl_3 < AlCl_3 < BCl_3$
(c) $BCl_3 < GaCl_3 < AlCl_3$
(d) $AlCl_3 < BCl_3 < GaCl_3$

WB-JEE-2013

Ans. (c) : Ionic character is inversely proportional to the charge on cation and directly proportional to size of cation.

@apna_pdf

$$BCl_3 \quad AlCl_3 \quad GaCl_3$$

$$B \rightarrow +3 \quad Al \rightarrow +3 \quad Ga \rightarrow +3$$

Hence, the correct order of ionic character will be.
$BCl_3 < GaCl_3 < AlCl_3$.

637. The hydration energy of Mg^{2+} ion is higher than that of

(a) Al^{3+} (b) Be^{2+}
(c) Na^+ (d) None of these

CG PET- 2013

Ans. (c) : Hydration energy depends on charge of ion and ionic radius. Higher the charge, greater the hydration energy. On the other hand, smaller the size, greater the hydration energy. Charge is considered first for comparison. Hence, Mg^{2+} has higher hydration energy than Na^+.

638. Among the elements B, Mg, Al and K the correct order of increasing metallic character is

(a) $B < Al < Mg < K$ (b) $B < Mg < Al < K$
(c) $Mg < B < Al < K$ (d) $Mg < Al < B < K$
(e) $K < Mg < Al < B$

Kerala-CEE-2013

Ans. (a) : In the periodic table, the metallic character of the elements increases as we move down the group and decreases across a period left to right. Hence, the increasing order of metallic character will be $B < Al < Mg < K$.

639. Which of the following is most acidic?

(a) H_2O (b) H_2S
(c) H_2Se (d) H_2Te

UPTU/UPSEE-2013

Ans. (d) : As we move down the group 16 elements, the acidity of hydrides increases down the group Thus, H_2O has least acidic character where as H_2Te has more acidic character.

640. Which one of the following cannot form an amphoteric oxide?

(a) Al (b) Sn
(c) Sb (d) P

AP EAMCET (Engg.) 2012

Ans. (d) : Metal oxides which react with both acids as well as bases to produce salts and water is known as amphoteric oxide. Phosphorus does not form the amphoteric oxide.
P (Phosphorous) being a non-metal always form acidic oxide like P_2O_3, P_5O_{10} etc.

641. Among LiCl, RbCl, $BeCl_2$ and $MgCl_2$ compounds with maximum and minimum ionic character are respectively

(a) LiCl; RbCl (b) RbCl; $BeCl_2$
(c) RbCl; $MgCl_2$ (d) $MgCl_2$; $BeCl_2$

SRMJEEE – 2012

Ans. (b) : Polarisation is inversely proportional to ionic character.
Polarisation order : $BeCl_2 > MgCl_2 > LiCl > RbCl$
so ionic character : $RbCl > LiCl > MgCl_2 > BeCl_2$
Maximum and minimum ionic character are RbCl and $BeCl_2$ respectively.

642. Which of the following sets contains oxides in the sequence of basic, amphoteric and acidic in nature respectively?

(a) CaO, SiO_2, Al_2O_3 (b) Al_2O_3, CO_2, SiO_2
(c) CO, SO_2, P_2O_5 (d) BaO, Al_2O_3, SiO_2

SRMJEEE – 2012

Ans. (d) : Barium oxide (BaO), Alumina (Al_2O_3) and Silica (SiO_2) shows the character of basic nature, amphoteric character and acidic nature respectively.
SiO_2– An amphoteric solution is a substance that can chemically react as either acid or base.

643. The polarizing power of the following anions, N^{3-}, O^{2-} and F^-, follow the order

(a) $N^{3-} > F^- > O^{2-}$ (b) $O^{2-} > N^{3-} > F^-$
(c) $O^{2-} > F^- > N^{3-}$ (d) $N^{3-} > O^{2-} > F^-$

AMU-2012

Ans. (d) : The polarizing power is directly proportional to the size of anion. First of all, we find act the order of size of the ions. More the negative charge, more the size of anions Thus, size of anions follow the following order:–

$$N^{3-} > O^{2-} > F^-$$

Thus, the order of polarizing power will be:-

$$N^{3-} > O^{2-} > F^-$$

644. Which of the following orbitals has zero probability of finding the electron in the xy-plane?

(a) p_x (b) p_z
(c) d_{yz} (d) $d_{x^2-y^2}$

AMU-2012

Ans. (b) : In the p_z orbitals the possibility of finding electrons in the xy-plane will be zero.

645. Which of the following is least hydrolysed?

(a) $BeCl_2$ (b) $MgCl_2$
(c) $CaCl_2$ (d) $BaCl_2$

MHT CET-2012

Ans. (a) : In the alkaline earth metal chloride, $BeCl_2$ and $MgCl_2$ get hydrolyzed due to their covalent nature. Other halides do not get hydrolyzed. Polarization power is inversely proportional to the solubility i.e. size of cation is directly proportional to the solubility. Be^{2+} has least size than Mg^{2+} due to which they having the least hydrolysis.

646. Among the following, the maximum covalent character is shown by the compound

(a) $FeCl_2$ (b) $SnCl_2$
(c) $AlCl_3$ (d) $MgCl_2$

(AIEEE-2011)

Ans. (c) : According to the Fajan's rule, the polarization is directly proportional to the covalent character of the compound and polarization is directly proportional to the charge on cation.
So, we can say that compounds having large charge on cation are more covalent.

$$\overset{+2}{Fe}Cl_2 \qquad \overset{+2}{Sn}2\,Cl_2$$

$$\overset{+3}{Al}Cl_3 \qquad \overset{+2}{Mg}Cl_2$$

Thus, $AICI_3$ has the more covalent character.

647. Among the following the compound that is readily soluble in water is

(a) $BeSO_4$ (b) $CaSO_4$
(c) $SrSO_4$ (d) $BaSO_4$

J & K CET-(2011)

@apna_pdf

Ans. (a) : The solubility of alkaline earth metal sulphates decreases down the group because ionic size increases. $BeSO_4$ is readily soluble in water, because the greater hydration enthalpy of Be^{2+} ion overcomes the lattice enthalpy Factor.

648. Which of the following property does not correspond to the order HI < HBr < HCl < HF?

(a) Thermal stability (b) Reducing power
(c) Ionic character (d) Dipole moment

MHT CET-2011

Ans. (b) : • Thermal stability is inversely proportional to the polarization power. Hence, the given order is true.

• The reducing power of halogen halide increases in the following order i.e. HF < HCl < HBr < HI

Hence, the given order is not true.

• The ionic character is inversely proportional to the size of anion. Hence, the ionic character is true.

• The dipode moment of hydrogen halide decreases down the group because of decreasing of electronegativity.

Hence, the given order is true.

649. Which of the following represents correct acidity order Li_2O, BeO and B_2O_3?

(a) $Li_2O<BeO<B_2O_3$ (b) $B_2O_3<BeO<Li_2O$
(c) $BeO<Li_2O<B_2O_3$ (d) $BeO<B_2O_3<Li_2O$

UPTU/UPSEE-2011

Ans. (a) : The acidic character is directly proportional to the charge on cation and inversely proportional to the size of cation.

$$Li_2O \quad BeO \quad B_2O_3$$
$$Li \rightarrow +1 \quad Be \rightarrow +2 \quad B \rightarrow +3$$

B_2O_3 contains the more charge on cation and Li_2O contains less charge on cation. Hence, the correct order of acidic character will be–

$$Li_2O < BeO < B_2O_3.$$

650. In water or its acidic solution, proton can exist as $H_3O^+, H_9O_4^+, \left[H(H_2O)_n\right]^+$. This is due to more polarizing power of.

(a) H (b) H_2^+
(c) H^+ (d) H_2O

S C R A 2010 (A) CHEMISTRY

Ans. (c) : In water or its acidic solution, proton can exist (hydronium ion), this is because water containing lone pair of e^- on oxygen atom shared electron (co-ordinate bond) with it, forming H_3O^+ ion. This is due to more polarising power of H^+

651. Assertion: Molecules of larger size have higher polarizability.
Reason: Polarizability is observed only in those molecules which has permanent dipole moment.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect
(d) If both the Assertion and Reason are incorrect

AIIMS-2010

Ans. (c): According to the Fajan's rule, the polarizability is directly proportional to the size of anion. If the size of anion is larger then the polarizability is also will be more. Polarizability is also observed by induced polar atom from another polar atom. Hence, assertion is true but reason is not true.

652. One would expect proton to have very large

(a) ionisation potential (b) radius
(c) charge (d) hydration energy

BCECE-2010

Ans. (d) : Proton have very small size, so have large hydration energy. The degree of hydration depend, upon the size of the cation. Smaller the size of a cation greater the hydration energy.

653. Which of the following is Lewis acid?

(a) OH^- (b) H^+
(c) F^- (d) NH_3

JIPMER-2010

Ans. (b): The electron deficient species with vacant orbital is known by lewis acid. Here, H^+ is the lewis acid whereas OH^-, F and NH_3 are lewis bases.

654. The order of stability of metal xides is

(a) $Al_2O_3 < MgO < Fe_2O_3 < Cr_2O_3$
(b) $Cr_2O_3 < MgO < Al_2O_3 < Fe_2O_3$
(c) $Fe_2O_3 < Cr_2O_3 < Al_2O_3 < MgO$
(d) $Fe_2O_3 < Al_2O_3 < Cr_2O_3 < MgO$

Karnataka-CET, 2009

Ans. (c) : The stability of metal oxide is directly related to lattice energy and lattice energy depends on charge and size of ions. So, the order is–

$$Fe_2O_3 < Cr_2O_3 < Al_2O_3 < MgO$$

655. Which of the following metal oxides is most basic?

(a) ZnO (b) Al_2O_3
(c) As_2O_3 (d) K_2O

J & K CET-(2008)

Ans. (d) : The given species are:–

$$ZnO \quad Al_2O_3 \quad As_2O_3 \quad K_2O$$
$$Zn\rightarrow+2 \quad Al\rightarrow+3 \quad As\rightarrow+3 \quad K\rightarrow+1$$
$$O \rightarrow -2 \quad O \rightarrow -2 \quad O \rightarrow -2 \quad O \rightarrow -2$$

The charge of ion is inversely proportional to the basicity of the compound. Here, oxide, of potassium bearing less charge on cation so that's why it has most basic character.

656. The correct order of heat of formation of halogen acids is

(a) HI > HBr> HCI > HF
(b) HF > HCl > HBr > HI
(c) HCl > HF > HBr > HI
(d) HCl > HBr > HF > HI

UPTU/UPSEE-2008

Ans. (b) : On moving from top to bottom of halogen group the bond dissociation energy of hydrogen halides decreases and so the heat of formation of halogen acids also decreases.

657. Among the following, which is water insoluble?

(a) Sodium fluoride (b) Potassium fluoride
(c) Beryllium fluoride (d) Magnesium fluoride

AP EAMCET (Engg.) -2007

@apna_pdf

Ans. (d) : Fluorides of magnesium metals are ionic, have high melting points, and are insoluble in water.
- Sodium fluoride reacts with water forms hydrogen fluoride and NaOH.

658. Assertion (A): NaCl is less soluble in heavy water than in ordinary water.
Reason (R): Dielectric constant of ordinary water is more than that of heavy water.
The correct answer is
(a) Both (A) and (R) are true and (R) is the correct explanation of (A).
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A).
(c) (A) is true, but (R) is not true.
(d) (A) is not true, but (R) is true.

AP EAMCET (Engg.) -2007

Ans. (a) : NaCl is less soluble in heavy water than in ordinary water because dielectric constant of ordinary water (i.e, 81) is more than that of heavy water (i.e 80).

659. The most stable compound is
(a) LiF (b) LiCl
(c) LiBr (d) LiI

JCECE - 2007

Ans. (a) : By Fajan's rule, smaller the size of cation, larger the size of anion then larger the polarizing power and stability of compound is more.

660. The carbonate that will not decompose on heating is
(a) Na_2CO_3 (b) $CaCO_3$
(c) $BaCO_3$ (d) $SrCO_3$
(e) Li_2CO_3

Kerala-CEE-2007

Ans. (a) : The carbonates of alkaline earth metal decompose into CO_2 and metal oxide when heated. All alkali metal carbonates (except Li_2CO_3) are highly stable and do not decompose on heating due to which Na_2CO_3 will not decompose on heating.

661. Which of the following is the most basic oxide?
(a) SeO_2 (b) Al_2O_3
(c) Sb_2O_3 (d) Bi_2O_3

NEET-2006

Ans. (d) : Basicity of oxide depends on the size of the central atom. i.e. basicity is directly proportional to the size of cation . In the given option , Bi has more atomic size due to which they shows the more basic character.

662. Which one is most ionic?
(a) P_2O_5 (b) MnO_2
(c) Mn_2O_7 (d) P_2O_3

JCECE - 2006

Ans. (d) : According to Fajan's rule, compounds having largest charge on cation are more covalent or least electrovalent. So, compounds having lowest charge on cation will be more electrovalent or ionic.

$$\overset{+4}{Mn}O_2 \qquad \overset{+7}{Mn_2}O_7$$

$$\overset{+5}{P_2}O_5 \qquad \overset{+3}{P_2}O_3$$

So, P_2O_3 will be most ionic.

663. Amphoteric oxide are in:
(a) ZnO, K_2O, SO_3 (b) ZnO, P_2O_5, Cl_2O_7
(c) SnO_2, Al_2O_3, ZnO (d) PbO_2, SnO_2, SO_3

UPTU/UPSEE-2006

Ans. (c) : Amphoteric oxides can be defined as oxides that can behave as an acid and a base to produce salt and water. SnO_2 is an amphoteric oxide. Aluminum oxide reacts with both acidic and basic substance to give neutralization reaction and it is called amphoteric oxide. Zinc oxide is amphoteric because it reacts with both acids and bases to form salts.

664. The covalent character of group 15 elements decreases in the sequence
(a) Bi > Sb > As > P (b) P > As > Sb > Bi
(c) Bi > As > Sb > P (d) As > Sb > Bi > P

AMU–2006

Ans. (b) : In group 15 elements, except nitrogen, the electronegativities of other elements are so low that they generally form covalent compounds even with highly electropositive elements. The covalent character of the group 15 elements decreases as P > As > Sb > Bi.

665. Which among the following is strongest acid?
(a) $H(ClO)O_2$ (b) $H(ClO)O_3$
(c) $H(ClO)O$ (d) $H(ClO)$

JIPMER-2006

Ans. (b) : The species which have more no. of oxygen atom attached with chlorine atom, gets more acidic, Here, $H(ClO)O_3$ has more number of oxygen atom, thus, it has more acidic character.

666. Least ionized salt is
(a) KCl (b) AgCl
(c) $MgCl_2$ (d) $CaCl_2$

UP CPMT-2005

Ans. (b) : Least ionised salt will be one which has highest covalent character.
∵ KCl, $MgCl_2$ and $CaCl_2$ are chlorides of members group 1 and group 2 of periodic table. So, they are ionic. AgCl is chloride of d-block elements. So, it is least ionic and least ionised.

667. Based on lattice energy and other considerations which one of the following alkali metal chlorides is expected to have the highest melting point?
(a) RbCl (b) KCl
(c) NaCl (d) LiCl

(AIEEE 2005)

Ans. (c) : Melting point is directly proportional to lattice energy. It depends upon charge of ions and size of ions.

$$\boxed{\text{Melting point} \propto \text{Lattice Energy} \propto \frac{\text{Charge}}{\text{size}}}$$

As we go down in the group, ionic character increases hence, melting point of halides should increase but NaCl has the highest meting point (800°C) due to its high lattice energy.

668. The following salt shows maximum covalent character:
(a) $AlCl_3$ (b) $MgCl_2$
(c) $CsCl$ (d) $LaCl_3$

UPTU/UPSEE-2004

Ans. (a) : According to the Fajan's rule, the covalent character is directly proportional to the amount of cation and inversaly proportional to the size of cation.

@apna_pdf

$AlCl_3$ $MgCl_2$ $CsCl$ $LaCl_3$

$Al \rightarrow +3$ $Mg \rightarrow +2$ $Cs \rightarrow +1$ $La \rightarrow +3$

$AlCl_3$ and $LaCl_3$ has the equal amount of charge but Al^{3+} has less atomic size than La^{3+} due to which $AlCl_3$ has maximum covalent character.

669. Which of the following element is most electropositive?

(a) Al (b) Mg

(c) P (d) S

J & K CET-(2003)

Ans. (b) : Atoms which tend to donate electrons are called electropositive atom and the atom convert into a positive ion(M^+) upon donating electrons.

The element Mg is most electropositive.

The electronegativity of aluminium is 1.61 in the Pauling scale.

Hence, if electronegativity is large then electropositivity is less. Hence, magnesium has higher electropositivity.

Note:- Cesium(Cs) is the most electropositive of the stable elements having atomic no. 55.

670. Select the correct statement.

(a) When a covalent bond is formed, transfer of electrons takes place

(b) Pure H_2O does not contain any ion

(c) A bond is formed when attractive forces overcome repulsive forces

(d) HF is less polar than HBr

(AIEEE-2002)

Ans. (c) : The bond forms when attractive forces are more than repulsive forces. To get stability, more attractive forces must be present in it.

671. Which of the following order is wrong?

(a) $NH_3 < PH_3 < AsH_3$ – acidic

(b) $Li < Be < B < C$ – 1st IP

(c) $Al_2O_3 < MgO < Na_2O < K_2O$ – basic

(d) $Li^+ < Na^+ < K^+ < Cs^+$ – ionic radius

NEET-2002

Ans. (b) : NH_3, PH_3 and AsH_3 are basic due to the presence of the lone pair of electrons on the central atom but as the size increase down the group the basic character decrease. Therefore, the acidic strength will increases down the group as–

$$NH_3 < PH_3 < AsH_3$$

- Ionisation energy increases from left to right in a period due to the increases in effective nuclear charge on the element. Be has high I.E than B due to its completely filled 2s orbital that provides stability to the element.

Thus the order of IE_1 is–

$Li < B < Be < C$

672. Which one of the following is the weakest acid?

(a) HCl (b) HBr

(c) HF (d) HI

UP CPMT-2001

Ans. (c) : In gaseous state, HX are covalent and do not show acid character but in aqueous solution, they ionize to give hydronium ion (H_3O^+) and act as acid.

$$HX + H_2O \rightarrow H_3O^+ + X^-$$

The relative strength of acids increases as follows:

$$HF < HCl < HBr < HI$$

The strength of acids depend on bond lengths.

$$\text{Acidity} \propto \frac{1}{\text{Bond strength}}$$

$\therefore$ HF is least acidic because its bond strength (i.e. bond dissociation energy is highest. Hydrogen bonding is another reason for least acidic strength of HF.

673. Which of the following is soluble in excess of NaOH?

(a) $Fe(OH)_3$ (b) $Al(OH)_3$

(c) $Cr(OH)_3$ (d) $Mn(OH)_3$

J & K CET-(1999)

Ans. (b) : In the excess amount of NaOH, $Al(OH)_3$ is soluble. Thus, to separate $Fe(OH)_3$ and $Al(OH)_3$ aqueous NaOH solution is added $Al(OH)_3$ will dissolve in it whereas $Fe(OH)_3$ will remain insoluble. These two can be separated by filtration.

674. Boron compounds behave as Lewis acids because of their

(a) acidic nature

(b) covalent nature

(c) ionization property

(d) electron deficient nature

J & K CET-(1999)

Ans. (d) : The lewis acids has the vacant orbital due to which they show electron deficient nature and attack at the point in which electron density is more.

675. According to Fajan's rule covalent bond is favoured by:

(a) small cation and large anion

(b) small cation and small anion

(c) large cation and large anion

(d) large cation and small anion

AP EAMCET (Medical) -1998

Ans. (a): According to the **Fajan's rule**, covalent bond is favoured by small cation and large anion. Also large charge on cation and cation with pseudo noble gas configuration will favor covalent bond.

676. Among the following oxides, the one which is most basic is

(a) ZnO (b) MgO

(c) Al_2O_3 (d) N_2O_5

NEET-1994

Ans. (b) : Generally metals form basic oxides especially alkaline and alkaline earth metals. Hence, Mgo is most basic among Al_2O_3, ZnO, N_2O_5.

ZnO and Al_2O_3 are amphoteric oxide, N_2O_5 is oxide of non-metal, so it is acidic.

677. Among the following which compound will show the highest lattice energy?

(a) KF (b) NaF

(c) CsF (d) RbF

NEET-1993

Ans. (b) : As we know that in alkali metal, the lattice energy decreases down the group as the size of cation increases. Hence, the NaF has the highest lattice energy.

$$\text{Lattice energy} \propto \frac{1}{r_A + r_B}$$

@apna_pdf

678. Which two sets of reactants best represents the amphoteric character of $Zn(OH)_2$?

Set I $Zn(OH)_2(s)$ and OH^- (aq)
Set II $Zn(OH)_2(s)$ and H_2O (l)
Set III $Zn(OH)_2(s)$ and H^+ (aq)
Set IV $Zn(OH)_2(s)$ and NH_3 (aq)

(a) III and II (b) I and III
(c) IV and I (d) II and IV

VITEEE 2015

Ans. (b) : Zinc hydroxide is amphoteric in nature
It reacts with acid as well as base.

$$Zn(OH)_2(S)+2H^+(aq)\rightarrow ZnO(aq)+2H_2O(l)$$

$$Zn(OH)_2(S)+2OH^-(aq)\rightarrow[Zn(OH)_4]^{2-}(aq)+2H^+$$

The amphoteric character of $[Zn(OH)_4]^{2-}$ is represented by I and III.

679. Which of the following oxides is strongly basic?

(a) Tl_2O (b) B_2O_3
(c) Al_2O_3 (d) Ga_2O_3

VITEEE 2014

Ans. (a) : On moving down the group, the acidic character decreases and the basic character increases so, the Tl_2O is strongly basic

680. Lattice energy of an ionic compound depends upon

(a) Charge on the ion and size of the ion
(b) Packing of ions only
(c) Size of the ion only
(d) Charge on the ion only

AP EAMCET 2009

Ans. (a) : Lattice energy of an ionic compound depends upon charge on the ion and size of the ion i.e.

$$\boxed{\text{Lattice Energy} \propto \frac{\text{Charge}}{\text{Size of ion}}}$$

681. Among the following, the molecule expected to be stabilised by anion formation is C_2, O_2, NO, F_2.

(a) C_2 (b) F_2
(c) NO (d) O_2

JEE Main 2019

Ans. (a) : In case of only C_2, incoming electron will enter in the bonding moleculer orbital which increases the bond order and stability too. Whereas rest of all takes electrons in their antibonding molecular orbital which decreases bond order and stability.

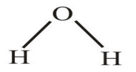
6. Dipole Moment

682. Amongst BeF_2, BF_3, H_2O, NH_3, CCl_4 and HCl, the number of molecules with non-zero net dipole moment is——

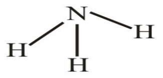
JEE Main-25.06.2022, Shift-II

Ans. (3) : Polar Molecules - H_2O, NH_3, HCl

(i)



(ii) NH_3



(iii) HCl

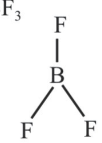
H—Cl

Non- Polar molecules = BeF_2, BF_3 CCl_4

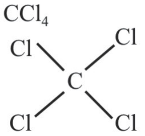
(i) BeF_2

F—Be—F

(ii) BF_3



(iii) CCl_4



683. Arrange the following in the decreasing order of their covalent character?

(a) LiCl (b) NaCl
(c) KCl (d) CsCl

Choose the most appropriate answer from the options given below:

(a) (A) > (C) > (B) > (D)
(b) (B) > (A) > (C) > (D)
(c) (A) > (B) > (C) > (D)
(d) (A) > (B) > (D) > (C)

JEE Main-29.06.2022, Shift-I

Ans. (c) : On moving down the group from top to bottom the covalent character decrease. Hence, the decreasing order of covalent character is-
LiCl > NaCl > KCl > CsCl.

684. The dipole-dipole interaction energy between rotating polar molecules is proportional to____ where 'r' is the distance between polar molecules.

(a) $\frac{1}{r^4}$ (b) $\frac{1}{r^9}$
(c) $\frac{1}{r^3}$ (d) $\frac{1}{r^2}$
(e) $\frac{1}{r^6}$

Kerala CEE -03.07.2022

Ans. (e) : Dipole – dipole interactions result when two dipolar molecules interact with each other through space.
dipole – dipole interaction energy between rotating polar molecules $\propto \frac{1}{r^6}$
dipole – dipole interaction energy between stationary polar molecules $\propto \frac{1}{r^3}$
So, the correct option is (e)

685. Dipole moment of HCl = 1.03 D, HI = 1.6 Å. The ratio of fraction of electric charge δ, existing on each atom in HCl and HI is

(a) 12: 1 (b) 2.7: 1
(c) 3.3: 1 (d) 1: 3.3

AP EAMCET (Engg.)-2009
VITEEE- 2009

Ans. (c): Dipole moment of HCl = 1.03D
Bond length of HCl = 1.3 Å
Dipole moment of HI = 0,38 Å
Bond length of HI = 1.6 Å

@apna_pdf

Dipole moment (μ) = Electric charge (δ) × Bond length (*l*)

$$\text{Electric charge }(\delta)=\frac{\text{Dipole moment}}{\text{Bond length}}$$

$$\frac{\delta_{HCl}}{\delta_{HI}}=\frac{\mu_{HCl}}{l_{HCl}}\times\frac{l_{HI}}{\mu_{HI}}$$

$$\frac{\delta_{HCl}}{\delta_{HI}}=\frac{1.03}{0.38}\times\frac{1.6}{1.3}=\frac{3.33}{1}$$

$\delta_{HCl} : \delta_{HI} = 3.3 : 1$

686. The dipole moment of HBr is 2.60×10^{-30}cm and the interatomic spacing is 1.41Å. What is the percent ionic character of HBr?

(a) 50% (b) 11.5%

(c) 4.01% (d) 1.19%

BCECE-2015, 2013

Ans. (b) : Given that, $\mu_{obs.} = 2.60 \times 10^{-30}$ cm

$d = 1.41Å = 1.41 \times 10^{-10}$ m

$q = 1.6 \times 10^{-19}$ C

$\therefore \quad \mu_{cal} = q \times d$

$= 1.6 \times 10^{-19} \times 1.41 \times 10^{-10}$

$= 2.256 \times 10^{-29}$ cm

$$\%\text{ Ionic Character } = \frac{\mu_{obs}}{\mu_{cal.}}\times100$$

$$=\frac{2.60\times10^{-30}}{2.25\times10^{-29}}\times100 \quad = 11.5\%$$

687. Which of the following molecules will exhibit zero dipole moment?

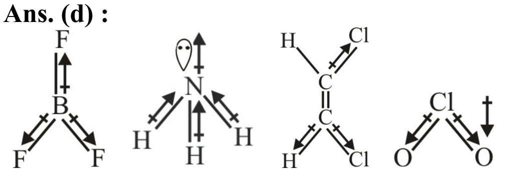
(a) CH_2Cl_2 (b) ClO_2

(c) NH_3 (d) BF_3

J & K CET-(2014)

AMU-2008

Ans. (d) :



μ=0 μ=1.47D μ≠0 μ≠0

BF_3 NH_3 cis-$C_2H_2Cl_2$ ClO_2

688. If a molecule MX_3 has zero dipole moment, the sigma bonding orbital used by M (At. no. 13) are

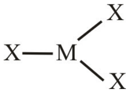
(a) pure p (b) sp- hybridised

(c) sp^2-hybridised (d) sp^3- bybridised

CG PET-2005

J & K CET-(1999)

Ans. (c) : MX_3 molecule has zero dipole moment when M is sp^2 hybridesed, the molecule has trigonal planar geometry and has zero dipole moment as the bond dipoles cancel.



689. Among the following the molecule possessing highest dipole moment is

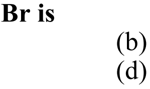
(a) CO_2 (b) BF_3

(c) SO_2 (d) Trans-2-butene

JIPMER-2014

J & K CET-2009

Ans. (c) : CO_2, BF_3 and trans-2-butene molecules having net dipole moment zero. Only SO_2 molecule possessing some net dipole moment so SO_2 molecule having highest dipole moment.



μ ≠ 0

690. The most polar bond is

(a) O–F (b) N–Cl

(c) N–F (d) N–N

UP CPMT-2002

NEET-1992

Ans. (c) : Polarity of bond depend on the difference between the electronegativity of two bonded atom. Electro negativity difference increases, polarity also increases.

O – F = 3.5 – 4.0 = –0.5

N – Cl = 3.0 – 3.0 = 0

N – N = 0

N – F = 3 – 4 = –1

So, N–F bond will be more polar.

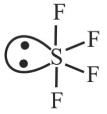
691. Which of the following is a polar molecule?

(a) SiF_4 (b) XeF_4

(c) BF_3 (d) SF_4

NEET-2013, 2005

Ans. (d) : SF_4 molecules having some resultant dipole moment due to their distorted geometry. Therefore SF_4 is polar molecule. But in SiF_4, XeF_4 and BF_3 molecule net dipole moment is zero. So, it is non-polar molecules.



μ ≠ 0

692. The dipole moment of HBr is 1.6×10^{-30} cm and inter atomic spacing is 1 Å. The % ionic character of HBr is

(a) 7 (b) 10

(c) 25 (d) 27

UPTU/UPSEE-2013

JCECE-2008

Ans. (b) : $\mu_{obs} = 1.6 \times 10^{-30}$ cm

Bond length (d) = 1 Å = 1×10^{-10}m

Charge (q) = 1.6×10^{-19} C

$\mu_{cal.} = q \times d = 1.6 \times 10^{-19} \times 1 \times 10^{-10}$ cm

$= 1.6 \times 10^{-29}$ cm

$$\%\text{ Ionic character } = \frac{\mu_{obs}}{\mu_{cal}}\times100$$

$$=\frac{1.6\times10^{-30}}{1.6\times10^{-29}}\times100$$

= 10 %

693. A covalent molecule X - Y is found to have a dipole moment of 1.5×10^{-29} C.m and a bond length of 150 pm. the percent ionic character of the bond will be________

(a) 50% (b) 62.5%

(c) 75% (d) 80%

AP EAPCET 20.08.2021 Shift-II

@apna_pdf

Ans. (b): Given that

$$\mu_{obs} = 1.5\times10^{-29}\ \text{C.m}$$
$$d = 150 \times 10^{-12}\ \text{m}$$
$$q = 1.6 \times 10^{-9}\text{c}$$
$$\therefore\ \mu_{cal.} = q \times d$$
$$= 1.6 \times 10^{-9} \times 150 \times 10^{-12}$$
$$= 1.6 \times 10^{-9} \times 10^{-29}$$
$$= 2.4 \times 10^{-29}\ \text{c.m}$$

$$\%\ \text{Ionic character} = \frac{\mu_{obs.}}{\mu_{cal.}}\times100$$
$$= \frac{1\cdot5\times10^{-29}}{2.4\times10^{-29}}\times100$$
$$= \frac{1\cdot5\times100}{2.4}$$
$$= 62.5\%$$

694. Match the following

List-I **Molecule**	**List-II** **Dipole moment (D)**	
(A) HBr	**(I)**	**1.04**
(B) H_2S	**(II)**	**0**
(C) NH_3	**(III)**	**0.79**
(D) $CHCl_3$	**(IV)**	**0.95**
	(V)	**1.47**

The correct match is

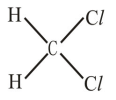
	A	B	C	D
(a)	I	V	IV	III
(b)	III	IV	V	I
(c)	I	V	II	IV
(d)	IV	V	I	III

TS-EAMCET (Engg.), 07.08.2021 Shift-II

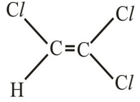
Ans. (b) :

Molecule	**Dipole moment (D)**
HBr	0.79
H_2S	0.95
NH_3	1.47
$CHCl_3$	1.04

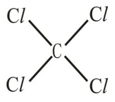
695. Which compound among the following will have a permanent dipole moment?



(i)



(ii)



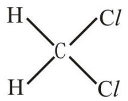
(iii)

$Br-C\equiv C-Br$
(iv)

(a) (i) only
(b) (ii) only
(c) (iii) only
(d) (iv) only

AP-EAPCET-20.08.2021,Shift-I

Ans. (a) :



It has permanent dipole moment due to two chlorine atom has attached to the carbon position.

696. Which of the following molecule has the maximum dipole moment?

(a) NH_3
(b) CS_2
(c) C_2H_6
(d) NCl_3

AP-EAPCET-20.08.2021,Shift-I

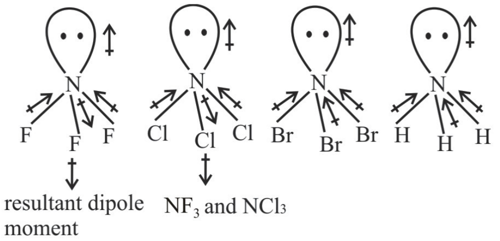
Ans. (a) : CS_2 and C_2H_6 has zero dipole moment and NH_3 is 1.06D and NCl_3 is 0.6D In NCl_3 three lone pair on chlorine atom will reduce.

697. Which of the following will have maximum dipole moment?

(a) NF_3
(b) NCl_3
(c) NBr_3
(d) NH_3

AP-EAPCET-19.08.2021, Shift-I

Ans. (b) :

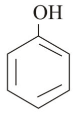


Have less dipole moment because the resultant in opposite direction. But in the case of NBr_3 and NH_3 molecule, NH_3 have more dipole moment as compare to the NBr_3 because the N–Br bond are less polar as in the N–H bond. So the NH_3 molecule have more dipole moment.

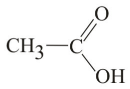
698. The compound with maximum vapour pressure at a given temperature is

(a) $CH_3-CH_2-CH_2-CH_2OH$

(b)



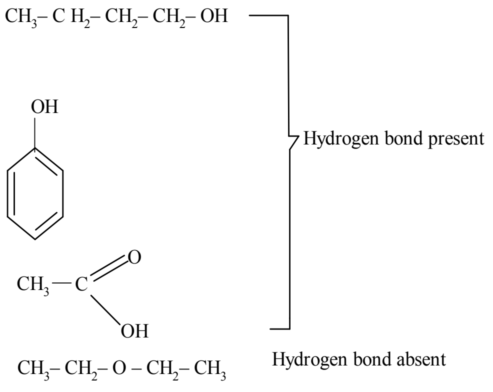
(c)



(d) $CH_3-CH_2-O-CH_2-CH_3$

TS-EAMCET-09.08.2021, Shift-I

Ans. (d) :



Due to absence of hydrogen bond (Ethoxy ethane) $CH_3–CH_2–O–CH_2–CH_3$ gives maximum vapour pressure at a given temperature.

699. The dipole-dipole interaction energy stationary polar molecules and rotating polar molecules, respectively is proportional to r is the distance between the polar molecules

@apna_pdf

(a) $r^3, \frac{1}{r^2}$ (b) $\frac{1}{r^3}, \frac{1}{r^6}$

(c) $\frac{1}{r^2}, r^2$ (d) $\frac{1}{r^2}, \frac{1}{r^4}$

TS EAMCET 05.08.2021, Shift-I

Ans. (b) : Dipole-dipole interaction energy between polar molecules in solids depends on the distance between them as per following relation.

Dipole-dipole interaction energy $\propto \frac{1}{r^3}$

and that between rotating polar molecules $\propto \frac{1}{r^6}$.

Where r is the distance between polar molecules.

700. One Debye is equal to how many coulomb meter?

(a) 3.33×10^{-30} (b) 2.22×10^{-20}

(c) 1.11×10^{-10} (d) 4.44×10^{-24}

TS EAMCET 05.08.2021, Shift-I

Ans. (a) : Debye was defined as the dipole moment resulting from two charges of opposite sign but an equal magnitude.

1 debye = 3.33×10^{-30} Coulomb meter.

1 debye = 10^{-18} esu-cm.

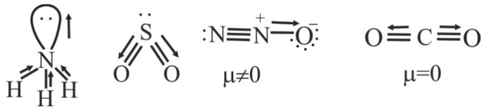
701. Which compound among the following has the highest dipole moment?

(a) NH_3 (b) SO_2

(c) N_2O (d) CO_2

AP-EAPCET-19.08.2021, Shift-II

Ans. (b) :



Two oxygen are more electronegative than a single nitrogen and also S–O bond is longer than N–H bond, through the dipole moment of S–O is more than N–H despite the lone pair on S.

702. The dipole moments of CCl_4, $CHCl_3$ and CH_4 are in the order

(a) $CCl_4 < CH_4 < CHCl_3$

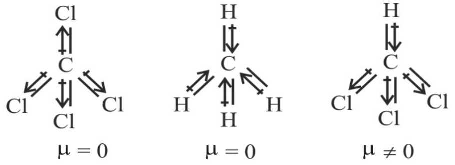
(b) $CH_4 < CCl_4 < CHCl_3$

(c) $CH_4 = CCl_4 < CHCl_3$

(d) $CHCl_3 < CH_4 = CCl_4$

(JEE Main 2020, 7 Jan. Shift-I)

Ans. (c) : All the three compounds possess a tetrahedral geometry. But in case of CCl_4 and CH_4, identical atoms are present around carbon. Therefore, CCl_4 and CH_4 having zero dipole moment.



In case of $CHCl_3$ different atoms are present around carbon and the sum of dipole moment is greater than zero. So, the correct order is

$CH_4 = CCl_4 < CHCl_3$

703. Which of the following set of molecules will have zero dipole moment?

(a) Ammonia beryllium difluoride, water, 1, 4-dischlorobenzene

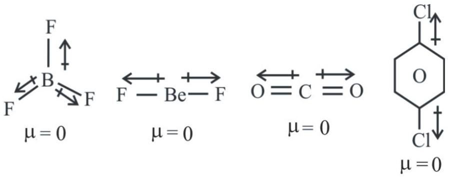
(b) Boom trifluoride, hydrogen fluoride carbon dioxide, 1, 3-dichlorobenzene

(c) Nitrogen trifluoride, beryllium difluoride, water, 1, 3-dichlorobenzene

(d) Boron trifluoride, beryllium difluoride, carbon dioxide, 1, 4-dichlorobenzene

NEET-2020

Ans. (d) : Boron trifluoride (BF_3), Beryllium difluoride (BeF_2), carbon dioxide (CO_2), 1, 4-dichlorobenzene molecules having symmetric geometry Therefore, its resultant dipole moment is zero,



704. Assertion: 1- Butene has less dipole moment than 1-butyne.

Reason: 1-Butyne has more s-character.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.

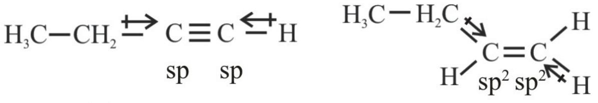
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Evening)

Ans. (a):



1- Butyne 1-Butene

1-butyne has sp hybridized and more electronegative than double bonded carbon (sp^2) in 1-butene. So, 1-butyne has 50% s-character which is greater than 1-butene having 33% s-character. Therefore, 1-butyne has more dipole moment than 1-butene because 1-butyne has more % s-character.

705. The dipole moment of which of the following molecule is greater than zero?

(a) CCl_4 (b) BF_3

(c) CO_2 (d) NH_3

Assam CEE-2018

Ans. (d) : In NH_3, the net dipole moment is non zero because of Pyramidal shape.

Option (a), (b) & (c) is having not dipole moment zero.

706. Among the following the molecule with the highest dipole moment is–

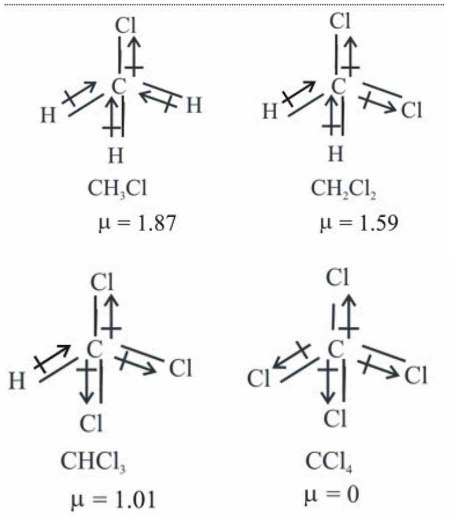
(a) CH_3Cl (b) CH_2Cl_2

(c) $CHCl_3$ (d) CCl_4

BCECE-2018

@apna_pdf

Ans. (a) : CH_3Cl molecule has highest dipole moment because the resultant in same direction.



707. In terms of polar character which one of the following orders is correct?

(a) $H_2S < NH_3 < H_2O < HF$
(b) $H_2O < NH_3 < H_2S < HF$
(c) $HF < H_2O < NH_3 < H_2S$
(d) $NH_3 < H_2O < HF < H_2S$

UPTU/UPSEE-2017

Ans. (a) : As we know that more be the electro negativity difference, more be the polar character, thus correct order is– $H_2S < NH_3 < H_2O < HF$

708. Among the following, the molecule that will have the highest dipole moment is

(a) H_2 (b) HI
(c) HBr (d) HCl
(e) HF

Kerala-CEE-2017

Ans. (e) : Dipole moment is a measure of bond polarity which is turn affected by the electronegativity of atoms in the chemical bond. Greater the electronegativity of atom higher will be the dipole moment.

H – F molecule having highest dipole moment due to high bond polarity in H – F bond.

709. Dipole-dipole interaction energy between polar molecules in solids depends on the radius of the molecule (r) and it is directly proportional to

(a) $(1/r^2)$ (b) $(1/r^6)$
(c) $(1/r)$ (d) $(1/r^5)$
(e) $(1/r^3)$

Kerala-CEE-2016

Ans. (e) : Dipole - dipole interaction energy between polar molecules in solid is directly proportional to $1/r^3$

710. Which of the following compounds has zero dipole moment?

(a) CH_2Cl_2 (b) NH_3
(c) CH_4 (d) PH_3

Manipal-2016

Ans. (c) : Molecules with regular geometry having zero dipole moment therefore, CH_4 molecule has regular tetrahedral geometry and having zero net dipole moment.

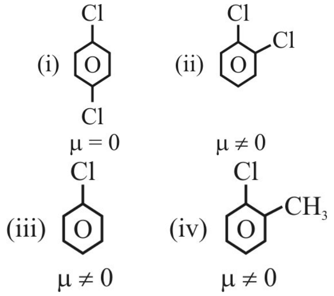
But in case of CH_2Cl_2, NH_3 and PH_3 molecules their geometries are distorted therefore, it have same dipole moment.

711. Which of the following compounds has zero dipole moment?

(a) 1, 4-dichlorobenzene
(b) 1, 2-dichlorobenzene
(c) 1, 3-dichlorobenzene
(d) 1-chloro-2-methyl benzene

AP-EAMCET (Engg.) 2015

Ans. (a) : Dipole moment is defined as the measure of polarity of a chemical bond between two atoms in a molecules i.e. separation of two opposite electrical charges.



712. Pick up the incorrect statement.

(a) Dipole moment of ammonia is due to orbital dipole and resultant dipole in orbital dipole and resultant dipole in the same direction.
(b) In BF_3 bond dipoles are higher but dipole moment is zero.
(c) Dipole moment is a vector quantity.
(d) O_2, H_2 show bond dipole due to polarisation.

COMEDK-2014

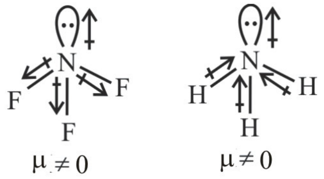
Ans. (d) : O_2, H_2 do not show bond dipole as they are homoatomic molecules hence, are non-polar.

713. Which of the following molecules has the maximum dipole moment?

(a) CO_2 (b) CH_4
(c) NH_3 (d) NF_3

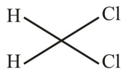
NEET-2014

Ans. (c) : CO_2 and CH_4 molecules have zero net dipole moment. NH_3 and NF_3 have some net dipole moment. But in case of NF_3 molecule having less dipole moment because the resultant in opposite direction, while NH_3 have more dipole moment because the resultant in same direction. So, NH_3 molecule has maximum dipole moment.

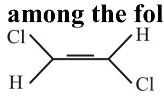


@apna_pdf

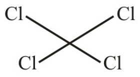
714. The compound that will have a permanent dipole moment among the following is



I



II



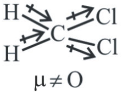
III

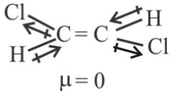
IV

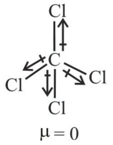
(a) I (b) II
(c) III (d) IV

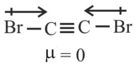
WB-JEE-2014

Ans. (a) : Compounds with asymmetry geometries having some resultant dipole moment. Therefore, CH_2Cl_2 molecule possess some permanent dipole moment.









715. Which of the following will have maximum dipole moment?

(a) NF_3 (b) NH_3
(c) CH_4 (d) PCl_3

J & K CET-2013

Ans. (b) : NH_3 molecule will have maximum dipole moment because in case of NH_3, H is less electronegative than N and hence dipole moment of each N–H bond is towards N and create high net dipole moment. But in NF_3 and PCl_3 molecule resultant dipole moment opposes. So both molecule having less dipole moment.

716. The dipole moment of diatomic molecules AB and CD are 10.41 and 10.27 Debye respectively while there bond distances are 2.82Å and 2.67Å respectively then

(a) bonding is nearly covalent in both the molecules
(b) bonding is 100% ionic in both the molecules
(c) AB has more ionic character than CD
(d) AB has lesser ionic bond character than CD

UP CPMT-2013

Ans. (d) : Dipole moment (μ) = q × d

or $q = \frac{\mu}{d}$

$\therefore$ Magnitude of charge on AB (q_{AB}) $= \frac{\mu_{AB}}{d_{AB}}$

$$= \frac{10.41}{2.82} = 3.69\,\text{esu}$$

and magnitude of charge on CD (q_{CD}) $= \frac{\mu_{CD}}{d_{CD}}$

$$= \frac{10.21}{2.67} = 3.84\,\text{esu}$$

As magnitude of charge is more on CD molecule than that of AB molecule, thus it has more ionic than AB.

717. Which bond would be expected to have the positive end of the bond dipole on the nitrogen atom ?

(a) N–H (b) C–N
(c) Al–N (d) N–O

SCRA-2012

Ans. (d) : The given species are N–H, C–N, Al–N, and N–O are–

$$\begin{array}{cccc} \delta^- \leftarrow +\delta^+ & \delta^+ + \rightarrow \delta^- & \delta^+ + \rightarrow \delta^- & \delta^+ + \rightarrow \delta^- \\ N - H & C - N & Al - N & N - O \end{array}$$

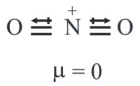
In the N–O species, the polarity of bond towards the oxygen atom and the nitrogen get positive charge.

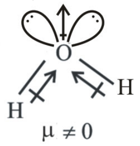
718. which one of the following molecules has zero dipole moment?

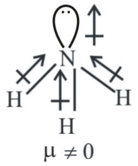
(a) NO_2^+ (b) H_2O
(c) NH_3 (d) CO

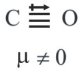
CG PET- 2011

Ans. (a) : NO_2^+ molecule having zero dipole moment because it have symmetric geometry.







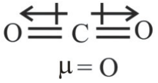


719. Among the following which one is a linear molecule having zero dipole moment?

(a) H_2O (b) HCl
(c) CO_2 (d) H_2S

J & K CET-2011

Ans. (c) : CO_2 is a linear molecule having zero dipole moment. CO_2 is sp - hybridesed so, it has linear geometry. Net resultant dipole moment is zero because CO_2 is symmetric molecule.

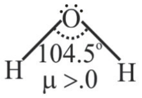


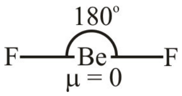
720. H_2O is dipolar whereas, BeF_2 is not. It is because

(a) The electronegativity of F is greater than that of O
(b) H_2O involves hydrogen bonding whereas BeF_2 is a discrete molecule
(c) H_2O is linear and BeF_2 is angular
(d) H_2O is angular and BeF_2 is linear

UP CPMT-2011

Ans. (d) : The structure of H_2O is angular of V-shape as it is sp^3-hybridised with bond angle 105°. Its dipole moment is positive or more than zero. But in BeF_2 structure is linear due to sp-hybridisation (μ = 0). Hence, due to μ > 0, H_2O is dipolar and due to μ = 0, BeF_2 is non-polar.





@apna_pdf

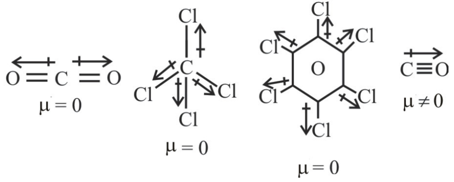
721. Consider(i) CO_2, (ii) CCl_4, (iii) C_6Cl_6 and (iv) CO and tell which of the following statements is correct?

(a) (i), (ii) and (iii) only have zero dipole moment
(b) (i), (ii) and (iv) only have zero dipole moment
(c) only (iv) has zero dipole moment
(d) All have zero dipole moment

UPTU/UPSEE-2011

Ans. (a) : CO_2, CCl_4 and $C_6 Cl_6$ molecules have regular geometry. Therefore, these molecule have zero dipole moment.

But in case of CO molecule, oxygen is more electronegative than carbon due to this bond polarity generate in C – O bond and CO molecule having non-zero dipole moment.



722. Consider the following compounds:
1. $CHCl_3$
2. CH_3Cl
3. NH_3
What is the correct order of the dipole moment of the above compounds?

(a) 1 > 3 > 2
(b) 2 > 1 > 3
(c) 2 > 3 > 1
(d) 3 > 2 > 1

SCRA-2010

Ans. (d) : In $CHCl_3$, CH_3Cl and NH_3, has higher dipole moment because all the vectors are added up to give large dipole moment. In case of $CHCl_3$ and CH_3Cl has higher dipole moment. So, order will be

$NH_3 > CH_3Cl > CHCl_3$

723. Which one of the following molecules has zero dipole moment?

(a) NO_2^+
(b) H_2O
(c) NH_3
(d) CO

SCRA-2010

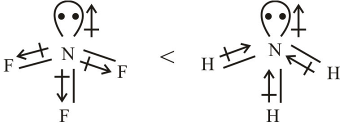
Ans. (a) : All the three molecules CO, H_2O and NH_3 have dipole moment due to individual bond dipoles doesn't cancel each other. But in the case of NO_2^+ as the individual bond dipole cancel each other which results in zero net dipole moment.

724. Which of the following molecule has highest dipole moment?

(a) B_2H_6
(b) NF_3
(c) NH_3
(d) BF_3

AIIMS-2010

Ans. (c): In case of BF_3 and B_2H_6 molecule have zero dipole moment due to their symmetric geometry. NF_3 molecule has less dipole moment than NH_3 because the resultant in opposite direction.



(dipole moment)

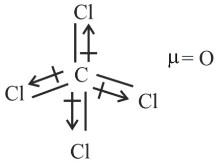
So, NH_3 has highest dipole moment.

725. Identify the molecule that has Zero dipole moment.

(a) CH_3Cl
(b) $CHCl_3$
(c) CH_2Cl_2
(d) CCl_4

J & K CET-2010

Ans. (d) : CCl_4 molecule has zero dipole moment due to the symmetric geometry i.e., all chlorine atoms around carbon are identical.



726. The molecule which has zero dipole moment is

(a) CH_3Cl
(b) NF_3
(c) BF_3
(d) ClO_2

JCECE-2010

Ans. (c) : The molecules having distorted geometry have dipole moment and those having regular geometry have zero dipole moment.

∵ NH_3, CH_3Cl and ClO_2 have distorted geometry.

∴ They have dipole moment.

∵ BF_3 has regular triangular planar geometry.

The dipole moment of BF_3 is zero.

727. The bond length of HCl bond is 2.29×10^{-10}m. The percentage ionic character of HCl, if measured dipole moment is 6.226×10^{-30}C-m, is

(a) 8%
(b) 20%
(c) 17%
(d) 50%

JIPMER-2010

Ans. (c): Given that, $\mu_{obs} = 6.226 \times 10^{-30}$ C-m
Bond length (d) = 2.29×10^{-10} m
Electric charge (q) = 1.6×10^{-19} C

$$\therefore \mu_{cal.} = q \times d$$
$$= 1.6 \times 10^{-19} \times 2.29 \times 10^{-10} \text{ C-m}$$
$$= 3.664 \times 10^{-29} \text{ C-m}$$

$$\% \text{ Ionic character} = \frac{\mu_{obs}}{\mu_{cal}} \times 100$$

$$= \frac{6.226\times10^{-30}}{3.664\times10^{-29}} \times 100$$

$$= 16.99\% \approx 17\%$$

728. A netural molecule XF_3 has a zero dipole moment. The element X is most likely

(a) chlorine
(b) boron
(c) nitrogen
(d) carbon
(e) bromine

Kerala-CEE-2010

Ans. (b) : The element X is most likely be Boron in XF_3 neutral molecule. The molecule BF_3 has regular triangular planar geometry therefore, its dipole moment is zero.

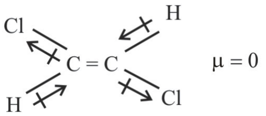
729. Which of the following has zero dipole moment?

(a) 1, 1-dichloromethane
(b) cis-1, 2-dichloroethene
(c) trans-1, 2-dichloroethene
(d) 1-chloroethane

[BITSAT- 2009]

@apna_pdf

Ans. (c) : Trans - 1, 2 - dichloro ethene has zero dipole moment because the resultant dipole moment opposes each other.



730. If H–X bond length is 2.00 Å and H–X bond has dipole moment 5.12×10^{-30} C-m, the percentage of ionic character in the molecule will be

(a) 10% (b) 16%
(c) 18% (d) 20%

CG PET-2009

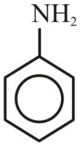
Ans. (b) : Given that, Dipole moment $=5.12\times10^{-30}$ cm
Bond length (ℓ) = 2.00 Å = 2×10^{-10} m
Change (q) = 1.6×10^{-19} C

$$\mu_{cal.} = q\times\ell = 1.6\times10^{-19}\times2\times10^{-10}\text{ C-m}$$
$$= 3.2\times10^{-29}\text{ C-m}$$

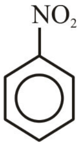
$$\%\text{ Ionic character} = \frac{\mu_{obs}}{\mu_{cal}}\times100$$
$$= \frac{5.12\times10^{-30}}{3.2\times10^{-29}}\times100$$
$$= 16\%$$

731. Which of the following will have large dipole moment?

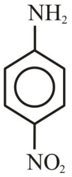
(a)



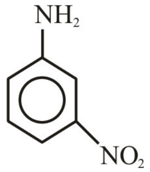
(b)



(c)

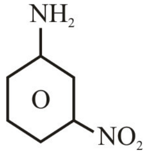


(d)

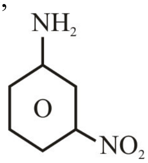


UPTU/UPSEE-2009

Ans. (d) :



is unsymmetric molecule. usually unsymmetrical molecules have higher dipole moment than symmetrical molecules. Therefore,



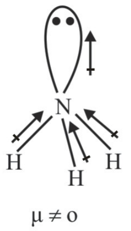
molecule have large dipole moment.

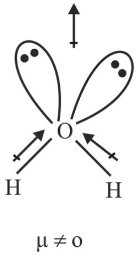
732. The correct order of dipole moment for NH_3, H_2O and CO_2 molecules is

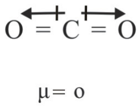
(a) $NH_3 > H_2O > CO_2$ (b) $CO_2 > NH_3 > H_2O$
(c) $H_2O > CO_2 > NH_3$ (d) $H_2O > NH_3 > CO_2$

AP-EAMCET (Medical), 2008

Ans. (d) : The given species are the NH_3, H_2O and CO_2







As we know that oxygen has more electronegative power than nitrogen due to which more polarity present in O-H bond. Oxygen has two lone pair of oxygen is also increase the overall polarity. Thus H_2O has more dipole moment than NH_3.

733. Which one of the following is a non polar molecule?

(a) CCl_4 (b) $CHCl_3$
(c) CH_2Cl_2 (d) CH_3Cl

J & K CET-2008

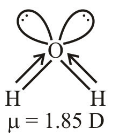
Ans. (a) : CCl_4 is a non-polar molecule because net dipole moment is zero. This is due to the symmetric geometry of CCl_4 molecule.

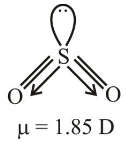
734. In which of the following pairs, both molecules possess dipole moment?

(a) CO_2, SO_2 (b) BCl_3, PCl_3
(c) H_2O, SO_2 (d) CO_2, CS_2

UP CPMT-2008

Ans. (c): H_2O and SO_2 both possess dipole moment due to bent structure.





735. The molecule having zero dipole moment is

(a) CH_2Cl_2 (b) BF_3
(c) NF_3 (d) ClF_3

UPTU/UPSEE-2008

Ans. (b) : Molecules having distorted geometry have dipole moment and those having regular geometry have zero dipole moment.

NF_3, CH_2Cl_2 and ClF_3 have distorted geometry So, they have dipole moment.

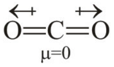
But BF_3 has regular triangular planar geometry. Therefore, it having zero dipole moment.

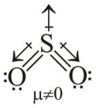
736. In which of the following pairs, both molecules possess dipole moment ?

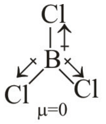
(a) CO_2, SO_2 (b) BCl_3, PCl_3
(c) H_2O, SO_2 (d) CO_2, CS_2

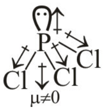
AP-EAMCET (Medical) - 2007

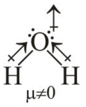
Ans. (c) : The species are given as : CO_2, SO_2, BCl_3, PCl_3, H_2O











Hence, the pair of SO_2 and H_2O having the dipole moment.

@apna_pdf

737. Which of the following hydrocarbons has the lowest dipole moment?

(a) 
(b) $CH_3C\equiv CCH_3$

(c) $CH_3CH_2C\equiv CH$

(d) $CH_2=CH-C\equiv CH$

BITSAT-2007

Ans. (b) : $H_3C-C\equiv C-CH_3$ symmetrical and linear. Hence, dipole moment = 0.

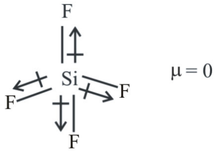
738. Which of the following has zero dipole moment?

(a) ClF (b) PCl_3

(c) SiF_4 (d) $CFCl_3$

CG PET-2006

Ans. (c) : : SiF_4 molecule has zero dipole moment due to its regular tetrahedral geometry and symmetric So, dipole moment get cancelled.



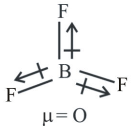
739. Zero dipole moment is possessed by

(a) PCl_3 (b) BF_3

(c) ClF_3 (d) NH_3

J & K CET-2006

Ans. (b) : BF_3 molecule has zero dipole moment because in BF_3 resultant dipole moment opposes and cancelled out.



740. Consider the following halogen containing compounds:

(A) $CHCl_3$ **(B) CCl_4**

(C) CH_2Cl_2 **(D) CH_3Cl**

(E) 
The compounds with a net zero dipole moment are:

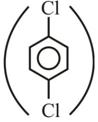
(a) B and E only (b) C only

(c) C and D only (d) A and D only

(e) A and D only

Kerala-CEE-2006

Ans. (a) : CCl_4 and 1, 4 dichlorobenzene



have symmetrical geometry so, its net dipole moment is zero. But is case of $CHCl_3$, CH_3Cl and CH_2Cl_2 molecule having non-zero dipole moment due to their distorted geometry.

741. The molecule which does not exhibit dipole moment is:

(a) NH_3 (b) $CHCl_3$

(c) H_2O (d) CCl_4

UPTU/UPSEE-2006

Ans. (d) : CCl_4 molecule does not exhibit dipole moment due to symmetric tetrahedral geometry. While NH_3, $CHCl_3$ and H_2O molecules have distorted geometry therefore they possess some dipole moment.

742. Assertion (A) : The spin only magnetic moment of Sc^{3+} is 1.73 BM.

Reason (R) : The spin only magnetic moment (in BM) of an ion is equal to $\sqrt{n(n+2)}$, where n is the number of unpaired electrons present in the ion.

The correct answer is:

(a) both (A) and (R) are true and (R) is the correct explanation of (A)

(b) both (A) and (R) are true and (R) is not the correct explanation of

(c) (A) is true but (R) is not true

(d) (A) is not true but (R) is true

AP-EAMCET (Engg.)-2005

Ans. (d) : The given metal is Sc^{3+}.

Electronic configuration of Sc = [Ar], $3d^1$, $4s^2$

For Sc^{3+} = [Ar], 3d°, 4s°

Number of unpaired electron = 0

$$\therefore \quad \mu_s=\sqrt{n(n+2)}$$

$$\mu_s=\sqrt{0(0+2)}$$

$$\mu_s=0$$

The formula for spin only magnetic moment is $\sqrt{n(n+2)}$, where n is the number of unpaired electron.

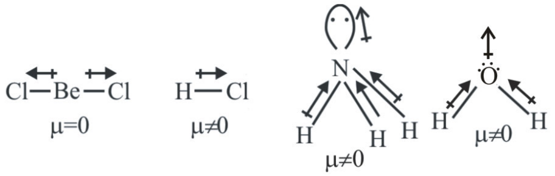
743. Which of the following molecules has zero dipole moment?

(a) $BeCl_2$ (b) HCl

(c) NH_3 (d) H_2O

AP-EAMCET (Engg.)-2005

Ans. (a) : The species are given as : $BeCl_2$, HCl, NH_3 and H_2O.



Hence, $BeCl_2$ has zero dipole moment.

744. If the molecule of HCl were totally polar, the expected value of dipole moment is 6.12D (debye), but the experimental value of dipole moment was 1.03D. Calculate the percentage ionic character:

(a) 17 (b) 83

(c) 50 (d) zero

(d) 90

Kerala-CEE-2005

@apna_pdf

Ans. (a) : % Ionic character = $\frac{\mu_{\text{experimental}}}{\mu_{\text{ expected}}} \times 100$

% Ionic character = $\frac{1.03}{6.12} \times 100$

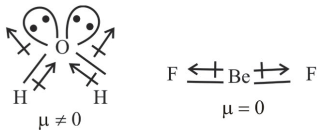
= 16.83% ≈17%

745. H_2O is dipolar, whereas BeF_2 is not. It is because

(a) the electronegativity of F is greater than that of O
(b) H_2O involves hydrogen bonding whereas BeF_2 is a discrete molecule
(c) H_2O is linear and BeF_2 is angular
(d) H_2O is angular and BeF_2 is linear

NEET-2004

Ans. (d) :



H_2O has angular shape therefore its resultant dipole moment is greater than zero. H_2O is dipolar molecule, but BeF_2 molecule has linear shape therefore, its resultant dipole moment zero. So BeF_2 is non-polar molecule.

746. Which of the following are arranged in the decreasing order of dipole moment?

(a) CH_3C1,CH_3Br,CH_3F
(b) CH_3C1,CH_3F,CH_3Br
(c) CH_3Br,CH_3C1,CH_3F
(d) CH_3 Br, CH_3F,CH_3C1

AIIMS-2003

Ans. (b): : Dipole moment = Charge × Bond length

$\xrightarrow{\text{C–F} \qquad \text{C–Cl} \qquad \text{C–Br}}$

On moving left to right bond length increases while charge density decreases. Therefore, decreasing order of dipole moment.

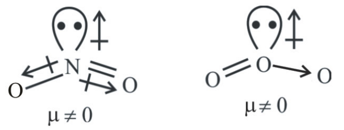
$CH_3Cl > CH_3F > CH_3Br$

747. Which one of the following pairs of molecules will have permanent dipole moments for both members?

(a) SiF_4 and NO_2
(b) NO_2 and CO_2
(c) NO_2 and O_3
(d) SiF_4 and CO_2

AIEEE-2003

Ans. (c) : NO_2 and O_3 molecule will have permanent dipole moment because both the molecule having some resultant non-zero dipole moment.

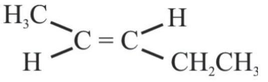


748. The only molecule having dipole moment is

(a) 2,2-dimethylpropane
(b) trans-2-pentene
(c) trans-3-hexene
(d) 2,2,3,3-tetramethylbutane

J & K CET-2003

Ans. (b) : 2, 2 - dimethylpropane, trans-3-hexene and 2, 2,3,3 - tetramethylbutane molecules having zero dipole moment because of their symmetric geometry but trans - 2 - pentene is non symmetric geometry and having some net dipole moment.



μ ≠ 0

749. In which of the following, the dipole moment is zero?

(a) H_2O_2
(b) CO_2
(c) SO_2
(d) NH_3

JCECE-2003

Ans. (b): CO_2 molecule has zero dipole moment because both oxygen atom symmetrically present around carbon atom and form linear geometry.

μ = O

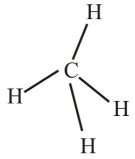
But in case of H_2O_2, SO_2 and NH_3 molecule have some dipole moment.

750. The molecule having largest dipole moment among the following is

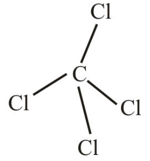
(a) CHI_3
(b) CH_4
(c) $CHCl_3$
(d) CCl_4

UP CPMT-2003

Ans. (c) : Dipole moment is a vector quantity.
Dipole moment = charge on any one atom × bond length
∵ The compounds having regular geometry and having bonds of same type have zero dipole moment.
∴ CH_4 and CCl_4 have zero dipole moment



CH_4

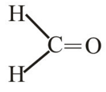


CCl_4

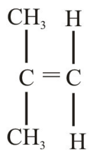
Between CHI_3 and $CHCl_3$, $CHCl_3$ will have larger dipole moment because the electro negativity difference between carbon and chlorine is more as compared to between carbon and iodine
∴$CHCl_3$ will have highest dipole moment.

751. Which of the following has the highest dipole moment?

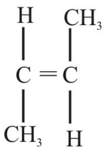
(a)



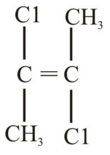
(b)



(c)



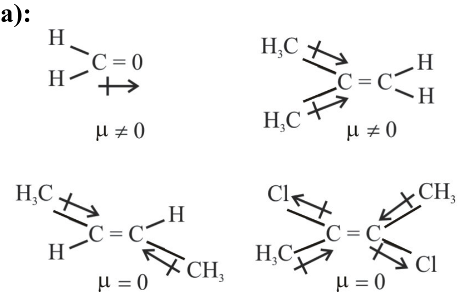
(d)



AIIMS-2002

@apna_pdf

Ans. (a):



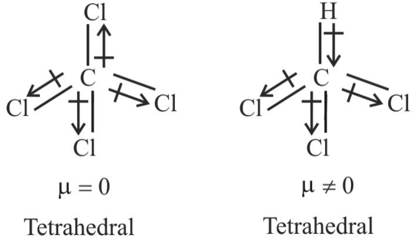
In  molecule, oxygen has more electronegative and therefore molecule having highest dipole moment.

752. CHCl$_3$ is a polar solvent while CCl$_4$ is a non-polar solvent because CCl$_4$ has

(a) linear structure
(b) symmetrical structure
(c) unsymmetrical structure
(d) square planar structure.

J & K CET-(2019)

Ans. (b) : CCl$_4$ is a non-polar solvent because CCl$_4$ has symmetrical structure, i.e., all chlorine atoms around carbon atoms are identical. But in CHCl$_3$ molecules atoms around the carbon atom is non - identical. So, CHCl$_3$ is a polar solvent.



753. Dipole-dipole interaction energy between stationary polar molecule separated by a distance 'r' is proportional to

(a) 1/r	(b) $1/r^2$
(c) $1/r^3$	(d) $1/r^6$

Assam CEE-2019

Ans. (c) : Dipole-dipole interaction energy between polar molecules in solids depends on the distance between them as per following = $\frac{1}{r^3}$

(r= radius on the molecule under consideration)

754. Which of the following possess net dipole moment?

(a) SO$_2$	(b) BF$_3$
(c) BeCl$_2$	(d) CO$_2$

Karnataka-CET-2019

Ans. (a) : Molecules having regular geometry have zero dipole moment and those having distorted geometry having dipole moment.

BF$_3$, BeCl$_2$ and CO$_2$ have regular geometry therefore having zero dipole moment.

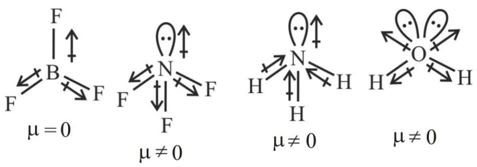
But SO$_2$ has distorted geometry therefore it possess net dipole moment.

755. Which of the following is the correct order of dipole moment?

(a) $NH_3 > BF_3 < NF_3 < H_2O$
(b) $BF_3 < NF_3 < NH_3 < H_2O$
(c) $BF_3 > NH_3 < NF_3 < H_2O$
(d) $H_2O > NF_3 < NH_3 < BF_3$

NEET-Odisha-2019

Ans. (b) : The given species are NH$_3$, NF$_3$, H$_2$O, BF$_3$



As we know that oxygen has more electronegativity than nitrogen due to which more polarity present in O – H bond. Oxygen has two lone pair also increase the overall polarity. Thus H$_2$O has more polar than NH$_3$ and NF$_3$ molecules.

In case of NH$_3$ and NF$_3$ molecules, NH$_3$ has more polar than NF$_3$ because in NH$_3$ resultant dipole moment in same direction BF$_3$ has regular triangular planar geometry. So, it has zero dipole moment. Then the correct orders of dipole moment is :-

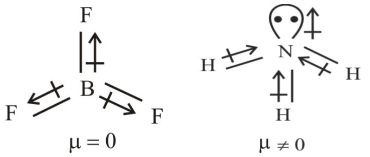
$BF_3 < NF_3 < NH_3 < H_2O$

756. Which have correct order of dipole moment:

(a) $SO_2 > H_2O$	(b) $NF_3 > NH_3$
(c) $BF_3 < NH_3$	(d) $SO_2 < SO_3$

AIIMS-27.05.2018 (M)

Ans. (c):



In case of BF$_3$ atoms around the 'B' atom are similar so BF$_3$ molecule has zero dipole moment but in NH$_3$ molecule, atoms around 'N' atom is non-identical and has highest dipole moment than BF$_3$.

757. Which bond is most polar?

(a) F—F	(b) I—F
(c) Cl—F	(d) Br—F

AMU-2002

Ans. (b) : I–F has more polar bond due to the more electro negativity difference between them.

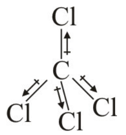
2.5 4.0
I — F
$\Delta X_{I-F} = 1.5$

758. The molecule having zero dipole moment is :

(a) CHCl$_3$	(b) H$_2$O
(c) CCl$_4$	(d) HCl

AP-EAMCET-1999

Ans. (c): Symmetric molecules having with similar electronegative are non polar i.e. have zero dipole moment whereas, CHCl$_3$, H$_2$O and HCl are polar molecule.



@apna_pdf

759. Which of the following molecules has the highest dipole moment?
(a) CO_2 (b) NF_3
(c) BCl_3 (d) CCl_4

AP-EAMCET-1995

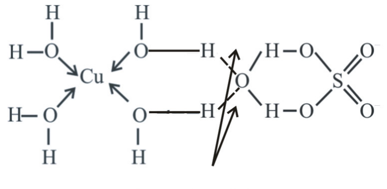
Ans. (b): In CO_2, BCl_3, CCl_4 all the molecule have zero dipole moment due to their symmetric geometry but NF_3 is non symmetric geometry and highest dipole moment.

7. Hydrogen Bonding

760. How many hydrogen bonded water molecules are present in $CuSO_4 \cdot 5H_2O$?
(a) 5 (b) 4
(c) 1 (d) 0

TS EAMCET 05.08.2021, Shift-I
NEET-Odisha 2019
SCRA-2015
AMU-2014
JIPMER-2013

Ans. (c): In $CuSO_4.5H_2O$ four water molecule are co-ordinated to Cu^{2+} and one is hydrogen bonded with SO_4^{2-}



Hydrogen bonded

761. Which of the following hydrogen bond is the strongest?
(a) $O-H\cdots N$ (b) $F-H\cdots F$
(c) $O-H\cdots O$ (d) $O-H\cdots F$

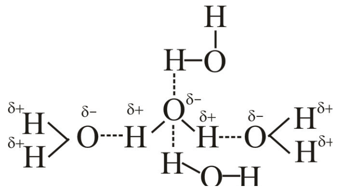
WB-JEE-2018, JCECE - 2009
AIIMS-1997

Ans. (b) : Strength of hydrogen bonding depends upon the electronegativity of elements. Therefore, F–H ---F show strongest hydrogen bond because fluorine is most electronegative atom.

762. The maximum number of hydrogen bonds that a molecule of water can have is
(a) 1 (b) 2
(c) 3 (d) 4

AP EAMCET (Engg.) 21.09.2020, Shift-I
Karnataka-CET, 2008
JCECE - 2006

Ans. (d) : One water molecule is joined to four water molecules – two with H-atoms and other two with O-atoms. Thus, the maximum number of hydrogen bonds that a molecule of water can have is four as shown below:



763. Strongest hydrogen bond is shown by
(a) water (b) ammonia
(c) hydrogen fluoride (d) hydrogen sulphide

NEET-1992, 1990

Ans. (c) : Strength of hydrogen bonding is depends on the electronegativity of atom. Higher the electro negativity , stronger the hydrogen bonding.
Since, fluorine is more electronegative atom and it forms stronger hydrogen bond.

764. The high boiling point of water is due to which reason?
(a) Coordinate bonding
(b) Covalent bond
(c) Electrostatic force of attraction
(d) Hydrogen bonding

UP CPMT-2003, AIIMS-1996

Ans. (d) : High boiling point of water is due to hydrogen bonding.
The compounds having oxygen or fluorine or nitrogen along with hydrogen forms hydrogen bond. Since they have strong forces of attraction, more heat is required to break them while we boil these liquids. So, they have high boiling point.

765. The dominant intermolecular force that must be overcome to convert liquid methanol to its vapour is__________.
(a) Covalent Bonds
(b) Dipole-Dipole Interactions
(c) Hydrogen Bonds
(d) Co-ordinate Bonds

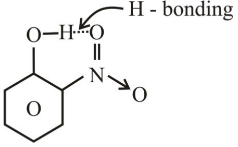
AP-EAMCET 25-08-2021 Shift-I
NEET-2009

Ans. (c) : In CH_3OH (methanol), intermolecular hydrogen bonding are found. Thus, H-bonding play an role overcome in converting liquid methanol to vapour.

766. Intra-molecular hydrogen bonding is found in
(a) o-nitrophenol (b) m-nitrophenol
(c) p-nitrophenol (d) phenol

AMU-2015, Kerala-CEE-2011

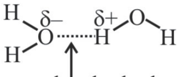
Ans. (a) : Intra-molecular hydrogen bonding is found in o-nitro phenol. For intra-molecular hydrogen bonding the two groups are close enough to each other and for five or six membered rings.



767. Inter-molecular hydrogen bonding exists in
(a) o-nitrophenol (b) o-chlorophenol
(c) water (d) ammonium chloride

UPTU/UPSEE-2015
J & K CET-(2007)

Ans. (c) : Intermolecular hydrogen-bonding takes place between H atom and electronegative element present in the different molecules of some substance.



intermolecular hydrogen bonding in water

@apna_pdf

768. Given below are two statements: one is labelled as Assertion A and the other is labelled as Reason R.

Assertion A: Dipole-dipole interactions are the only non-covalent interactions, resulting in hydrogen bond formation.

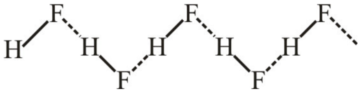
Reason R: Fluorine is the most electronegative element and hydrogen bonds in HF are symmetrical.

In the light of the above statements, choose the most appropriate answer from the options given below:

(a) Both A and R are true and R is the correct explanation of A
(b) Both A and R are true but R is NOT the correct explanation of A
(c) A is true but R is false
(d) A is false but R is true

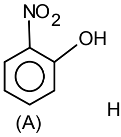
JEE Main 26.02.2021, Shift-I

Ans. (d) : In hydrogen bonding, Dipole-dipole interactions are non covalent but ion-dipole interaction can also result in H-bond formation. F is most electro negative element & structure is

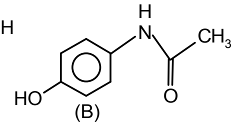


Symmetrical H-bonds are Present
Hence, Assertion is false and reason is true.

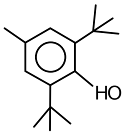
769. The compound/s which will show significant intermolecular H-bonding is/are



(A)



(B)

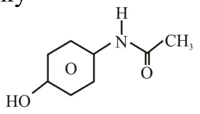


(C)

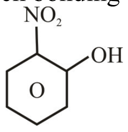
(a) (B) only (b) (C) only
(c) (A) and (B) (d) (A), (B) and (C)

(JEE Main 2021, 27 Aug. Shift-II)

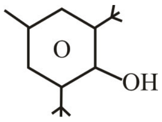
Ans. (a) : Only



will show intermolecular hydrogen bonding while



compound will show intramolecular hydrogen bonding and compound



does not show hydrogen bonding because of steric hindrance due to presence of bulkier group.

770. Which of the following is an incorrect statement?

(a) Hydrogen bonding is stronger than dispersion forces
(b) Sigma bonds are stronger than π-bonds
(c) Ionic bonding is non-directional
(d) σ-electrons are referred to as mobile electrons

Kerala-CEE-29.08.2021

Ans. (d) : (A) Hydrogen bonds are powerful force in determining the structure and properties of many compounds.

(B) Sigma bonds are formed by the head to head overlapping between two orbital whereas pi-bonds are formed by the lateral overlapping due to which sigma bond is stronger bond than pi-bond. Hence, the statement is true.

(C) This statement is true because ionic bonds are formed by the transfer of electron between two atom. Thus, transfer of electron are not depends upon the direction. Hence, we can say that ionic bond are non directional.

(D) This statement is false because π-electrons are referred to as mobile electrons.

771. Hydrogen bonding is not present in

(a) glycerine (b) water
(c) hydrogen sulphide (d) hydrogen fluoride.

J & K CET-(2017)

Ans. (c) : Sulphur is less electronegative than fluorine and oxygen atoms due to which hydrogen sulphide will not shows hydrogen bonding while water, hydrogen fluoride and glycerine will shows hydrogen bonding.

772. Which of the following compounds show hydrogen bonding?

(a) HCl (b) C_2H_6
(c) RCH_2CHO (d) RCH_2NHCH_3

Manipal-2016

Ans. (d) :RCH_2NHCH_3 compound will show hydrogen bonding because hydrogen is directly attached with more electronegative atom i.e. nitrogen.

773. Which one of the following compounds shows the presence of intramolecular hydrogen bond?

(a) H_2O_2
(b) HCN
(c) Cellulose
(d) Concentrated acetic acid

NEET-II, 2016

Ans. (c) : H_2O_2, HCN and concentrated CH_3COOH form intermolecular hydrogen bonding while cellulose has intra-molecular hydrogen bonding this is due to the fact that the glucose monomers form straight chains and thus its polymeric structure crowd together showing intra-molecular hydrogen bonding.

774. The molecular interactions responsible for hydrogen bonding in HF

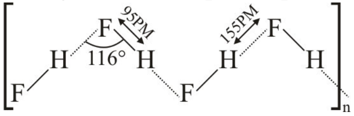
(a) ion-induced dipole (b) dipole-dipole
(c) dipole-induced dipole (d) ion-dipole

AP-EAMCET (Engg.) - 2014

Ans. (b) : A hydrogen bond is formed by a dipole-dipole force between an electronegative atom and a hydrogen atom that attaches covalently with another electronegative atom of the same molecule or of a different molecule. Only nitrogen, oxygen, and fluorine atoms can with hydrogen to form hydrogen bond.

@apna_pdf

Hence, the molecular interaction responsible for hydrogen bonding in HF are dipole-dipole interaction.

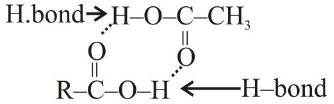


775. The pair of molecules forming strongest hydrogen bonds are

(a) HCOOH and CH_3COOH
(b) CH_3COCH_3 and $CHCl_3$
(c) H_2O and H_2
(d) SiF_6 and SiH_4

UPTU/UPSEE-2014

Ans. (a) : Formic acid (HCOOH) and acetic acid (CH_3COOH) forms strongest hydrogen bonding because they form two hydrogen bonds and having high polarity.



776. The polypeptides are obtained by assembling the peptide units by

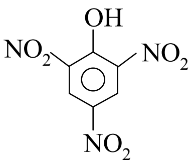
(a) ionic bond
(b) covalent bond
(c) intermolecular H-bonding
(d) covalent and H-bonding

UPTU/UPSEE-2013

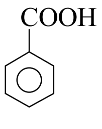
Ans. (c) : More than one polypeptide chains when assemble as a result of intermolecular hydrogen bonding between them, the polypeptide assume the secondary structure of proteins.

777. Which of the following is not soluble in sodium carbonate solution?

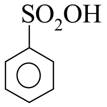
(a)



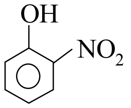
(b)



(c)

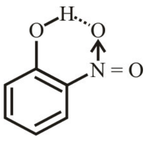


(d)



UP CPMT-2013

Ans. (d) : Picric acid (2,4,6-trinitro phenol), benzene sulphonic acid and benzoic acid are strong acids in nature and react with alkali sodium carbonate to form their salts, whereas in o-nitrophenol, —NO_2 and —OH groups are located exactly right for the formation of intramolecular hydrogen bond, therefore o-nitrophenol doesn't remove its —H atom and doesn't react with sodium carbonate solution.



Intra-molecular H-bond in o-nitrophenol

778. The hydrogen bonds are encountered in HF, H_2O, NH_3 and HF_2^-. The relative order of energies of hydrogen bonds is

(a) HF > H_2O > H_3N > HF_2^-
(b) H_2O > HF_2^- > HF > NH_3
(c) HF > HF_2^- > H_2O > NH_3
(d) HF_2^- > HF > H_2O > NH_3

AMU-2012

Ans. (d) : The strength or energy of hydrogen bonding depends upon the electronegativity of atoms.

Order of electronegativity:- F^- > F > O > N

Order of energies of hydrogen bonds is :- HF_2^- > HF > H_2O > NH_3

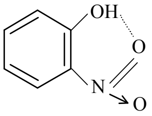
779. The vapour pressure of

 is higher than 
due to

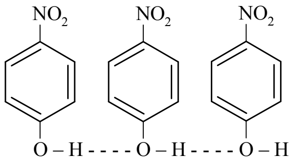
(a) Dipole moment
(b) Dipole-dipole interaction
(c) H-bonding
(d) Lattice structure

BITSAT-2012

Ans. (c) : Ortho-nitrophenol has intramolecular H-bonding



and para-nitrophenol has intermolecular H-bonding.



Hence former is more volatile than latter.

780. Hydrogen molecule differs from chlorine molecule in the following respect.

(a) Hydrogen molecule is non - polar but chlorine molecule is polar
(b) Hydrogen molecule is polar while chlorine molecule is non-polar
(c) Hydrogen molecule can form intermolecular hydrogen bond but chlorine molecule does not
(d) Hydrogen molecule cannot participate in coordinate bond formation but chlorine molecule can

JIPMER-2012

Ans. (d) : Chlorine has a lone pair of electron and vacant d-orbitals, thus they can take part in coordinate bond but hydrogen molecule does not have a lone pair of electrons so, it will not take part in the coordinate bond.

@apna_pdf

781. Among water molecules, the type of bond present between H and O is

(a) hydrogen bond (b) electrovalent bond
(c) coordinate bond (d) covalent bond

UP CPMT-2012

Ans. (a) : Oxygen atom of each H_2O molecule is covalent linked with two H-atoms of its own molecule and with another H-atom of adjacent H_2O molecules by H-bonding.

782. Intermolecular hydrogen bonding is strongest in

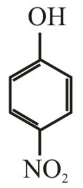
(a) HCHO (b) CH_3OH
(c) C_6H_5OH (d) CH_3NH_2

UPTU/UPSEE-2012

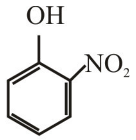
Ans. (b) : Hydrogen bond is found in a compound in which hydrogen bond is directly attached to a highly electronegative elements such as fluorine, oxygen and nitrogen. In HCHO the hydrogen atom is not directly attached to an oxygen atom. Thus, will show very less hydrogen bonding, while in case of CH_3NH_2, CH_3OH and C_6H_5OH, CH_3OH will show strongest hydrogen bonding because hydrogen is directly attached with more electronegative oxygen atom.

In C_6H_5OH compound strength of hydrogen bonding reduces due to the presence of bulky phenyl ($–C_6H_5$) group.

783. Out of the given two compounds, the vapour pressure of B at a particular temperature is



(A)

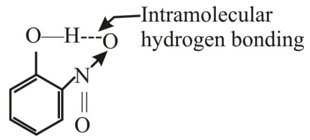


(B)

(a) higher than that of A
(b) lower than that of A
(c) higher or lower than A depending on the size of the vessel
(d) same as that of A

Karnataka-CET-2011

Ans. (a) : Vapour pressure of o-nitrophenol is more than vapour pressure of p-nitrophenol due to the intramolecular hydrogen bonding. As a results, it is more volatile.



o-nitrophenol

784. The low density of ice compared to water is due to

(a) induced dipole-induced dipole interactions
(b) dipole-induced dipole interactions
(c) hydrogen bonding interactions
(d) dipole-dipole interactions

JCECE-2010

Ans. (c) : Hydrogen bonding interactions are responsible for the low density of ice as compared to water.

785. Two ice cubes are pressed over each other until they unite to form one block. Which one of the following forces dominates for holding them together?

(a) Dipole-dipole interaction
(b) Van der waals' forces
(c) Hydrogen bond formation
(d) Covalent attraction

BITSAT-2008

Ans. (c) : Two ice cubes are pressed over each other until they unite to form one block. It is due to H-bonding.

786. Unusually high b.p. of water is result of

(a) Intermolecular hydrogen bonding
(b) Intramolecular hydrogen bonding
(c) both intra & intermolecular hydrogen bonding
(d) High specific heat

WB-JEE-2008

Ans. (a) : High boiling point of water is due to formation of four intermolecular hydrogen bonding, since they have strong force of attraction, more heat is required to break them while boiling these liquids. So, it has high boiling point.

787. H-bond is not present in :

(a) water (b) glycerol
(c) hydrogen fluoride (d) hydrogen sulphide

BCECE-2005

Ans. (d) : Sulphur is less electronegativity than fluorine and oxygen due to which H_2S do not show the hydrogen bonding while H_2O, HF and glycerol shows hydrogen bonding.

788. Which of the following does not have the hydrogen bond?

(a) Phenol (b) Liquid NH_3
(c) Water (d) Liquid HCl

CG PET-2005

Ans. (d) : Chlorine is less electronegativity than fluorine, oxygen and nitrogen due to which liquid HCl not show hydrogen bonding. H_2O, phenol and liquid NH_3 show hydrogen bonding.

789. H-bond is strongest in

(a) C_2H_5OH (b) $H – F$
(c) H_2O (d) CH_3COCH_3

JIPMER-2005

Ans. (b) : Strength of hydrogen bonding will depends upon the electronegativity of atom. Greater the electronegative atom, greater the hydrogen bonding strength. Therefore, fluorine has highest electronic activity and form strongest hydrogen bond in HF molecule.

790. Which of the following compounds in liquid state does not have hydrogen bonding?

(a) H_2O (b) HF
(c) NH_3 (d) C_6H_6

CG PET-2004

Ans. (d) : In benzene molecule, electronegativity difference between C–H bond is less therefore molecule behaves as non-polar and does not show hydrogen bonding. But H_2O, HF and NH_3 shows hydrogen bonding because F, O and N atom are highly electronegative.

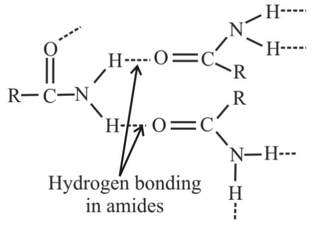
@apna_pdf

791. Assertion: Boiling and melting points of amides are higher than corresponding acids.
Reason: It is due to strong intermolecular hydrogen bonding in their molecules.

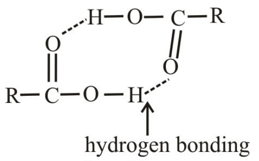
(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2002

Ans. (a): In case of amide 2 N – H bonds are present. So, amides are doing more intermolecular H-bonding due to this force of attraction between the molecules, increases and that's why boiling and melting point increase. While in case of acids only 1 O – H bond is present. So, less intermolecular hydrogen bonding is formed due to this boiling and melting points of acids decreases.



Hydrogen bonding in amides



hydrogen bonding in acids

792. In which of the following substances, hydrogen bonding is absent?

(a) HF (b) H_2O
(c) CCl_4 (d) Salicylaldehyde

AP-EAMCET (Medical), 2001

Ans. (c) : Chlorine has less electronegativity value than fluorine due to which they do not show the hydrogen bonding.

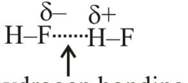
- HF, H_2O and salicylaldehyde shows hydrogen bonding.

793. The predominant intermolecular forces in HF is due to

(a) dipole-induced dipole interaction
(b) hydrogen bond formation
(c) dispersion interaction
(d) dipole-dipole interaction

J & K CET-(2000)

Ans. (b) : Intermolecular forces in HF is due to formation of hydrogen bonding.



hydrogen bonding in HF.

794. Which one of the following values could be used to estimate the strength of a hydrogen bond in water?

(a) strength of an O – H bond in H_2O
(b) heat evolved when one mole of H_2O is formed from its elements
(c) enthalpy change of vapourisation of water
(d) the melting point of ice

J & K CET-(1998)

Ans. (c) : Water forms a hydrogen bonding in its molecule. Due to hydrogen bonding, the electrostatic force of attraction in the molecules become large. Hence, its boiling point is high because large energy is required to separate these molecules. Hence enthalpy changed value of vapourisation of water could be used to estimate the strength of a hydrogen bonding in water.

795. Assertion: Ionic compounds tend to be non-volatile.
Reason: The inter-molecular forces in these compounds are weak.

(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion.
(c) If Assertion is true but the Reason is false
(d) If both Assertion and Reason are false

AIIMS-1994

Ans. (c): Intermolecular forces (i.e., electrostatic forces) in ionic compounds are strong thus they form big crystal lattices and are non-volatile. Thus, only assertion is true but reason is false.

796. Methanol and ethanol are miscible in water due to

(a) covalent character
(b) hydrogen bonding character
(c) oxygen bonding character
(d) none of the above

JIPMER-2008
JCECE - 2007

Ans. (b) : Methanol and ethanol contain polar covalent O–H bond. Hence, they form hydrogen bonding with water due to this they are miscible in water.

797. H_2O is liquid while H_2S is a gas due to

(a) covalent bonding
(b) molecular attraction
(c) H-bonding
(d) both H-bonding and molecular attraction

UPTU/UPSEE-2008
JIPMER-2005

Ans. (c) : H_2O contains intermolecular hydrogen bond, due to this it exist as liquid while H_2S does not containing intermolecular hydrogen bond, it contains weak van der Waal forces. So it exist as gas.

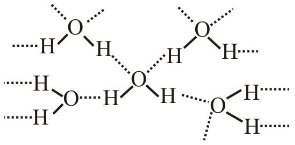
@apna_pdf

798. The boiling point of the water is higher than liquid HF. The reason is that

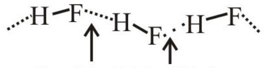
(a) Hydrogen bonds are stronger in water
(b) Hydrogen bonds are stronger in HF
(c) Hydrogen bonds are larger in number in HF
(d) Hydrogen bonds are larger in number in water

WB-JEE-30.04.2022

Ans. (d) : One water molecule forms four intermolecular hydrogen bonds while one hydrogen fluoride forms two intermolecular hydrogen bonds, Thats why, boiling point of the water is higher than liquid HF.



One H_2O molecule will form four H-bonds.



One liquide HF will form two H-bonds

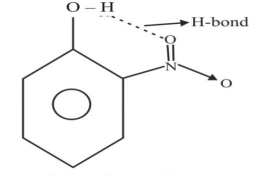
799. The correct option among the following about hydrogen bonding is

a) Hydrogen bond strength increases with the decrease of electronegativity of the atom connected to hydrogen
b) Hydrogen bonding involves more than two atoms
c) In general, intramolecular hydrogen bonding forms through five or six membered rings
d) Hydrogen bonding is an electrostatic force

(a) A and B (b) B and C
(c) A and C (d) C and D

TS EAMCET 10.08.2021, Shift-II

Ans. (d) : (a) Hydrogen bond strength increases with the increase of electronegative of the atom connected to hydrogen.
(b) As a result of hydrogen bonding, a hydrogen atoms links the two electronegative atoms simultaneously.
(c) In intramolecular species, H – bonding forms through five or six membered rings.



(o-nitro phenol)

(d) Hydrogen bonding is an electrostatic force. Hence, the statement is true.

800. Match the following

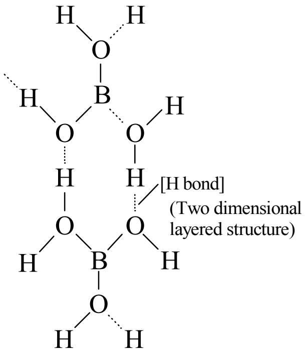
List-I Compound	List-II Physical/Chemical property/name/structure
A. H_3BO_3	**I. Dimeric form**
B. $AlCl_3$	**II. Back bonding**
C. $B_3N_3H_6$	**III. Hydrogen bonding**
D. BF_3	**IV. Inorganic benzene**

The correct match is

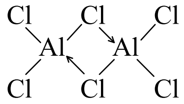
	A	B	C	D
(a)	I	II	III	IV
(b)	III	II	IV	I
(c)	III	I	II	IV
(d)	III	I	IV	II

TS-EAMCET (Engg.), 06.08.2021

Ans. (d):
Compound-Physical/Chemical property/name/structure
(a) H_3BO_3 - Hydrogen bonding

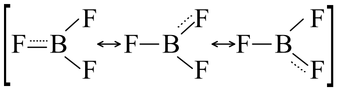


(b) $AlCl_3$ - Dimeric form



(Al_2Cl_6)

(c) $B_3N_3H_6$ - Inorganic benzene
(d) BF_3 - Back bonding



801. When hydrogen bond is formed between two molecules, it is called:

(a) intra-molecular H-bond
(b) intermolecular H-bond
(c) directional H-bond
(d) Both (b) and (c)

AP-EAMCET-1993

Ans. (b): Intermolecular hydrogen bond is formed between two molecules while intramolecular hydrogen bond is formed within the same molecule. The example of intermolecular H-bonding is H_2O whereas o-nitro phenol has intramolecular H-bonding.

802. In which of the following compounds is hydrogen bonding strongest in liquid phase?

(a) HF (b) CH_4
(c) HI (d) PH_3

AP-EAMCET-1993

Ans. (a): HF molecule has highest dipole character. Hence, the HF has strongest hydrogen bonding in liquid phase.

803. Water has a higher boiling point than corresponding hydrides H_2S, H_2Se and H_2Te. This is because of:

@apna_pdf

(a) angular structure of water
(b) presence of lone pair of electrons in H_2O
(c) presence of intra-molecular H-bonding in water
(d) presence of intermolecular H-bonding in water

AP-EAMCET-1991

Ans. (d): Water has a higher boiling point than corresponding hydrides i.e. H_2S, H_2Se, H_2Te. This is because of presence of intermolecular H-bonding in water.

804. Which of the following hydrogen bonds are strongest in vapour phase?

(a) HF…………HF	(b) HF…………HCl
(c) HCl…………HCl	(d) HF…………HI

AIEEE 2007

Ans.(a): The hydrogen bond in HF is strongest because fluorine is the most electronegative element hence form strongest hydrogen bond.

805. Which of the following can form H–bond?

(a) NH_3	(b) R–CN
(c) R–O–R	(d) R–Br

VITEEE 2003

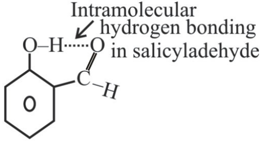
Ans. (a) : Only NH_3 molecule will show hydrogen bonding because it is polar in nature and having high electro negativity difference. But in case of R–CN, R–O–R and R–Br and non-polar or less polar and also having low electronegativity difference.

806. Intra-molecular hydrogen bonding is formed in

(a) H_2O_2	(b) salicyladehyde
(c) NH_3	(d) benzophenone

KCET 2013

Ans. (b) : Intramolecular hydrogen bond is formed within the same molecule when two groups are enough close to each other and form five or six member ring after hydrogen bonding. Therefore, only salicylaldehyde shows intermolecular hydrogen bonding.



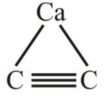
8. Ionic, Covalent and Coordinate Bonding

807. The number and type of bonds between two carbon atoms in CaC_2 are

(a) One σ bond and one π bond
(b) One σ bond and two π bonds
(c) One σ bond only
(d) One σ and one δ bond

WB JEE-2016, SCRA - 2014, AIEEE-2011

Ans. (b) : The molecular formula of calcium carbide is CaC_2. The Structure of CaC_2 is:



Triple bond are formed between two carbon atom. Hence, one sigma and two pi-bonds are present.

808. Which of the following is not correct regarding the properties of ionic compounds?

(a) Ionic compounds have high melting and boiling points
(b) Their reaction velocity in aqueous medium is very high
(c) Ionic compounds in their molten and aqueous solutions do not conduct electricity
(d) They are highly soluble in polar solvents

UPTU/UPSEE-2010
CG PET -2008
AP-EAMCET-2004

Ans. (c): Ionic compounds in their molten and aqueous solution are a good conductor of electricity. However, they are bad conductor in solid state.

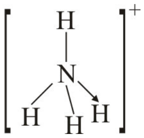
- Ionic compound has high melting and boiling point due to strong bond length.
- The mobility of ions is very fast in aqueous solution.
- The ionic compounds are very soluble in polar solvent due to electrostatic attraction between two opposite charge of the aqueous solution and salts.

809. Which of the following contains a coordinate covalent bond?

(a) H_2O	(b) NH_3
(c) NH_4^+	(d) C_2H_4

COMEDK-2011
AP-EAMCET-1993

Ans. (c): Co-ordinate bond is also a type of covalent bond in which sharing of electron given by only one atom. In NH_4^+, N is the donor atom whereas H atom is the acceptor atom. Thus, NH_4^+ has a coordinate covalent bond.

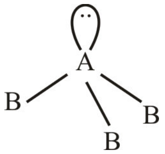


810. A covalent molecule AB_3 has pyramidal structure. The number of lone pair and bond pair electrons in the molecule are respectively

(a) 0 and 4	(b) 3 and 1
(c) 1 and 3	(d) 2 and 2

COMEDK-2018
Karnataka-CET, 2009

Ans. (c) : In general, a compound with formula AB_3 is sp^2 hybridised with triangular planar geometry. However, the given compound has pyramidal structure which is possible only when it has a lone pair of electrons. Thus, AB_3 has 3 bond pairs and one lone pair. The hybridisation of AB_3 molecule with one lone pair is sp^3.



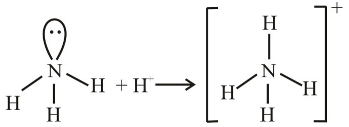
811. Which one of the following has a coordinate bond?

(a) NH_4Cl	(b) $AlCl_3$
(c) NaCl	(d) Cl_2

JIPMER-2012
Karnataka-CET, 2009

@apna_pdf

Ans. (a) : NH_4Cl forms coordinate bond.



$$NH_4^+ + Cl^- \rightarrow NH_4Cl$$

Lone pair of nitrogen is donated to H^+ ion and formed coordinate bond.

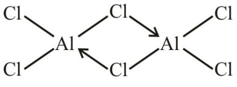
812. The sum of the number of dative bonds present in all the given species are

Al_2Cl_6, $Al(H_2O)_6$, CO, NH_4^+

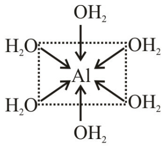
(a) 5 (b) 7
(c) 8 (d) 10

TS EAMCET 10.08.2021, Shift-II

Ans. (d) : A co-ordinate covalent or dative bond is a covalent bond that forms when both electrons come from the same atom. The given species are Al_2Cl_6, $[Al(H_2O)_6]^{3+}$, CO and NH_4^+.

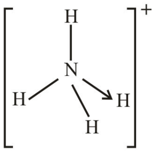


2- dative bond



6- dative bond

1- dative bond



1- dative bond

There are 10 dative bond present in given species.

813. A hard substance melts at high temperature and is an insulator in both solid and in molten state. This solid is most likely to be a/an

(a) ionic solid (b) molecular solid
(c) metallic solid (d) covalent solid

(JEE Main 2021, 18 March Shift-II)

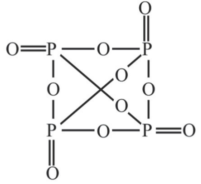
Ans. (d) : Covalent solids having high melting points and act as insulator in both solid and in molten state due to absence of free electrons in covalent solid.

814. Number of different bonds present in P_4O_{10} is ....

(a) 8 P–O bonds and 4 P = O bonds
(b) 12 P–O bonds and 3 P = O bonds
(c) 12 P–O bonds and 4 P = O bonds
(d) 8 P–O bonds and 3 P = O bonds

AP EAMCET (Engg.) 18.09.2020, Shift-I

Ans. (c) : Phosphorus pentaoxide is a chemical compound with molecular formula P_4O_{10}. This white crystalline solid is the anhydride of phosphoric acid. It is a powerful desiccant and dehydrating agent. The structure of P_4O_{10} is given as –



Number of
P—O bonds = 12
P = O bonds = 4

815. Which bond in a molecule of ethyl magnesium bromide is ionic in nature?

(a) C — C bond (b) C — Mg bond
(c) Mg — Br bond (d) C — H bond

MHT CET-03.05.2019, Shift-I

Ans. (c) : In ethyl magnesium bromide, the nature of Mg–Br bond is ionic because of the higher eletronegative difference between them. In other words, magnesium is metal and bromine is non-metal and the combination of these two gives rise to an ionic compound named magnesium bromide.

816. Which of the following compounds contain (s) no covalent bond (s) ?

KCl, PH_3, O_2, B_2H_6, H_2SO_4

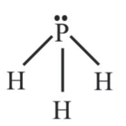
(a) KCl, B_2H_6, PH_3 (b) KCl, H_2SO_4
(c) KCl (d) KCl, B_2H_6

JEE Main-2018

Ans. (c) :

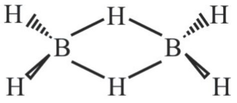
$$K \xrightarrow{\text{losses } e^-} K^+ \qquad Cl \xrightarrow{\text{gains } e^-} Cl^-$$

So, KCl forms ionic bond not covalent bond.

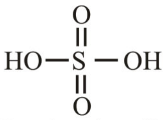


Covalent bonding in PH_3

Covalent bonding in O_2



Covalent bonding in B_2H_6



Covalent bonding in H_2SO_4

817. Which of the following is not a conductor of electricity?

(a) Solid NaCl (b) Cu
(c) Fused NaCl (d) Brine solution

Karnataka-CET-2018

Ans. (a) : In solid state, no unpaired electrons are present in molecule. So they does not conduct electricity. Therefore , solid NaCl does not having unpaired electron which helps in conduction of electricity. So solid NaCl is not a conductor of electricity.

818. Maximum number of covalent bonds formed by N and P are

(a) 3, 5 (b) 3, 6
(c) 3, 4, 5 (d) 3, 4, 6
(e) None of these

Kerala-CEE-2018

Ans. (a) : N and P belongs to the same group of elements of periodic table. It contains the five valence electron on valence shell

$${}_7N = 1s^2, 2s^2, 2p^3$$

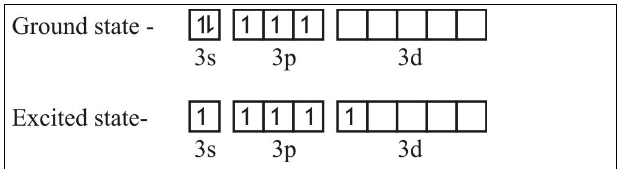
Ground state

2s

Hence, nitrogen can form three bonds in ground state.

$${}_{15}P = [Ne]3s^2, 3p^3, 3d^0$$

@apna_pdf



Here, P can form five bond in excited state. Hence, the correct option is (a).

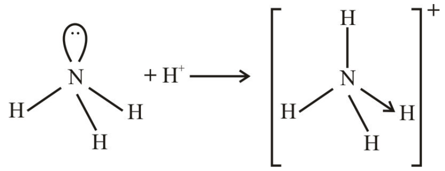
819. **NH$_3$ molecule attract H$^+$ ion towards itself to form ammonium ion (NH$_4^+$) through**

(a) electrovalent bond (b) metallic bond

(c) co-ordinate bond (d) hydrogen bonding

BCECE-2017

Ans. (c) : NH$_3$ molecules forms NH$_4^+$ ion by forming coordinate bond with H$^+$ ion.



820. **Select the most appropriate statement in BF$_3$**

(a) All the bonds are completely ionic

(b) The B-F bond is partially ionic.

(c) B-F bond has partial double bond character.

(d) Bond energy and bond length data indicates single bond character of the B-F bond.

(e) All the bonds are covalent.

Kerala-CEE-2017

Ans. (e) : BF$_3$ has three B–F bond in own structure. The hybridisation of boron in BF$_3$ is sp^2. Boron contains the three valence electron which is share with the fluorine atom and the covalent bond formed. Boron completes its octet by back -bonding making B–F bond partial double bond.

821. **Which of the following is covalent?**

(a) NaCl (b) KCl

(c) BeCl$_2$ (d) MgCl$_2$

(e) CaCl$_2$

Kerala-CEE-2017

Ans. (c) : BeCl$_2$ has covalent character because the electronegativity difference between Be & Cl is very less whereas NaCl, MgCl$_2$, KCl and CaCl$_2$ are the salt of alkali and alkaline earth metal.

822. **An ionic compound is**

(a) SnCl$_2$ (b) CCl$_4$

(c) GeCl$_4$ (d) SiCl$_4$

JCECE-2016

Ans. (a) : In p-block members, as we move down the group, lower positive oxidation state (+2) is more stable and ionic character increases due to inert pair effect. Hence, SnCl$_2$, i.e. (Sn = +2), is ionic in nature.

823. **Anhydrous mixture of KF and HF contain which types of ions?**

(a) K$^+$, H$^+$, F$^-$ (b) {KF$^+$, (HF$^-$)}

(c) KH$^+$, F$^-$ (d) K$^+$, HF$_2^-$

JIPMER-2016

Ans. (d) : KF and HF forms K$^+$[HF$_2$]$^-$ compound in anhydrous mixture. This is due to presence of hydrogen bonding between fluorine atom of KF and hydrogen atom of HF molecules.

$$KF+HF \rightarrow K^+[F^- \text{---} HF] \rightarrow K^+[HF_2]^-$$

Hydrogen
bonding

824. **HCl gas is covalent and NaCl is an ionic compound. This is because**

(a) sodium is highly electropositive

(b) hydrogen is a non-metal

(c) HCl is a gas

(d) electronegativity difference between H and Cl is less than 2.1

Karnataka-CET-2016

Ans. (d) : In HCl molecule the electronegativity difference between H and Cl atom is less so they act as covalent compound while in NaCl molecule the electronegativity difference in Na and Cl atom is high. Therefore, NaCl act as ionic compound.

825. **Which compound has electrovalent bond ?**

(a) H$_2$O$_2$ (b) CCl$_4$

(c) NaBr (d) CHCl$_3$

MPPET-2013

Ans. (c) : Electrovalent bond formed by transfer of e$^-$ and gain of e$^-$. After dissociation of electrovalent bond, opposite ion (cation and anion) are formed mostly. It is formed between non metal and metal.

$$Na-Br \longrightarrow Na^+ + Br^-$$

- H$_2$O$_2$, CCl$_4$ and CHCl$_3$ have the covalent bond because these bonds formed due to sharing of electron.

826. **Which one of the following statements about C$_2$ molecule is wrong?**

(a) The bond order of C$_2$ is 2

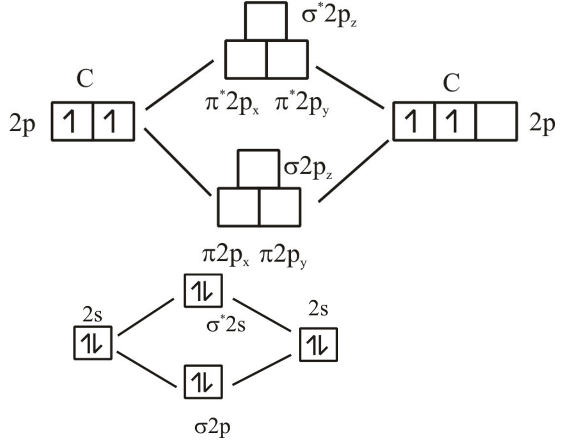
(b) In vapour phase, C$_2$ molecule is diamagnetic

(c) Double bond in C$_2$ molecule consists of both π-bonds because of the presence of 4e$^-$ in two π-molecular orbitals.

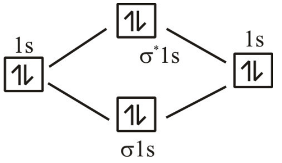
(d) Double bond in C$_2$ molecule consists to one σ-bond and one π bond

JIPMER-2013

Ans. (d) : According to MOT diagram of C$_2$ molecule double bond in C$_2$ molecule consist of both π–bonds no σ–bond is present.



@apna_pdf



• Bond order $= \frac{1}{2}\left[e^-_B - e^-_{AB}\right]$

$$= \frac{1}{2}[4-0]$$

$$= 2$$

• All $4e^-$ are present in two π–molecular orbital so, it show the diamagnetic character.

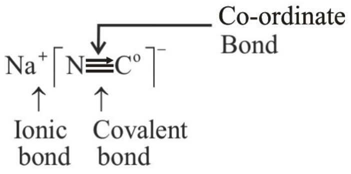
827. Which one of the following contains ionic, covalent and coordinate bonds?

(a) NaCl (b) NaCN

(c) NaNC (d) NaOH

Karnataka-CET-2012

Ans. (c) : NaNC contains ionic, covalent and coordinate type of bonding.



NaCN only shows ionic and covalent bonding.
NaCl and NaOH shows ionic bonding.

828. Which of the following is not a characteristic of a covalent compound?

(a) No definite geometry

(b) Insoluble in polar solvent

(c) Small difference in electronegativity between the combining atoms

(d) Low melting point

Karnataka-CET-2012

Ans. (a) : The covalent compound have some properties which is given below.
(i) The geometry of the covalent compound is definite.
(ii) Covalent compounds are in soluble in polar solvents.
(iii) The covalent bond formed in between two atom of covalent compound due to small difference of electronegativity.
(iv) The covalent compounds have low melting point rather than ionic compounds.

829. Which of the following dissolves in ionic solvents?

(a) C_6H_6 (b) CH_3OH

(c) CCl_4 (d) C_5H_{12}

MHT CET-2012

Ans. (b) : CH_3OH is the polar molecule which is dissolve in the polar solvent (ionic solvent).

$$\overset{\delta^+}{CH_3}-\overset{\delta^-}{OH}$$

C_6H_6, CCl_4 and C_5H_{12} are the non-polar molecule due to which they can not be dissolved in the polar solvent (e.g. H_2O).

830. CO is practically non-polar since

(a) the σ-electron drift from C to O is almost nullified by the π-electron drift from O to C

(b) the σ-electron drift from O to C is almost nullified by the π-electron drift from C to O

(c) the bond moment is low

(d) there is a triple bond between C and O

WB-JEE-2012

Ans. (a) : CO is the heterodiatomic molecule. It has the σ bond (sigma electron) and π-bond (π-electron). The polarity of this molecule is destroyed by the σ-electron drift from C to O and π-electron drift from O to C.

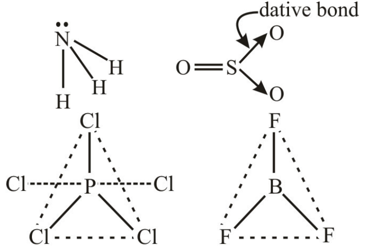
831. The dative bond is present in

(a) NH_3 (b) SO_3

(c) PCl_5 (d) BF_3

JCECE-2011

Ans. (b) : The structures of the given molecules are as-



Hence, SO_3 molecules contains co-ordinate or dative bonds.

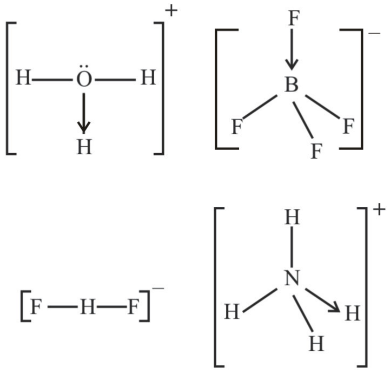
832. Which of the following does not contain any coordinate bond?

(a) H_3O^+ (b) BF_4^-

(c) HF_2^- (d) NH_4^+

MHT CET-2011

Ans. (c) :



Hence, HF_2^- does not contain the any type of Co-ordinate bond.

833. The compound which contains both ionic and covalent bond

(a) KCl (b) KCN

(c) CH_4 (d) H_2

BCECE-2010

Ans. (b) : KCN contains both ionic and covalent bond.

$$K^+C\equiv N^-$$

K^+ and CN^- forms ionic bond and C–N bond is covalent.

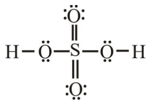
@apna_pdf

834. In the electronic structure of H_2SO_4, the total number of unshared electrons is

(a) 20 (b) 16
(c) 12 (d) 8

JIPMER-2010

Ans. (a)



No. of lone pair = 10

∴ No. of unshared e^- = 10×2 = 20 e^-

835. Which combination of atoms can form a polar covalent bond?

(a) H and H (b) H and Br
(c) N and N (d) Na and Br

UPTU/UPSEE-2009

Ans. (b) : The condition for a polar covalent bond is that the combining atom must have the low electronegativity difference not zero. Here, H–Br fulfills the condition and form the polar covalent bond.

$$H \leftrightarrows Br$$

- H and H & N and N forms the non-polar covalent bond because the electronegativity difference is zero.
- Na and Br forms the ionic bond.

836. The nature of the bond in diamond is

(a) ionic (b) covalent
(c) metallic (d) coordinate covalent

J & K CET-2008

Ans. (b) : Diamond forms covalent bond. In diamond only carbon atoms are present. Each carbon atom attached by 4 other carbon atoms through covalent bonds.

837. The number of covalent bonds in fluorine molecules is

(a) 2 (b) 3
(c) 1 (d) 5

J & K CET-2007

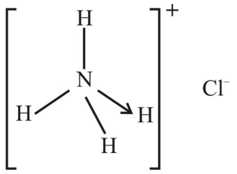
Ans. (c) : Fluorine molecules form one F–F covalent bond. Electronic configuration of F → $1s^2\ 2s^2\ 2p^5$
This show fluorine requires one more electron to complete it's octate. So, it forms only one covalent bond.

838. Which of the following contains both covalent and ionic bond ?

(a) CCl_4 (b) $CaCl_2$
(c) NH_4Cl (d) H_2O

MHT CET-2007

Ans. (c) : Ammonium chloride has ionic as well as covalent bond. Ionic bond formed between $[NH_4]^+$ and Cl^- whereas covalent co-ordinate bond formed between N→H.



- CCl_4 and H_2O are form the covalent bond whereas $CaCl_2$ has only ionic bond between own ion.

839. Which of the following combination will form an electrovalent bond?

(a) P and Cl (b) $NH_3$and BF_3
(c) H and Ca (d) H and S

UPTU/UPSEE-2005

Ans. (c) : The ionic bond formed between such type of element in which more electronegative difference present in between them. Here, Ca and H has the maximum electronegative difference. Hence it forms the electrovalent bond.

840. Ionic bonds are usually formed by combination of elements with

(a) high ionisation potential and low electron affinity
(b) low ionisation potential and high electron affinity
(c) high ionisation potential and high electron affinity
(d) low ionisation potential and low electron affinity

CG PET -2005

Ans. (b) : Ionic bonds are usually formed by combination of element which easily loose electrons i.e. low ionisation energy and element which easily takes electron i.e. having high electron affinity.

841. An example of a polar covalent compounds is:

(a) KCl (b) NaCl
(c) CCl_4 (d) HCl

JCECE-2005

Ans. (d) : KCl and NaCl are ionic compound because bond formed due to transfer of electron whereas CCl_4 and HCl are both covalent compound but one is polar and other one is non-polar. CCl_4 is the non-polar covalent compound because it's magnitude of polarity cancel to each other. Hence, HCl is the polar covalent compound.

842. When electric current is passed through an ionic hydride in molten state:

(a) hydrogen is liberated at anode
(b) hydrogen is liberated at cathode
(c) no change takes place
(d) hydride for migrates towards cathode
(e) hydride ion remains in solution

Kerala-CEE-2005

Ans. (a) : When electric current is passed through an ionic hydride in molten state then hydrogen gas liberated at anode.

$$M^+H^- \longrightarrow M^+ + \underset{\text{Hydride ion}}{H^-}$$

$$H^- \longrightarrow \frac{1}{2}H_2 + e^-\,(\text{At anode})$$

843. A covalent bond between two atoms is formed by which of the following?

(a) Electron nuclear attraction
(b) Electron sharing
(c) Electron transfer
(d) Electrostatic attraction

CG PET -2004

@apna_pdf

Ans. (b) : Covalent bond is a chemical bond that involves the sharing of electron pairs between atoms. These electron pairs, and the stable balance of attractive and repulsive forces between atoms, when they share electrons, is known as covalent bonding.

844. Identify the non-polar molecule in the set of compounds given:
HC*l*, HF, H_2, HBr

(a) H_2 (b) HC*l*
(c) HF, HBr (d) HBr

UPTU/UPSEE-2004

Ans. (a) : The species are given below-

H_2 is the non-polar molecule because the electronegative difference between H–H is zero. Hence, H_2 non-polar molecule.

845. Assertion: The O–O bond length in H_2O_2 is shorter than that of O_2F_2.
Reason: H_2O_2 is an ionic compound.

(a) If both Assertion and Reason are correct and the Reason is correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2003

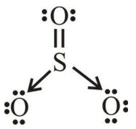
Ans. (d) : O – O bond length in O_2F_2 is less than H_2O_2 because in O_2F_2, highly electronegative fluorine atom attracts lone pair of oxygen that's why lone pair-lone pair repulsion in O–O bond decreases and O–O bond length is also decreases.

846. The number of S – S bonds in sulphur trioxide is

(a) Three (b) two
(c) one (d) zero

J & K CET-2003

Ans. (d) : There is zero S – S bond in sulphur trioxide (SO_3).

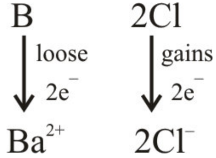


847. In which of the following ionic bond is present?

(a) BF_3 (b) CCl_4
(c) HCl (d) $BaCl_2$

JCECE-2003

Ans. (d) : In $BaCl_2$ compound, the electronegativity difference between Barium and Chlorine atom is high therefore only $BaCl_2$ forms ionic bond.

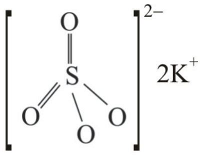


848. Which one of the following molecules contains both ionic and covalent bonds?

(a) CH_2Cl_2 (b) K_2SO_4
(c) $BeCl_2$ (d) SO_2

AP-EAMCET-2002

Ans. (b): K_2SO_4 molecule contains both ionic and covalent bonds.



849. Which of the following is the weakest bond?

(a) hydrogen bond (b) metallic bond
(c) ionic bond (d) covalent bond

J & K CET-2001

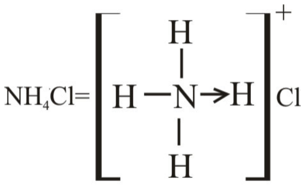
Ans. (a) : Hydrogen bonding is the weakest bond because it only formed by attraction between dipoles not formed a real bond.

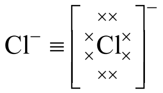
850. Which of the following molecule/ion has all the three types of bonds electrovalent, covalent and co-ordinate :

(a) HCl (b) NH_4Cl
(c) Cl^- (d) H_2O_2

BITSAT-2015

Ans. (b) : Bond structure of molecules are :
HCl = H – Cl





$H_2O_2 \equiv H – O – O – H$
Hence, from above structure it is clear that NH_4Cl molecule contains all three types bonds.

851. Consider the following with regard to water molecule :

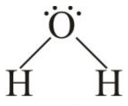
1. Non-polar covalent **2. Polar covalent**
3. σ bond **4. sp^3 hybridization**

Which of the above describe the bonding in water molecule?

(a) 2 and only (b) 1 and 4
(c) 2 and 3 only (d) 2, 3 and 4

SCRA-2014

Ans. (d) : Water molecule contains the two bond pair and two lone pair. H_2O is polar in nature because O–H bond are polar in nature. The hybridization of H_2O molecule is sp^3. There are two σ bond present.



(H_2O molecule)

@apna_pdf

852. **Assertion: LiCl is predominantly a covalent compound.**
Reason: Electronegativity difference between Li and Cl is too small.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect
(d) If both the Assertion and Reason are incorrect

AIIMS-2014

Ans. (c) : LiCl is covalent compound because the size of Li^+ is smaller and Cl^- is larger. Therefore, Li^+, has high polarizing power according to Fajan's rule, then LiCl is covalent in nature. Electronegativity difference between Li and Cl is high.

853. **The correct statement for the molecule CsI_3 is**

(a) It is a covalent molecule
(b) It contains Cs^+ and I_3^-
(c) It contains Cs^{3+} and I^- ions
(d) It contains Cs^+, I^- and lattice I_2 molecule

JEE Main-2014

Ans. (b) : CsI_3 is an ionic compound.

$$CsI_3 \longrightarrow Cs^+ + I_3^-$$

Cs belongs to alkali metal groups therefore Cs^{3+} is not possible because alkali metals only shows +1 oxidation state, i.e. Cs^+. I_2 molecules is not present in lattice because its size is too large.

854. **The attractive force which holds various constituents together in different chemical species is called**

(a) valence bond
(b) chemical bond
(c) atomic bond
(d) electrovalent bond.

J & K CET-2014

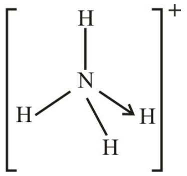
Ans. (b) : Only chemical bonds forms attractive force because it is formed by sharing of electrons between atoms. Electrovalent bonds are ionic bonds and formed by donation of electron so it is not formed by attractive forces.

855. **Which one of the following statements is true for ammonium ion?**

(a) All bonds are ionic
(b) All bonds are co-ordinate covalent
(c) H- atoms are situated at the corners of a square
(d) H-atoms are situated at the corners of tetrahedron.

AP – EAMCET - (Medical)-1997

Ans. (d) : In ammonium ion NH_4^+, three N–H bonds are covalent and one N–H bond is co-ordinate covalent. Hydrogen atoms are situated at the corners of a tetrahedron as N atom is sp^3 hybridised.



856. **Assertion:** The atoms in a covalent molecule are said to share electrons, yet some covalent molecules are polar.
Reason: In a polar covalent molecule, the shared electrons spend more time than the average near one of the atoms.

(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion
(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion
(c) If Assertion is true but the Reason is false
(d) If both Assertion and Reason are false

AIIMS-1996

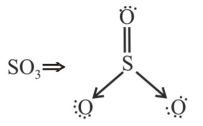
Ans. (a) : Covalent bonds are formed by the sharing of electrons between atoms if there is difference in electronegativity between atoms then shared electron spent more time near more electronegativity atom but if electronegativity difference is less then shared electron exist in centre.

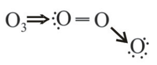
857. **The compound containing co-ordinate bond is**

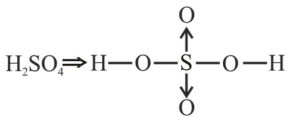
(a) SO_3
(b) O_3
(c) H_2SO_4
(d) all of these

AIIMS-1994

Ans. (d) :







Hence, all species contains the co-ordinate bond.

858. **Heterolytic fission of an organic covalent bond gives only**

(a) anion
(b) free radicals
(c) cation
(d) both (a) and (c)

AIIMS-1994

Ans. (d) : There are two types of fission take place in an organic covalent bond i.e. (i) Homolytic and heterolytic fission. On the heterolytic fission, cation and anion are formed.

$$C{-}X \xrightarrow[\text{Cleavage}]{\text{Heterolytic}} C^+ + X^-$$

@apna_pdf

9. Molecular Orbital Theory

859. Which of the following molecules/ions do not contain unpaired electrons?

(a) O_2^{2-} (b) B_2

(c) N_2^+ (d) O_2

(JEE Main 2021, 31 Aug. Shift-II)
Karnataka-CET-2012
UP CPMT-2011

Ans. (a) : O_2^{2-} (number of electrons = 18) does not contain unpaired electrons.

$O_2^{2-}: \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2$
$\approx \pi 2p_y^2, \pi^* 2p_x^2 \approx \pi^* 2p_y^2$

860. Which of the following show pπ – dπ bonding?

(a) NO_3^- (b) SO_3^{2-}

(c) BO_3^{3-} (d) CO_3^{2-}

BCECE-2016, 2012

Ans. (b) : NO_3^-, BO_3^{3-} and CO_3^{2-} contains the second period elements (central atom and surrounding atom) and there is no availability of d– orbital in second period element due to which they cannot acquire the pπ– dπ bonding.
In SO_3^{2-}, sulphur belongs to the third period of the periodic table and it has the d–orbital due to which they can form pπ–dπ bonding.

861. Which of the following elements forms pπ – pπ bond with itself?

(a) P (b) Se
(c) N (d) Te

Karnataka-CET-2017
MHT CET-2017

Ans. (c) : The condition for forming the pπ-pπ bond is that, the molecule having the small size with high electronegativity. In the given options, only nitrogen has fulfill the condition for pπ-pπ bond. N has more electronegativity than P, Se and Te.

862. The number of antibonding electron pairs in O_2^{2-} molecular ion on the basis of molecular orbital theory is (Atomic number of O is 18)

(a) 5 (b) 4
(c) 3 (d) 2

Karnataka-CET-2007
NEET-1998

Ans. (b) : The electronic configuration of O_2^{2-} ion is-

$$O_2^-\left(18e^-\right) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, 2p_z^2,$$
$$\pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2, \pi^* 2p_y^2 = \pi^* 2p^2$$

Hence, number of antibonding electron pairs in O_2^{2-} molecular ion are four.

863. AX is a covalent diatomic molecule, where A and X are second row elements of periodic table. Based on molecular orbital theory, the bond order of AX is 2.5. The total number of electrons in AX is ....
(Round off to the nearest integer).

(JEE Main 2021, 18 March Shift-I)

Ans. (15) : It is given that the bond order of AX is 2.5. The compound AX will be NO because the total number of electron of NO is 15 Total number of electrons equal to 13 will also have the 2.5 bond order. But in this case neutral diatomic molecule will not be possible.

864. Arrange the following species in the correct order of their stabilities.

$N_2^-, C_2, Ne_2, O_2^{2-}$

(a) $Ne_2 < O_2^{2-} < C_2 < N_2^-$

(b) $Ne_2 < C_2 < O_2^{2-} < N_2^-$

(c) $Ne_2 < N_2^- < O_2^{2-} < C_2$

(d) $Ne_2 < O_2^{2-} < N_2^- < C_2$

AP EAPCET 25.08.2021, Shift-II

Ans. (a) : According molecular orbital theory–

For N ≤ $14e^-$	**For N > 14 e^-**
$\sigma^* 2p_z$	$\sigma^* 2p_z$
$\pi^* 2p_x = \pi^* 2p_y$ (bonding)	$\pi^* 2p_x = \pi^* 2p_y$
$\sigma 2p_z$	$\pi 2p_x = \pi 2p_y$
$\pi 2p_x = \pi 2p_y$ (bonding)	$\sigma 2p_z$
$\sigma^* 2s$	$\sigma^* 2s$
$\sigma 2s$ (bonding)	$\sigma 2s$
$\sigma^* 1s$ (antibonding orbital)	$\sigma^* 1s$
$\sigma 1s$ (bonding orbital)	$\sigma 1s$

$$\therefore \text{B.O.} = \frac{\text{No. of bonding } e^- - \text{No. of antibonding } e^-}{2}$$

So, bond order is increase so stability is increase. Bond order of $N_2^- = 5/2$, $C_2 = 2$, $O_2^{2-} = 1$ and $Ne_2 = 0$.

865. Addition of an electron to an antibonding molecular orbital _____

(a) increase bond - order
(b) decreases bond - order
(c) stabilizes the system
(d) decreases the inter-nuclear distance

AP-EAPCET-24.08.2021, Shift-I

Ans. (b) : The formula of bond order is –
Bond order

$$= \frac{\text{no. of bonding } e^- - \text{no. of of anti bonding } e^-}{2}$$

If the no. of electron in antibonding increases the bond order decreases. Hence the second option is correct.

866. According to molecular orbital theory, the species among the following that does not exist is :

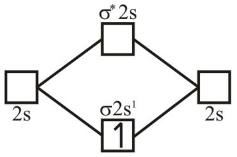
(a) He_2^- (b) He_2^+

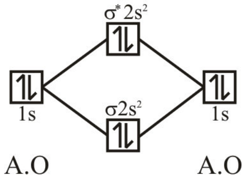
(c) O_2^{2-} (d) Be_2

JEE Main 25-02-2021, Shift-I

@apna_pdf

Ans. (d) : (i) $He_2^-(5)$: $\sigma 1s^2 \sigma^* 1s^2\, \sigma 2s^1$





$$\text{Bond Order} = \frac{1}{2}[N_b - N_a]$$

$$= \frac{1}{2}[3-2] = \frac{1}{2} = 0.5$$

(ii) $He_2^+(3)$: $\sigma 1s^2\, \sigma^* 1s^1$

$$\text{Bond Order} = \frac{1}{2}[N_b - N_a]$$

$$= \frac{1}{2}[2-1] = 0.5$$

(iii) $O_2^{2-}(18)$: $\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2$

$$\pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^2 = \pi^* 2p_y^2$$

$$\text{Bond Order} = \frac{1}{2}[N_b - N_a]$$

$$= \frac{1}{2}[10-8] = 1$$

(iv) $Be_2 = 4 + 4 = 8$

$= \sigma\, 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$

$$\text{Bond Order} = \frac{1}{2}[N_b - N_a]$$

$$= \frac{1}{2}[2-2] = 0$$

Bond Order of Be_2 is zero so, it does not exist.

867. The total number of electrons in all bonding molecular orbitals of O_2^{2-} is ....
(Round of to the nearest integer)

(JEE Main 2021, 27 July Shift-II)

Ans. 10 : The species is O_2^{2-}. The total no. of e^- in O_2^{2-} is 18.

MO configuration $= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$

$(\sigma 2p_z)^2 (\pi 2p^2{}_x = \pi 2p^2{}_y)\ (\pi^* 2p^2{}_x = \pi^* 2p^2{}_y)$

The bonding molecular orbital contains the 10 electron.

868. The bond stability of N_2, N_2^- and N_2^{2-} varies as

(a) $N_2 < N_2^- < N_2^{2-}$ (b) $N_2^- < N_2 < N_2^{2-}$
(c) $N_2^{2-} < N_2^- < N_2$ (d) $N_2^- < N_2^{2-} < N_2$

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (c) : Stability of a molecule is related with bond order as:

Stability ∝ Bond order

Bond order of N_2, N_2^- and N_2^{-2} are 3, 2.5 and 2 respectively. Therefore, the bond stability order is $N_2^{-2} < N_2^- < N_2$.

Hence, the correct option is (c).

869. During the change of O_2 to O_2^-, the incoming electron goes to the orbital.

(a) $\pi 2p_x$ (b) $\pi^* 2p_x$
(c) $\pi 2p_y$ (d) $\pi^* 2p_z$

AIIMS 25 May 2019 (Morning)

Ans. (b) : : The total number of electron in O_2 molecule is 16. The molecular orbital configuration of O_2 is $(\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$ $(\sigma 2p_z)^2 (\pi 2p^2 x = \pi 2p^2{}_y)\ (\pi^* 2p^1{}_x = \pi^* 2p^1{}_y)$

Similarly, for O_2^-, total $e^- = 17$

MO electronic configuration

$= (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2\ (\sigma 2p_z)^2$

$(\pi 2p^2{}_x = \pi 2p^2{}_y)\ (\pi^* 2p^2{}_x = \pi^* 2p^1{}_y)$

In O_2 to O_2^-, the incoming electron goes to the $\pi^* 2p_x$ orbital.

870. Which of the following species cannot exist on the basis of Molecular Orbital Theory?

(a) O^{2+} (b) He_2^+
(c) H_2^+ (d) He_2

J & K CET-2019
CG PET-2004

Ans. (d) : The molecule which have bonding electron equal to the Antibonding electron then the molecule cannot exist. He_2 has the 4 electron.

MO configuration of $He_2 = (\sigma 1s^2)\ (\sigma^* 1s)^2$

Hence, no of bonding electron is equal to the no. of antibonding. Hence, the He_2 molecule cannot exist.

871. In the process, $O_2^+ \rightarrow O_2^{2+} + e^-$ the electron lost is from :

(a) bonding π-orbital
(b) antibonding π-orbital
(c) $2p_z$ orbital
(d) $2p_x$ orbital

Manipal-2019

Ans. (b) : $O_2^- \rightarrow O_2^{2+} + e^-$

O_2^+ Total $e^- = 15 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2$

$\pi 2\,p_x^2 = \pi 2\,p_y^2, \pi^* 2p_x^1$

The removal of electron takes place from $\pi^* P_x$ orbital which is π- antibonding orbital.

872. Which of the following diatomic molecular species has only π bonds according to molecular orbital theory?

(a) Be_2 (b) O_2
(c) N_2 (d) C_2

NEET-2019

Ans. (d) : The total number of electrons in C_2 molecule is 12. The molecular orbital electronic configuration of C_2 is $(\sigma 1s)^2\ (\sigma^* 1s)^2\ (\sigma 2s)^2\ (\sigma^* 2s)^2\ \ (\pi 2p_x^2 = \pi 2p_y^2)$.

Thus, C_2 has only π bonds according to MOT.

@apna_pdf

873. Assertion: NH_2^- has a square planar shape.

Reason: Species which involve dsp^2 hybridization have square pyramidal structure.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion

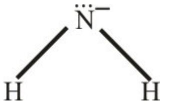
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

(c) If Assertion is correct but Reason is incorrect

(d) If both the Assertion and Reason are incorrect

AIIMS-26 May,2018 (M)

Ans. (d): The hybridization of NH_2^- is sp^3 with two lone pair The structure of NH_2^- is given below –



V– Shaped or Bent shape

Species which involve dsp^2 hybridization have square planer geometry whereas the molecules having the sp^3d^2 hybridization with one lone pair has the square pyramidal structure.

874. According to molecular orbital theory which of the following statement about the magnetic character and bond order is correct regarding O_2^+

(a) Paramagnetic and Bond order < O_2

(b) Paramagnetic and Bond order > O_2

(c) Diamagnetic and Bond order < O_2

(d) Diamagnetic and Bond order > O_2

BITSAT-2018

Ans. (b) : $O_2 : \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2$

$\pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$

Bond order $= \dfrac{10-6}{2} = 2$

(two unpaired electrons in antibonding molecular orbital)

$O_2^+ : \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2$

$\pi 2p_x^2 = \pi 2p_y^2 \pi^* 2p_x^1 \pi^* 2p_y^0$

Bond order $= \dfrac{10-5}{2} = 2.5$

(One unpaired electron in antibonding molecular orbital)

Hence O_2 as well as O_2^+ both are paramagnetic, and bond order of O_2^+ is greater than that of O_2.

875. According to MOT, O_2 is paramagnetic in nature, what is the number of electrons in antibonding molecular orbitals?

(a) 8 (b) 7

(c) 9 (d) 6

AMU-2017

Ans. (d) : The given species is O_2. The total number of electron in O_2 is 16. The molecular orbital configuration is $(\sigma 1s)^2$ $(\sigma^* 1s)^2$ $(\sigma 2s)^2$ $(\sigma^* 2s)^2$ $(\sigma 2p_z)^2$ $(\pi 2p_x^2 = \pi 2p_y^2)$ $(\pi^* 2p_x^1 = \pi^* 2p_y^1)$. Hence, antibonding molecular orbital contains the 6 electron.

876. The molecule (ion) having one unpaired electron is :

(a) NO (b) CO

(c) CN^- (d) O_2

Manipal-2017

Ans. (a) : NO (total e^- = 7 +8 + = 15) = $\sigma 1s^2$, $\sigma^* 1s^2$, $\sigma 2s^2$, $\sigma^* 2s^2$, $\sigma 2p_z^2$, $\pi 2p_x^2 = \pi 2p_y^2$, $\pi^* 2p_x^1$

Unpaired electron = 1

(b) CO (total e^- = 14) = $\sigma 1s^2$, $\sigma^* 1s^2$, $\sigma 2s^2$, $\sigma^* 2s^2$

$\pi 2p_x^2 = \pi 2p_y^2$, $\sigma 2p_z^2$

Unpaired electron = 0

(c) CN (Total e^- =14) =is isoelectronic with CO.

Hence, it has 0 unpaired electron

(d) O_2 (Total e^- = 16) $\sigma 1s^2$, $\sigma^* 1s^2$, $\sigma 2s^2$, $\sigma^* 2s^2$

$\sigma 2p_z^2$, $\pi 2p_x^2 = \pi 2p_y^2$, $\pi^* 2p_x^1 = \pi^* 2p_y^1$

Unpaired e^- = 2

877. Which one of the molecular species has unpaired electrons?

(a) N_2 (b) N_2^{2+}

(c) N_2^{2-} (d) O_2^{2-}

COMEDK-2016

Ans. (c) : $N_2(\text{total } e^- = 14) : \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2,$

$\left(\pi 2p_x^2 = \pi 2p_y^2\right), \sigma 2p_z^2$

$N_2^{2+}(\text{total } e^- = 12) : \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2 \left(\pi 2p_x^2 = \pi 2p_y^2\right)$

$N_2^{2-}(\text{total } e^- = 16) : \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \left(\pi 2p_x^2 = \pi 2p_y^2\right), \sigma 2p_z^2,$

$\left(\pi^* 2p_x^1 = \pi^* 2p_y^1\right)$

$O_2^{2-}(\text{total } e^- = 18) : \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \left(\pi 2p_x^2 = \pi 2p_y^2\right)$

$\left(\pi^* 2p_x^2 = \pi^* 2p_y^2\right)$

Here, N_2^{2-} contains the two unpaired electron.

878. The total number of antibonding electrons in N_2 and O_2 molecules respectively is

(a) 4, 6 (b) 6, 8

(c) 5, 8 (d) 4, 8

AP EAMCET (Medical) - 2013

Ans. (a) : The species are N_2 and O_2.

Total electron in N_2 = 14

Molecular electronic configuration of N_2 =

$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

∴ Antibonding electron = 4

Total electron in O_2 = 16

Molecular electronic configuration of O_2 =

$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$

∴ Antibonding electron = 6

@apna_pdf

879. Using MOT, which of the following pairs denote paramagnetic species?

(a) B_2 and C_2 (b) B_2 and O_2

(c) N_2 and C_2 (d) O_2 and O_2^{2-}

BITSAT-2013

Ans. (b) : B_2 and O_2 are paramagnetic due to presence of unpaired electron. MO configuration of B_2 is :

$\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \pi 2p_x^1 = \pi 2p_y^1$

MO configuration of O_2 is :

$\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \sigma 2p_z^2 \pi 2p_x^2$

$= \pi 2p_y^2 \pi^* 2p_x^1 = \pi^* 2p_y^1$

880. The ground state electronic configuration of CO molecule is

(a) $1\sigma^2 2\sigma^2 1\pi^4 3\sigma^2$ (b) $1\sigma^2 2\sigma^2 3\sigma^2 1\pi^2 2\pi^2$

(c) $1\sigma^2 2\sigma^2 1\pi^2 3\sigma^2 2\pi^2$ (d) $1\sigma^2 1\pi^2 2\sigma^2 2\sigma^2$

WB-JEE-2013

Ans. (a) : CO molecule contains the 14 electron in ground state. The molecular orbital configuration of CO is $(\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2$ $(\pi 2p_x^2 = \pi 2p_y^2)$ $(\sigma 2p_z)^2$.

881. The number of molecular orbitals obtained by mixing two atomic orbitals from each of the atoms is:

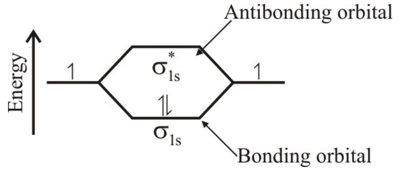
(a) 2 (b) 3

(c) 4 (d) 6

MPPET-2012

Ans. (a) : Due to hybridized orbitals of atoms, if 'n' number of orbitals are combined, then the number of orbitals formed would also be equal to 'n'.

• One bonding orbital & one anti-bonding orbital, when two '1s' orbitals combine –



882. The molecule having one unpaired electron is:

(a) CO (b) O_2

(c) N_2 (d) NO

MPPET-2012

Ans. (d) : (i) $:C \overset{\leftarrow}{\equiv} O:$ (ii) $\underset{\cdot\cdot}{\ddot{O}} = \underset{\cdot\cdot}{\ddot{O}}$

(iii) $\ddot{N} \equiv \ddot{N}$ (iv) $\underset{\cdot}{\ddot{N}} = \underset{\cdot\cdot}{\ddot{O}}$ (one unpaired e^-)

883. According to molecular orbital theory, the total number of bonding electron pairs in O_2 is

(a) 2 (b) 3

(c) 5 (d) 4

AP EAMCET (Engg.)-2012

Ans. (c) : According to molecular orbital theory molecular orbital configuration of O_2 is –

$O_2(16e^-) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, 2p_z^2$,

$\pi 2p_x^2 = \pi 2p_y^2$ $, \sigma 2p_z^2$ $, \pi^* 2p_y^1 = \pi^* 2p^1$

∴ Number of bonding electrons = 10

and number of bonding electron pairs = 5

and Number of antibonding electrons = 6

884. Molecular orbital theory was proposed by

(a) Lewis (b) Mulliken

(c) Slater (d) Pauling

AP- EAMCET(Medical) -2010

Ans. (b): Molecular Orbital Theory (MOT) was developed by F. Hund and R.S. Mulliken in 1932.

- Lewis was best known for his discovery of the covalent bond and his concept of electron pairs. His Lewis dot structure and other contributions to valence bond theory have shaped **modern theories of chemical bonding**.
- **Slater's rules** provide numerical values for the effective nuclear charge in a many electron atom.
- **Pauling** was the scientist who gave scale of electroelectronegativity.

885. Which is false statement about LCAO?

(a) Addition of atomic orbitals result in molecular orbitals.

(b) Atomic orbitals of nearly same energy combine to form molecular orbitals.

(c) Bonding molecular orbitals occupy higher energy than atomic orbitals.

(d) Each molecular orbital accommodates maximum no of two electrons.

J & K CET-2010

Ans. (c) : The linear combination of atomic orbital's to form molecular orbital's takes place only if the following conditions are satisfied-

(i) Two or more than two atomic orbital combination to form molecular orbital's

(ii) The combining atomic orbitals must have the same or nearly the same energy.

(iii) Bonding molecular orbital's occupy less energy than atomic orbital's

(iv) Each molecular orbital fits in with maximum no. of two electrons.

886. Which one of the following is paramagnetic

(a) O_2 (b) N_2

(c) He (d) NH_3

MPPET-2009

Ans. (a) : Paramagnetism is due to the presence of unpaired electrons in the material.

According to molecular orbital theory–

$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$

$\pi^* 2p_x^1 = \pi^* 2p_y^1$

O_2 is paramagnetic because antibonding molecular orbital has 2 unpaired electron.

887. The correct statement with regard to H_2^+ and H_2^- is:

(a) both H_2^+ and H_2^- are equally stable

(b) both H_2^+ and H_2^- do not exist

(c) H_2^- is more table than H_2^+

(d) H_2^+ is more stable than H_2^-

Karnataka-CET, 2009

Ans. (d) : $H_2^+ : \sigma 1s^1, \overset{*}{\sigma} s^0$ Bond order $= \frac{1}{2}$

$H_2^+ : \sigma 1s^2, \overset{*}{\sigma} s^1$ Bond order $= \frac{2-1}{2} = \frac{1}{2}$

@apna_pdf

The bond order of H_2^+ and H_2^- are same but H_2^+ is more stable than H_2^-. It is due to the presence of one electron in the antibonding molecular orbital in H_2^-.

888. Which of the following is correct based on Molecular orbital theory for peroxide ion?

(a) Its bond order is two and it is diamagnetic
(b) Its bond order is one and it is paramagnetic
(c) Its bond order is two and it is paramagnetic
(d) Its bond order is one and it is diamagnetic

GUJCET-2007

Ans. (d) : The chemical formula of peroxide ion is O_2^{2-}

Total electron = 16+2 = 18

Molecular electronic configuration of

$$O_2^{2-} = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p^2$$

$$\pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2, \pi^* 2p_y^2 = \pi^* 2p^2$$

$$\text{Bond order} = \frac{\text{no. of bonding electron} - \text{no. of antibonding electron}}{2}$$

$$\text{Bond order} = \frac{10-8}{2} = 1$$

So, its bond order is one and it is diamagnetic in nature.

889. One of the following examples exhibit transient existence

(a) H
(b) H_2^+
(c) H^+
(d) He

J & K CET-2007

Ans. (c) : H^+ has the zero bond order due to which we can say that H^+ is not stable or exhibit transient existence and H_2^+ has the positive value of bond order. Hence, it is stable.

890. Molecular orbital electronic configuration of X anion is
$KK(\sigma 2s)^2 (\sigma^* 2s)^2 (\pi 2p_x)^2 (\pi 2p_y)^2 (\sigma 2p_z)^2 (\pi^* 2p_x)^1$
Then anion X is –

(a) N_2^-
(b) O_2^-
(c) N_2^{2-}
(d) O_2^{2-}

AMU-2005

Ans. (a) : The given molecular orbital electronic configuration of X anion is K K- $\sigma 2s^2$, $\sigma^* 2s^2$, $\pi 2p_x^2$, $\pi 2p_y^2$, $\sigma 2p_z^2$, $\pi^* 2p_x^1$,. The anion contains the 15 electron on molecule orbital configuration.

(a) N_2^- ⇒ (total e^-) = 14 + 1 = 15
(b) O_2^- ⇒ (total e^-)= 16 + 1 = 17
(c) N_2^- ⇒ (total e^-) = 14 + 2 = 16
(d) O_2^{2-} ⇒ Total e^- = 16 + 2 = 18

Hence, anion X is N_2^-.

891. Paramagnetism of oxygen is explained on the basis of its electronic configuration of:

(a) $(2\pi_x^*)(2\pi_y)^1$
(b) $(\pi^* 2p_x)^1 (\pi^* 2p_y)^1$
(c) $(2\sigma_s^*)^1 (2\pi_y)^1$
(d) $(2\sigma_s^*)^1 (2\pi_y)^1$

JCECE-2005

Ans. (b) : The chemical formula of oxygen is O_2. The total number of electron in oxygen is 16.

The molecular orbital configuration of O_2 is

$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2$

$\pi^* 2p_x^1 = \pi^* 2p_y^1$

From the above configuration it is clear that the last electron goes to the $\pi^* 2P_x = \pi^* 2P_y$ which has two unpaired electron and shows the paramagnetic character.

892. Number of unpaired eletronis in O_2 molecule is:

(a) zero
(b) one
(c) two
(d) four

UP CPMT-2005

Ans. (c) : Write the electronic configuration of O_2 according to molecular orbital theory to find the number of unpaired electrons in it.

O_2 = (total e^- = 8+8 =16)

$= \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2,$

$\pi^* 2p_x^1 = \pi^* 2p_y^1$ ∴ number of unpaired electrons =2

893. Which of the following molecules have unpaired electrons in antibonding molecular orbitals?

(a) O_2
(b) N_2
(c) C_2
(d) B_2

J & K CET-2002

Ans. (a) : O_2(Total e^- =16) = $(\sigma 1s^2)$ $(\sigma^* 1s^2)$ $(\sigma 2s^2)$ $(\sigma^* 2s^2)$ $(\sigma 2p_z^2)$ $(\pi 2p_x^2 = \pi 2p_y^2)$ $(\pi^* 2p_y^1 = \pi^* 2p_y^2)$

Unpaired e^- in ABMO = 2

(b) (N_2 Total e^- 14) = $(\sigma 1s^2)$ $(\sigma^* 1s^2)$ $(\sigma 2s^2)$ $(\sigma^* 2s^2)$ $(\pi 2p_x^2 = \pi 2p_y^2)$ $(\sigma 2p_z^2)$

Unpaired e^- in ABMO = 0

(c) C_2 (Total e^- =12) = $(\sigma 1s^2)$ $(\sigma^* 1s^2)$ $(\sigma 2s^2)$ $(\sigma^* 2s^2)$ $(\pi 2p_x^2 = \pi 2p_y^2)$

Unpaired e^- = in ABMO = 0

(d) B_2 (total e^- =10) = $(\sigma 1s^2)$ $(\sigma^* 1s^2)$ $(\sigma 2s^2)$ $(\sigma^* 2s^2)$ $(\pi 2p_x^1 = \pi 2p_y^1)$

Unpaired e^- in ABMO = 0

Here, O_2 has tow unpaired electron in antibonding molecular orbital ABMO

894. Which of the following is paramagnetic?

(a) N_2O_4
(b) NO
(c) N_2O_3
(d) N_2

AP EAMCET- 1995

Ans. (b) : From the Molecular orbital theory–

$$\text{NO}(\text{total } e^- = 15) = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 =$$

$$\pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y$$

Hence, last e^- goes to in anti bonding as an unpaired e^-. So, NO is paramagnetic in nature.

@apna_pdf

895. The ground state electronic configuration of valence shell electrons in nitrogen molecule (N_2) is written as KK, $\sigma 2s^2$, $\sigma^* 2s^2$, $\pi 2p_x^2 = \pi 2p_y^2$. $\sigma 2p_z^2$. Hence the bond order in nitrogen molecule is

(a) 2 (b) 3

(c) 0 (d) 1

NEET-1995

Ans. (b) : Bond order = $= \dfrac{N_b - N_a}{2}$

Where- N_b = no. of bonding electron

N_a = no. of antibonding electron

$\therefore$ Bond order of $N_2 = \dfrac{10-4}{2} = 3$

Hence, the bond order of N_2 is 3

896. Using MO theory, predict which of the following species has the shortest bond length?

(a) O_2^{2+} (b) O_2^{+}

(c) O_2 (d) O_2^{2}

AIEEE 2009

Ans. (a) : The bond length of molecule is inversely proportional to the bond order. First of all we calculate the bond order of given species–

(a) $O_2^{2+}(\text{total } e^- 16-2=14)$

$= (\sigma 1s)^2(\sigma^* 1s)^2(\sigma 2s)^2(\sigma^* 2s)^2\ (\pi 2p^2_x = \pi 2p^2_y)$

$(\sigma 2p_z)^2$

B.O. = $\dfrac{10-4}{2} = 3$

(b) $O_2^{+}(\text{total } e^- = 16-1=15)$

$= (\sigma 1s)^2(\sigma^* 1s)^2(\sigma 2s)^2(\sigma^* 2s)^2\ (\sigma 2p_z)^2(\pi 2p^2_x = \pi 2p^2_y)$

$(\pi^* 2p^1_x)$

B.O. = $\dfrac{10-5}{2} = 2.5$

(c) $O_2^{-}(\text{total } e^- = 16+1=17)$

$= (\sigma 1s)^2(\sigma^* 1s)^2(\sigma 2s)^2(\sigma^* 2s)^2\ (2p_z)^2\ (\pi 2p^2_x = \pi 2p^2_y)$

$(\pi^* 2p^2_x = \pi^* 2p^1_y)$

B.O. = $\dfrac{10-7}{2} = 1.5$

(d) $O_2^{2-}(\text{total } e^- = 18) = (\sigma 1s)^2\ (\sigma^* 1s)^2\ (\sigma 2s)^2(\sigma^* 2s)^2$

$(\sigma 2p_z)^2\ (\pi 2p^2_x = \pi 2p^2_y)\ (\pi^* 2p^2_x = \pi^* 2p^2_y)$

B.O. = $\dfrac{10-8}{2} = 1$

The molecule which has the maximum bond order, having the shortest bond length. O_2^{2+} has the shortest bond length.

897. Oxygen molecule is paramagnetic because

(a) Bonding electrons are more than anti-bonding electrons

(b) It contains two unpaired electrons

(c) Anti-bonding electrons are more than bonding electrons

(d) Bonding electrons are equal to anti bonding electrons

SCRA-2015

Ans. (b): Oxygen molecule is paramagnetic because it contains two unpaired electrons in the anti bonding state. The molecular orbital configuration of O_2 is–

$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$

Here, O_2 has the two unpaired electron.

898. In He_2, the electrons in bonding and antibonding orbitals are

(a) 2, 2 (b) 4, 2

(c) 4, 0 (d) 2, 4

J & K CET-2015

Ans. (a) : The total number of electron in He_2 is 4. The molecular orbital configuration of He_2 is $(\sigma 1s)^2\ (\sigma^* 1s)^2$ He_2 contains the two electrons in bonding as well as antibonding orbital.

899. Using MOT, compare O_2^+ and O_2^- species and choose the incorrect option

(a) O_2^+ have higher bond order than O_2^-

(b) O_2^- is less stable

(c) O_2^+ is diamagnetic while O_2^- is paramagnetic

(d) Both O_2^+ and O_2^- are paramagenetic

Karnataka-CET-2015

Ans. (c) : The species are O_2^+ and O_2

(i) O_2^+ (Total e^- = 15)

MO configuration = $\sigma 1s^2$, $\sigma^* 1s^2$, $\sigma 2s^2$, $\sigma^* 2s^2$, $\sigma 2p_z^2$, $\pi 2\ p_x^2 = \pi 2\ p_y^2$, $\pi^* 2\ p_y^1$

Bond order = $\dfrac{N_b - N_a}{2} = \dfrac{10-5}{2} = 2.5$

Unpaired electron = 1 (paramagnetic)

(ii) O_2^- (Total e^- = 16+1=17)

MO configuration = $\sigma 1s^2$, $\sigma^* 1s^2$, $\sigma 2s^2$, $\sigma^* 2s^2$, $\sigma 2p_z^2$

$\pi 2\ p_x^2 = \pi 2\ p_y^2$, $\pi^* 2\ p_x^2 = \pi^* 2\ p_y^1$

Bond order = $\dfrac{10-7}{2} = 1.5$

Unpaired electron = 1 (paramagnetic)

The incorrect option is (c) because both species are paramagnetic in nature.

900. KO_2 exhibits paramagnetic behaviour. This is due to the paramagnetic nature of

(a) KO^- (b) K^+

(c) O_2 (d) O_2^-

AP-EAMCET (Engg.) - 2014

Ans. (d) : KO_2 exhibits paramagnetic behaviour because oxygen exists as O_2^- ions.

$$O_2^- = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2,$$
$$\pi 2p_x^2 = \pi 2p_y^2,\ \pi^* 2p_x^2 = \pi^* 2p_y^1$$

Due to the presence of 1 unpaired electron in anti-bonding molecular orbital, it is paramagnetic in behaviour.

901. In case of hetero nuclear diatomics of the type AB, where A is more electronegative than B. bonding molecular orbital resembles the character of A more than that of B. The statement

@apna_pdf

(a) is false
(b) is true
(c) cannot be evaluated since data is not sufficient
(d) is true only for certain systems

WB-JEE-2014

Ans. (b) : Electronegativity is the tendency of an element to attract a shared pair of electrons towards itself. Heteronuclear diatomic molecules have atoms with different electronegativities and hence tend to become polarized. In a heteronuclear diatomic molecule AB, where A is more electronegative then B. Since the electrons shift more towards A due to its more electronegative character hence bonding molecular orbital resembles the character of A more than that of B.

902. According to molecular orbital theory, which of the following will not be a viable molecule?

(a) He_2^{2+} (b) He_2^+
(c) H_2^- (d) H_2^{2-}

JEE Main 2018

Ans. (d) : A positive bond order (i.e. $N_b > N_a$) means a stable molecule while negative (i.e. $N_b < N_a$) or zero (i.e. $N_b = N_a$) bond order means an unstable molecule.

(a) $He_2^{2+}(\text{total } e^- = 2) = (\sigma 1s)^2$

$$\text{Bond order} = \frac{N_b - N_a}{2} = \frac{2-0}{2} = 1$$

(b) $He_2^+(\text{total } e^- = 3) = (\sigma 1s)^2(\sigma^* 1s)^1$

$$\text{Bond order} = \frac{2-1}{2} = 0.5$$

(c) $H_2^-(\text{total } e^- = 3) = (\sigma 1s)^2(\sigma^* 1s)^1$

$$\text{Bond order} = \frac{2-1}{2} = 0.5$$

(d) $H_2^{2-}(\text{total } e^- = 4) = (\sigma 1s)^2(\sigma^* 1s)^2$

$$\text{Bond order} = \frac{N_b - N_a}{2} = \frac{2-2}{2} = 0$$

H_2^{2-} has the zero bond order. It will not be a viable molecule.

903. According to molecular orbital theory, which of the following is true with respect to Li_2^+ and Li_2 ?

(a) Both are unstable
(b) Li_2^+ is unstable and Li_2 is stable
(c) Both are stable
(d) Li_2^+ is stable and Li_2 is unstable

JEE Main 2019

Ans. (d) : The stability of molecule is depend upon the mathematical value of bond order.

$$N_b > N_a \longrightarrow \text{Stable molecule}$$

$$N_b = N_a \longrightarrow \text{Unstable molecule}$$

$Li_2^+(\text{total } e^- = 5) = (\sigma 1s)^2(\sigma^* 1s)^2(\sigma 2s)^1$.

$$\text{Bond order} = \frac{N_b - N_a}{2} = \frac{3-2}{2} = 0.5$$

$Li_2^-(\text{total } e^- = 7) = (\sigma 1s)^2(\sigma^* 1s)^2(\sigma 2s)^2(\sigma^* 2s)^1$

$$\text{Bond order} = \frac{4-3}{2} = 0.5$$

Here, Li_2^+ has two electron in antibonding molecular orbital whereas Li_2^+ has 3 electron in ABMO. The species which have less electron in ABMO are more stable. Li_2^- is least stable than Li_2^-.

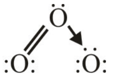
10. Formal Charge

904. The formal charge on the central oxygen atom in O_3 molecule is

(a) 0 (b) +1
(c) –1 (d) –2

COMEDK-2016

Ans. (b) : The Lewis dot structure of O_3 is



Formal charge on central oxygen atom

Formal charge = (Total no. of valence electron in free atom) – (lone pair) – $\frac{1}{2}$(total no. of bonding electrons)

$$\text{F.C} = 6 - \frac{1}{2} \times 6 - 2 = +1$$

905. The formal charges of $N_{(1)}$, $N_{(2)}$ and O atoms in $:\underset{1}{\ddot{N}} = \underset{2}{N} = \ddot{O}:$ are respectively

(a) +1,–1, 0 (b) –1,+1,0
(c) +1,+1,0 (d) –1,–1,0

BCECE-2014

Ans. (b) : The formal charge of $N_{(1)}$, $N_{(2)}$ and O atom in $N_{(1)} = N_{(2)} = O$ are–

Formal charge = (Total no. of valence electron in free atom) – (lone pair) – $\frac{1}{2}$(total no. of bonding electrons)

In N atom marked 1,

$$\text{Formal charge } (N_1) = 5 - 4 - \frac{1}{2}\ (4)$$
$$= 5 - 4 - 2$$
$$= -1$$

$$\text{Formal charge } (N_2) = 5 - 0 - \frac{1}{2}\ (8)$$
$$= 5 - 4$$
$$= +1$$

$$\text{Formal charge of O atom} = 6 - 4 - \frac{1}{2}\ (4)$$
$$= 6 - 4 - 2$$
$$= 0$$

Thus, the formal charge of $N_{(1)}$, $N_{(2)}$, O atoms are –1, +1, 0 respectively.

906. The formal charges of C and O atoms in $CO_2(:\ddot{O} = C = \ddot{O}:)$ are, respectively

(a) 1, –1 (b) –1, 1
(c) 2, –2 (d) 0, 0

AP EAMCET (Engg.) - 2012

@apna_pdf

Ans. (d)
Formal charge = (total no. of valance e$^-$ present in atom) – (total no. of non bonding e$^-$ present in atom) – $\frac{1}{2}$(total no. of Bonding e$^-$ present in atom)

Formal charge on C in CO_2 -
total no. of valance e$^-$ = 4
total no. of non- Bonding e$^-$ = 0
Total no of Bonding e$^-$ = 8

$$F.C = 4 - 0 - \frac{1}{2} \times 8$$
$$= 4 - 4 = 0$$

F.C = 0
Formal charge on C is 0.
Formal charge on O in CO_2 -
total no. of valance e$^-$ = 6
total no. of non- Bonding e$^-$ = 4
Total no of Bonding e$^-$ = 4

$$F.C.\ of\ O = 6 - 4 - \frac{1}{2} \times 4$$
$$= 6 - 6 = 0$$

Formal charge on O is 0 (zero)

907. The formal charges of $N_{(1)}, N_{(2)}$ and O atoms in $:\underset{(1)}{\ddot{N}}=\underset{(2)}{N}=\ddot{O}:$ are respectively

(a) $+1, -1, 0$
(b) $-1, +1, 0$
(c) $+1, +1, 0$
(d) $-1, -1, 0$

AP-EAMCET- (Engg.)-2011

Ans. (b) : Formal charge (FC) = Valence electron– Lonepair $-\frac{1}{2}$ bond pair

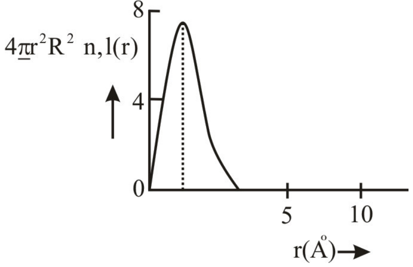
For $:\underset{(1)}{\ddot{N}}=\underset{(2)}{N}=\ddot{O}:$

$$\text{For } N_{(1)} = 5 - 4 - \frac{1}{2} \times 4 = -1$$
$$\text{For } N_{(2)} = 5 - 0 - \frac{1}{2}(8) = +1$$
$$\text{For } O = 6 - 4 - \frac{1}{2}(4) = 0$$

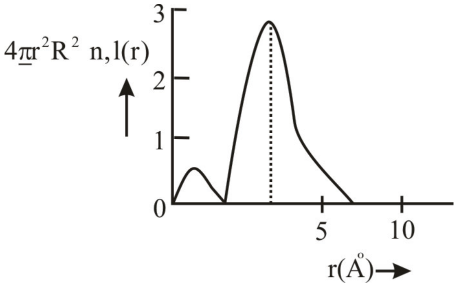
11. Valence Bond Theory

908. The plots of radial distribution functions for various orbitals of hydrogen atom against 'r' are given below :

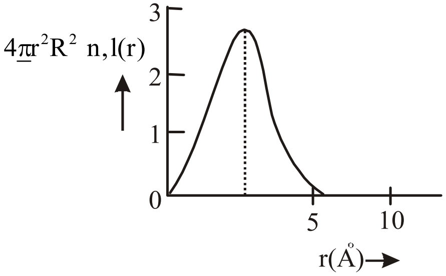
(A)



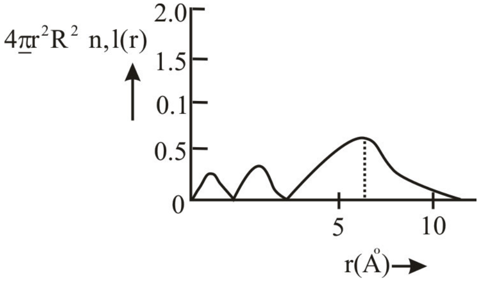
(B)



(C)



(D)



The correct plot for 3s orbital is :
(a) A (b) B
(c) C (d) D

JEE Main 25-02-2021, Shift-I

Ans. (d) : For 3s orbital-
No. of radial nodes = n – λ –1
∵ n = 3 and λ = 0 (for s – subshell)
∴ No. of radial nodes = 3 – 0 – 1= 2
Which is correctly matched by option (d).

909. Valence bond theory of L. Pauling and J.C. Slater accounts for .... characteristics of covalent bond.

(a) directional (b) non-directional
(c) sharing (d) None of these

AP-EAMCET-1993

Ans. (a): Valence Bond Theory (VBT) of L. Pauling and J.C. Slater accounts for directional characteristics of covalent bond.

- The covalent bond formed between two atom by the sharing of electron.
- The ionic bond are non-directional in nature.

910. In case of nitrogen, NCl_3 is possible but not NCl_5 while case of phosphorus, PCl_3 as well as PCl_5 are possible. It is due to

(a) availability of vacant d orbitals in P but not in N
(b) lower electronegativity of P than N
(c) lower tendency of H-bond formation in P than N
(d) occurrence of P in solid while N in gaseous state at room temperature.

VITEEE-2018

@apna_pdf

Ans. (a) : Phosphorus belongs to the 3rd period which contains the vacant d–orbital but in the case of N, it's not contains the d-orbital because this is belongs to the second period.

${}_7N = 1s^2\ 2s^2\ 2p^3$ ${}_{15}P = 1s^2\ 2s^2\ 2p^6\ 3s^2\ 3p^3\ 3d^0$

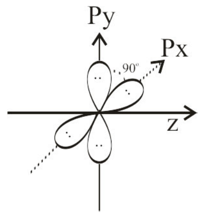
12. Types of Overlapping and Nature of Covalent Bonds

911. Main axis of diatomic molecule is z. The orbitals p_x and p_y overlap to form

(a) π-molecular orbital
(b) σ- molecular orbital
(c) δ- molecular orbital
(d) No bond is formed

Karnataka-CET-2016
NEET-2001

Ans. (d) : The shape of the P-orbital is dumbell.
According to the question-



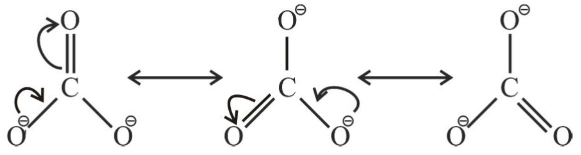
p_x and p_y are perpendicular to each other due to which they cannot overlap and no bond will be form.

912. Identify the species having one π-bond and maximum number of canonical forms from the following

(a) SO_3 (b) O_2
(c) SO_2 (d) CO_3^{2-}

(JEE Main 2021, 25 July Shift-II)

Ans. (d) : The structure of CO_3^{2-} is given below :



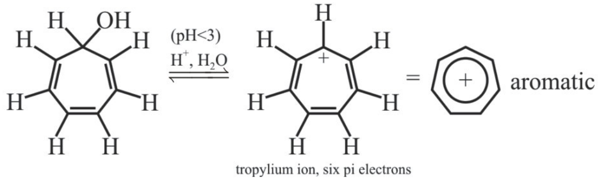
The above structure contains the one π-bond.

913. The total number of overlapping p-orbitals present in cycloheptatrienyl cation is

(a) 4 (b) 5
(c) 6 (d) 7

TS-EAMCET (Engg.), 06.08.2021

Ans. (c):



- The cycloheptatrienyl cation has 6 pi electrons and an empty p orbital.
- The cycloheptatrienyl cation is easily formed by treating the corresponding alcohol with dilute (0.01N) aqueous sulfuric acid.
- The cycloheptatrienyl cation is commonly known as the **tropylium ion**.

914. Which one of the following energy is stored in the links between the atoms ?

(a) Nuclear energy (b) Chemical energy
(c) Potential energy (d) Thermal energy

NDA (I)-2019

Ans : (b) Chemical energy is stored in the links between the atoms.

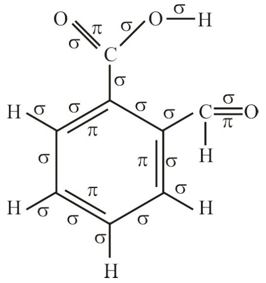
- Potential energy is the energy which possess due to virtue of its position.
- Nuclear energy is stored in the nucleus of an atom.
- Thermal energy is the energy which possess due to movement of the particles within the object or system.

915. The number of σ and π-bonds in 2-formylbenzoic acid are respectively.

(a) 10, 3 (b) 14, 3
(c) 12, 5 (d) 17, 5

MHT CET-02.05.2019, Shift-II

Ans. (d) : The structure of 2-formyl benzoic acid is given below-



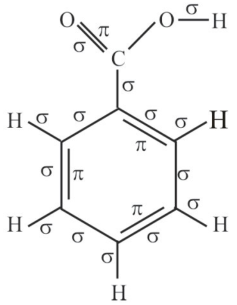
There are 17σ and 5π bonds present in 2-formyl benzoic acid.

916. The number of pi-bonds present in benzoic acid molecule are

(a) 5 (b) 4
(c) 3 (d) 6

MHT CET-03.05.2019, Shift-I

Ans. (b) : The structure of benzoic acid is given below :



There are four pi bond present in above structure.

917. A π-bond is formed by side way overlapping of

(a) s-s orbitals (b) s-p orbitals
(c) p-p orbitals (d) s-p-s orbitals

J & K CET-2019

@apna_pdf

Ans. (c) : In the formation of π–bond the atomic orbitals overlap in such a way that their axes remain parallel to each other and perpendicular to the internuclear axis. The orbitals formed due to sidewise overlapping consists of two saucer type charged clouds above and below the plane of the participating atoms.

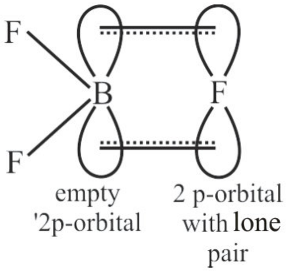
918. Among the following compounds of boron, the species which also forms π-bond in addition to σ-bonds is

(a) BH_3 (b) B_2H_6

(c) BF_3 (d) BF_4^-

UPTU/UPSEE-2017

Ans. (c) : Boron trifluoride has planar structure. Boron has an empty p-orbital, while fluorine has a lone pair of electrons in its p-orbital. As a result, boron is a Lewis acid, while fluorine is a Lewis base. Back bonding is a form of bonding in which fluorine donates a lone pair of electrons to boron atoms.



919. In the formation of π-bond, the atomic orbitals overlap in such a way that

(a) their axes remain parallel to each other and perpendicular to the internuclear axis

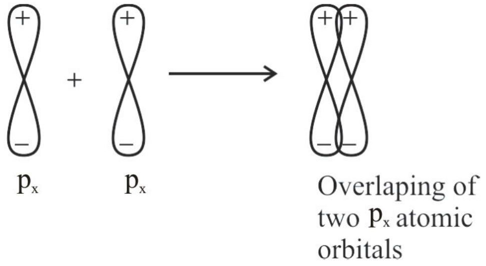
(b) their axes remain parallel to each other and parallel to the internuclear axis

(c) their axes remain perpendicular to each other and parallel to the internuclear axis

(d) their axes remain perpendicular to each other and perpendicular to the internuclear axis.

J & K CET-2014

Ans. (a) : The π bond formed when the atomic orbitals overlap in such a manner that their axes remain parallel to each other and perpendicular to the internuclear axis.



920. Which one of the following has longest covalent bond distance?

(a) C–C (b) C–H

(c) C–N (d) C–O

AP EAMCET (Engg.) -2014

Ans. (a) :

Species	Bond Length (pm)
C – C	154
C – H	107
C – N	143
C – O	143

C – C has the longest covalent bond distance.

921. Which one of the following statements is correct?

(a) Hybrid orbitals do not form σ bonds

(b) Lateral overlap of p-orbitals of p-orbitals and d-orbitals produces π – bonds

(c) The strength of bonds follows the order $\sigma_{p-p} < \sigma_{s-s} < \pi_{p-p}$

(d) s-orbitals do not form σ bonds

AP-EAMCET (Engg.)-2013

Ans. (b) :

(i) Hybrid orbital only head on overlapping to form σ bonds.

(ii) Lateral overlap of p–orbital and d–orbitals produces π – bonds.

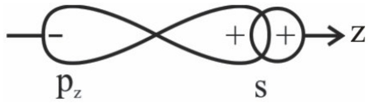
(iii) Head on overlapping is stronger than sideways overlapping. The strength of order is –

$$\pi_{p\text{-}p} < \sigma_{s-s} < \sigma_{p-p}$$

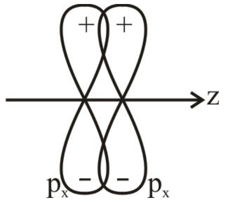
(iv) s-orbitals are spherically and thus show only head on overlapping to form σ bond.

922. Which of the following represents the zero overlap?

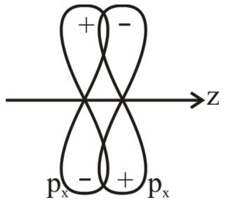
(a)



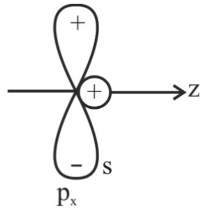
(b)



(c)



(d)



AMU-2013

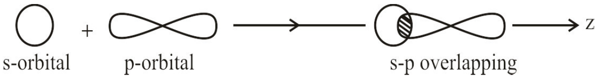
@apna_pdf

Ans. (d) : The covalent bond may be classified into two types depending upon the types of overlapping:

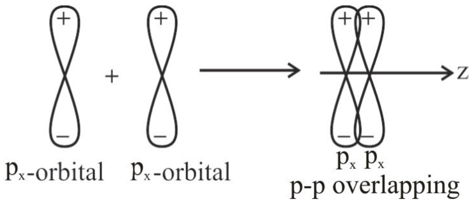
(i) Head on overlap

(ii) Side wise overlapping.

(i)



(ii)



When two atoms came closer to each other, there is overlapping of atomic orbitals. This overlap may be positive, negative or zero depending upon the properties of overlapping of atomic orbitals.

923. Which of the following species contains equal number of a σ and π-bonds>?

(a) $(CN)_2$ (b) $(CH)_2(CN)_2$

(c) HCO^-_3 (d) XeO_4

NEET-2013

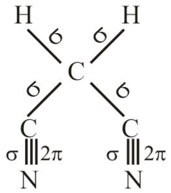
Ans. (d) :

(a)

σ – bond = 3

π – bond = 4

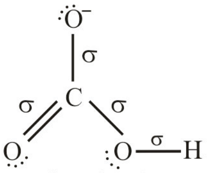
(b)



σ – bond = 6

π – bond = 4

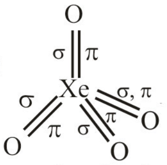
(c)



σ – bond = 4

π – bond = 1

(d)



σ – bond = 4

π – bond = 4

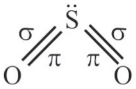
924. Which one of the following molecules contains no π bond?

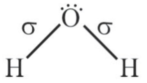
(a) SO_2 (b) NO_2

(c) CO_2 (d) H_2O

NEET-2013

Ans. (d) : The species are given below:





Here, H_2O has not any π bond.

925. The number of sigma (σ) and pi (π) bonds present in 1, 3, 5, 7-octatetraene respectively are

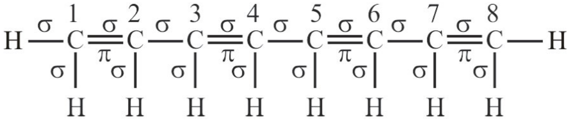
(a) 14 and 3 (b) 17 and 4

(c) 16 and 5 (d) 15 and 4

(e) 16 and 3

Kerala-CEE-2012

Ans. (b) : The structure of 1,3,5,7 octatetraene is given below-



There are 17σ and 4π-bond.

926. The enolic form of acetone contains

(a) 9 sigma bonds, 2 pi bonds and 1 lone pair

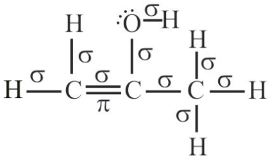
(b) 9 sigma bonds, 1 pi bonds and 2 lone pairs

(c) 8 sigma bonds, 2 pi bonds and 2 lone pairs

(d) 10 sigma bonds, 1 pi bonds and 1 lone pair

AMU-2012

Ans. (b) : The chemical formula of enolic form of acetone is-



(9 σ bonds, 1π bond, two lone pair)

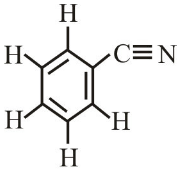
927. The number of sigma (σ) and pi (π) covalent bonds respectively in benzene nitrile are.....

(a) 5, 13 (b) 15, 3

(c) 13, 5 (d) 16, 2

GUJCET-2011

Ans. (c):



Benzene nitrile

Number of σ bonds = 13

Number of π bonds = 5

928. Consider the following molecule:

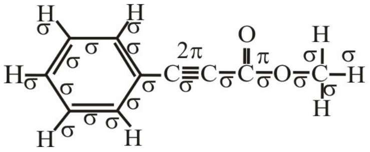
What are the number of sigma and pi bonds present in the above molecule respectively?

(a) 20, 6 (b) 18, 5

(c) 15, 5 (d) 14, 4

SCRA-2010

Ans. (a) :



There are 20 σ and 6π bonds.

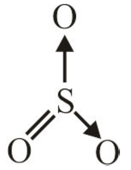
@apna_pdf

929. The type of bonds present in sulphuric anhydride are

(a) 3σ and three pπ – dπ
(b) 3σ one pπ – pπ and two pπ – dπ
(c) 2σ and three pπ – dπ
(d) 2σ and two pπ – dπ

BITSAT-2009
VITEEE- 2009

Ans. (b) : The formula of sulphuric anhydride is SO_3 and its structure is as follows :



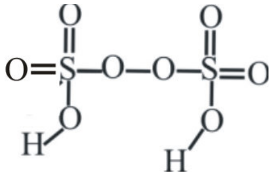
⇒ 3σ, 1pπ-pπ, 2 pπ-dπ bond are present.

930. The number of sigma and pi bonds in peroxodisulphuric acid are, respectively

(a) 9 and 4
(b) 11 and 4
(c) 4 and 8
(d) 4 and 9

AP EAMCET-2008

Ans. (b) : The molecular formula of peroxodisulphuric acid is $H_2S_2O_7$.



In peroxodisulphuric acid, 11σ-bond and 4 π-bond are present.

931. Non-directional orbital is :

(a) 4p
(b) 4d
(c) 4f
(d) 3s

BCECE-2006

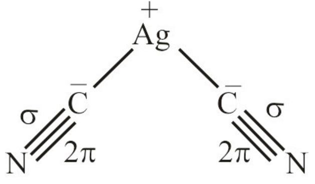
Ans. (d) : Shape of s, p, d orbitals are spherical, dumbell, double dumbell respectively and the shape of f orbital is quite complex. The s-orbitals are spherical in shape and hence non-directional in nature.

932. In $[Ag(CN_2)]^-$, the number of π bonds is:

(a) 2
(b) 3
(c) 4
(d) 6

AIIMS-2006

Ans. (c): The structure of $[Ag(CN)_2]^-$ is given below:



π —bond→4

933. Which one of the following statement is not correct for sigma and pi-bonds formed between two carbon atoms?

(a) Sigma-bond is stronger than a pi-bond
(b) Bond energies of sigma and pi-bonds are of the order of 264 kJ/mol and 347 kJ/mol, respectively
(c) Free rotation of atoms about a sigma-bond is allowed but not in case of a pi-bond.
(d) Sigma-bond determines the direction between carbon atoms but a pi-bond has no primary effect in this regard

NEET-2003

Ans. (b) : Sigma bond is stronger than pi bond because of maximum overlapping extent. Bond energy of sigma and pi bonds are not of the order of 264 kJ/mol and 347 kJ/mol respectively. The bond energy of C – C is 347 kJ/mol and of C = C is 619 kJ/mol.

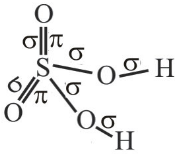
The rotation of σ bond take place in room temperature.

934. What is the number of sigma (σ) and pi (π) bonds present in sulphuric acid molecule?

(a) 6σ, 2π
(b) 6σ, 0π
(c) 2σ, 4π
(d) 2σ, 2π

AP-EAMCET (Medical), 2002

Ans. (a) : The chemical formula of the sulfuric acid is H_2SO_4. The structure is given below –



935. Which statement is not correct?

(a) A sigma bond is weaker than a pi bond
(b) A sigma bond is stronger than a pi bond
(c) A double bond is stronger than a single bond
(d) A double bond is shorter than a single bond

NEET-1990

Ans. (a) : (a) A sigma bond is stronger than the pi bonds.

(b) A sigma bond is stronger than a pi bond because the overlapping of orbitals take place to a larger extent.

(c) The bond length of double and single bond are 1.34A° and 1.54A° respectively. From the data, it is clear that the distance between two atom is small and makes the bond stronger.

(d) The bond length of double bond is 1.34 A° and single bond length is 1.54A°.

936. Which of the following does not apply to metallic bond?

(a) Overlapping valence orbitals
(b) Mobile valence electrons
(c) Delocalized electrons
(d) Highly directed bonds

NEET-1989

Ans. (d) : The metallic bonds are formed when the electron of valence shell of valence orbital overlaps to each other. In metals, there is huge number of mobile electron moving in microscopic level. The electrons are delocalized over a rigid lattice of metal ions in a metallic bond. Metals having free electrons as mobile electrons due to which metallic bond does not have directional property.

@apna_pdf

13. Application of Molecular Orbital Theory

937. In oxygen and carbon molecule the bonding is

(a) $O_2 : 1\sigma, 1\pi; C_2 : 0\sigma, 2\pi$

(b) $O_2 : 0\sigma, 2\pi; C_2 : 2\sigma, 0\pi$

(c) $O_2 : 1\sigma, 1\pi; C_2 : 1\sigma, 1\pi$

(d) $O_2 : 2\sigma, 0\pi; C_2 : 0\sigma, 2\pi$

Karnataka CET-17.06.2022, Shift-II

Ans. (a) : In O_2 the molecular bonding configuration is-

$$O_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_z^2,\ \pi 2p_x^2 = \pi 2p_y^2,\ \pi^* 2p_x^1 = \pi^* 2p_y^1$$

$$C_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2,\ \pi 2p_x^2 = \pi 2p_y^2$$

Hence, the oxygen and carbon molecule the bonding is $O_2 : 1\sigma, 1\pi$ and $C_2 : O\sigma, 2\pi$

938. Bonding in which of the following diatomic molecule(s) become (s) stronger, on the basis of MO Theory by removal of an electron?

(A) NO (B) N_2 (C) O_2 (D) C_2 (E) B_2

Choose the most appropriate answer from the options given below:

(a) (A), (B), (C) only

(b) (B), (C), (E) only

(c) (A), (C) only

(d) (D) only

JEE Main-25.06.2022, Shift-I

Ans. (c) : (i) For NO = $\sigma 1s^2\ \sigma^* 1s^2\ \sigma 2s^2\ \sigma^* 2s^2$

$$\sigma 2p_z^2,\ \pi 2p_x^2 = \pi 2p_y^2,\ \pi^* 2p_x^1 = \pi 2p_y$$

Bond order = $\frac{10-5}{2} = 2.5$

(ii) $N_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2$

Bond order = $\frac{10-4}{2} = 3$

(iii) $O_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2$

$$\sigma 2p_z^2, \pi 2p_x^2 = \pi 2p_y^2, \pi^* 2p_x^1 = \pi^* 2p_y^1$$

Bond order = $\frac{10-6}{2} = 2$

(iv) $C_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2$

Bond order = $\frac{8-4}{2} = 2$

(v) $B_2 = \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^1 = \pi 2p_y^1$

Bond order = $\frac{6-4}{2} = 1$

Bond strength ∝ Bond order

Hence, $NO \rightarrow NO^+$

Bond order 2.5 3

$O_2 \rightarrow O_2^+$

Bond order 2 2.5

939. Which among the following are having diamagnetic property?

(i) B_2 **(ii) N_2**

(iii) O_2 **(iv) C_2**

(a) ii, iii

(b) i, iv

(c) ii, iv

(d) i, ii

AP-EAMCET-2017

Ans. (c) : According to molecular orbital configuration for,

(i) B_2 = (total electron = 10)

$$= \sigma_{1s^2}, \overset{*}{\sigma}_{1s^2}, \sigma_{2s^2}, \overset{*}{\sigma}_{2s^2}, \pi_{px^1} = \pi_{py^1}$$

Thus, B_2 have two unpaired electron and paramagnetic.

(ii) N_2 = (Total electron = 16)

$$= \sigma_{1s^2}, \overset{*}{\sigma}_{1s^2}, \sigma_{2s^2}, \overset{*}{\sigma}_{2s^2}, \pi_{2px^2} = \pi_{2py^2}, \sigma_{2pz^2}$$

Thus N_2 has no unpaired electron and diamagnetic

(iii) O_2 (Total electron = 16)

$$= \sigma_{1s^2}, \overset{*}{\sigma}_{1s^2}, \sigma_{2s^2}, \overset{*}{\sigma}_{2s^2}, \sigma_{2pz^2}, \pi_{2px^2} = \pi_{2py^2}, \overset{*}{\pi}_{2px^2} = \overset{*}{\pi}_{2py^2}$$

Thus, O_2 has two unpaired electron and paramagnetic

(iv) C_2 = (Total electron = 12)

$$= \sigma_{1s^2}, \overset{*}{\sigma}_{1s^2}, \sigma_{2s^2}, \overset{*}{\sigma}_{2s^2}, \pi_{2px^2} = \pi_{2py^2}$$

Thus, C_2 has no unpaired electron and diamagnetic.

Hence (c) is correct.

940. The molecular orbital configuration of CO is

$$\boldsymbol{\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \pi 2p_x^2 = \pi 2p_y^2, \sigma 2p_z^2}$$

The bond order and magnetic nature of CO molecule are respectively :

(a) 7 and paramagnetic

(b) 5 and paramagnetic

(c) 3 and diamagnetic

(d) 2 and diamagnetic

SCRA-2010

Ans. (c) : The molecular orbital configuration of CO is-

$$\sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2 \left[\begin{matrix} \pi 2p_x^2 \\ \pi 2p_y^2 \end{matrix}\right., \sigma 2p_z^2$$

Bond order = $\frac{1}{2}$ [No. of bonding-No. of anti bonding]

$$= \frac{1}{2}[10-4]$$

$$= \frac{6}{2} = 3$$

941. The electronic configuration

$$\sigma 1s^2 \sigma^* 1s^2 \sigma 2s^2 \sigma^* 2s^2 \sigma 2p_z^2 \pi 2p_x^2 = \pi 2p_y^2 \pi^* 2p_x^1 = \pi^* 2p_y^1$$

can be assigned to

(a) N_2

(b) O_2

(c) F_2

(d) Ne_2

AMU-2006

Ans. (b) : Total number of electrons in bonding and antibonding orbitals = 16. Hence the given electronic configuration represents O_2 molecule.

@apna_pdf

05.

States of Matter

1. The Gas Laws

1. A box contains 0.90 g of liquid water in equilibrium with water vapor at 27°C. The equilibrium vapor pressure of water at 27°C is 32.0 Torr. When the volume of the box is increased, some of the liquid water evaporates to maintain be equilibrium pressure. If all the liquid water evaporates. Then the volume of the box must be____ litre. [Nearest integer]
[Given : R= 0.082 L atm K^{-1} mol^{-1}]
(Ignore the volume of the liquid water and assume water vapors behave as an ideal gas.

JEE Main-29.06.2022, Shift-II

Ans. (29) : Given: No. of particle in 0.90 g of liquid water molar mass of H_2O = 18

$T = 27°C = 300K$

$R = 0.0821 \text{ L atm } K^{-1} \text{ Mol}^{-1}$

Vapour pressure of water at 27°C is 32.0 Torr

$\because$ 1 atm = 760 Torr

Form ideal gas equation

$$PV = nRT$$

$$V = \frac{nRT}{P} = \frac{0.90\times0.082\times300\times760}{18\times32}$$

$$= 29.24$$

2. At 300 K, a sample of 3.0 g of gas a occupies the same volume as 0.2 g of hydrogen at 200 K at the same pressure. The molar mass of gas A is_____ g mol^{-1}. (nearest integer) Assume that the behaviour of gases as ideal.
(Given : The molar mass of hydrogen (H_2) gas is 2.0 g mol^{-1}).

JEE Main-24.06.2022, Shift-II

Ans. (45) : From ideal gas equation,

$$PV = nRT$$

Pressure and volume are the same

So, $n_1T_1 = n_2T_2$

$$\frac{m_1}{M_1}T_1 = \frac{m_2}{M_2}T_2$$

$$\frac{3.0}{M_1}\times300 = \frac{0.2}{2.0}\times200$$

$$900 = 20\times M_1$$

$$M_1 = \frac{900}{200}$$

$$M_1 = 45 \text{g mol}^{-1}$$

3. Which of the following plots is not according to Boyle's law?

(a) 
(b) 
(c) 
(d) 
COMEDK 2016

Ans. (d) : $P \propto \frac{1}{V}$, the graph will be a straight line passing through origin

4. A given mass of a gas obeys Boyle's law at certain temperature. Which one of the plots will not given a straight line?

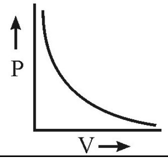
(a) V versus $\frac{1}{P}$ (b) P versus $\frac{1}{V}$
(c) log P versus log V (d) P versus V

A-P EAMCET 1995

Ans. (d) : Boyle's law is a gas law which states that the pressure exerted by a gas (of a given mass, kept at a constant temperature) is inversely proportional to the volume occupied by it.

According to Boyle's law at certain temperature–

$$P \propto \frac{1}{V}$$



5. Which of the following is a representation of Charles' law?

(a) $P_1T_1 = P_2T_2$ (b) $P_1T_2 = P_2T_1$
(c) $P_1V_1 = P_2V_2$ (d) $V_1T_2 = V_2T_1$

A-P EAMCET 1995

Ans. (d) : Charles's law states that the volume of an ideal gas is directly proportional to the absolute temperature at constant pressure.

According to Charles's law, at constant pressure

$$V \propto T$$

or $V_1T_2 = V_2T_1$

6. n moles of an ideal gas at temperature, T (in Kelvin) occupy V L of volume, exerting a pressure of P atmospheres. What is the concentration(in mol/L)?

@apna_pdf

(a) $\frac{P}{RT}$ (b) $\frac{PT}{R}$

(c) $\frac{RT}{P}$ (d) $\frac{R}{PT}$

A-P EAMCET 2001

Ans. (a) : For ideal gas equation –

$\therefore$ $PV = nRT$

$$\frac{n}{V} = \frac{P}{RT}$$

or $C = \left(\frac{n}{V}\right) = \frac{P}{RT}$

7. The total pressure of a mixture of 6.4g of O_2 and 5.6 of N_2 present in a 2 L vessel is 1200 mm.

(a) 1200 (b) 600

(c) 900 (d) 200

A-P EAMCET 2000

Ans. (b) : Given that,

Total pressure = 1200 mm

No. of moles of oxygen (m) = $\frac{6.4}{32} = 0.2$ moles

No. of moles of nitrogen (m) = $\frac{5.6}{28} = 0.2$ moles

$\therefore$ Mole fraction of $N_2 = \frac{n_2}{n+n_2} = \frac{0.2}{0.2+0.2} = \frac{1}{2}$

Since, partial pressure = mole fraction of N_2 × total pressure

$= \frac{1}{2} \times 1200 = 600\,\text{mm}$

8. At 27ºC, a closed vessel contains a mixture of equal weights of helium, (mol. wt. = 4), methane (mol. wt. = 16) and sulphur dioxide (mol. wt. = 64). The pressure exerted by the mixture is 210 mm. If the partial pressures of helium, methane and sulphur dioxide are P_1, P_2 and P_3 respectively, which one of the following is correct?

(a) $p_3 > p_2 > p_1$ (b) $p_1 > p_2 > p_3$

(c) $p_1 > p_3 > p_2$ (d) $p_2 > p_3 > p_1$

A-P EAMCET 2002

Ans. (b) : The partial pressure of helium (P_1), methane (P_2) and sulphur dioxide (P_3).

n_1 (He) = 64/4 = 16

n_2 (CH_4) = 64/16 = 4

n_3 (SO_2) = 64/64 = 1

$$\therefore \quad P_1(\text{He}) = X_{\text{He}} \times P = \frac{16}{21} \times 210 = 160\,\text{mm}$$

$$P_2(CH_4) = X_{CH_4} \times P = \frac{4}{21} \times 210 = 40\,\text{mm}$$

$$P_3(SO_2) = X_{SO_2} \times P = \frac{1}{21} \times 210 = 10\,\text{mm}$$

The correct order is –

$P_1 > P_2 > P_3$

9. A and B are ideal gases. The molecular weights of A and B are in the ratio of 1 : 4. The pressure of a gas mixture containing equal weights A and B is p atm. What is the partial pressure (in atm) of B in the mixture?

(a) $\frac{p}{5}$ (b) $\frac{p}{2}$

(c) $\frac{p}{2.5}$ (d) $\frac{3p}{4}$

A-P EAMCET 2005

Ans. (a) : Given that,

Molecular weight ratio of A and B = 1 : 4

Since, mole ratio of A and B if equal weight of A and B are taken = 4 : 1

$\therefore$ Partial pressure of B $= \frac{1}{(1+4)} \times P = \frac{P}{5}$

10. A certain mass of a gas occupies a volume of 2 L at STP. To what temperature the gas must be heated to double its volume, keeping the pressure constant?

(a) 100 K (b) 273 K

(c) 273 ºC (d) 546 ºC

A-P EAMCET 2007

Ans. (c) : Given that, $V_1 = 2L$, $T_1 = 273K$

$V_2 = 4L$, $T_2 = ?$

According to the Charles's law-

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

Putting the value are these, we get –

$$\frac{2}{273} = \frac{4}{T_2}$$

$$T_2 = \frac{4 \times 273}{2} = 546\text{K or } 273^\circ\text{C}$$

11. A person living in Shimla observed that cooking food without using pressure cooker takes more time. The reason is that at high altitude

(a) Temperature decreases

(b) Pressure increases

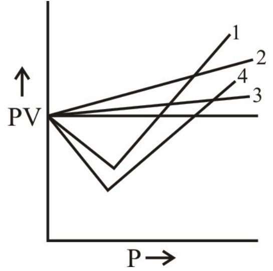
(c) Pressure decreases

(d) Temperature increases

AP EAPCET 23-08-2021 Shift-I

Ans. (c) : A person living in Shimla observed that cooking food without using pressure cooker takes more time. The reason is that at high altitude pressure decreases. Hence, correct option is (c).

12. The figure represents PV vs P relation for CO, CH_4, H_2 and He gases under identical conditions. Which curve, shown in the figure, represents He gas ?



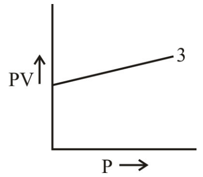
(a) 1 (b) 2

(c) 3 (d) 4

TS-EAMCET (Engg.), 05.08.2021 Shift-II

@apna_pdf

Ans. (c)



This curve represent the He gas in this given figure.

13. 1 L each of gases A and B diffused through a membrane in 15 and 30 minutes, respectively, under identical conditions. What is the ratio of molecular weight of A and B ?

(a) 1 : 2 (b) 2 : 1
(c) 4 : 1 (d) 1 : 4

TS-EAMCET (Engg.), 05.08.2021 Shift-II

Ans. (d) : Using Graham's law of diffusion-

$$\frac{r_1}{r_2} = \sqrt{\frac{m_2}{m_1}}$$

$$\frac{v/15}{v/30} = \sqrt{\frac{m_2}{m_1}}$$

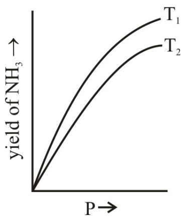
$$\frac{2}{1} = \sqrt{\frac{m_2}{m_1}}$$

$$\frac{m_2}{m_1} = \frac{4}{1}$$

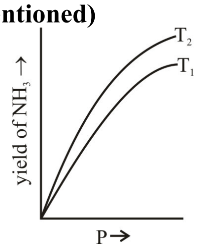
$$\boxed{m_1 : m_2 = 1 : 4}$$

14. For the formation of $NH_3(g)$ from H_2 and N_2, which one of the following graphs represents the yield of ammonia at equilibrium ? (Assume $T_1 < T_2$, unless mentioned)

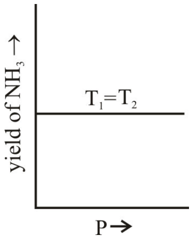
(a)



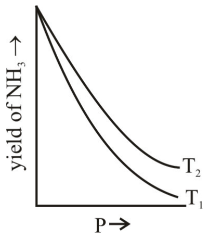
(b)



(c)

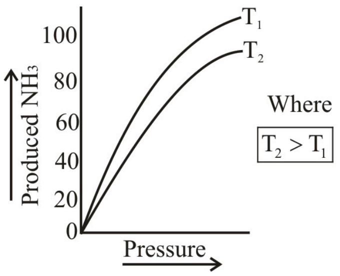


(d)



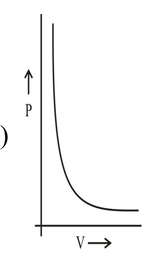
TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (a) :

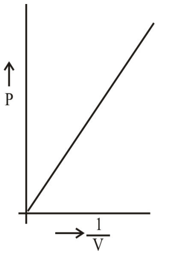


15. Which of the following plots correctly represent Boyle's law?

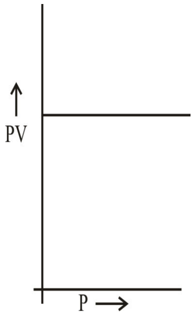
(a)



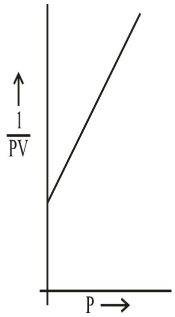
(b)



(c)



(d)

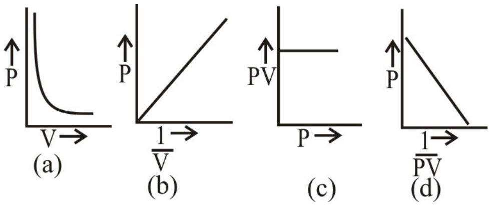


(a) a, b, d (b) a, c, d
(c) a, b, c, d (d) a, b, c

TS EAMCET 10.08.2021, Shift-I

Ans. (d) : Boyle law state that the pressure (p) of a given quantity of gas varies inversely with its volume (v) at constant temperature.

$$\boxed{PV = K}$$



Thus a, b, c is light

16. Match the following graphs of a gas with their corresponding y and x coordinates.

	Graph		y vs x
A.		**1.**	**pV vs V**
B.		**2.**	**P vs V**
C.		**3.**	$p \text{ vs } \frac{1}{V}$

Code:

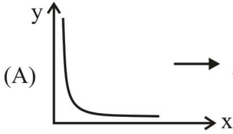
	A	B	C
(a)	2	3	1
(b)	1	3	2
(c)	2	1	3
(d)	1	2	3

AP EAMCET (Engg.) 18.9.2020 Shift-I

@apna_pdf

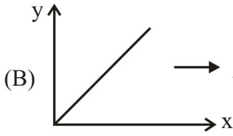
Ans. (a) :

(A)



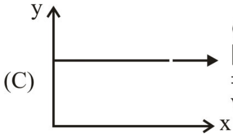
② p vs V (Boyle's law)
[p ∝ 1/V] ⇒ p and V
Vary inversely.

(B)



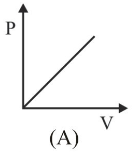
③ p vs V (Boyle's law)
[p ∝ 1/V] ⇒ p and 1/V
Vary directly.

(C)

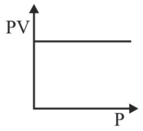


① p vs V (Boyle's law)
[pV = constant]
⇒ pV remains unchanged
with V or p..

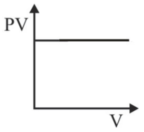
17. Which of the following graphs correctly represents Boyle's Law?



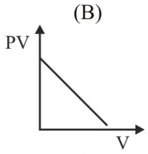
(A)



(B)



(C)



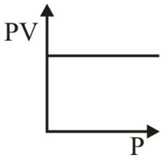
(D)

(a) (A), (B) & (C) only (b) (B) & (C) only
(c) (C) & (D) only (d) (B) & (D) only

AP EAPCET 19-08-2021 Shift-I

Ans. (b) : Boyles law states that –"at constant temperature the pressure of a fixed amount of gas varies inversely with its volume i.e.

$p \alpha \frac{1}{v}$



or pv = K_1 Where K_1 = Proportionality constant it means that at constant temperature product of pressure and volume of a fixed amount of gas is constant.

18. The ratio of rates of diffusion of gases X and Y is 1 : 5 and that of y and Z is 1 : 6. The ratio of rates of diffusion of Z and X is

(a) 1 : 30 (b) 1 : 6
(c) 30 : 1 (d) 6 : 1

AP EAMCET (Engg.) -2014

Ans. (c) : Let assume that the rate of diffusion of X,Y,Z are respectively r_x, r_y, r_z.

Given, $\frac{r_x}{r_y} = \frac{1}{5}$ …..(i)

and $\frac{r_y}{r_z} = \frac{1}{6}$ …..(ii)

Multiplying the equation (i) with (ii) – we get

$$\frac{r_x}{r_y} \times \frac{r_y}{r_z} = \frac{1}{5} \times \frac{1}{6}$$

or $\frac{r_x}{r_z} = \frac{1}{30}$

or $\frac{r_z}{r_x} = \frac{30}{1}$

Hence, the ratio of rates of diffusion of Z and X is 30: 1.

19. The correct value of the gas constant R is close to

(a) 0.082 L atm K^{-1} mol^{-1}
(b) 0.082 L atm^{-1} mol
(c) 0.82 L atm K
(d) 0.082 L atm^{-1} K mol^{-1}

COMEDK 2019

Ans. (a) : $R = \frac{PV}{nT}$

For 1 mole of gas at STP

$$R = \frac{1 \times 22.4}{1 \times 273} = 0.082 \text{ L atm } K^{-1} mol^{-1}$$

20. The rate of diffusion of SO_2, CO_2 PCl_3 and SO_3 are in the following order

(a) $PCl_3 > SO_3 > SO_2 > CO_2$
(b) $CO_2 > SO_2 > PCl_3 > SO_3$
(c) $SO_2 > SO_3 > PCl_3 > CO_2$
(d) $CO_2 > SO_2 > SO_3 > PCl_3$

AIIMS 25 May 2019 (Evening)

Ans. (d): Graham's law states that at a constant temperature and for constant pressure gradient the rates of effusion of different gases are inversely proportional to the square root of their densities. According to the Graham's law –

$$\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$$

Where – M_2 = Molecular weight of second gas
M_1 = Molecular weight of first gas

From the above relation it is clear that the rate of diffusion is inversely proportional to the square root of the molecular weight of the gas.

$M_{PCl_3} = 137.33 \text{ g/mol}$ $M_{SO_3} = 80.06 \text{ g/mol}$

$M_{SO_2} = 64.066 \text{ g/mol}$ $M_{CO_2} = 44 \text{ g/mol}$

The increasing order of molecular weight of the gases are –

$$M_{CO_2} < M_{SO_2} < M_{SO_3} < M_{PCl_3}$$

Hence, the rate of diffusion has the following decreasing order –

$$CO_2 < SO_2 < SO_3 < PCl_3$$

21. Which of the following gases will have the highest rate of diffusion?

(a) CO_2 (b) N_2
(c) NH_3 (d) O_2

AIIMS-1994

Ans. (c): According to the Graham's law of diffusion – the rate of diffusion is inversely proportional to the square root of the molecular weight of the gases.

$$r \propto \frac{1}{\sqrt{M}}$$

Where r = rate of diffusion
M = molecular weight

@apna_pdf

Hence, $M_{CO_2} = 44, M_{N_2} = 28, M_{NH_3} = 17, M_{O_2} = 32$ NH_3 has the less value of molecular weight due to which they get higher diffusion.

22. Assertion: Use of pressure cooker reduces cooking time.
Reason :At higher pressure cooking occurs faster.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2000

Ans. (a): Pressure cookers allow food to cook faster because it raises the pressure and therefore the temperature of the water in it, which ultimately cooks faster.
Hence, both assertion and reason are correct and the reason is a correct explanation of the assertion.

23. Gas in cylinder is maintained at 10 atm pressure and 300 K temperature. The cylinder will explode if pressure of gas is beyond 15atm. What is maximum temperature upto which gas can be heated?

(a) 400 K	(b) 500 K
(c) 450 K	(d) 250 K

AIIMS-27 May, 2018 (M)

Ans. (c): Given, $P_1 = 10$ atm $P_2 = 15$ atm
$T_1 = 300K$ $T_2 = ?$
According to the Gay Lussac's law –
At constant volume, pressure of a fixed amount of a gas varies directly with the temperature.

$$P \propto T$$

or $$\frac{P}{T} = K \text{ (constant)}$$

$$\therefore \frac{P_1}{T_1} = \frac{P_2}{T_2} \text{ (The volume is constant for the cylinder)}$$

$$\frac{10}{300} = \frac{15}{T_2}$$

$$T_2 = 450 \text{ K}$$

24. Two separate bulbs contain ideal gases A and B. The density of gas A is twice that of gas B. The molecular weight of A is half that of gas B. The two gases are at the same temperature. The ratio of the pressure of A to that of gas B is:

(a) 1/4	(b) 1
(c) 4	(d) 2

AIIMS-27 May, 2018 (E)

Ans. (c): Given –

For bulb A –	For bulb B –
$d_A = 2d_B$	$T_A = T_B = T$
$M_A = \frac{M_B}{2}$	$\frac{P_A}{P_B} = ?$

Form the ideal gas equation – we get

$$PV = nRT$$

or $$P = \frac{d}{M}RT$$

Where – P = Pressure of gas
d = Density of gas
M = Molecular weight
R = Gas constant
T = Temperature

$$\therefore P_A = \frac{d_A}{M_A}RT \quad \text{….. (i)}$$

and $$P_B = \frac{d_B}{M_B}RT \quad \text{….. (ii)}$$

Form equation (i) and (ii) – we get

$$\frac{P_A}{P_B} = \frac{d_A}{M_A} \times \frac{M_B}{d_B}$$

$$\frac{P_A}{P_B} = \frac{2d_B}{M_B} \times \frac{2M_B}{d_B}$$

or $$\frac{P_A}{P_B} = \frac{4}{1}$$

25. Cyclopropane and oxygen at partial pressure 170 torr and 570 torr respectively are mixed in a gas cylinder. What is the ratio of the number of moles of cyclopropane to the number of moles of oxygen (nC_3H_6/nO_2)?

(a) $\frac{170 \times 42}{570 \times 32} = 0.39$

(b) $\frac{170}{42} \Big/ \left(\frac{170}{42} + \frac{570}{32}\right) \approx 0.19$

(c) $\frac{170}{740} = 0.23$

(d) $\frac{170}{570} = 0.30$

AIIMS-2015

Ans. (d): Given, $p_{C_3H_6} = 170$ torr

$p_{O_2} = 570$ torr

$\frac{n_{C_3H_6}}{n_{O_2}} = ?$

let, p be the total pressure of the cylinder.
Form the relation between partial pressure and mole fraction – we get

$$p_{C_3H_6} = X_{C_3H_6}.P$$

$$p_{C_3H_6} = \frac{n_{C_3H_6}}{n_{C_3H_6} + n_{O_2}} \times P \quad \text{….(i)}$$

$$P_{O_2} = \frac{n_{O_2}}{n_{O_2} + n_{C_3H_6}} \times P \quad \text{….(ii)}$$

Form equation (I) and (II) – we get

$$\frac{p_{C_3H_6}}{P_{O_2}} = \frac{n_{C_3H_6}}{n_{O_2}} \times \frac{P}{P}$$

Or $$\frac{n_{C_3H_6}}{n_{O_2}} = \frac{170}{570} = 0.30$$

@apna_pdf

26. When a sample of gas is compressed at constant temperature from 15 atm to 60 atm, its volume changes from 76 cm^3 to $20.5cm^3$. Which of the following statements are possible explanations of this behavior?

(1) The gas behaves non- ideally

(2) The gas dimerises

(3) The gas is adsorbed into the vessel walls

(a) 1,2 and 3 (b) 1 and 2 only

(c) 2 and 3 only (d) 1 only

AIIMS-2016

Ans. (d): Given, $P_1 = 15$ atm $V_1 = 76\ cm^3$

$P_2 = 60$ atm $V_2 = 20.5\ cm^3$

From the mathematical expression of Boyle's law –

$$P_1V_1 = P_2V_2$$

$$15 \times 76 = 60 \times 20.5$$

$$1140 \neq 1230$$

$$\therefore \quad P_1V_1 \neq P_2V_2$$

Hence, from the above data it is clear that the gas behaves non-ideally. The given information is not sufficient to comment on other statement.

27. Pure hydrogen sulphide is stored in a tank of 100 litre capacity at 20ºC and 2 atm pressure. The mass of the gas will be

(a) 34 g (b) 340g

(c) 282.68g (d) 28.24 g

AIIMS-2017

Ans. (c): Given, volume = 100 litre

T = 20°C + 273 = 293 K

P = 2 atm

W = ?

Molecular weight of $H_2S(M) = 34$

From the ideal gas equation – we get

$$PV = nRT$$

Where – n = number of mole of the gas

$$Pv = \frac{W}{M}\cdot RT$$

Or $$W = \frac{PVM}{RT}$$

$$W = \frac{2 \times 100 \times 34}{0.0821 \times 293}$$

$$W = 282.74$$

$$W \approx 282.68\ g$$

28. A gas (1g) is kept at 4 bar pressure. If we add 2 g of gas B, then the total pressure inside the container is 6 bar. Which of the following is true?

(a) $M_A=2M_B$ (b) $M_B=2M_A$

(c) $M_A=4M_B$ (d) $M_B=4M_A$

AIIMS-26 May, 2018 (M)

Ans. (d): Given,

For gas A – For gas B –

$W_A = 1g$ $W_B = 2$ g

$P_A = 4$ bar $P_B = 6 - 4 = 2$ Bar

At the container, the volume and temperature are constant. Now, ideal gas equation can be written as for gas A and gas B.

$$P_AV = nRT$$

or $$P_AV = \frac{W_A}{M_A}\cdot RT \qquad ....(i)$$

Similarly, for gas B –

$$P_BV\frac{W_B}{M_B}\cdot RT \qquad ....(ii)$$

Putting the values as well as dividing equation (i) to the (ii) – we get

$$\frac{4V}{2V} = \frac{1}{M_A} \times \frac{M_B}{2}$$

or $$2 = \frac{M_B}{2M_A}$$

or $$M_B = 4M_A$$

29. A bottle of dry ammonia and a bottle of dry hydrogen chloride connected through a long tube are opened simultaneously at both ends. The white ammonium chloride ring first formed will be

(a) at the centre of the tube.

(b) near the hydrogen chloride bottle.

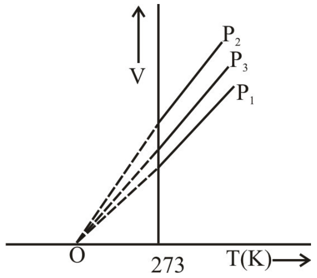
(c) near the ammonia bottle.

(d) throughout the length of the tube.

AIIMS-2014

Ans. (b): According to the Graham's law of diffusion, the rate of diffusion is inversely proportional to the square root of the molecular weight of the gas. The effusion of NH_3 take place fastly than the HCl because it has the less molecular weight than the HCl. Therefore, NH_3 will travel more distance than HCl in the same time interval and the two gas will first meet nearer to HCl end.

30. The volume- temperature graphs of a given mass of an ideal gas at constant pressure are shown below.



What is the correct order of pressure?

(a) $p_1 > p_3 > p_2$ (b) $p_1 > p_2 > p_3$

(c) $p_2 > p_3 > p_1$ (d) $p_2 > p_1 > p_3$

AIIMS-2008

Ans. (a): Boyle's law states that at constant temperature, the pressure of the fixed amount of gas varies inversely with its volume Mathematically, it can be written as –

$$P \propto \frac{1}{V}$$

or $$P = K_1\frac{1}{V}$$

Where K_1 = Proportionality constant.

@apna_pdf

In the given graph, P_2 has the maximum volume due to which they gets the lower value of pressure. On the other hand, P_1 has the least value of volume, it has the higher pressure.

Hence, the correct order of pressure will be –

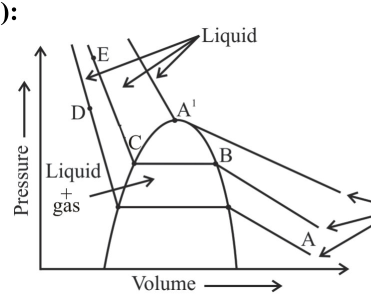
$P_1 > P_3 > P_2$

31. In P versus V graph, the horizontal line is found in which _____exists.

(a) Gas
(b) Liquid
(c) Equilibrium between gas and liquid
(d) Super critical temperature

AIIMS-2007

Ans. (c):



In the right side of the above graph, the CO_2 exists in the gas phase. A point like D represents liquid state and a point under the dome shaped area represents existence of liquid and gaseous carbon dioxide in equilibrium.

32. If P is pressure and ρ is density of a gas, then P and ρ are related as

(a) $P \propto \rho$
(b) $P \propto (1/\rho)$
(c) $P \propto \rho^2$
(d) $P \propto (1/\rho^2)$

AIIMS-2002

Ans. (a): The ideal gas equation for n mole can be written as –

$$PV = nRT$$

or $$P = \frac{W}{MV}RT$$

or $$P = \frac{\rho}{M}\cdot RT$$

or $$P \propto \rho$$

Hence, pressure of the gas is directly proportional to the density of gas.

33. At 298K, equal volumes of SO_2, CH_4 and O_2 are mixed in empty container. The total pressure exerted in 2.1 atm. The partial pressure of CH_4 in mixture is:

(a) 0.6 atm
(b) 1.2 atm
(c) 2.4 atm
(d) 3.6 atm

AIIMS-2000

Ans. (b): Given, Total Pressure (P) = 2.1 atm, $p_{CH_4} = ?$

Let, W be the weight of all gases.

$$\therefore\ n_{SO_2} = \frac{W}{64}, \qquad n_{CH_4} = \frac{W}{16}, \qquad n_{O_2} = \frac{W}{32}$$

$$p_{CH_4} = \frac{n_{CH_4}}{n_{CH_4} + n_{SO_2} + n_{O_2}} \times \text{Total pressure}$$

$$p_{CH_4} = \frac{\frac{W}{16}}{\frac{W}{16} + \frac{W}{64} + \frac{W}{32}} \times 2.1$$

$$p_{CH_4} = \frac{1}{\left(1 + \frac{1}{4} + \frac{1}{2}\right)} \times 2.1$$

$$p_{CH_4} = \frac{1}{\left(\frac{7}{4}\right)} \times 2.1$$

$$p_{CH_4} = \frac{2.1 \times 4}{7}$$

$$p_{CH_4} = 1.2 \text{ atm}$$

34. A gas occupies a volume of 300 cc at 27ºC and 620 mm pressure. The volume of gas at 47°C and 640 mm pressure is:

(a) 260cc
(b) 310 cc
(c) 390cc
(d) 450 cc

AIIMS-1997

Ans. (b): Given, $V_1 = 300$ cc, $V_2 = ?$

$T_1 = 27°C + 273 = 300$ K $T_2 = 47°C + 273 = 320$ K

$P_1 = 620$ mm Hg $P_2 = 640$ mm Hg

If temperature, volume and pressure of a fixed amount of gas vary from T_1, V_1 and P_1 to T_2, V_2 and P_2 then we can write-

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\frac{620 \times 300}{300} = \frac{640 \times V_2}{320}$$

or $$V_2 = 310 \text{ cc}$$

35. On the top of a mountain, water boils at :

(a) high temperature
(b) same temperature
(c) high pressure
(d) low temperature

AP-EAMCET (Engg.) 2015

Ans. (d) : On the top of a mountain, water boils at low temperature. Pressure is directly proportional to temperature. At low pressure, boiling point of water come down.

36. When a perfect gas a 27° is heated at a constant pressure, to a final temperature of 327°C, then the volume of the gas increases to _____ times the original

(a) 3
(b) 4
(c) 2
(d) 6

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c) : Given, $T_1 = 27°C = 300$ K

$T_2 = 327°C = 600K$, $V_1 = V$, $V_2 = ?$

Since, the process is a constant pressure process, apply Charle's law-

$$\frac{V_1}{V_2} = \frac{T_1}{T_2}$$

@apna_pdf

$$\frac{V}{V_2} = \frac{300}{600}$$

$$\frac{V}{V_2} = \frac{1}{2}$$

$$\boxed{V_2 = 2V}$$

So, the volume of gas increase to '2' times the original

37. CH_4 diffuses two times faster than a gas X. The number of molecules present in 32 g of gas X is (N is Avogadro number)

(a) N (b) $\frac{N}{2}$

(c) $\frac{N}{4}$ (d) $\frac{N}{16}$

AP-EAMCET- (Engg.) - 2010

Ans. (b) : According to Graham's law of diffusion

$$\frac{r_{CH_4}}{r_x} = \sqrt{\frac{M_x}{M_{CH_4}}}$$

Given, $r_{CH_4} = 2 \cdot r_x$

$$\frac{2rx}{rx} = \sqrt{\frac{Mx}{16}}$$

So, $2 = \sqrt{\frac{M_x}{16}}$

$M_x = 4 \times 16 = 64$

Thus, the molecular mass of gas X is 64.

Number of molecules of gas X in 32 gm gas $= \frac{32}{64} \times N$

$$= \frac{N}{2}$$

38. The volume of oxygen gas liberated at 27°C and 760 mm Hg pressure when 24.5 g of $KClO_3$ is heated, is (M. wt. of $KClO_3$ = 122.5)

(a) 4.48 L (b) 9.6 L

(c) 7.4 L (d) 11.2 L

AP - EAMCET(MEDICAL) - 2009

Ans. (c) : The decomposition of KCl_3 can be written as–

$$2KClO_3 \longrightarrow 2KCl + 3O_2$$

At STP 2×122.5 $3 \times 22.4 = 67.2$ L

$= 245$

$\because$ When 245g $KClO_3$ is heated, then amount of oxygen liberated i.e = 67.2 L

$\therefore$ When 24.5g $KClO_3$ is heated, liberated oxygen $= \frac{67.2 \times 24.5}{245} = 6.72$ L

The given amount of O_2 was librated at STP. Therefore, at 27°C and 760 mm Hg pressure, the volume of liberated oxygen will be–

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

or $$V_2 = \frac{P_1V_1}{T_1} \times \frac{T_2}{P_2}$$

$$V_2 = \frac{760 \times 6.72}{273} \times \frac{300}{760}$$

$V_2 = 7.38$ L

$V_2 \approx 7.4$ L

39. A gaseous mixture containing He, CH_4 and SO_2 was allowed to effuse through a fine hole then find what molar ratio of gases coming out initially? (Given mixture contains He, CH_4 and SO_2 in 1 : 2 : 3 mole ratio).

(a) $\sqrt{2} : \sqrt{2} : 3$ (b) 2 : 2 : 3

(c) 4 : 4 : 3 (d) 1 : 1 : 3

VITEEE-2014

Ans. (c) : Given mole ratio of He, CH_4 and SO_2 is 1:2:3 respectively.

$$\frac{n'_{He}}{n'_{CH_4}} = \frac{1}{2}\sqrt{\frac{\text{molar mass of } CH_4}{\text{molar mass of He}}}$$

$$= \frac{1}{2}\sqrt{\frac{16}{4}}$$

$$= \frac{1}{2} \times 2 = \frac{1}{1} = 1$$

$$\frac{n'_{He}}{n'_{SO_2}} = \frac{1}{2}\sqrt{\frac{64}{4}} = \frac{4}{3}$$

So, The molar ratio of the gases coming out will be–

$$n_{He} : n_{CH_4} : n_{SO_2} = 4:4:3$$

40. Two glass bulbs A and B are connected by a very small tube having a stop-cock. Both A has a volume of 100 cm^3 and contained the gas while bulb B was empty. On opening stop-clock, the pressure fell down to 40%. The volume of the bulb B must be

(a) 75 cm^3 (b) 125 cm^3

(c) 150 cm^3 (d) 250 cm^3

VITEEE- 2011

Ans. (c) : According to the Boyle's law – at the constant temperature. The pressure of the gas is inversely propotimal to it's volume.

$$\therefore \ P \propto \frac{1}{V}$$

i.e. for two gases –

$$P_1 V_1 = P_2 V_2$$

Given – Glass bulb (A) Glass bulb (B)

$P_1 = P$ $P_2 = \frac{P \times 40}{100}$

$V_1 = 100$ cm^3 $V_2 = ?$

$\therefore$ $P_1V_1 = P_2V_2$

or $$V_2 = \frac{P_1V_1}{P_2}$$

$$V_2 = \frac{\cancel{P} \times 100 \times 100}{\cancel{P} \times 40}$$

$$V_2 = 250 \text{cm}^3$$

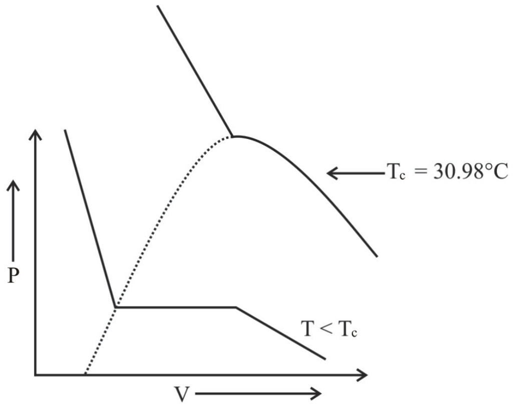
$\therefore$ Volume of bulb B = 250 – 100 = 150 cm^3

@apna_pdf

41. Graph between P & V below critical temperature is:

(a) 
(b) 
(c) 
(d) 
AIIMS 26 May 2019 (Evening)

Ans. (d): Critical temperature of a substance is the temperature at and above which vapour of the substance cannot be liquefied, no matter how much pressure is applied.



42. A 2.5 liter flask contains 0.25 mol each of sulphur dioxide and nitrogen gas at 27°C. The total pressure exerted by the mixture of the two gases will be

(a) 4.98×10^5 Pa (b) 2.49×10^5 Pa
(c) 4.98×10^{10} Pa (d) 2.49×10^{10} Pa

[Given : R=8.314 $JK^{-1}mol^{-1}$]

AMU – 2007

Ans. (a) : Total number of moles of two gases = 0.5 mole

Total pressure exerted by two gases, $P = \dfrac{nRT}{V}$

Here, n = 0.5, R = 8.314 J mol^{-1} K^{-1}, T = 300K,
V = 2.5 liter = 2.5×10^3 cm^3
Here R = 8.314 K^{-1} mol^{-1} = 8.314 k Pa K^{-1} mol^{-1}
= 8.314×10^3 Pa K^{-1} mol^{-1} cm^3

$$p = \frac{0.25\times8.314\times10^3\times300}{2.5} \text{ Pa} = 498.84\times10^3 \text{ Pa}$$
$= 4.98\times10^5$ Pa

43. Which of the following variable determine the state of a system?

(a) Volume and temperature
(b) Pressure and temperature
(c) Volume, pressure, and temperature
(d) Volume, pressure, temperature and concentration

AMU–2003

Ans. (c) : From the ideal gas equation-
PV = nRT
Where- P = Pressure of the gas
V = Volume of the gas
n = Number of the gas
R = Gas constant
T = Absolute temperature

Ideal gas equation is a relation between four variables and it describes the state of any gas, therefore, it is also called equation of state.

44. Standard boiling point of a liquid is

(a) equal to the normal boiling point
(b) slightly lower than the normal boiling point
(c) slightly higher than the normal boiling point
(d) The boiling point at 1 atm pressure

Assam CEE-2019

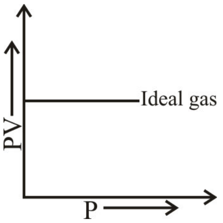
Ans. (d) : Boiling point at 1 atm pressure also it is slightly lower than normal boiling point of liquid.

45. Slope between PV and P at constant temperature is :

(a) zero (b) 1
(c) $\dfrac{1}{2}$ (d) $\dfrac{1}{\sqrt{2}}$

BCECE-2004

Ans. (a) : When we plot PV vs. P plot of gases because at constant temperature, PV will be constant (Boyle's law) and PV vs. P graph at all pressures will be a straight line parallel to X-axis. In this situation, the slope between PV and P is zero.



46. If two molecules of A and B having mass 100 kg and 64 kg and rate of diffusion of A is 12×10^{-3}, then what will be the rate of diffusion of B?

(a) 15×10^{-3} (b) 64×10^{-3}
(c) 5×10^{-3} (d) 46×10^{-3}

BCECE-2008

Ans. (a) : Given data, M_A = 100 kg , $r_A = 12 \times 10^{-3}$
M_B = 64 kg, r_B = ?

The rate of diffusion are directly proportional to their molecular weights, M_A and M_B.

$$\therefore \quad \frac{r_A}{r_B} = \sqrt{\frac{M_B}{M_A}}$$
$$= \frac{12\times10^{-3}}{r_B} = \sqrt{\frac{64}{100}}$$
$$= \frac{12\times10^{-3}}{r_B} = \frac{8}{10}$$
$r_B = 15 \times 10^{-3}$

47. At a constant volume the specific heat of a gas is 0.05 and its molecular weights is 40. The gas is :

(a) Monoatomic (b) Diatomic
(c) Triatomic (d) None of above

BITSAT 2010

@apna_pdf

Ans. (a) : $q = \frac{c}{m}$

$\Rightarrow C_V = q \times m$

$= C_V = q \times m$

$= 0.05 \times 40$

$= 3.0$ cal

$C_P - C_V = R$

$C_P = C_V + R$

$= 3 + 2$

$= 5$

$\frac{C_P}{C_V} = \frac{5}{3} = 1.66$

Monoatomic gas.

48. 100 ml O_2 and H_2 kept at same temperature and pressure. What is true about their number of molecules.

(a) $NO_2 > NH_2$ (b) $NO_2 < NH_2$

(c) $NO_2 = NH_2$ (d) $NO_2 + NH_2 = 1$ mole

BITSAT 2018

Ans. (c) : This is Avogadro's hypothesis.

According to this, equal volume of all gases contain equal no. of molecules under similar condition of temperature and pressure.

49. The predominant intermolecular forces present in ethyl acetate, a liquid, are:

(a) London dispersion and dipole-dipole

(b) London dispersion, dipole-dipole and hydrogen bonding

(c) Dipole-dipole and hydrogen bonding

(d) Hydrogen bonding and London dispersion

[JEE Main 2020, 8 Jan Shift-I]

Ans. (a) : Force of attraction between two temporary dipoles is known as London force. Another name for this force is dispersion force. Here, ethyl acetate has the temporary dipole whereas liquid has permanent dipole due to which dipole-dipole forces act as the liquid.

50. Based on kinetic theory of gases following laws can be proved

(a) Boyle's law (b) Charles' law

(c) Avogadro's law (d) All of these

[AIEEE 2002]

Ans. (d) : We can deduce gas laws from kinetic theory of gases as follows-

(i) Boyle's law

$$P = \frac{1}{3}\frac{nm}{V}V_{rms}^2$$

$$PV = \frac{1}{3}\, nm\, V_{rms}^2$$

Now, as V_{rms} is a function of temperature above, so if temperature is constant, V_{rms} is constant. Hence, at constant temperature, the term an right hand side of equation is a constant.

$\therefore$ PV = constant

(ii) Charles' law-

$$P = \frac{1}{3}\frac{mn}{V}\; V_{rms}^2$$

or $$V = \frac{2n}{3P}\left(\frac{1}{2}mV_{rms}^2\right)$$

$$V = \frac{2}{3}\frac{n}{P}\frac{3}{2}K_BT$$

So, when P = constant then V = T

or $\frac{V}{T} = a$ (constant)

(iii) Avogadro's law-

Let, there are two gases under same condition of pressure, volume and temperature, then for gas 1,

$$PV = \frac{1}{3}m_1n_1\left(V_1\right)_{rms}^2$$

for gas 2,

$$PV = \frac{1}{3}m_2n_2\left(V_2\right)_{rms}^2$$

As the temperature is same, $\frac{1}{2}m_1\left(V_1\right)_{rms} = \frac{1}{2}m_2\left(V_2\right)_{rms}$

$\therefore$ $n_1 = n_2$

Equal volume of all gases at same pressure and temperature contains equal number of molecules.

51. When r. p and M represent rate of diffusion, pressure and molecular mass, respectively, then the ratio of the rates of diffusions (r_A/r_B) of two gases A and B is given as

(a) $\left(p_A/p_B\right)^{1/2}\left(M_A/M_B\right)$

(b) $\left(p_A/p_B\right)\left(M_B/M_A\right)^{1/2}$

(c) $\left(p_A/p_B\right)^{1/2}\left(M_B/M_A\right)$

(d) $\left(p_A/p_b\right)\left(M_A/M_B\right)^{1/2}$

[AIEEE 2011]

Ans. (b) : According to Graham's law of diffusion

$$r_d \propto \frac{1}{\sqrt{\text{Molar mass}}}$$

At constant temperature

$$r_d \propto \frac{\text{pressure}}{\sqrt{\text{Molar mass}}}$$

$$\frac{r_A}{r_B} = \frac{P_A/\sqrt{M_A}}{P_B/\sqrt{M_B}}$$

$$\frac{r_A}{r_B} = \left(\frac{P_A}{P_B}\right)\left(\frac{M_B}{M_A}\right)^{1/2}$$

52. If 10^{-4} dm^3 water is introduced into a 1.0 dm^3 flask at 300 K, then how many moles of water are in the vapour phase when equilibrium is established?

(Given, vapour pressure of H_2O at 300 K is 3170 Pa;

R = 8.314 JK^{-1}mol^{-1}

(a) 5.56×10^{-3} mol (b) 1.53×10^{-2} mol

(c) 4.48×10^{-2} mol (d) 1.27×10^{-3} mol

[AIEEE 2010]

Ans. (d) : Given: - T = 300K, R = 8.314 JK^{-1}mol^{-1}

Vapour pressure (p) = 3170 Pa

Volume of water = 10^{-4} dm^3

@apna_pdf

Volume of flask = 1 $dm^3 = 10^{-3}$ m^3

Number of moles = (n) = ?

As we know that vapour pressure doesn't depends on volume of water. So we use volume of flask (V).

From ideal gas equation,

$$n=\frac{PV}{RT}$$

$$n=\frac{3170\times10^{-3}}{300\times8.314}$$

n= 1.27×10^{-3} mol

53. An open vessel at 27ºC is heated until two fifth of the air (assumed as an ideal gas) in it has escaped from the vessel. Assuming that the volume of the vessel remains constant, the temperature at which the vessel has been heated is

(a) 750 K (b) 500 K

(c) 750ºC (d) 500ºC

[JEE Main 2019, 12 Jan Shift-II]

Ans. (b) : Given :- T_1 = 27°C = 300K

$$n_1=n,\ n_2=n-\frac{2}{5}n=\frac{3}{5}n.$$

Ideal gas equation at constant pressure and volume,

nT = constant

$$n_1T_1=n_2T_2$$

$$T_2=\frac{n_1T_1}{n_2}$$

$$T_2=\frac{n\times(300)}{\frac{3}{5}n}=\frac{300\times5}{3}=500K$$

54. The volume of gas A is twice than that of gas B. The compressibility factor of gas A is thrice than that of gas B at same temperature. The pressures of the gases for equal number of moles are

(a) $p_A=2p_B$ (b) $2p_A=3p_B$

(c) $p_A=3p_B$ (d) $3p_A=2p_B$

[JEE Main 2019, 12 Jan Shift-I]

Ans. (b) : Compressibility factor (Z) = $\frac{PV}{nRT}$

At constant temperature and moles, $\frac{Z}{PV}$ = constant

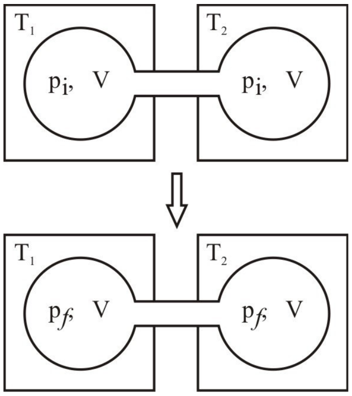
$$Z_A=3Z_B, V_A=2V_B$$

$$\frac{Z_A}{P_AV_A}=\frac{Z_B}{P_BV_B}$$

$$\frac{P_A}{P_B}=\frac{Z_A}{Z_B}\times\frac{V_B}{V_A}=\frac{3}{2}$$

$$2P_A=3P_B$$

55. Two closed bulbs of equal volume (V) containing an ideal gas initially at pressure, p_i and temperature T_1 are connected through a narrow tube of negligible volume as shown in the figure below. The temperature of one of the bulbs is then raised to T_2. The final pressure p_f is



(a) $2p_i\left(\frac{T_1}{T_1+T_2}\right)$ (b) $2p_i\left(\frac{T_2}{T_1+T_2}\right)$

(c) $2p_i\left(\frac{T_1T_2}{T_1+T_2}\right)$ (d) $p_i\left(\frac{T_1T_2}{T_1+T_2}\right)$

JEE Main-2016

Ans. (b) : For closed system, total number of mole before and after increment of temperature is equal i.e.,

$$(n_1+n_2)_i\,(n_1+n_2)_f$$

$n=\frac{PV}{RT}$ from ideal gas equation

$$\frac{P_iV}{RT_1}+\frac{P_iV}{R\cdot T_1}=\frac{P_fV}{RT_1}+\frac{P_fV}{RT_2}$$

$$\frac{2P_i}{T_1}=\frac{P_f}{T_1}+\frac{P_f}{T_2}=P_f\left(\frac{T_1+T_2}{T_1\times T_2}\right)$$

$$P_f=\frac{2P_i}{T_1}\left(\frac{T_1+T_2}{T_1\times T_2}\right)$$

$$P_f=\frac{2PiT_1.T_2}{T_1(T_1+T_2)}$$

$$\boxed{P_f=\frac{2P_iT_2}{T_1+T_2}}$$

56. The intermolecular interaction that is dependent on the inverse cube of distance between the molecules is

(a) ion-ion interaction

(b) ion-dipole interaction

(c) London force

(d) Hydrogen bond

[JEE Main 2015]

Ans. (b) : Ion-ion interaction is dependent on the square of distance, i.e. ion-ion interaction $\propto\frac{1}{r^2}$

Similarly, ion-dipole interaction $\propto\frac{1}{r^3}$

London forces $\propto\frac{1}{r^6}$

And dipole-dipole interaction $\propto\frac{1}{r^3}$

Superficially it seems as both ion dipole interaction and hydrogen bonding vary with the inverse cube of

@apna_pdf

distance between the molecules but when we look at the exact expression of field (force) created in two situations it comes as

$$|E| \text{ or } |F| = \frac{2|P|}{4\pi\varepsilon_0 r^3}$$

(In case of ion-dipole interaction)

And $$F = \frac{2q^2r - 4q^2a}{4\pi\varepsilon_0 r^3}$$

(In case of dipole-dipole interaction)

From the above it is very clear, the ion-dipole interaction is the better answer as compared to dipole-dipole interaction i.e. hydrogen bonding.

57. A spherical balloon of radius 3 cm containing helium gas has a pressure of 48×10^{-3} bar. At the same temperature, the pressure, of a spherical balloon of radius 12 cm containing the same amount of gas will be.......x 10^{-6} bar.

[JEE Main 2020, 6 Sep Shift-I]

Ans. (750) : Given:- $P_1 = 48 \times 10^{-3}$ bar

$r_1 = 3\text{cm}$ $r_2 = 12$ cm

$P_2 = ?$

$$\text{Initial Volume } (V_1) = \frac{4}{3}\pi r_1^3 = \frac{4}{3}\pi(3)^3$$

$$\text{Final volume} = (V_2) = \frac{4}{3}\pi r_2^3 = \frac{4}{3}\pi(12)^3$$

Ideal gas equation at constant temperature,

PV = constant

$P_1V_1 = P_2V_2$

$$P_2 = \frac{48\times10^{-3}\times\frac{4}{3}\pi(3)^3}{\frac{4}{3}\pi(12)^3}$$

$= 750 \times 10^{-6}$ bar

58. The relative strength of interionic /intermolecular forces in decreasing order is

(a) dipole-dipole>ion-dipole>ion-ion
(b) ion-ion>ion-dipole>dipole-dipole
(c) ion-dipole>ion-ion>dipole-dipole
(d) ion-dipole>dipole-dipole>ion-ion

[JEE Main 2020, 7 Jan Shift-I]

Ans. (b) : Ion-Ion interaction are stronger because they have stronger electrostatic force of attraction whereas dipoles have partial charges and hence the electrostatic force of attraction is the weak. The relative strength of inter ionic/intermolecular forces in decreasing order is Ion-ion > ion-dipole > dipole - dipole.

59. A car tyre is filled with nitrogen gas 35 psi at 27ºC. It will burst if pressure exceeds 40 psi. The temperature in ºC at which the car tyre will burst is......
(Rounded-off to the nearest integer).

[JEE Main 2021, 25 Feb Shift-I]

Ans. (70) : Given :- $P_1 = 35$ psi, $P_2 = 40$ psi

$T_1 = 27°C = 300K$, $T_2 = ?$

From ideal gas equation, at constant volume

$$\frac{P}{T} = \text{constant}$$

$$\frac{P_1}{T_1} = \frac{P_2}{T_2}$$

$$T_2 = 40 \times \frac{300}{35} = 342.85\,K$$

$$T_2 = 342.85 - 273.15 \approx 70°C$$

60. The volume occupied by 4.75 g of acetylene gas at 50ºC and 740 mm Hg pressure is.......L (Rounded off to the nearest integer).
[Given, R = 0.0821 L atm K^{-1} mol^{-1}]

[JEE Main 2021, 24 Feb Shift-II]

Ans. (5) : Given :- P = 740 mm Hg = $\frac{740}{760}$ atm

T = 50°C = 323K, w = 4.75g

Volume (V) = ?

$$\text{Moles of acetylene gas (n)} = \frac{w}{M} = \frac{4.75}{26}\text{mol}$$

From ideal gas equation,

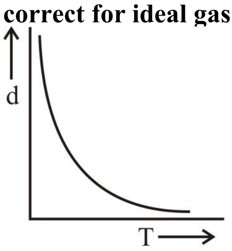
PV = nRT

$$V = \frac{4.75}{26}\times\frac{0.0821\times323}{\frac{740}{760}}$$

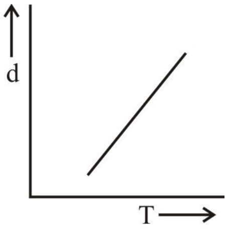
$$= \frac{4.75\times0.0821\times323\times760}{25\times740}$$

$V \approx 5$ L

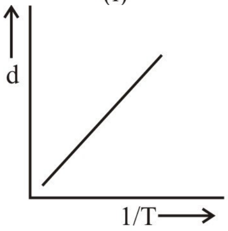
61. Which one of the following graphs is not correct for ideal gas?



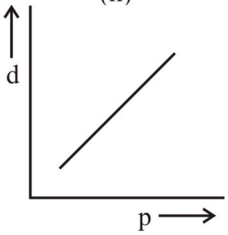
(i)



(ii)



(iii)



(iv)

d = density, p = pressure,
T = temperature

(a) III (b) I
(c) IV (d) II

[JEE Main 2020, 2 Sep Shift-I]

Ans. (d) : Ideal gas equation,

PV = nRT

$$\text{Density (d)} = \frac{\text{Mass}(m)}{\text{Volume}(V)}$$

$$\text{Mole (m)} = \frac{\text{Mass}(m)}{\text{Molar mass}(M)}$$

@apna_pdf

$$PV = \frac{m}{M}RT$$

$$d = \frac{m}{V} = \frac{PM}{RT}$$

At constant therefore, $d \propto$ Pressure (P)

$d \propto$ Molar mass (M)

$$d \propto \frac{1}{\text{Temperature}(T)}$$

d vs T graph is hyperbola

d vs $1/T$ is straight line

d vs P is straight line

62. The pressure exerted by a non-reactive gaseous mixture of 6.4 g of methane and 8.8 g of carbon dioxide in a 10L vessel at 27ºC is…….kPa (Round off to the nearest integer) (Assume gases are ideal, $R = 8.314$ J mol^{-1} K^{-1} Atomic mass = C: 12.0 u, H: 1.0 u, 0:16.0 u)

[JEE Main 2021, 17 March Shift-I]

Ans. (150) Given:- V=10 L=10^{-2} m^3, T = 27°C = 300K

$$n_{CH_4} = \frac{6.4}{16} = 0.4 \text{ mol}$$

$$n_{CO_2} = \frac{8.8}{4.4} = 0.2 \text{ mol}$$

$n = n_{CH_4} + n_{CO_2} = 0.4 + 0.2 = 0.6$ mol

P = ?

From ideal gas equation

PV = nRT

$$P = \frac{nRT}{V}$$

$$P = \frac{0.6 \times 8.314 \times 300}{10^{-2}}, \quad P \approx 150 \text{k Pa}$$

63. An LPG cylinder contains gas at a pressure of 300 kPa at 27ºC. The cylinder can withstand the pressure of 12×10^6 Pa. The room in which the cylinder is kept catches fire. The minimum temperature at which the bursting of cylinder will take place is…….ºC. (Nearest integer)

[JEE Main 2021, 25 July Shift-II]

Ans. (927) : Given :– T_1 = 27°C = 300K

P_1 = 300k Pa $\quad$ $P_2 = 1.2 \times 10^6$ Pa

Ideal gas equation at constant volume,

$$\frac{P}{T} = \text{constant}$$

$$\frac{P_1}{T_1} = \frac{P_2}{T_2}$$

$$T_2 = \frac{1.2 \times 10^6 \times 300}{300 \times 10^3} = 1200K$$

$$T_2 = 927°C$$

64. An empty LPG cylinder weight 14.8 kg. When full, it weight 29.0 kg and shows a pressure of 3.47 atm. In the course of use at ambient temperature, the mass of the cylinder is reduced to 23.0 kg. The final pressure in side of the cylinder is…….atm. (Nearest integer)

[JEE Main 2021, 1 Sep Shift-II]

Ans. (2) : Given :- Initial weight of gas = 29 –14.8

= 14.2 kg

= 14200g

Final weight of gas = 23 – 14.8 = 8.2 kg = 8200g

P_1 = 3.47 atm

From ideal gas equation at constant temperature and volume,

$$\frac{P}{n} = \text{Constant}$$

$$\frac{P_1}{n_1} = \frac{P_2}{n_2}$$

$$P_2 = \frac{3.47}{\frac{14200}{M.M}} \times \frac{8200}{M.M} = \frac{3.47 \times 8200}{14200}$$

P_2 = 2 atm

65. Among the following statements, that which was not proposed by Dalton was

(a) Chemical reactions involve reorganization of atoms. These are neither created nor destroyed in a chemical reaction.

(b) When gases combine or reproduced in a chemical reaction they do so in a simple ratio by volume provided all gases are at the same T and P.

(c) All the atoms of a given element have identical properties including identical mass. Atoms of different elements differ in mass.

(d) Matter consists of indivisible atoms.

[JEE Main 2020, 7 Jan Shift-I]

Ans. (b) : When gases combine or reproduced in a chemical reaction they do so in a simple ratio by volume provided all gases are at the same temperature and pressure. This is the Gay Lussac's law.

Volume $\propto$ No. of moles

So, only this statement is not given by Dalton.

66. Which equation will explain the nature of PV versus P curve for CO_2 gas at moderately low pressure ?

(a) PV=RT+Pb $\quad$ (b) PV=RT+a/V

(c) PV=RT–a/V $\quad$ (d) PV=RT–aV

J & K CET-(2018)

Ans. (c) : Vander Waal's equation for real gas

$$\left(P + \frac{an^2}{v^2}\right)(v - nb) = nRT$$

For 1 mole gas,

$$\left(P + \frac{a}{v^2}\right)(v - b) = RT$$

At moderately low pressure,

$V \gg b$

$$\therefore \left(P + \frac{a}{v^2}\right)V = RT$$

$$PV + \frac{a}{v} = RT$$

$$PV = RT - \frac{a}{V}$$

@apna_pdf

67. The boiling point of water decreases at high altitudes because

(a) the atmospheric pressure is low
(b) the temperature is low
(c) the atmospheric pressure is high
(d) the temperature is high

J & K CET-(2005)

Ans. (a) : Water starts boiling when vapour pressure is equal to atmospheric pressure This temperature is known as boiling point of water. At high altitude boiling point of water decreases because the atmospheric pressure is also decreases.

68. Which of the following is the true value of the gas constant R in Joules/degree/mole?

(a) 8.314
(b) 6.023×10^{23}
(c) 8.314×10^{7}
(d) 6.023

J & K CET-(2002)

Ans.(a): For STP

n = 1 mole
T = 0°C = 273k
$P = 1.01 \times 10^5\ N/M^2$
V = 22.4 liter
$= 22.4 \times 10^{-3}\ m^3$

from ideal gas equation–

PV = nRT

$$R = \frac{PV}{nT}$$

$$R = \frac{1.01\times10^5\times22.4\times10^{-3}}{1\times273}$$

$$\boxed{R = 8.31\,Jmol^{-1}k^{-1}}$$

69. Five grams each of the following gas at 87°C and 750 mm pressure is taken. The gas with least volume is

(a) HF
(b) HCl
(c) HBr
(d) HI

J & K CET-(2000)

Ans. (d) : According to ideal gas equation,

PV = nRT

$$PV = \frac{w}{M}RT \qquad \left\{mole(n) = \frac{weight(w)}{Molar\,mass\,(M)}\right\}$$

From above equation, we said that, as molar mass of gas increases, volume will decreases.

HI molecule will have highest molar mass. Hence HI have least volume.

70. The carbon di-oxide gas does not follow gaseous laws at all ranges of pressure and temperature because:

(a) it is triatomic gas
(b) its internal energy is quite high
(c) there is attraction between its molecules
(d) it solidify at low temperature

JCECE - 2004

Ans. (c) : CO_2 is a real gas. So, it does not follow kinetic theory of gases, gas law and ideal gas equation.

Ideal gases do not show intermolecular force of attraction but CO_2 is real gas. It shows intermolecular force of attraction between its molecules.

71. If rate of diffusion of CH_4 is twice than that of a gas *x*, then its molecular mass is :

(a) 64 g
(b) 16 g
(c) 32 g
(d) 8 g

JCECE - 2006

Ans. (a) : According to Graham's law of diffusion, rate of diffusion $(r_d) \propto \frac{1}{\sqrt{Molecular\,Mass}}$

It is given that, $r_{CH_4} = 2r_x$

$$\frac{r_x}{r_{CH_4}} = \sqrt{\frac{M_{CH_4}}{M_a}} \quad \Rightarrow \quad \frac{r_x}{2r_x} = \sqrt{\frac{16}{x}}$$

$$\frac{1}{(2)^2} = \frac{16}{x}$$

$$x = 16\times4 = 64$$

72. Avogadro's hypothesis states that:

(a) The ideal gas consists of a large number of small particles called molecules
(b) Under the same conditions of temperature and pressure equal volumes of gases contain the same number of molecules
(c) Volume of a definite quantity of gas at constant pressure is directly proportional to absolute temperature
(d) A given mass of gas at constant pressure is directly proportional to absolute temperature

JCECE - 2005

Ans. (b) : According to Avogadro's law, equal volumes of gases contain the same number of molecules at constant temperature and pressure.

Volume (V) ∝ Number of molecules

73. The volume of a gas measured at 27°C and 1 atm pressure is 10L. To reduce the volume to 2L at 1 atm pressure, the temperature required is

(a) 60 K
(b) 75 K
(c) 150 K
(d) 225 K

JCECE - 2007

Ans. (a) : Given :-

$V_1 = 10L \qquad V_2 = 2L$

$P = 1atm \qquad T = 27°C = 300K$

From ideal gas equation at constant pressure

$$\frac{V}{T} = constant$$

$$\frac{V_1}{T_1} = \frac{V_2}{V_2} \quad \Rightarrow \quad T_2 = \frac{V_2}{V_1}\times T_1$$

$$T_2 = \frac{2}{10}\times300 = 60K$$

74. A gas mixture contains O_2 and N_2 in the ratio of 1 : 4 by weight. The ratio of their number of molecules is

(a) 1 : 8
(b) 1 : 4
(c) 3 : 16
(d) 7 : 32

JIPMER-2008

@apna_pdf

Ans. (d) : Given :- $\frac{w_{O_2}}{w_{N_2}} = \frac{1}{4}$

Molecular mass of $O_2 = 32$

Molecular mass of $N_2 = 28$

$$\frac{n_{O_2}}{n_{N_2}} = \frac{w_{O_2}/M_{O_2}}{w_{N_2}/M_{N_2}} = \frac{w_{O_2}}{w_{N_2}} \times \frac{M_{O_2}}{M_{N_2}}$$

$$\frac{n_{O_2}}{n_{N_2}} = \frac{1}{4} \times \frac{28}{302} = \frac{7}{32}$$

Number of molecules = mole × N_A

$$\frac{\text{Number of molecules of } O_2}{\text{Number of molecules of } N_2} = \frac{7 \times N_A}{32 \times N_A}$$

$$= \frac{7}{32}$$

75. Ratio of molecular weights of A and B is $\frac{4}{25}$ then ratio of rates of diffusion will be

(a) 5 : 1 (b) 5 : 2

(c) 25 : 3 (d) 25 : 4

JIPMER-2005

Ans. (b)

Given,

$$\frac{\text{Molecular weight of } (M_A)}{\text{Molecular weight of } B(M_B)} = \frac{4}{25}$$

Find $\frac{r_A}{r_B}$

According to Graham's law of diffusion

$$\text{rate of diffusion} \propto \frac{1}{\sqrt{\text{Molecular weight}}}$$

$$\frac{r_A}{r_B} = \sqrt{\frac{M_B}{M_A}} = \sqrt{\frac{25}{4}} = \frac{5}{2}$$

$r_A : r_B = 5 : 2$

76. Moles of N_2 = 0.4 and moles of O_2 = 0.1 find (P_{N_2}) Partial pressure of N_2 at atmospheric pressure.

(a) 0.2 atm (b) 0.8 atm

(c) 0.6 atm (d) 0.4 atm

JIPMER-2019

Ans. (b) : Given that,

Moles of $N_2 = 0.4$

Moles of $O_2 = 0.1$

Then, mole fraction of $N_2 = \frac{0.4}{0.4+0.1} = 0.8$

We know that –

Partial pressure = mole fraction × total pressure

= 0.8 × 1 = 0.8 atm

77. If V = 1 litre, 10 mole of H_2 and 10 mole of N_2 gas are mixed at temperature 26°C. Then calculate pressure of the gas.

(a) 491 atm (b) 300 atm

(c) 550 atm (d) 600 atm

JIPMER-2019

Ans. (a) : Given,

V = 1L T = 26°C = 299 K

$n_T = 10 + 10 = 20$ mole

From ideal gas equation,

PV = nRT

$$P = \frac{nRT}{V} = \frac{20 \times 0.0821 \times 299}{1}$$

≈ 491 atm

78. Which of the following equations does not represent Charles's law for a given mass of gas at constant pressure?

(a) $\frac{V}{T} = K$

(b) log V = log K + log T

(c) log K = log V + log T

(d) $\frac{d(\text{In } V)}{dT} = \frac{1}{T}$

Karnataka-CET-2019

Ans. (c) : According to Charle's law, volume of a definite quantity of gas at constant pressure is directly proportional to absolute temperature.

$$V \propto T$$

$$\frac{V}{T} = \text{constant} = K$$

Taking log on both side

logV – logT = logK

logV = logK + logT

Differentiating both side w.r.t temperature

$$\frac{d(\ln V)}{dT} = \frac{d}{dT}\log T = \frac{1}{T}$$

79. 0.5 mole of each of H_2, SO_2 and CH_4 are kept in a container. A hole was made in the container. After 3 hours the order of partial pressure in the container will be

(a) $pSO_2 > pH_2 > pCH_4$ (b) $pSO_2 > pCH_4 > pH_2$

(c) $pH_2 > pSO_2 > pCH_4$ (d) $pH_2 > pCH_4 > pSO_2$

Karnataka-CET, 2009

Ans. (b) : Rate of diffusion $\propto \frac{1}{\sqrt{\text{molecular mass}}}$.

Lighter the gas, more is the rate of diffusion.

∴ Order of diffusion : $H_2 > CH_4 > SO_2$

Hence, order of partial pressure is

$pSO_2 > pCH_4 > pH_2$

80. In order to increase the volume of a gas by 10%, the pressure of the gas should be

(a) increased by 10% (b) increased by 1%

(c) decreased by 10% (d) decreased by 1%

KARNATAKA-CET, 2008

Ans. (c) : According to Boyle's law,

$$p \propto \frac{1}{V}$$

Hence, in order to increase the volume of a gas by 10%, the pressure of the gas should be decreased by 10%.

81. The ratio of rate of diffusion of SO_2 (M = 64) and oxygen (M = 32) is :

(a) 1 : 1 (b) 2 : 1

(c) 1 : 2 (d) 1 : 1.414

Manipal-2019

@apna_pdf

Ans. (d) : According to Graham's law of diffusion,

$$\text{rate of diffusion} \propto \frac{1}{\sqrt{\text{Molar mass}}}$$

$$\frac{r_{SO_2}}{r_{O_2}} = \sqrt{\frac{M_{O_2}}{M_{SO_2}}} = \sqrt{\frac{32}{64}} = \frac{1}{\sqrt{2}}$$

$$r_{SO_2} : r_{O_2} = 1 : 1.414$$

82. In liquid gas equilibrium, the pressure of vapours above the liquid is constant at

(a) Constant temperature
(b) Low temperature
(c) High temperature
(d) None of these

AIPMT-1995

Ans. (a) : At equilibrium, amount of vapour is same until temperature is not changed. Vapour pressure only depends on temperature. If temperature is kept constant then vapour pressure is also constant at equilibrium.

83. The beans are cooked earlier in pressure cooker because

(a) boiling point increase with increasing pressure
(b) boiling point decrease with increasing pressure
(c) extra pressure of pressure cooker softens the beans
(d) internal energy is not lost while cooking in pressure cooker

NEET-2011

Ans. (a) : In pressure cooker, as pressure on the particle increases they comes closer due to the increases in kinetic energy of particles, which further increases the temperature inside the pressure cooker. Thus boiling point increases, which help beans to cooked earlier.

84. A gas at 350 K and 15 bar has molar volume 20 percent smaller than that for an ideal gas under the same conditions. The correct option about the gas and its compressibility factor (Z) is

(a) $Z < 1$ and repulsive forces are dominant
(b) $Z > 1$ and attractive forces are dominant
(c) $Z > 1$ and repulsive forces are dominant
(d) $Z < 1$ and attractive forces are dominant

NEET-2019

Ans. (d) : Compressibility factor (Z) = $\frac{V_{real}}{V_{ideal}}$

For given gas, $\frac{V_{real}}{V_{ideal}} < 1$

Then compressibility factor (Z) is also less than 1

$Z < 1$

If $Z < 1$ then, attractive force are dominant on gaseous molecules.

85. At STP, 0.50 mol H_2 gas and 1.0 mol He gas

(a) have equal average kinetic energies
(b) have equal molecular speeds
(c) occupy equal volumes
(d) have equal effusion rates

NEET-1993

Ans. (a) : Average kinetic energy of gases is depends only on the temperature So, H_2 and He gas will have equal average kinetic energies

$$\text{Kinetic energy} = \frac{3}{2}RT$$

86. Correct gas equation is

(a) $\frac{V_1T_2}{P_1} = \frac{V_2T_1}{P_2}$
(b) $\frac{P_1V_1}{P_2V_2} = \frac{T_1}{T_2}$
(c) $\frac{P_1T_1}{V_1} = \frac{P_2V_2}{T_2}$
(d) $\frac{V_1V_2}{T_1T_2} = P_1P_2$

NEET-1989

Ans. (b) : According to ideal gas equation,

$PV = nRT$

for 1 mole

$$\frac{PV}{T} = \text{constant}$$

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\frac{P_1V_1}{P_2V_2} = \frac{T_1}{T_2}$$

87. A gaseous mixture was prepared by taking equal moles of CO and N_2. If the total pressure of the mixture was found 1 atmosphere, the partial pressure of the nitrogen (N_2) in the mixture is

(a) 0.5 atm
(b) 0.8 atm
(c) 0.9 atm
(d) 1 atm

NEET-2011

Ans. (a) : Given : Total Pressure = 1 atm

Weight of N_2 = weight of CO
Molar mass of CO = 28
Molar mass of N_2 = 28

$$\text{Mole fraction of } N_2 = \frac{w/28}{\frac{w}{28} + \frac{w}{28}} = \frac{1}{2} = 0.5$$

Partial pressure = Mole fraction × Total pressure

$$P_{N_2} = 0.5 \times 1 = 0.5 \text{ atm}$$

88. A bubble of air is underwater at temperature 15°C and the pressure 1.5 bar. If the bubble rises to the surface where the temperature is 25°C and the pressure is 1.0 bar, what will happen to the volume of the bubble

(a) volume will become greater by a factor of 1.6.
(b) volume will become greater by a factor of 1.1
(c) volume will become smaller by a factor of 0.70
(d) volume will become greater by a factor of 2.5

NEET-2011

Ans. (a) : Given : $T_1 = 15^\circ C = 288$ K

$T_2 = 25^\circ C = 298$ K
$P_1 = 1.5$ bar $\qquad P_2 = 1$ bar

According to ideal gas equation,

$PV = nRT$

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

@apna_pdf

$$\frac{V_2}{V_1} = \frac{1.5 \times 298}{288}$$

$$\frac{V_2}{V_1} = 1.55$$

$V_2 = 1.55\ V_1$

So, volume will become greater by a factor of 1.6.

89. The pressure exerted by 6.0 g of methane gas in a 0.03 m^3 vessel at 129^{o}C is (Atomic masses : C =12.01, H = 1.01 and R= 8.314 K^{-1} mol^{-1})

(a) 215216 Pa (b) 13409 Pa
(c) 41648 Pa (d) 31684Pa

NEET-2010

Ans. (c) : Given : W = 6g, V = 0.03 m^3

T = 129°C = 402 K

P = ?

From ideal gas equation,

$$P = \frac{nRT}{V} = \frac{\frac{6}{16.05} \times 8.314 \times 402}{0.03}$$

P = 41647.7 Pa

P = 41648 Pa

90. Which of the following mixtures of gases does not obey Dalton's law of partial pressure?

(a) Cl_2 and SO_2 (b) CO_2 and He
(c) O_2 and CO_2 (d) N_2 and O_2

NEET-1996

JIPMER-2019

Ans. (a) : Non-reacting gases does not follow Dalton's law of partial pressure.

So, SO_2 and Cl_2 mixture of gases does not obey Dalton's law of partial pressure because they react and form SO_2Cl_2.

91. At what temperature, the rate of effusion of N_2 would be 1.625 times than the rate of SO_2 at 50^{o}C?

(a) 373 K (b) 620 K
(c) 100 K (d) 173 K

NEET-1996

Ans. (c) : Given : $\frac{r_{N_2}}{r_{SO_2}} = 1.625$

$$\text{Rate of effusion} \propto \sqrt{\text{Temperature}}$$

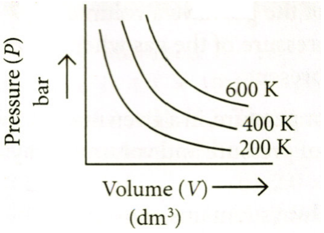
$$\propto \frac{1}{\sqrt{\text{Molor Mass}}}$$

$$\frac{r_{N_2}}{r_{SO_2}} = \sqrt{\frac{T_{N_2}}{28} \times \frac{64}{323}} = 1.625$$

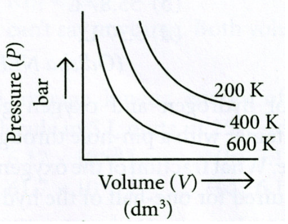
$$T_{N_2} = 373\ K = 100°C$$

92. Choose the correct option for graphical representation of Boyle's law, which shows a graph of pressure vs volume of a gas at different temperatures.

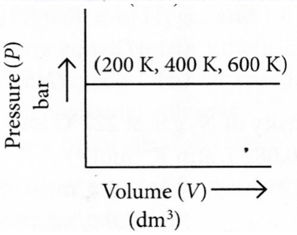
(a)



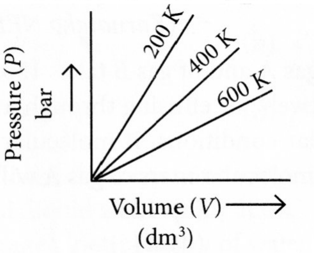
(b)



(c)



(d)



NEET-2021

Ans. (a) : According to Boyle's law

$$P \propto \frac{1}{V}$$

Pressure is inversely proportional to volume at constant temperature.

PV = constant

As the magnitude of PV increases, temperature also increases. Hence option (a) is correct.

93. At 25^{o}C and 730 mm pressure, 380 mL of dry oxygen was collected. If the temperature is constant, what volume will the oxygen occupy at 760 mm pressure?

(a) 569 mL (b) 365 mL
(c) 265 mL (d) 621 mL

NEET-1999

Ans. (b) : Given : T = 25°C = 298 K

V_1 = 380 mL, P_1 = 730 mm

P_2 = 760 mm

V_2 = ?

According to ideal gas equation at constant temperature.

PV = constant

$P_1V_1 = P_2V_2$

$730 \times 380 = 760 \times V_2$

$$V_2 = \frac{730 \times 380}{760}$$

V_2 = 365 mL

@apna_pdf

94. Pressure remaining the same, the volume of a given mass of an ideal gas increase for every degree centigrade rise in temperature by definite fraction of its volume at

(a) 0^oC

(b) its critical temperature

(c) absolute zero

(d) its Boyle temperature

NEET-1989

Ans. (a) : $V_T = V_0 (1 + \propto T)$

V_0 is the volume at 0°C

for 1° rise in temperature,

$V_T = V_0 (1 + \propto)$

$V_T = V_0 + V_0 \propto$

$V_T - V_0 = V_0 \propto$

$DV = V_0 \propto$

Where $\propto$ is definite fraction

Hence, Volume V_0 is at 0°C temperature

95. Choose the correct option for the total pressure (in atm) in a mixture of 4 g O_2 and 2 g H_2 confined in a total volume of on litre at 0^oC is [Given R = 0.082 L atm $mol^{-1}K^{-1}$, T = 273K]

(a) 26.02	(b) 2.518
(c) 2.602	(d) 25.18

NEET-2021

Ans. (d) : Given : $W_{O_2} = 4g$, $W_{H_2} = 2g$

V = 1L T = 0°C = 273 K

Total Pressure (P_T) = ?

$$\text{Total moles} = \frac{4}{32} + \frac{2}{2} = \frac{9}{8} \text{ mole}$$

From ideal gas equation,

PV = nRT

$$P = \frac{nRT}{v} = \frac{9}{8} \times \frac{0.082 \times 273}{1}$$

P = 25.18 atm

96. A mixture of N_2 and Ar gases in a cylinder contains 7 g of N_2 and 8 g of Ar. If the total pressure of the mixture of the gases in the cylinder is 27 bar, the partial pressure of N_2 is [Use atomic masses (in g mol^{-1}) : N = 14, Ar = 40]

(a) 9 bar	(b) 12 bar
(c) 15 bar	(d) 18 bar

NEET-2020

Ans. (c) : Given : Weight of N_2 = 7g

Weight of Ar = 8g

Total pressure = 27 bar

Molar mass of N_2 = 28

Molar mass of Ne = 40

$$\text{Mole fraction of } N_2 = \frac{7/28}{\frac{7}{28} + \frac{8}{40}} = \frac{5}{9}$$

Partial Pressure = Mole fraction × Total Pressure

$$P_{N_2} = \frac{5}{9} \times 27 = 15 \text{ bar}$$

97. The volume occupied by 1.8g of water vapour at 374^oC and 1 bar pressure will be (Use R = 0.083 bar L K^{-1} mol^{-1})

(a) 96.66 L	(b) 55.87 L
(c) 3.10 L	(d) 5.37 L

NEET-Odisha-2019

Ans. (d) : Given : w = 1.8 g

T = 374°C = 647 K P = 1 bar

According to ideal gas equation

$$V = \frac{nRT}{P} = \frac{\frac{w}{M}RT}{P}$$

$$V = \frac{1.8 \times 0.083 \times 647}{18 \times 1}$$

V = 5.37 L

98. Equal moles of hydrogen and oxygen gases are placed in a container with a pin-hole through which both can escape. What fraction of the oxygen escape in the time required for one-half of the hydrogen to escape?

(a) 3/8	(b) 1/2
(c) 1/8	(d) 1/4

NEET-2016

Ans. (c) : Given :

Fraction of hydrogen escaped-

$$= \frac{1}{2} \times \text{Total mole (x) of hydrogen}$$

$$\frac{r_{O_2}}{r_{H_2}} = \frac{V_{O_2}/t_{O_2}}{V_{H_2}/t_{H_2}} = \sqrt{\frac{M_{H_2}}{M_{O_2}}}$$

$$\frac{V_{O_2}}{V_{H_2}} = \sqrt{\frac{M_{H_2}}{M_{O_2}}}$$

$$t_{O_2} = t_{H_2}$$

$$\frac{V_{O_2}}{\frac{1}{2}} = \sqrt{\frac{2}{32}} = \sqrt{\frac{1}{16}}$$

$$2V_{O_2} = \frac{1}{4}$$

$$V_{O_2} = \frac{1}{8}$$

99. What is the density of N_2 gas at 227^oC and 5.00 atm pressure? (R = 0.082 L atm K^{-1} mol^{-1})

(a) 1.40 g/mL	(b) 2.81 g/mL
(c) 3.41 g/mL	(d) 0.29 g/mL

NEET-Karnataka 2013

Ans. (c) : Given : T = 227°C = 500 K

P = 5 atm, Molar mass of N_2 (M) = 28

From ideal gas equation,

$$PV = nRT = \frac{w}{M}RT$$

$$\frac{w}{V} = \text{density (d)}$$

$$d = \frac{PM}{RT} = \frac{5 \times 28}{500 \times 0.082}$$

d = 3.41 g/mL

@apna_pdf

100. Equal masses of H_2, O_2 and methane have been taken in a container of volume V at temperature 27°C in identical conditions. The ratio of the volumes of gases $H_2 : O_2$: methane would be

(a) 8 : 16 : 1 (b) 16 : 8 : 1
(c) 16 : 1 : 2 (d) 8 : 1 : 2

NEET-2014

Ans. (c) : According to Avogadro's law, volume of gas is directly proportional to the number of moles of gas at constant temperature and pressure.

$$V \propto n$$

$$V_{H_2} : V_{O_2} : V_{CH_4} = n_{H_2} : n_{O_2} : n_{CH_4}$$

$$\text{mole} = \frac{\text{weight}}{\text{molar mass}}$$

$$V_{H_2} : V_{O_2} : V_{CH_4} = \frac{w}{2} : \frac{w}{32} : \frac{w}{16}$$

$$= 16 : 1 : 2$$

101. What volume of oxygen as (O_2) measured at 0°C and 1 atm, is needed to burn completely 1 L of propane gas (C_3H_8) measured under the same conditions?

(a) 5 L (b) 10 L
(c) 7 L (d) 6 L

NEET-2008

Ans. (a) : $C_3H_8 + 5O_2 \longrightarrow 3CO_2 + 4H_2O$

From the balanced chemical reaction, we know that for combustion of 1L of propane gas, 5L of oxygen gas is required.

102. 0.24 g of a volatile gas, upon vaporization, gives 45 mL vapour at NTP. What will be the vapour density of the substance? (Density of H_2 = 0.089 g/L)

(a) 95.93 (b) 59.93
(c) 95.39 (d) 5.993

NEET-1996

Ans. (b) : Vapour density = $\frac{\text{Molar mass}}{2}$

$$\text{Mole} = \frac{\text{weight}}{\text{molar mass}} = \frac{\text{volume (in L)}}{22.4\text{L}} = \frac{V(\text{in mL})}{22400}$$

$$\text{Molar mass} = \frac{w}{V} \times 22400$$

$$= \frac{0.24}{45} \times 22400$$

$$= 119.46$$

$$\text{Vapour density} = \frac{119.46}{2}$$

$$= 59.73$$

103. Mark the correct statement.

(a) For a chemical reaction to be feasible, ΔG should be zero
(b) Entropy is a measure of order of a system
(c) For a chemical reaction to be feasible, ΔG increases
(d) The total energy of an isolated system is constant

UP CPMT-2014

Ans.(d): According to first law of thermodynamic, the total energy of an isolated system remain constant. Energy can neither be created nor destroyed. It may be change one form to another form.

104. Mark out of the wrong expression.

(a) Boyle's temperature, $T_B = \frac{a}{bR}$

(b) Critical pressure, $p_c = \frac{a}{27b^2}$

(c) Critical volume, $T_c = \frac{8a}{27Rb}$

(d) Critical volume, $V_c = 3b$

UP CPMT-2011

Ans. (a) : Boyle's temperature, $T_B = \frac{a}{Rb}$

105. A mixture of gases having different molecular weights is separated by which method ?

(a) Atmolysis
(b) Metathesis
(c) Ostwald and Walker method
(d) Reverse osmosis

UP CPMT-2010

Ans. (a): Diffusion method is used to separate a mixture of gases having different molecular weights as rate of diffusion varies inversely with molecular mass, i.e.

$$r \propto \frac{1}{\sqrt{M}}$$

This method is called atmolysis.

106. Which is the correct relation for diffusion of gases?

(a) $r \propto d$ (b) $r \propto \sqrt{d}$
(c) $r \propto \frac{1}{\sqrt{d}}$ (d) None of these

UP CPMT-2005

Ans. (c): According to Graham's law of diffusion,

$$r \propto \frac{1}{\sqrt{d}}$$

Where, r = rate of diffusion of gas
d = density of gas

107. A gaseous mixture contains 56 g of N_2, 44 g of CO_2 and 16 g of CH_4. The total pressure of mixture is 720 mm of Hg. The partial pressure of methane is

(a) 75 atm (b) 160 atm
(c) 180 atm (d) 215 atm

UP CPMT-2003
A-P EAMCET 1991

Ans. (c) : Partial pressure of CH_4
= mole fraction of CH_4 × total pressure
Given, mass of N_2= 56 g, mass of CO_2 = 44 g
Mass of CH_4= 16 g

$$\text{Moles of } N_2 = \frac{\text{mass}}{\text{mol.wt.}} = \frac{56}{28} = 2$$

$$\text{Moles of } CO_2 = \frac{\text{mass}}{\text{mol.wt.}} = \frac{44}{44} = 1$$

@apna_pdf

Moles of CH_4= $\frac{\text{mass}}{\text{mol.wt.}}=\frac{16}{16}=1$

$\therefore$ Total moles = moles of N_2+moles of CO_2+moles of CH_4

= 2+1+1

= 1

$\therefore$ Mole fraction of CH_4= $\frac{\text{moles of } CH_4}{\text{total moles}}=\frac{1}{4}$

$\therefore$ Partial pressure of CH_4= $\frac{1}{4}\times 720$ atm

= 180 atm

108. At identical temperature and pressure, the rate of diffusion of hydrogen gas is $3\sqrt{3}$ times that of a hydrocarbon having molecular formula C_nH_{2n-2} What is the value of n?

(a) 1
(b) 4
(c) 3
(d) 8

WB-JEE-2010

Ans. (b) : Given,

$$\frac{r_{H_2}}{r_{C_nH_{2n-2}}}=3\sqrt{3}$$

Let molar mass of $r_{C_nH_{2n-2}}=M$

According to Graham's law of diffusion.

Rate of diffusion $\propto \frac{1}{\sqrt{\text{Molar Mass}}}$

$$\frac{r_{H_2}}{r_{C_nH_{2n-2}}}=\sqrt{\frac{M}{2}}$$

$$\left(3\sqrt{3}\right)^2=\frac{M}{2}$$

M = 27 × 2 = 54

12n + 1(2n – 2) = 54

14n – 2 = 54

14n = 56

n = 4

109. In a flask, the weight ratio of CH_4 (g) and SO_2 (g) at 298 K and 1 bar is 1 : 2. The ratio of the number of molecules of SO_2(g) and CH_4 (g) is

(a) 1:4
(b) 4:1
(c) 1:2
(d) 2:1

WB-JEE-2017

Ans. (c) : Given,

$$\frac{w_{CH_4}}{w_{SO_2}}=\frac{1}{2}$$

$$\text{Mole}=\frac{\text{weight}}{\text{molar mass}}$$

$$\frac{n_{CH_4}}{n_{SO_2}}=\frac{w_{CH_4}}{M_{CH_4}}\times\frac{M_{SO_2}}{w_{SO_2}}$$

$$\frac{1}{2}\times\frac{64}{16}=2$$

No. of molecules = mole × N_A

$$\frac{\text{No. of molecules of } SO_2}{\text{No. of molecules of } CH_4}=\frac{n_{SO_2}}{n_{CH_4}}=\frac{1}{2}$$

110. At 273 K temperature and 76 cm Hg pressure, the density of a gas is 1.964 g L^{-1}. The gas is

(a) CH_4
(b) CO
(c) He
(d) CO_2

WB-JEE-2020

Ans. (d) : Given, T = 273 K

P = 76 cm Hg = 760 mmHg = 1atm

d = 1.964

According to ideal gas equation,

$$d=\frac{PM}{RT}\Rightarrow\frac{1\times M}{0.0821\times 273}=1.964$$

M = 1.964 × 0.0821 × 273

M = 44

Hence, molar mass of CO_2 is 44.

111. Equal masses of ethane and hydrogen are mixed in an empty container at 298 K.The fraction of total pressure exerted by hydrogen is

(a) 15:16
(b) 1:1
(c) 1:4
(d) 1:6

WB-JEE-2020

Ans. (a) : Given, mass of ethane = mass of hydrogen = x

We know that,

Molar mass of ethane (C_2H_6) = 30

Molar mass of hydrogen (H_2) = 2

Then,

Moles of ethane $=\frac{x}{30}$

Moles of hydrogen $=\frac{x}{2}$

Mole fraction of hydrogen $=\frac{x/2}{x/2+x/30}$

Partial pressure of hydrogen = mole fraction of H_2 × total pressure

Then,

$$\frac{\text{Partial pressure of } H_2}{\text{Total pressure}}=\text{mole fraction of } H_2$$

$$=\frac{x/2}{x/2+x/30}=\frac{15}{16}$$

112. A mixture of 40 g of oxygen and 40 g of helium has a total pressure of 0.9 atm. The partial pressure of oxygen is

(a) 0.5 atm
(b) 0.1 atm
(c) 0.9 atm
(d) 0.2 atm

AIIMS-1994

Ans. (b) : Given :-

Amount of oxygen = 40g

Amount of helium = 40g

Total pressure (P) = 0.9 atm

Partial pressure of oxygen $\left(p_{O_2}\right)$=?

$\therefore$ moles of oxygen $\left(n_{O_2}\right)=\frac{40}{32}$

Moles of helium $\left(n_{He_2}\right)=\frac{40}{4}=10$

@apna_pdf

Now,

$$p_{O_2} = X_{mixture} \times \text{Total pressure}$$

$$p_{O_2} = \frac{n_{O_2}}{n_{O_2} + n_{He_2}} \times 0.9$$

$$p_{O_2} = \frac{\frac{40}{32}}{\frac{40}{32} + 10} \times 0.9$$

$$p_{O_2} = \frac{40}{32} \times \frac{4}{45} \times 0.9$$

$$p_{O_2} = 0.1 \text{ atm}$$

2. Ideal Gas Equation and Related Gas Laws

113. A 10 L flask contains 64 g of oxygen at 27°C (Assume O_2 gas is behaving ideally). The pressure inside the flask in bar is
(Given R = 0.0831 L bar K^{-1} mol^{-1}

(a) 4.9 (b) 2.5
(c) 498.6 (d) 49.8

NEET-17.07.2022

Ans. (a) : Given that, T = 27°C = 273 + 27 = 300 K
V = 10.0 L, R = 0.0831 L Bar K^{-1} mol^{-1}

$\because$ Moles of $O_2 = \frac{64}{32} = 2$ mole

From ideal gas equation,

$$PV = nRT$$

$$P = \frac{nRT}{V}$$

$$= \frac{2 \times 0.0831}{10.0} \times 300$$

P = 4.986 Bar

114. 100 g of an ideal gas is kept in a cylinder of 416 L volume at 27°C under 1.5 bar pressure. The molar mass of the gas is ________ g mol^{-1} (Nearest integer).
(Given : R = 0.083 L bar K^{-1} mol^{-1})

JEE Main-28.06.2022, Shift-II

Ans. (4) : Given that: $R = 0.083 \text{ L bar } K^{-1} mol^{-1}$

$V = 416 L$, $P = 1.5 bar$, $T = 27°C$

From ideal gas equation

$$PV = \frac{mRT}{M}$$

$$\boxed{n = \frac{m}{M}}$$

$$1.5 \times 416 = \frac{100}{M} \times 0.83 \times 300$$

$$M = 3.99$$

115. A vessel contains equal volumes of SO_2 and CH_4. Through a small hole the gases effused into vacuum. After 200 seconds the total volume is reduced to half. What is the ratio of SO_2 and CH_4 remaining in the vessel?

(a) 1 : 2 (b) 2 : 1
(c) 1 : 1 (d) 1 : 4

AP-EAMCET (Med.)-1999

Ans. (b) : According to the Graham's law of diffusion.

$$\frac{V_{SO_2}}{V_{CH_4}} = \sqrt{\frac{M_{CH_4}}{M_{SO_2}}} = \sqrt{\frac{16}{64}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$$

or $V_{SO_2} : V_{CH_4} = 1 : 2$

So, SO_2 and CH_4 effused in the ratio 1 : 2. Hence, the amount of remaining in the vessel will be ratio SO_2 : CH_4 = 2 : 1.

116. If the pressure and the absolute temperature of a given mass of gas are doubled, the new volume will be …….. of the initial volume

(a) double (b) half
(c) triple (d) same

A-P EAMCET 1991

Ans. (d) : Let initial pressure = P_1
Final pressure $P_2 = 2P_1$
Initial temperature = T_1
Final temperature $T_2 = 2T_1$
Initial volume = V_1
Final volume = V_2
$\therefore$ From ideal gas equation at constant number of moles

$$PV \propto T$$

$$\frac{P_1V_1}{P_2V_2} = \frac{T_1}{T_2}$$

$$\frac{P \times V_1}{2P \times V_2} = \frac{T}{2T}$$

$$\boxed{V_1 = V_2}$$

117. A sample of gas has a volume of 0.2 L measured at 1 atm pressure and 0ºC. At the same pressure but at 273ºC, its volume becomes

(a) 0.1 L (b) 0.4 L
(c) 0.8 L (d) 0.6 L

A-P EAMCET 1992, 93

Ans. (b) : Given that, $V_1 = 0.2$ L, V_2 = ?
$P_1 = 1$ atm, $P_2 = 1$ atm
T_1 = 0ºC = 273 K, T_2 = 273ºC = 273+273 = 546 K
The combined gas law is given as–

$$\therefore \quad \frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$V_2 = \frac{1 \times 0.2 \times 546}{1 \times 273} = 0.4 \text{ L}$$

118. The molecular weight of a gas that diffuses twice as rapidly as a gas with molecular weight 64, is

(a) 6.4 (b) 8
(c) 128 (d) 16

A-P EAMCET 1994

Ans. (d) : Given that, $r_1 = r$, $r_2 = 2r$, $M_1 = 64$, M_2 = ?

$$\therefore \quad \frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$$

$$\frac{r}{2r} = \sqrt{\frac{M_2}{64}}$$

@apna_pdf

Squaring both side, we get

$$\frac{1}{4} = \frac{M_2}{64}$$

or $M_2 = \frac{64}{4}$

or $M_2 = 16$

119. A flask contains 3g H_2 and 24 g O_2, The partial pressure of hydrogen in the mixture is

(a) 1/8th of the total pressure
(b) 1/9th of the total pressure
(c) 1/2nd of the total pressure
(d) 2/3rd of the total pressure

A-P EAMCET 1994

Ans. (d) : Given, weight of H_2 = 3 gm

$\therefore$ No. of mole of $H_2 = \frac{3}{2}$ mole

and weight of O_2 = 24 gm

$\therefore$ No. of mole of $O_2 = \frac{24}{32} = \frac{3}{4}$ mole

Hence, the partial pressure of $H_2 = \frac{3/2}{3/2+3/4} \times P$

$$= \frac{3/2}{9/4} \times P$$

$$= \frac{2}{3} \text{ of the total pressure}$$

120. One mole of argon gas will have least density at

(a) STP (b) 0ºC and 2 atm
(c) 273ºC and 2 atm (d) 273ºC and 1 atm

A-P EAMCET 1998

Ans. (d) : Density $(\rho) = \frac{PM}{RT}$

Density $\propto \frac{1}{\text{temperature}}$

or Density $\propto$ pressure

Therefore, the density will be minimum when the ratio of pressure to temperature is minimum.

121. A mixture contains 16 g of oxygen, 28 g of nitrogen and 8g of CH_4. Total pressure of mixture is 740 mm. What is the partial pressure of nitrogen in mm?

(a) 185 (b) 370
(c) 555 (d) 740

A-P EAMCET 1999

Ans. (b) : Given that, Total pressure = 740 mm

No. of moles of oxygen$= \frac{16}{32} = 0.5$ moles

No. of moles of nitrogen $= \frac{28}{28} = 1.0$ moles

No. of moles of $CH_4 = \frac{8}{16} = 0.5$ moles

$\therefore$ Total number of moles = 0.5 + 1.0 + 0.5 = 2 moles

Mole fraction of N_2 = 1/2 = 0.5

Since, Partial pressure of N_2 = mole fraction of N_2 × total pressure

= 0.5 × 740 = 370 mm

122. What is the numerical value of the gas constant R in J mol^{-1} K^{-1}?

(a) 0.0821 (b) 8.314×10^7
(c) 8.314 (d) 1.987

A-P EAMCET 1999

Ans. (c) : The gas constant is inversely used in diverse disciplines. Hence it is expressed in many units. Some gas constant value in different units are listed below–

$R = 8.314 \times 10^7$ erg mol^{-1} K^{-1}

= 8.314 J mol^{-1} K^{-1}

= 0.08205 L atm mol^{-1} K^{-1}

123. 4 g of an ideal gas occupies 5.6035 L of volume at 546 K and 2 atm pressure. What is its molecular weight?

(a) 4 (b) 16
(c) 32 (d) 64

A-P EAMCET 2002

Ans. (b) : Given that,

w = 4 gm, V = 5.6035 L, T = 546 K

P = 2 atm.

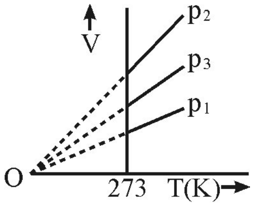
From and ideal gas equation –

$\therefore \quad \frac{M}{w} = \frac{RT}{PV}$

or $\quad \frac{M}{4} = \frac{0.084 \times 546}{2 \times 5.6035}$

or $\quad M = 16$

124. The volume-temperature graphs of a given mass of an ideal gas at constant pressures are shown below. What is the correct order of pressures?



(a) $p_1 > p_3 > p_2$ (b) $p_1 > p_2 > p_3$
(c) $p_2 > p_3 > p_1$ (d) $p_2 > p_1 > p_3$

A-P EAMCET 2006

Ans. (a) : For ideal gas equation–

$PV = nRT$

At constant pressure, V = KT

So, the graph will be a straight line with slope K = nR/P

Higher the slope lower will be the pressure.

Hence the correct order of pressure–

$$P_1 > P_3 > P_2$$

125. Henry's law constant for CO_2 in water is 1.67×10^8Pa at 298 K. Calculate the approximate quantity of CO_2 in 500 ml of soda water when packed under 5 atm CO_2 at 298 K.

(a) 3.7g (b) 1.84 g
(c) 2.2 g (d) 4.4 g

AP-EAMCET 25-08-2021 Shift - I

Ans. (a) : Given,

$P_{CO_2} = 5\text{atm}$

$P_{CO_2} = 5 \times 1.013 \times 10^5$ Pa

Henry's Law

$p = K_H.x$

@apna_pdf

Where, p = Partial pressure of gas
K_H = Henry's law constant
x = Mole fraction of gas

$$\therefore \quad x = \frac{5\times1.013\times10^5}{1.67\times10^8}$$

$$X_{CO_2} = \frac{n_{CO_2}}{n_{CO_2} + n_{H_2O}}$$

$$X_{CO_2} = \frac{n_{CO_2}}{n_{CO_2} + \frac{500}{18}} = \frac{5\times1.013\times10^5}{1.67\times10^8} = 0.003032$$

$$n_{CO_2} = 0.0843$$

Mass of CO_2 dissolved = 0.087 × 44
= 3.7 gm

126. An ideal gas expanded irreversibly against 10 bar pressure from 20 L to 30 L. Calculate q if the process is Isoenthalpic. (1 L. bar = 100 J)

(a) 0 (b) 100 J
(c) –100 J (d) 10 kJ

AP-EAMCET 25-08-2021 Shift - I

Ans. (d) :
$W_{irr} = -P(V_2 - V_1)$
$= -10\,(30 - 20)$
$= -100$ lit × bar
$= -100 \times 100$ Joule
$= -10{,}000$ Joule
$= -10$ kJ

Since the change in enthalpy is 0 and the work done will be equal to the –q.

127. A gas deviates most from ideal behavior when it is subjected to____.

(a) Low temperature & high pressure
(b) High temperature & low pressure
(c) High temperature & high pressure
(d) Low temperature & Low pressure

AP-EAMCET 25-08-2021 Shift - I

Ans. (a) : At low temperature and high pressure, gaseous atoms or molecules get closer to each other and vander Waal forces operates. So molecules or atoms start attracting each other. Hence a gas deviate the most from its ideal behaviour.

128. The volume of 2.8 g of carbon monoxide at 27ºC and 0.821 atm. pressure is (R= 0.0821 L atm. K^{-1} mol^{-1})

(a) 1.5 L (b) 0.3 L
(c) 3 L (d) 30 L

AP EAMCET (Medical) -1998

Ans. (c): Given that,
Amount of carbon monoxide = 2.8 g
T = 27 + 273 = 300 K
P = 0.821 atm
R = 0.0821 L atm K^{-1} mol^{-1}

Now, from the ideal gas equation–

$$PV = \frac{w}{M}\cdot RT$$

$$\text{or} \quad V = \frac{w}{M\times P}\times R\times T$$

$$\text{or} \quad V = \frac{2.8}{28\times0.821}\times0.0821\times300$$

or V = 3 litre.

129. Which of the following is not an ideal solution?

(a) Benzene and Toluene
(b) Chloro-benzene and 1,2-dichloro benzene
(c) Methyl iodide and Isopropanol
(d) Ethyl bromide and Methyl bromide

AP EAPCET 25.08.2021, Shift-II

Ans. (c) : A solution in which the interaction between molecules of the components does not differ from the interactions between the molecules of each component.
Ideal solution are – n-Heptane and n-Hexane, Chlorobenzene and bromobenzene, Benzene and toluene, Carbon tetrachloride and silicon tetrachloride, Ethyl and Methyl bromide.

130. Which of the following options correctly represents the relations of compressibility factor (z) and van der Waals equation for mole of gas at low pressure?

(a) $z + \frac{a}{VAT} = 1$ (b) $z + \frac{Pb}{RT} = 1$
(c) $z = 1 + \frac{RT}{Pb}$ **(d)** $z = 1 + \frac{Pb}{RT}$

TS EAMCET 10.08.2021, Shift-I

Ans. (a) : Compressibility factor(z) = $\frac{PV}{RT}$

For one male of gas
Van der waal's equation

$$\left(P + \frac{a}{V^2}\right)(V - b) = RT$$

At low pressure V-b $\approx V$

$$\text{Then} \quad \left(P + \frac{a}{V^2}\right)V = RT$$

$$PV + \frac{a}{V} = RT$$

$$PV = RT - \frac{a}{V}$$

$$\frac{PV}{RT} = 1 - \frac{a}{VRT} \qquad \left[z = \frac{PV}{RT}\right]$$

$$\text{So} \quad z = 1 - \frac{a}{VRT} \qquad or\ \boxed{z + \frac{a}{VRT} = 1}$$

131. At 27°C in a 10 L flask 4.0 g of an ideal gaseous mixture containing. He (molar mass 4.0 g mol^{-1}) and Ne (molar mass 20g mol^{-1}) has a pressure of 1.23 atm. What is the mass % of neon? (R = 0.082 L atm K^{-1} mol^{-1})

(a) 25.2 (b) 62.5
(c) 84.2 (d) 74.2

AP EAMCET-2017

Ans. (b) : Given,
Volume (V) = 10 lit
T = 27°C = 27 + 273 = 300K
$W = W_1 + W_2 = 4$ gm ……(i)
$M_{(He)}$ = 4 g/mole
$M_{(Ne)}$ = 20 g/mole

@apna_pdf

P = 1.23 atm

$\therefore$ PV = $(n_1 + n_2)$ RT

$$\frac{1.23\times10}{0.082\times300} = \frac{W_1}{4}+\frac{W_2}{20}$$

$$0.5 = \frac{5W_1+W_2}{20}$$

or $5W_1 + W_2 = 10$ …… (ii)

Form equation (i) and (ii) we get

$5W_1 + (4 - W_1) = 10$

$4W_1 = 6$

$W_1 = 6/4 = 1.5$

Putting the value of W_1 in equation (i)

We get –

$1.5 + W_2 = 4$

$\Rightarrow W_2 = 2.5$

Hence, mass % of Neon = $\frac{2.5\times100}{4}$

= 62.5%

132. Which is the correct expression, that relates changes of entropy for an ideal gas at constant temperature in the following

(a) $\Delta s = nRT\ln\frac{P_2}{P_1}$

(b) $\Delta s = T(P_2 - P_1)$

(c) $\Delta s = nR\ln\frac{P_1}{P_2}$

(d) $\Delta s = 2.303nRT\ln\frac{P_1}{P_2}$

MPPET-2008

Ans. (c) :

$$\Delta s = nR\ln\frac{P_1}{P_2}$$

Where Δs = Change in entropy

R = Gas constant

P_1 and P_2 are pressure.

133. The temperature at which 4 moles of a gas occupy 5 dm^3 volume at 3.32 bar pressure is

(a) 50 K (b) 50 °C

(c) 27 °C (d) 100 K

AP EAMCET (Engg.) 18.09.2020, Shift-I
AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (a) : Given,

P = pressure = 332 bar $\simeq$ 3.32 atm

V = volume = 5 dm^3 = 5 L

n = 4 mol

and we known,

R = 0.082 L atm mol^{-1} K^{-1}

For n mole of an ideal gas,

PV = nRT

$$\Rightarrow \quad T = \frac{pV}{nR} = \frac{332\times5}{4\times0.082}$$

= 50.60 K $\simeq$ 50 K

134. At STP, if 5.6 litres of a gas weights 7.5 g, then identify the gas.

(a) CO (b) NO

(c) NO_2 (d) CO_2

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (b) : Given,

At STP 5.6L of a gas weight 7.5g.

We know,

22.4L gas, contain 1 mole at STP

Then, 1L gas contain = $\frac{1}{22.4}$ mole .

Now,

5.6L gas contain,

No. of mole = $\frac{1}{22.4}\times5.6 = 0.25$ mole

Moles= $\frac{\text{Weight}}{\text{Molecular weight}}$

0.25= $\frac{7.5}{\text{Molecular weight}}$

Molecular weight = 30

Thus, the gas is NO

135. Equal masses of methane and oxygen are introduced into a vessel at 27ºC. What fraction of the total pressure is due to oxygen?

(a) $\frac{1}{10}$ (b) $\frac{1}{2}$

(c) $\frac{1}{3}$ (d) $\frac{1}{4}$

A-P EAMCET 1995

Ans. (c) : Let masses of methane (CH_4) and oxygen = m

$$\therefore \text{ Mole fraction of } O_2 = \frac{n_1}{n_1+n_2}$$

$$= \frac{m/32}{m/32+m/16}$$

$$= \frac{m/32}{3m/32}$$

$$= 1/3$$

136. The volume of a given mass of a gas is directly proportional to its Kelvin temperature at constant pressure. The above statement is known as ....

(a) Boyle's law

(b) vant Hoff's law

(c) Charle's law

(d) Dalton's law of partial pressures

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (c) : The variation in a volume of a gas with temperature was first studies by Jacques Charles (1787) and known as Charles' law.

Charles' law states as, "The volume of the given mass of a gas is directly proportional to its absolute temperature at constant pressure.

137. The average kinetic energy of one molecule of an ideal gas at 27°C and 1 atm pressure is

(a) 900 cal k^{-1} mol^{-1}

(b) 6.21 × 10^{-21}JK^{-1} molecule^{-1}

(c) 336.7 JK^{-1} molecule^{-1}

(d) 3741. 3JK^{-1} mol^{-1}

AP EAMCET (Engg.)-2009

@apna_pdf

Ans. (b): Given,
Mole = 1, Temperature (T) = 27°C+273= 300K and
R = 8.314J/mole K

$$KE = \frac{3}{2}nRT \text{ or } \frac{3}{2}\times\frac{R}{N_A}T$$

$$KE = \frac{3}{2}\times\frac{8.314}{6.023\times10^{23}}\times300$$

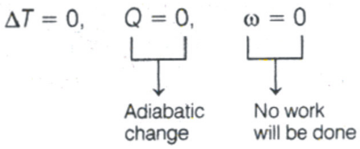
KE=6.21×10^{-21}J/K molecules

138. For an isothermal and free expansion of an ideal gas, which of the following is true ?
1. For an adiabatic change, heat (q) is non zero.
2. For an adiabatic change, heat (q) is zero.
3. For an isothermal reversible change, heat (q) is zero.
4. For an isothermal process, the temperature changes.

(a) 1	(b) 2
(c) 3	(d) 4

AP EAMCET (Engg.) 18.9.2020 Shift-I

Ans. (b) : For an isothermal and free expansion of an ideal gas,



So, the statement (2) is correct.

139. If two molecules of A and B having mass 100Kg 64 Kg and rate of diffusion of A is 12×10^{-3} then rate of diffusion of B will be ____

(a) 15×10^{-3}	(b) 64×10^{-3}
(c) 36×10^{-3}	(d) 10×10^{-3}

AP EAPCET 24.08.2021 Shift-II

Ans. (a) : Given that,
Mass of gas A = 100 kg
Mass of gas B = 64 kg
Rate of diffusion of A = 12×10^{-3}
Rate of diffusion of B = ?
So, we know that,

Rate of diffusion of A × $\sqrt{\text{Molar mass of A}}$ =

Rate of diffusion of B × $\sqrt{\text{Molar mass of B}}$

$12\times10^{-3}\times\sqrt{100}$ = Rate of diffusion of B × $\sqrt{64}$

$\frac{12\times10^{-3}\times10}{8}$ = Rate of diffusion of B

So, rate of diffusion of B = 15×10^{-3}

140. The density of an ideal gas can be given by—— where P,V,M,T and R respectively denote pressure Volume molar-mass Temperature and universal gas constant.

(a) $\frac{PM}{RT}$	(b) $\frac{PV}{RT}$
(c) $\frac{RT}{PM}$	(d) $\frac{RT}{PV}$

AP EAPCET 19-08-2021 Shift-I

Ans. (a) : From the ideal gas equation.
PV = nRT where – P = pressure
V = volume
N = no. of mole
R= Gas constant
T = Temperature

$\therefore \quad n = \frac{W}{M}$

Where W = weight of particle
M = molar mass
Putting the value of n in Equation (i) we get

$PV = \frac{W}{M}RT$

Or $PM = \frac{W}{V}RT \;(\therefore \tau = \frac{W}{V})$

$\therefore \tau = \frac{PM}{RT}$ Where τ = density of the gas.

141. How many liters of oxygen (at STP) are required for complete combustion of 39 g of liquid benzene?
(Atomic weights: C=12.O=16,H=1)

(a) 84	(b) 22.4
(c) 42	(d) 11.2

AP EAMCET (Engg.) 2001

Ans. (a) : $C_6H_6 + \frac{15}{2}O_2 \xrightarrow{\Delta} 6CO_2 + 3H_2O$

Molecular weight of benzene $(C_6H_6) = 78$

Moles of benzene = $\frac{\text{weight}}{\text{M.wt.}} = \frac{39}{78} = \frac{1}{2}$ moles

1 mole combustion of benzene required $\frac{15}{2}$ mole of oxygen gas

$\therefore \frac{1}{2}$ mole benzene required $\left(\frac{15}{2}\times\frac{1}{2} = \frac{15}{4}\right)$ mole of oxygen gas

As we know, mole = $\frac{\text{volume}}{22.4}$

Volume = Mole × 22. 4L

Volume of oxygen = $\frac{15}{4}\times22.4$L
= 84 L

142. What is the volume (in litres) of oxygen at STP required for complete combustion of 32 g of CH_4?
(Molecular weight of CH_4 is 16)

(a) 44.8	(b) 89.6
(c) 22.4	(d) 179.2

AP EAMCET (Engg.) 2001

Ans. (b) : On complete combustion, we get

$$CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$$

Weight of CH_4 = 34
M .wt. of CH_4 = 16

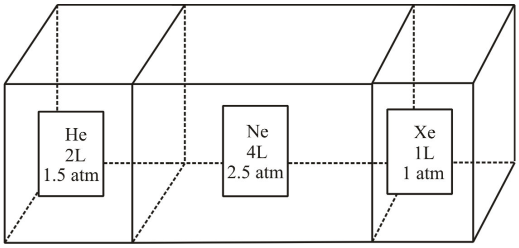
Moles of CH_4 = $\frac{\text{weight}}{\text{M.wt.}} = \frac{32}{16}$ = 2 moles

1 mole combustion of methane (CH_4) required 2 moles of oxygen at S T P.

@apna_pdf

$\therefore$ 2 mole methane requires 4 moles of oxygen.
Volume = Mole × 22 4 L
Volume of oxygen = 4 × 22.4
= 89.6 L

143. Consider the composite system. Which is held at 300K, shown in the figure. Assuming ideal gas behavior, calculate the total pressure if the barriers separating the compartments are removed. Assume that the volume of the barriers is negligible. (R=0.082 atmL/Mol.K)



(a) 1 atm (b) 2 atm
(c) 2.3 atm (d) 3.2 atm

AP EAPCET-6 Sep. 2021, Shift-II

Ans. (b) : The no, of moles can be calculated with the help of ideal gas equation.
i.e, PV= nRT

$$\text{So, } n_{He} = \frac{PV}{RT} = \frac{1.5\times2}{RT} = \frac{3}{RT} .....(1)$$

$$n_{Ne} = \frac{2.5\times4}{RT} = \frac{10}{RT} ......(2)$$

$$n_{Xe} = \frac{1\times1}{RT} = \frac{1}{RT} .....(3)$$

Total no. of moles present if barrier is removed.

$n = n_{He} + n_{Ne} + n_{Xe}$ …(3)

$$= \frac{3}{RT} + \frac{10}{RT} + \frac{1}{RT} = \frac{1}{RT}(3+10+1)$$

The total pressure is given by,

$$P = \frac{n_{Total} RT}{V}$$

$$= \frac{14 RT}{RT\times V}$$

$$= \frac{14}{7} = 2 \text{ atm.}$$

144. A certain mass of a gas occupies a volume of 2*l* at STP. To what temperature the gas must be heated to double its volume, keeping the pressure constant?

(a) 100 K (b) 273 K
(c) 273ºC (d) 546ºC

AP EAMCET (Engg.) -2007

Ans. (c) : Given,
At STP, Pressure = 1 atm
T_2 = 273 K
And volume, V_1 = 2 L
$V_2 = 2 V_1 = 4L$
From ideal gas equation,
P V = n R T
At constant pressure and same moles
Volume $\propto$ Temperature

Then,

$$\frac{V_1}{V_2} = \frac{T_1}{T_1}$$

$$T_2 = T_1 \times \frac{V_2}{V_1}$$

$$= 273 \times \frac{4}{2}$$

= 546 K
= 546–273
= 273^0 C

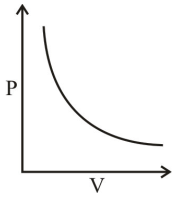
145. Which among the following are true for an irreversible isothermal expansion of an ideal gas?

(i) $W = -Q$ (ii) $\Delta U = 0$
(iii) $\Delta H \neq 0$ (iv) $\Delta T = 0$

(a) Only (i), (ii) & (iii)
(b) Only (i), (ii) & (iv)
(c) Only (ii), (iii) & (iv)
(d) Only (i), (ii) (iii) & (iv)

AP EAPCET 24.08.2021, Shift-I

Ans. (b) :



Since for an ideal gas the internal energy is proportional to temperature. It follows that there is no change in the internal energy of the gas during isothermal process. Then, the first law of thermodynamics then becomes.

$\Delta U = 0$
$\Delta T = 0$
$W = -Q$

146. Among the following. Van der Waal's constant 'a' would be maximum for ____.

(a) H_2 (b) O_2
(c) CH_4 (d) NH_3

AP EAPCET 24.08.2021, Shift-I

Ans. (d) : Van der Waal's constant 'a' is depend upon the magnitude of intermolecular attractive forces with the gas. The Vander Waal's force of attraction is more in NH_3.

147. When an ideal gas expands isothermally from 5 m^3 to 10 m^3 at 25 ^oC against a constant pressure of 10^7 $N.m^{-2}$, then the work done on the gas is__

(a) –100 MJ (b) –50 MJ
(c) –0.5 MJ (d) -10^5 MJ

AP EAPCET 20.08.2021 Shift-II

Ans. (b): Given that
Volume (ΔV) = 10–5 = $5m^3$
Pressure (P) = 10^7 $N.m^{-2}$
Temperature (T) = 25^oC
W = ?
$\therefore W = -P\Delta V$
$= -10^7 \times 5$
$= -50 \times 10^6$ J or –50 MJ

@apna_pdf

148. What is the density of N_2 gas at 227°C and 5.00 atm pressure?
(R= 0.082 L atm K^{-1} mol^{-1})

(a) 1.40g/mL (b) 2.81g/mL
(c) 3.41g/mL (d) 0.29g/mL

Karnataka NEET 2013

Ans. (c) : $PV = nRT$

$$PV = \frac{w}{M}RT \left[n = \frac{\text{Weight of the gas taken}(w)}{\text{Mol. mass of gas}(M)}\right]$$

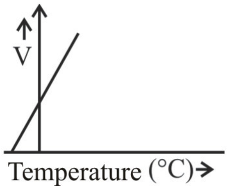
$$P = \frac{w}{M} \times \frac{RT}{V}$$

$$P = \frac{\rho RT}{M} \quad \left[\text{Density} = \frac{\text{Mass}}{\text{Volume}}\right]$$

$$\rho = \frac{PM}{RT}$$

$$= \frac{5 \times 28}{0.0821 \times 500} = 3.41 g/mL$$

149. The following graph illustrates



(a) Dalton's law (b) Charles' law
(c) Boyle's law (d) Gay-Lussac's law.

COMEDK 2017

Ans. (b) : Charles' law relates volume and temperature of a gas.

150. Containers A and B have same gases. Pressure, volume and temperature of A are all twice as that of B, then the ratio of number of molecules of A and B are

(a) 1:2 (b) 2:1
(c) 1:4 (d) 4:1

COMEDK 2018

Ans. (b) : $P_A V_A = n_A RT_A$ and $P_B V_B = n_B RT_B$

$$\frac{n_A}{n_B} = \frac{\frac{P_A V_A}{RT_A}}{\frac{P_B V_B}{RT_B}} = \frac{\frac{2P_B \times 2V_B}{2T_B}}{\frac{P_B \times V_B}{T_B}} = 2$$

Thus, number of molecules are also in the ratio 2:1.

151. In a flask of 'V' litres, 0.2 moles of O_2, 0.4 moles of N_2, 0.1 moles of NH_3 and 0.3 moles of He gases are present at 27°C. If total pressure exerted by these non-reacting gases is 1 atm, the partial pressure exerted by N_2 gas is

(a) 0.4 atm (b) 0.3 atm
(c) 0.2 atm (d) 0.1 atm

AP-EAMCET (Medical), 2008

Ans. (a) : Given data:

$n_{O_2} = 0.2$
$n_{N_2} = 0.4$
$n_{NH_3} = 0.1$
$n_{He} = 0.3$
$P_{Total} = 1$ atm

Partial pressure of Nitrogen $(p_{N_2}) = ?$

Now, $p_{N_2} = P_{Total} \times \chi_{N_2}$

$$p_{N_2} = 1 \times \frac{0.4}{0.2+0.4+0.1+0.3}$$

$$p_{N_2} = \frac{0.4}{1}$$

$$p_{N_2} = 0.4 atm$$

152. What are the conditions under which the relation between volume (V) an number of moles (n) of gas is plotted?
(P = pressure, T= temperature)

(a) Constant P and T (b) Constant T and V
(c) Constant P and V (d) Constant n and V

AP-EAMCET (Medical), 2001

Ans. (a) : According to Avogadro's law at constant pressure and temperature volume of a gas is directly proportional to number of moles of a gas.

153. What is the density (in $g.L^{-1}$) of CO_2 at 400 K and exerting a pressure of 0.0821 atm?
(R = 0.0821 L atm mol^{-1} K^{-1})

(a) 0.01 (b) 0.11
(c) 2.5 (d) 44

AP-EAMCET (Medical), 2002

Ans. (b) : Given,

T = 400 K
P = 0.0821 atm
R = 0.0821 L atm $mol^{-1}K^{-1}$
ρ = ? (g/L)

Now, from the ideal gas equation – we get

$$PV = nRT$$

or $$PV = \frac{w}{M}RT$$

or $$P = \frac{w}{M \times V}RT$$

or $$P = \frac{\rho}{M}RT$$

or $$\rho = \frac{PM}{RT} \quad [M_{CO_2} = 44]$$

or $$\rho = \frac{0.0821 \times 44}{0.0821 \times 400}$$

$$\rho = 0.11 g/L$$

154. Which of the following mixture form an ideal solution ?

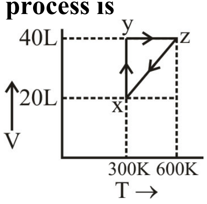
(a) $CCl_4 + C_7H_8$
(b) $CHCl_3 + C_6H_6$
(c) $H_2O + CH_3OH$
(d) $n-C_6H_{14} + n-C_7H_{16}$

TS-EAMCET (Engg.), 06.08.2021

@apna_pdf

Ans. (d): An ideal solution obeys Raoult's law at all temperatures and pressures.
The solute-solute and solvent-solvent interactions are almost similar to solute-solvent interactions. No association or dissociation takes place. It does not form an azeotrope mixture.
Benzene + toluene
n-hexane + n-heptane
Ethyl bromide + ethyl iodide

155. The following graph indicates the system containing 1 mole of gas involving various steps. When it moves from z to x, the type of undergoing process is



(a) Cyclic (b) Isothermal
(c) Isochoric (d) Isobaric

TS-EAMCET (Engg.), 06.08.2021

Ans. (d): At X → Temperature (T_1) = 300K, Volume (V_1) = 20L, Pressure (P_1) = ?
At Z → Temperature (T_2) = 600K, Volume (V_2) = 40L, Pressure = P_2

$$\therefore \quad \frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\frac{P_1}{P_2} = \frac{V_2 \times T_1}{T_2 \times V_1}$$

$$= \frac{40 \times 300}{600 \times 20}$$

$$\boxed{P_1 = P_2}$$

So, process is isobaric

156. A balloon filled with an air sample occupies 3 L volume at 35°C. On lowering the temperature to T, the volume decreases to 2.5L. The temperature T is?

(a) 16°C (b) –16°C
(c) 24°C (d) –20°C

TS-EAMCET (Engg.), 06.08.2021

Ans. (b): Given that, $V_1 = 3L$, $T_1 = 35 + 273 = 308K$
$V_2 = 2.5L$, $T_2 = ?$

According to Charle's law, $\frac{V_2}{V_1} = \frac{T_2}{T_1}$

$$T_2 = \frac{2.5 \times 308}{3}$$

$$T_2 = 256.67K$$

$$T_2 = -16.33°C$$

$$T_2 = 256.67 - 273$$

$$\boxed{T_2 = -16°C}$$

157. Which gas has a density of 1.24 g/L at 0°C and 1 atm pressure?

(a) O_2 (b) CH_4
(c) CO (d) CO_2

TS EAMCET 05.08.2021, Shift-I

Ans. (c) : By Ideal gas equations –

$$\because \quad PV = nRT$$

$$\text{or} \quad n = \frac{PV}{RT}$$

$$\text{or} \quad \frac{w}{M} = \frac{PV}{RT}$$

$$\text{since} \quad \frac{\rho}{M} = \frac{PV}{RT}$$

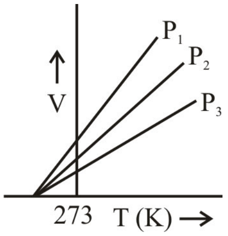
$$\text{or} \quad M = \frac{\rho RT}{P}$$

$$\text{or} \quad M = \frac{1.24 \times 0.0821 \times 273}{1}$$

$$M = 27.79 \simeq 28$$

Hence, 28 the atomic mass is CO.
So **(c)** is correct.

158. A plot of volume of the gas Versus T (K) is shown below : Which of the option is correct for the plot?



(a) $P_1 < P_2 < P_3$
(b) $P_3 < P_2 < P_1$
(c) $P_1 = P_2 \neq P_3$
(d) $P_1 = P_2 = P_3 = 0$ at 273 K

TS EAMCET 04.08.2021, Shift-I

Ans. (a) : According to Boyle's law state that the volume of gas at constant temperature varies inversely with the pressure exerted on it.

$$\boxed{V \propto \frac{1}{P}}$$

Hence, this plot indicate $P_1 < P_2 < P_3$.

159. Five moles of an ideal gas at 293 K is expanded isothermally from an initial pressure of 2.1 MPa to 1.3 MPa against at constant external pressure 4.3 MPa. The heat transferred in this process is——kJ mol^{-1}. (Rounded-off to the nearest integer)
[Use R = 8.314 J $mol^{-1}K^{-1}$]

JEE Main 25.02.2021, Shift-II

Ans. (3): Given:– No. of moles = 5
T = 293 k
P_1 = 2.1 MPa
P_2 = 1.3 MPa
P_{ext} = 4.3 MPa
We know that, for isothermal irreversible expansion,

$$W = -P_{ext}(\Delta V)$$

$$= -P_{ext}(V_2 - V_1) \quad \left\{ \begin{array}{l} \because PV = nRT \\ V = \frac{nRT}{P} \end{array} \right\}$$

@apna_pdf

$$= -4.3\left[\frac{5\times R\times 293}{1.3} - \frac{5\times R\times 293}{2.1}\right]$$

$$= -\frac{4.3\times 5\times 8.314\times 293\times 0.8}{1.3\times 2.1}$$

$$= -15.34\,\text{kJ}$$

For isothermal process, $\Delta U = 0$

From first law of thermodynamics

$Q = -w$

$Q = -(-15.34\text{kJ})$

$Q = 15.34$ kJ (for 5 moles)

$$\therefore\ Q/\text{mole} = \frac{15.35}{5} \approx 3\text{kJmol}^{-1}$$

160. The number of chlorine atoms in 20mL of chlorine gas at STP is ________ 10^{21}. (Round off to the Nearest Integer).
[Assume chlorine is an ideal gas at STP
$R=0.083$ L bar mol^{-1} K^{-1} , $N_A=6.023\times10^{23}$]

JEE Main 17.03.2021, Shift-II

Ans. (1) :
Given that, Volume of Cl_2= 20 mL
Gas constant (R)= 0.083 L bar $mol^{-1}K^{-1}$
Avogadro's no. $(N_A)=6.023\times10^{23}$
Now, from ideal gas equation-
PV=nRT

$$\text{or } PV = \frac{N}{6.023\times10^{23}}\times RT$$

$$\text{or } N = \frac{PV}{RT}\times 6.023\times10^{23}$$

$$N = \frac{1\times 20\times10^{-3}(L)\times 6.023\times10^{23}}{0.083(\text{Lbar mol}^{-1}K^{-1})\times 273(K)}$$

$N = 5.3\times10^{20}$

Cl atom $=2\times5.3\times 10^{20} = 1.02\times10^{21}\approx1\times10^{21}$.

161. 3.12g of oxygen is absorbed on 1.2 g of platinum metal. The volume of oxygen absorbed per gram of the absorbent at 1 atm and 300 K in L is _______. [R=0.0821 L atm $K^{-1}mol^{-1}$]

JEE Main 26.02.2021, Shift-I

Ans. (2) : Moles of O_2= $\frac{3.12\text{gm}}{32} = 0.0975$

$\therefore$ PV = nRT

$$\text{Volume of } O_2 = \frac{nRT}{P}$$

$$= \frac{0.0975\times0.082\times300}{1} = 2.4\text{L}$$

Therefore, volume of O_2 absorbed per gm of platinum

$$(Pt)= \frac{2.4}{1.2} = 2$$

162. A certain gas obeys $P(V_m - b)=RT$. The value of $\left(\frac{\partial Z}{\partial P}\right)_T$ is $\frac{xb}{RT}$.
The value of x is ________ .

JEE Main 26.02.2021, Shift-I

Ans. (1) : Given that,
P (V – b) = RT
PV – Pb= RT
Dividing RT both side, we get

$$\frac{PV}{RT} - \frac{Pb}{RT} = 1$$

$$\frac{PV}{RT} = 1 + \frac{Pb}{RT}$$

$$Z = 1 + \frac{Pb}{RT}\left(\because z = \frac{PV}{RT}\right)$$

$$\frac{dZ}{dP} = 0 + \frac{b}{RT}$$

Therefore,

$$\frac{b}{RT} = \frac{Xb}{RT}$$

X=1

Since, the value of X=1.

163. Assertion: At low pressure and high temperature, some gases behave as ideal gas.
Reason: At low temperature and high pressure, real gases behave as ideal gas.
(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Evening)

Ans. (c): Real gases does not follow kinetic gas assumption, kinetic gas equation and gas law's.
According to kinetic gas assumption ideal gas has no intermolecular forces of attraction and volume occupied by then are negligible. But real gases have intermolecular forces of attraction and have some volume.
For real gas, Van der Waal's gas equation are

$$\left(P + \frac{an^2}{V^2}\right)(V - nb) = nRT$$

At low pressure and high temperature real gas behave as ideal gas equation. Because when pressure decreases volume increases than correction terms is negligible.
At low pressure, volume increases

$$\left(P + \frac{an^2}{V^2}\right)(V - nb) = nRT$$

Both $\frac{an^2}{V_2}$ and nb correction terms are neglected.

So, real gas follow ideal gas equation, PV = nRT

But at low temperature and high pressure real gases doesn't behave like ideal gas.

164. Assertion: The pressure of a fixed amount of an ideal gas is proportional to its temperature.
Reason: Frequency of collision and their impact both increase in proportion to the square root of temperature.

@apna_pdf

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-27 May, 2018 (E)

Ans. (b): From ideal gas equation PV = nRT
According to gay Lussac's law, pressure is directly proportional to temperature at constant volume.
$P \propto T$
So, Assertion is correct.
Collision frequency is depends upon the root mean square velocity (U_{rms}) which is directly proportional to the square root of temperature.
$U_{rms} \propto \sqrt{T}$
SO, Reason is also correct but it is not correct explanation of assertion.

165. At what temperature, the rate of effusion of N_2 would be 1.625 times than that of SO_2 at 50°C?
(a) 110 K (b) 173 K
(c) 373 K (d) 273 K

BITSAT 2016

Ans.(c): $T_2 = 273 + 50 = 323k$

$$r \propto U \text{ and } U = \sqrt{\frac{3RT}{M}}$$

$$\therefore \frac{r_1}{r_2} = \sqrt{\frac{T_1M_2}{T_2M_1}} \text{ or}$$

$$\frac{r_{N_2}}{r_{SO_2}} = \sqrt{\frac{T_1 \times 64}{323 \times 28}} = 1.625$$

or $T_1 = 373$ K

166. Assertion: Gases do not liquefy above their critical temperature, even on applying high pressure.
Reason: Above critical temperature, the molecular speed is high and intermolecular attractions cannot hold the molecules together because they escape due to high speed.
(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2016

Ans. (a): The temperature below which gas can be liquefied by application of pressure is known as critical temperature. Above critical temperature gases do not liquefied even after applying high pressure because their molecular speed increases and intermolecular force of attraction cannot hold the molecules together

167. Assertion: At critical temperature liquid passes into gaseous state imperceptibly and continuously.
Reason: The density of liquid and gaseous phase is equal to critical temperature.
(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2017

Ans. (a): At critical temperature, density of liquid phase is equal to density of gaseous phase because of this liquid converted into gaseous state imperceptibly and continuously. Therefore, both assertion and reason are correct and reason is correct explosion of assertion

168. In van der Waal's equation at constant temperature of 300 K, a=1.4 atm Lt^2 mol^{-2}, V=100mL, n=1 mol, what is pressure of gas?
(a) 42 atm (b) 210 atm
(c) 500atm (d) 106 atm

AIIMS-26 May, 2018 (M)

Ans. (d): Given:- Temperature (T) = 300 K
a = 1. 4 atm Lt^2 mol^{-2}
V = 100 mL = 0. 1 L
N = 1 mole
Van der Waal's equation,

$$\left(P - \frac{an^2}{V^2}\right)(V) = nRT$$

on substituting values in above equation

$$\left(P - \frac{1.4 \times (1)^2}{(0.1)^2}\right)(0.1) = 1 \times 0.082 \times 300$$

P = 106 atm

169. The gas with the highest critical temperature is
(a) H_2 (b) He
(c) N_2 (d) CO_2

AIIMS-2014

Ans. (d) : Temperature below which gas can be liquefied by application of pressure is known as critical temperature (T_c). Critical temperature depends on the intermolecular force of attraction of molecules. Higher the attraction force greater the critical temperature.
CO_2 molecule is slightly polar so, it's critical temperature is highest.

170. X mL of H_2 gas effuses through a hole in a container in 5 seconds. The time taken for the effusion of the same volume of the gas specified below under identical condition is
(a) 10 seconds: He (b) 20 seconds: O_2
(c) 25 seconds: CO (d) 55 seconds: CO_2

AIIMS-2012

Ans. (b): Effusion is the property of flow of gaseous molecules from high concentration to low concentration from a pin hole with external pressure.

@apna_pdf

According to Graham's law of diffusion,

Rate of diffusion / effusion $\propto \frac{1}{\sqrt{\text{M.wt.}}}$

$$\frac{r_{O_2}}{r_{H_2}} = \sqrt{\frac{(\text{M.wt.})_{H_2}}{(\text{M.wt.})_{O_2}}} \Rightarrow \frac{\frac{V_{O_2}}{t_{O_2}}}{\frac{V_{H_2}}{t_{H_2}}} = \sqrt{\frac{(\text{M.wt.})_{H_2}}{(\text{M.wt.})_{O_2}}}$$

$$\frac{\frac{V}{t_{O_2}}}{\frac{V}{5}} = \sqrt{\frac{2}{32}}$$

$$\frac{5}{t_{O_2}} = \sqrt{\frac{2}{16}} = \frac{1}{4}$$

time (T_{O_2}) = 5 × 4 =20 seconds

171. The rate of diffusion of SO_2,CO_2,PCl_3 and SO_3 are in the following order

(a) $PCl_3 > SO_3 > SO_2 > CO_2$

(b) $CO_2 > SO_2 > PCl_3 > SO_3$

(c) $SO_2 > SO_3 > PCl_3 > CO_2$

(d) $CO_2 > SO_2 > SO_3 > PCl_3$

AIIMS-2013

Ans. (d): Rate of diffusion (r_d) $\propto \frac{1}{\sqrt{\text{Molar mass}}}$

Molar mass of $SO_2 = 64$ g/mol

Molar mass of $SO_3 = 80$ g/mol

Molar mass of $CO_2 = 44$ g/mol

Molar mass of PCl_3 = 137.3 g/mol

Order of rate of diffusion is

$CO_2 > SO_2 > SO_3 > PCl_3$

172. Which equation shows correct from of Berthelot equation.

(a) $\left(P + \frac{a}{T(V+C)^2}\right)(V-b) = RT$

(b) $\left(P + \frac{a}{T(V-C)^2}\right)(V-b) = RT$

(c) $\left(P + \frac{a}{TV^2}\right)(V-b) = RT$

(d) $\left(P + \frac{a}{TV^2}\right)(V+b) = RT$

AIIMS-2000

Ans. (c): In Berthelot equation only pressure correction is changed from Van der Waal's equation while volume is same.

Berthelot equation,

$$\left(P + \frac{a}{TV^2}\right)(V-b) = RT$$

173. The transport of matter in the absence of bulk flow is known as:

(a) diffusion (b) transfusion

(c) translation (d) rotation

AIIMS-1999

Ans. (a): The property of spontaneous flow of gaseous molecules from high concentration to low concentration without external pressure is known as diffusion. In diffusion, membrane or bulks flow is absent molecules are diffused in small amount.

174. Van der Waal's equation;

$\left[P + \frac{a}{V^2}\right](V-b) = nRT$ is applicable for:

(a) ideal gas (b) non- ideal gas

(c) both (a) and (b) (d) none of these

AIIMS-1998

Ans. (b): Van der Waal's equation

$$\left[P + \frac{a}{V^2}\right](V-b) = nRT$$

is only applicable for non-ideal gas.

Non-ideal gases does not follow kinetic theory of gases or gas's law. Two major corrections are required for non-ideal gases.

(i) The intermolecular forces of attraction between molecules is not negligible.

(ii) The volume of molecule is not negligible in comparison of total volume of gas.

175. Among the following the maximum deviation from ideal gas behavior is expected from ___

(a) $He_{(g)}$ (b) $CH_{4(g)}$

(c) $NH_{3(g)}$ (d) $H_{2(g)}$

AP EAPCET 19-08-2021, Shift-II

Ans. (c) : The deviation from the ideal gas depends on the pressure and temperature. $NH_3$is most readily liquefiable gas out of given gases in the above.

Since, it has the strongest intermolecular attraction forces.

176. Helium gas at 1 atm and SO_2 at 2 atm pressure, temperature being the same, are released separately at the same moment into 1 m long evacuated tubes of equal diameters. If helium reaches the other end of the tube in t s, what distance, SO_2 would traverse in the same time interval in the other tube?

(a) 25 cm (b) 50 cm

(c) 60 cm (d) 75 cm

SRMJEEE – 2007

Ans. (b) :

Given, $P_{He} = 1\,\text{atm}, P_{SO_2} = 2\,\text{atm}, t_{He} = t_{SO_2} = t$

distance = 1m = 100 cm, $M_{SO_2} = 64, M_{He} = 21$

$$\therefore \frac{r_{He}}{r_{SO_2}} = \frac{\frac{100}{t_{He}}}{\frac{X}{t_{SO_2}}} = \frac{P_{He}}{P_{SO_2}}\sqrt{\frac{M_{SO_2}}{M_{He}}}$$

$$\therefore \frac{100}{t} \times \frac{t}{x} = \frac{1}{2}\sqrt{\frac{64}{4}}$$

$\Rightarrow$ x = 50 cm

177. At 1 atm pressure, 0.5 g of a gas has the volume of 0.1 L at 300 K, Gas constant R = 0.0821 L. atm K^{-1} mol^{-1}. Find the molar mass of the gas.

(a) 112 (b) 24.6

(c) 123.1 (d) 49.2

SRMJEEE – 2013

@apna_pdf

Ans. (c) : Given, P = 1atm R = 0.0821 L.atmk^{-1} mol^{-1}

W = 0.5g M = ?

V = 0.1L

T = 300K

Now, From the ideal gas equation–

PV = nRT where – n = no. of moles

$$\text{or} \quad n = \frac{PV}{RT}$$

$$\text{or} \quad M = \frac{WRT}{PV}$$

$$M = \frac{0.5(g) \times 0.0821(L.atmk^{-1}mol^{-1}) \times 300(k)}{1(atm) \times (0.1)L}$$

M = 123.15g/mol

178. A gaseous mixture contains 2 moles of A, 3 moles of B. 5 moles of C and 10 moles of D contained in a vessel. If the gases are ideal and the partial pressure of C is 1.5 atm, then the partial pressure of B will be _____

(a) 1.5 atm (b) 0.6 atm

(c) 0.9 atm (d) 1.66 atm

AP- EAPCET- 07-09-2021, Shift-I

Ans. (c) : Given,

Mole of A = 2

Mole of B = 3

Mole of C = 5

Mole of D = 10

Partial pressure of C = 1.5 atm

Partial pressure of B = ?

$$\text{Partial pressure of C} = \frac{\text{Mole of C}}{\text{Total mole}} \times \text{Total pressure}$$

$$1.5 = \frac{5}{20} \times \text{Total pressure}$$

$$\boxed{\text{Total pressure} = 6\,\text{atm}}$$

$$\text{Now, Partial pressure of B} = \frac{\text{Mole of B}}{\text{Total mole}} \times \text{Total pressure}$$

$$= \frac{3}{20} \times 6 = 0.9\,\text{atm}$$

179. When 1 mole of CO_2(g) occupying volume 10L at 27°C is expanded under adiabatic condition, temperature falls to 150 K. Hence, final volume is

(a) 5 L (b) 20 L

(c) 40 L (d) 80 L

VITEEE-2013

Ans. (d) : For adiabatic condition –

$$\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1}$$

∵ CO_2 is triatomic gas

∴ $\gamma = 1.33$

Given, T_1 = 300 K, T_2 = 150 K, V_1 = 10 L, V_2 = ?

$$\left(\frac{150}{300}\right) = \left(\frac{10}{V_2}\right)^{1.33-1}$$

$$\left(\frac{1}{2}\right) = \left(\frac{10}{V_2}\right)^{0.33}$$

$$\left(\frac{1}{2}\right)^3 = \frac{10}{V_2}$$

V_2 = 10×8 = 80 Litre.

180. The pressure exerted by 6.0g of methane gas in a 0.03m^3 vessel at 129°C is (Atomic masses : C = 12.01, H = 1.01 and R = 8.314 JK^{-1} mol^{-1})

(a) 215216 Pa (b) 13409 Pa

(c) 41648 Pa (d) 31684 Pa

VITEEE- 2012

Ans. (c) : Given:–

Weight in gram of methane = 6.0 gram

Molecular weight of methane (CH_4) = 1 × 12 + 4 × 1

= 16 gram/mole

T = 129°C

= 129 + 273 = 402K

From, ideal gas equation,

$$PV = nRT \Rightarrow P = \frac{nRT}{V} = \frac{W}{M} \times \frac{RT}{V}$$

$$P = \frac{6}{16} \times \frac{8.314 \times 402}{0.03} = 41648\ \text{Pa}$$

181. A bubble of air underwater at temperature 15°C and the pressure 1.5 bar. If the bubble rises to the surface where the temperature is 25°C and the pressure is 1.0 bar, what will happen to the volume of the bubble?

(a) Volume will become greater by a factor of 1.6

(b) Volume will become greater by a factor of 1.1

(c) Volume will become smaller by a factor of 0.70

(d) Volume will become greater by a factor of 2.9

VITEEE- 2012

Ans. (a) : According to Ideal gas equation:-

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\Rightarrow \frac{1.5 \times V_1}{288} = \frac{1.0 \times V_2}{298} \quad \left\{ \begin{array}{ll} \because T_1 = 15°C & \text{and } T_2 = 25°C \\ = 15 + 273 & = 25 + 273 \\ = 288\,K & = 298\,K \end{array} \right.$$

$$\Rightarrow \frac{V_1}{V_2} = \frac{1.0 \times 288}{298 \times 1.5}$$

$$V_2 = \frac{1.5 \times V_1 \times 298}{288}$$

$$\frac{V_2}{V_1} = \frac{447}{288}$$

$$\boxed{\frac{V_2}{V_1} = 1.55}$$

$V_2 = 1.55\ V_1$

i.e., volume of bubble will be 1.55 times of initial volume of bubble.

@apna_pdf

182. When ideal gas expands in vacuum, the work done by the gas is equal to

(a) PV (b) RT

(c) 0 (d) nRT

VITEEE- 2006

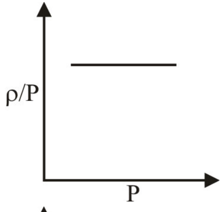
Ans. (c) : $W_{irr} = -P_{ext}\frac{R[P_1T_2 - P_2T_1]}{P_1P_2}$

During expansion in vaccum $P_{ext} = 0$

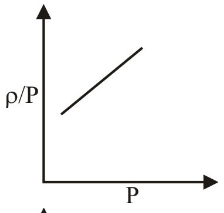
$\therefore$ work done = 0.

183. The ideal gas equation, PV = nRT, can be written in terms of density, ρ, and $\rho/P = \frac{M}{RT}$. The graph between ρ/P against P is given by

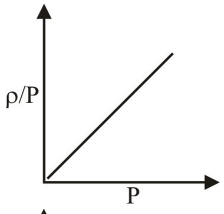
(a)



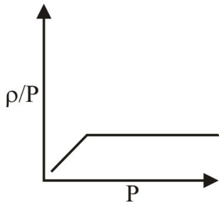
(b)



(c)



(d)



AMU-2013

Ans. (a) : From ideal gas equation,

PV = nRT

For 1 mole, PV = RT

Density (ρ) = $\frac{\text{Mass(M)}}{\text{Volume(V)}}$

Volume (V) = $\frac{\text{Mass(M)}}{\text{Density(P)}}$

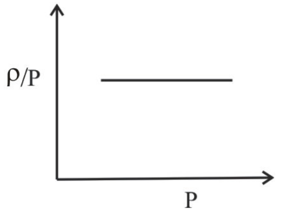
On substituting the value of volume (V) in ideal gas equation, we get

$$\frac{\rho}{P} = \frac{M}{RT}$$

$$\frac{\rho}{P} = \text{Constant}$$

$\rho \propto P$

Therefore,



184. One mole of an ideal gas expands at a constant temperature of 300 K from an initial volume of 10 liter to a final volume of 20 liter. The work done in expanding the gas is

(a) 750 Joule (b) 1726 Joule

(c) 1500 Joule (d) 3456 Joule

AMU-2011

Ans. (b) : Given :– T = 300 K

N = 1 mole

$V_1 = 10$ L

$V_2 = 20$ L

Work done in isothermal process,

$W = nRT \log_{10}\frac{V_2}{V_1}$

$= 1 \times 8.3 \times 300 \times 2.303 \log_{10}\frac{20}{10}$

= 1725.93 J ≈ 1726 J

185. The ratio of rates of diffusion of hydrogen chloride and ammonia gases is

(a) 1:1.46 (b) 1:2.92

(c) 1.46:1 (d) 1:0.73

AMU – 2010

Ans. (a) : r_1 = rate of diffusion of HCl

r_2 = Rate of diffusion of NH_3

M_1 = Molecular mass of HCl

M_2 = Molecular mass of NH_3

$$\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}} = \sqrt{\frac{17}{36.5}} = \sqrt{0.466} = 1 : 1.46$$

186. An ideal gas is undergoing from an initial volume, isothermal and adiabatic expansion from an initial volume, V_i and pressure, P_i to a common final volume of V_f, then

(a) $P_{adiabatic} < P_{isothermal} : V_{adiabatic} > V_{isothermal}$

(b) $P_{adiabatic} < P_{isothermal} : V_{adiabatic} < V_{isothermal}$

(c) $P_{adiabatic} > P_{isothermal} : V_{adiabatic} > V_{isothermal}$

(d) $P_{adiabatic} > P_{isothermal} : V_{adiabatic} < V_{isothermal}$

AMU–2006

Ans. (b) : We know that,

Slope of isothermal & adiabatic process are,

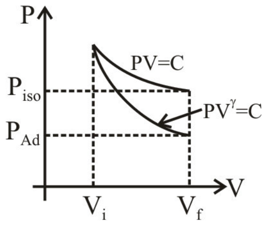
$$\left(\frac{dp}{dv}\right)_{iso} = \frac{-p}{v} \qquad \left(\frac{dp}{dv}\right)_{Ad} = -\gamma\frac{p}{v}$$

$$\therefore \quad \left(\frac{dp}{dv}\right)_{Ad} > \left(\frac{dp}{dv}\right)_{iso}$$

Case-I: Common volume V_f

@apna_pdf

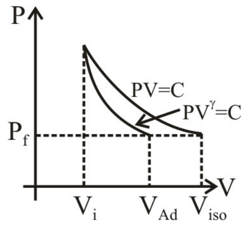
For expansion,



$\therefore \quad P_{iso} > P_{Ad}$

Case-II: Common pressure P_f

For expansion,



$\therefore \quad V_{iso} > V_{Ad}$

187. 7.5 g of gas occupies 5.6 L at STP. The gas is (atomic weights of C, N and O are 12, 14, 16, respectively)

(a) NO (b) N_2O
(c) CO (d) CO_2

Assam CEE-2020

Ans. (a) : One mole of Gas at STP occupies 22.4 L Thus, 5.6 L of Gas at STP contains 0.25 Moles

$$\text{No of moles} = \frac{\text{Wt.in grams}}{\text{Mol Wt}}$$

$$0.25 = \frac{7.5}{m}$$

$$\boxed{m = 30}$$

The Gas is NO.

188. Two litres of an ideal gas at a pressure of 10 atm expands isothermally into a vacuum until its total volume is ten litres During this process

(a) work is done; no heat is absorbed
(b) work is done; heat is emitted
(c) no work is done; heat is emitted
(d) no work is done; no heat is absorbed

Assam CEE-2019

Ans. (d) : For isothermal process,

$W = Q$

$\because$ For expansion of vacuum, $W = 0$

$\therefore \quad W = 0$

189. Gas equation PV = nRT is obeyed by ideal gas in

(a) adiabatic process (b) isothermal process
(c) both (a) and (b) (d) none of the above

BCECE-2007

Ans. (c) : Ideal gas in adiabatic and in isothermal process can obeyed gas equation PV = nRT

In isothermal process the temperature of the system is remain constant while in adiabatic process, no exchange of heat occurs between the system and the surrounding, So q = o

According to ideal gas equation the behavior of gases will be same at any specific condition. Therefore, the behavior of gas is also same in adiabatic and isothermal process so, there is no change in ideal gas equation in both the process.

190. If both oxygen and helium gases are at the same temperature, the rate diffusion of O_2 is very close to :

(a) 4 times that of He (b) 2 times that of He
(c) 0.35 times that of He (d) 8 times that of He

BCECE-2006

Ans. (c) : According to graham's law, rate of diffusion is inversely proportional to square root of molecular mass.

$$r_d \propto \frac{1}{\sqrt{\text{Molar mass}}}$$

$$\frac{(r_d)_{O_2}}{(r_d)_{H_e}} = \sqrt{\frac{(\text{M.Wt})_{H_e}}{(\text{M.Wt})_{O_2}}}$$

M. Wt. Of helium = 4

M. Wt. Of O_2 = 32

$$(r_d)_{O_2} = \sqrt{\frac{4}{32}} \times (r_d)_{H_2}$$

$$= 0.35 \times (r_d)_{H_2}$$

Rate of diffusion of O_2 is 0.35 time that of He.

191. 2g of O_2 at 27 °C and 760 mm of Hg pressure has volume :

(a) 1.4 L (b) 2.8 L
(c) 11.2 L (d) 22.4 L

BCECE-2005

Ans. (a) : Given : – mass of O_2 (M) = 2g

$T = 27^0C = 300$ K

P = 760 mm of Hg

$$\text{mole of } O_2 = \frac{\text{Mass of } O_2}{\text{Molecular mass of } O_2}$$

$$= \frac{2}{32} = \frac{1}{16}$$

Volume of O_2 at NTP = mole of O_2 × 22.4L

$$\text{Volume of } O_2 = \frac{1}{16} \times 22.4\text{L}$$

$$= 1.4 \text{ L}$$

192. A gas has a vapour density 11.2. The volume occupied by 1g of the gas at NTP is :

(a) 1 L (b) 11.2 L
(c) 22.4 L (d) 4 L

BCECE-2004

Ans. (a) : $\text{Vapour density} = \frac{\text{Molar mass}}{2}$

Molar mass = Vapour density × 2

= 11.2 × 2

= 22.4

$$\text{Moles} = \frac{\text{Weight}}{\text{Molar mass}}$$

$$\text{Mole} = \frac{1}{22.4}$$

@apna_pdf

Volume of gas = mole × 22.4 L

$$= \frac{1}{22.4} \times 22.4\text{ L}$$

$$= 1\text{ L}$$

193. If the pressure and absolute temperature of 2L of carbon dioxide gas are doubled, the value of the gas would become

(a) 2L (b) 4L
(c) 5L (d) 7L

BCECE-2011

Ans. (a) : Given : – $P_1 = P$

$P_2 = 2P$

$T_1 = T$

$T_2 = 2T$

$V_1 = 2L$

Find V_2

Form ideal gas equation,

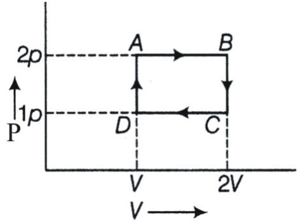
$PV = nRT$

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$V_2 = \frac{P \times 2L}{T} \times \frac{2T}{2P}$$

$V_2 = 2L$

194. An ideal mono-atomic gas follows the path ABCD. Then, the work done during the complete cycle is–



(a) zero (b) $-\frac{1}{2}PV$
(c) –PV (d) –2PV

BCECE-2015

Ans. (c) : Work done during the complete cycle is equal to area of the rectangle (A B C D). For clockwise cycle take negative sign and for anti – clockwise take positive sign.

Work done = – (Area of rectangle A B C D)

= –(length × breadth)

= – PV

195. A work is done on the system such that one mole of an ideal gas at 400K is compressed isothermally and reversibly to 1/10th of its original volume. The amount of (use R = 2 in cal) work done will be –

(a) 2.303 k-cal (b) 0.184 k-cal
(c) 1.84 k-cal (d) 4.60 k-cal

BCECE-2017

Ans. (c) : Work done for isothermal process is given by.

$$W = -\,nRT \ln \frac{V_2}{V_1}$$

$$= -\,2.303 \times nRT \log_{10} \frac{V_2}{V_1}$$

Given:–

T = 400 K

R = 2 cal

$$\frac{V_2}{V_1} = \frac{1}{10}$$

n = 1 mole

$$\therefore\ W = -\,1 \times 2 \times 400 \times 2.303 \log_{10} \frac{1}{10}$$

= 1.8424 k cal

= 1.84 k cal

196. Volume of an ideal gas is decreased by 5% at constant temperature such that there is an increase in pressure by x %. The increase in pressure (in%) will be :

(a) 5% (b) 4.7%
(c) 5.26% (d) 95%

BCECE-2017

Ans. (c) : Given : – If $V_1 = 100V$ then $V_2 = 95$ V

Because ΔV is decreased by 5%.

According to ideal gas equation.

$PV = nRT$

$P_1V_1 = P_2 V_2$

$$\frac{P_1}{P_2} = \frac{V_2}{V_1} = \frac{95V}{100V} = \frac{95}{100}$$

$P_1 = 95P$, $P_2 = 100P$

$$\text{Percentage change in pressure} = \left(\frac{P_2 - P_1}{P_1}\right) \times 100$$

$$= \left(\frac{100-95}{95}\right) \times 100$$

$$= \frac{5}{95} \times 100$$

= 5. 26 %

197. In a closed system, $A(s) \rightleftharpoons 2B(g) + 3C(g)$, if partial pressure of C is doubled, then partial pressure of B will be

(a) $2\sqrt{2}$ times the original value

(b) $\frac{1}{2}$ times the original value

(c) 2 times the original value

(d) $\frac{1}{2\sqrt{2}}$ times the original value

BITSAT 2016

Ans. (d) : $K_p = (P_B)^2 \times (P_C)^3$ -----(i)

Again, $(P_B)^2 \times (P_C)^3 = (P_{B_1})^2 \times (P_{C_1})^3$ ------(ii)

Given, $P_{C_1} = 2P_C$

From equation (i) and (ii) are equal,

$(P_B)^2 \times (P_C)^3 = (P_{B_1})^2 \times (2P_C)^3$

$(P_B)^2 \times (P_C)^3 = (P_{B_1})^2 \times 8(P_C)^3$

$$\boxed{P_{B_1} = \frac{P_B}{2\sqrt{2}}}$$

@apna_pdf

198. The inversion temperature (T_i) for a gas is given by

(a) a/Rb (b) 2a/Rb

(c) $\frac{Rb}{a}$ (d) $\frac{2Rb}{a}$

BITSAT 2005

Ans. (b) : Gases become cooler during Joule Thomson's expansion only if they are below a certain temperature known as inversion temperature (T_i).

$$T_i = \frac{2a}{Rb}$$

199. The cooking time in a pressure cooker is less because :

(a) More heat is used
(b) High pressure cooks the food
(c) The boiling point of water increases in the cooker
(d) Heat is uniformly distributed

BITSAT 2009

Ans. (c) : In pressure cooker, pressure is high thus, the boiling point of water increases, resulting cooking time is less than other open pots.

200. One moles each of four ideal gases are kept as follows :

I. 1 L of gas (A) at 2 atm pressure
II. 2.5 L of gas (B) at 2 atm pressure
III. 1.25 L of gas (C) at 2 atm pressure
IV. 2.5 L of gas (D) at 2.5 atm pressure

Which of the above gases is kept at highest temperature?

(a) Gas (A) (b) Gas (B)
(c) Gas (C) (d) Gas (D)

BITSAT 2017

Ans. (d) : ∵ For ideal gas,

$$PV = nRT$$

$$\text{or } T = \frac{PV}{nR}$$

$\because$ n = 1 = constant
R = 0.083 = constant
$\therefore T \propto PV$

Thus,
The gas that shows highest product of P × V, has high temperature.
For,
(A) $P \times V = 1 \times 2 = 2$
(B) $P \times V = 2 \times 2.5 = 5$
(C) $P \times V = 2 \times 1.25 = 2.5$
(D) $P \times V = 2.5 \times 2.5 = 6.25$
Hence, gas (D) show highest temperature.

201. The temperature, at which a gas shows maximum ideal behaviour, is known as

(a) Boyle's temperature
(b) Inversion temperature
(c) Critical temperature
(d) Absolute temperature

CG PET -2009

Ans. (a) : The temperature at which a gas shows maximum ideal behavior for considerable range of pressure in known as Boyle's temperature.

202. For an ideal gas, number of moles per liter in terms of its pressure P, temperature T and gas constant R is

(a) $\frac{PT}{R}$ (b) PRT

(c) $\frac{P}{RT}$ (d) $\frac{RT}{P}$

[AIEEE 2002]

Ans. (c) : From ideal gas equation,

$$PV = nRT$$

Where P is Pressure
V is volume
N is no. of moles
R is gas constant
T is temperature

Number of moles per liter $\left(\frac{n}{V}\right)$ is

$$\frac{n}{V} = \frac{P}{RT}$$

203. At a given temperature T, gases Ne, Ar, Xe and Kr are found to deviate from ideal gas behaviour. Their equation of state is given as,

$$P = \frac{RT}{V-b} \text{ at T.}$$

Here, b is the Vander Waal's constant. Which gas will exhibit steepest increase in the plot of Z (compression factor) vs P?

(a) Xe (b) Ar
(c) Kr (d) Ne

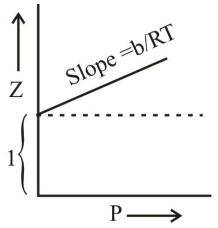
(JEE Main 2019, 9 April Shift-II)

Ans. (a) : From given equation,

$$P = \frac{RT}{V-b}$$

$$P(V-b) = RT$$

At high pressure Vander Waal's equation is converted into above equation
PV – Pb = RT
Dividing by RT on both side



$$\frac{PV}{RT} - \frac{Pb}{RT} = 1$$

$$Z = \frac{PV}{RT}$$

$$\therefore \quad Z = 1 + \frac{Pb}{RT}$$

y = mx + c
Z > 1 and
$Z \propto b$.

As the size of atom increases volume occupied by gas increases compressibility factor (z) also increases. Therefore, Xe has greater size and greater volume so, it will exhibit steepest increase in the plot of Z v/s P.

@apna_pdf

204. For one mole of an ideal gas, which of these statements must be true?
(A) U and H each depends only on temperature.
(B) Compressibility factor Z is not equal to 1.
(C) $C_{p.m} - C_{v.m} = R$
(D) $dU = C_vdT$ for any process.
(a) (B), (C) and (d) (b) (A) and (C)
(c) (A), (C) and (D) (d) (C) and (D)

[JEE Main 2020, 4 Sep Shift-I]

Ans. (c) : For real gases,

$$U = f(T,V)$$
$$H = f(T,P)$$

But for ideal gas, $U = f(T)$
$$H = f(T)$$

Hence, U and H each depends only on temperature.
For ideal gas compressibility factor z is equal to 1.

$C_{PM} - C_{VM} = R$ and

$dU = C_VdT$ for any process is also correct for ideal gases.

205. A certain gas obeys $P(V_m–b) = RT$.
The value of $\left(\frac{\partial Z}{\partial P}\right)_T$ is $\frac{xb}{RT}$.
The value of x is…….
(Z=compressibility factor)

[JEE Main 2021, 26 Feb Shift-I]

Ans. (1) : From Vander Waal's equation

$$\left(P - \frac{an^2}{V^2_m}\right)(V_m - nb) = nRT$$

At high pressure,

$$P(V_m - nb) = nRT$$

For 1 mole,

$$P(V_m - b) = RT$$

PVm – Pb = RT
Dividing RT on both side

$$\frac{PV_m}{RT} - \frac{Pb}{RT} = 1$$

$$Z = \frac{PV_m}{RT}$$

$$Z = 1 + \frac{Pb}{RT}$$

$$\left(\frac{\partial Z}{\partial P}\right)_T = \frac{b}{RT} + 0$$

$$\therefore \frac{b}{RT} = \frac{xb}{RT}$$

$\therefore$ x = 1

206. A home owner uses $4.00×10^3$ m^3 of methane (CH_4) gas, (assume CH_4 is an ideal gas). In a Year to heat his home. Under the pressure of 1.0 atm and 300K, mass of gas used is $x×10^5$ g. The value of x is……. (Nearest integer)
(Given, R = 0.083 L atm K^{-1} mol^{-1})

[JEE Main 2021, 25 July Shift-I]

Ans. (26) : For ideal gas equation,

PV = nRT

$$n = \frac{PV}{RT}$$

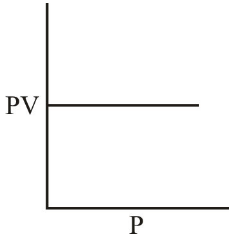
Given – P = 1 atm
$V = 4 \times 10^3\ m^3 = 4 \times 10^3 \times 1000$ L
T = 300 K
R = 0.083 L atm K^{-1} mol^{-1}

$$n = \frac{1 \times 4 \times 10^3 \times 1000}{300 \times 0.083}$$

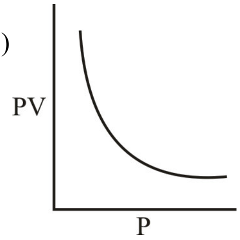
$n = 0.1606 \times 10^6$ mole
Mass = Mole × Molar mass
$= 0.1606 \times 10^6 \times 16$
$= 26 \times 10^5$ g
x = 26

207. Which one of the following is the correct PV vs P plot at constant temperature for an ideal gas? (P and V stand for pressure and volume of the gas respectively)

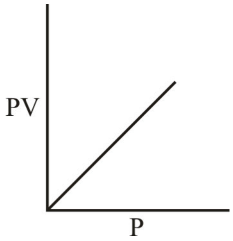
(a)



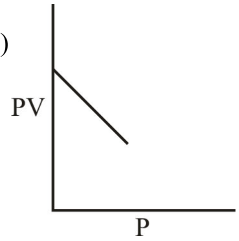
(b)



(c)



(d)



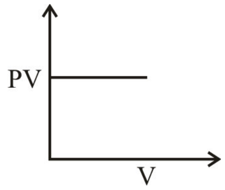
[JEE Main 2021, 31 Aug Shift-I]

Ans. (a) : From ideal gas equation.

PV = nRT
At constant temperature
PV = Constant

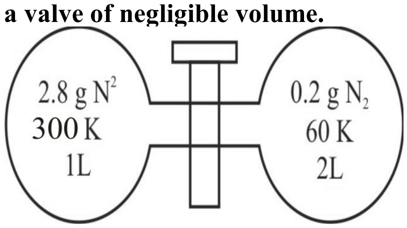
$$P \propto \frac{1}{V} \text{ (Boyle's law)}$$

Therefore, in PV v/s P plot at constant temperature for an ideal gas gives.



@apna_pdf

208. Two flasks I and II shown below are connected by a valve of negligible volume.



When the valve is opened, the final pressure of the system in bar is x×10^{-2}. The value of x is…………(Integer answer)
[Assume, Ideal gas, 1 bar = 10^5 Pa, molar mass of N_2 = 28.0 g mol^{-1}; R = 8.31 J mol^{-1} K^{-1}]
[JEE Main 2021, 27 Aug Shift-II]

Ans. (84) : Given:- $T_I = 300$ K, $T_{II} = 60$ K
$V_I = 1L$, $V_{II} = 2$ L
$M_I = 2.8$ g, $M_{II} = 0.2$ g

No. of moles in both Container when valve is closed = No. of moles on both container when valve is opend.

$$(n_I + n_{II})_{initial} = (n_I + n_{II})_{final}$$

Let us assume that the final temperature of system T (300 > T > 60)

Heat lost by N_2 in container I = $n_I c_m (300 - T)$

Heat gained by N_2 in container II = $n_{II} c_m (T - 60)$

Heat lost by N_2 in container I = Heat lost by N_2 in container II

$$n_I c_m (300 - T) = n_{II} c_m (T - 60)$$

Molar heat capacity for N_2 in both the container is same.

$$\left(\frac{2.8}{28}\right)(300 - T) = \left(\frac{0.2}{28}\right)(T - 60)$$

$$14(300 - T) = T - 60 \Rightarrow T = 284K$$

Let final pressure be P,

$$(n_I + n_{II})_{final} = \left(\frac{0.2+2.8}{28}\right) = \frac{3}{28} \text{ mol}$$

From ideal gas equation,

$$P(V_I + V_{II}) = (V_I + V_{II})_{final} RT$$

$$V_I + V_{II} = 3L = 3 \times 10^{-3} \text{ m}^3$$

$$P = \frac{3}{28} \times \frac{8.31 \times 280}{3 \times 10^{-3}} \text{Pa}$$

= 8.4 × 10^5 Pa
= 0.84 × 10^5 × 10^{-5} bar
= 0.84 bar = 84 × 10^{-2} bar
x = 84

209. The osmotic pressure of a solution containing 300 mg of a non-volatile, non-ionising, and non-associationg solute in 100 mL of water at 27 °C was found to be 1.23 atmosphere. The molar mass of the solute in g mol^{-1} is (R = 8.2 × 10^{-2} L atm K^{-1} mol^{-1})

(a) 40 (b) 120
(c) 60 (d) 180

J & K CET-(2016)

Ans. (c) : Osmotic pressure (π) of solution is

π = CRT

Where, C = Concentration of solution
R = gas constant
T = Temperature

$$C = \frac{\text{Mass}}{\text{Molar mass} \times \text{volume}} = \frac{m}{MV}$$

$$\pi = \frac{m}{MV} RT$$

$$1.23 = \frac{300 \times 10^{-3} \times 8.2 \times 10^{-2} \times 300}{M \times 100}$$

M = 60 g

210. Which of the following pair of gases will diffuse at the same rate through a porous plug?

(a) CO, NO_2 (b) NO, C_2H_6
(c) NO_2, CO_2 (d) NH_3, PH_3

J & K CET-(2011)

Ans. (b) : According to Graham's law,

$$\text{Rate of diffusion} \propto \frac{1}{\sqrt{\text{Molar mass}}}$$

Molar mass of compounds are,
CO = 28
NO_2 = 46
NO = 30
C_2H_6 = 2×12 + 6 × 1 = 30
CO_2 = 44, NH_3=17
PH_3 = 31

Therefore, rate of diffusion for NO and C_2H_6 is same because they have same molar mass.

211. If the ratio of the rates of diffusion of two gases A and B is 4 : 1. Then the ratio of their densities in the same order is

(a) 16 : 1 (b) 4 : 1
(c) 1 : 4 (d) 1 : 16

J & K CET-(2009)

Ans. (d) : According to Graham's law rate of diffusion(r_d) is inversely proportional to square root of density (ρ)

$$r_d \propto \frac{1}{\sqrt{\rho}}$$

$$\frac{(r_d)_A}{(r_d)_B} = \sqrt{\frac{\rho_B}{\rho_A}}$$

$$\frac{\rho_A}{\rho_B} = \left(\frac{(r_d)_B}{(r_d)_A}\right)^2 = \left(\frac{1}{4}\right)^2 = \frac{1}{16}$$

$$\rho_A : \rho_B = 1 : 16$$

212. Identify the pair of gases that have equal rates of diffusion

(a) CO, NO (b) N_2O, CO
(c) N_2O, CO_2 (d) CO_2, NO_2

J & K CET-(2008)

@apna_pdf

Ans. (c) : Rate of diffusion (r_d) is inversely proportional to square root of molar mass (M.M)

$$r_d \propto \frac{1}{\sqrt{M.M}}$$

Rate of diffusion for two gases are equal when they have same molar mass. Molar mass of NO_2 and CO_2 are same that 44. So, there rate of diffusion is also equal.

213. A, B and C are ideal gases. Their molecular weights are 2, 4 and 28 respectively. The rate of diffusion of these gases follow the order

(a) C > A > B (b) C > B > A

(c) A = B = C (d) A > B > C

J & K CET-(2006)

Ans. (d) : According to Graham's law rate of diffusion is inversely proportional to molecular mass of gases.

$$r_d \propto \frac{1}{\sqrt{M.M}}$$

Hence, gases whose molecular mass is higher then its rate of diffusion lesser. The order of rate of diffusion is

A > B > C

214. The rate of diffusion of a gas is proportional to

(a) $P/\sqrt{d}$ (b) $\sqrt{P/d}$

(c) P/d (d) $\sqrt{P}/d$

J & K CET-(2004)

Ans. (a) : According to Graham's law, rate of diffusion (r_d) is inversely proportional to square root of density of gases.

$$r_d \propto \frac{1}{\sqrt{\text{density}}} = \frac{1}{\sqrt{d}}$$

At constant temperature, rate of diffusion is directly proportional to pressure (P) and inversely proportional to density (d)

$$r_d \propto \frac{P}{\sqrt{d}}$$

215. Molar volume of CO_2 is maximum at

(a) NTP (b) 0°C and 2.0 atm

(c) 127°C and 1atm (d) 273°C and 2.0 atm

J & K CET-(2004)

Ans. (c) : From ideal gas equation,

$$PV = nRT$$

$$V = \frac{nRT}{P}$$

For 1 mole

$$V = \frac{RT}{P}$$

$R = 0.0821 \text{ L bar } K^{-1} mol^{-1}$

(a) At, NTP, T = 273 K , P = 1 atm

$$V = \frac{0.0821 \times 273}{1} = 22.4 L$$

(b) T = 0^oC = 273 K , P = 2 atm

$$V = \frac{0.0821 \times 273}{2} = 11.4 L$$

(c) T = 127^o C = 400 K, P = 1 atm

$$V = \frac{0.0821 \times 400}{1} = 32.84 L$$

(d) T = 273^oC = 546 K, P = 2 atm

$$V = \frac{0.0821 \times 546}{2} = 22.4 L$$

Hence, molar volume of CO_2 is maximum at 127^oC and 1 atm.

216. Measurement of the dry gas from the volume of moist gas is based on

(a) Boyle's law

(b) Avogadro's law

(c) Gay Lussac's law

(d) Dalton's law of partial pressure

J & K CET-(2001)

Ans. (d) : Dalton's law of partial pressure helps in measurement of the dry gas from the volume of moist gas.

$$P_{(\text{dry gas})} = P_{(\text{moist gas})} - \text{Aqueous Tension}$$

217. The volume of a gas expands by 0.25 m^3 at a constant pressure of 10^3 Nm^{-2}. The workdone is equal to

(a) 2.5 erg (b) 250 joule

(c) 250 watt (d) 250 newton

J & K CET-(1999)

Ans. (b) : Work done = –PdV

Given, Change in volume (dV) = 0.25 m^3

Pressure (P) = 10^3 Nm^{-2}

$W = -10^3 \times 0.25$ Nm

= –250 Nm

= –250 Joule.

218. An ideal gas is found to obey an additional law P^2V= constant. The gas is initially at temperature T and volume V. When is expands to a volume 2V, the temperature becomes.

(a) T/2 (b) 2T

(c) $\sqrt{2}$ T (d) $T/\sqrt{2}$

J & K CET-(1999)

Ans. (c) : From ideal gas equation,

$$PV = nRT$$

$$P = \frac{nRT}{V}$$

When ideal gas follow additional law,

P^2V = constant

P(PV) = constant

Substituting the value of P and PV from above ideal gas equation,

$$\frac{nRT}{V}(nRT) = \text{constant}$$

$$\frac{(nRT)^2}{V} = \text{constant}$$

$$\frac{T^2}{V} = \text{constant}$$

$$\frac{(T_1)^2}{V_1} = \frac{(T_2)^2}{V_2}$$

$$T_2 = \sqrt{\frac{V_2}{V_1} \times (T_1)^2}$$

$$= \sqrt{\frac{2V}{V}} \times T$$

$$T_2 = \sqrt{2}\,T$$

@apna_pdf

219. At constant pressure, what would be the percentage decreases in the density of an ideal gas for a 10% increase in the temperature?

(a) 10% (b) 9.1%
(c) 11% (d) 12.09%

J & K CET-(1998)

Ans. (b) : From ideal gas equation,

$$PV = nRT$$

$$PV = \frac{\text{mass (m)}}{\text{molar mass (M)}} RT$$

$$\text{density}(\rho) = \frac{m}{V} = \frac{PM}{RT}$$

$$\rho \propto \frac{1}{T}$$

It is given that, increase in temperature is 10%

Let T_1 is 100 T and $T_2 = 110$ T

$$\frac{\rho_1}{\rho_2} = \frac{T_2}{T_1} = \frac{110}{100}$$

$\rho_1 = 110\rho$, $\rho_2 = 100\rho$

$$\%\text{ change in density }(\rho) = \left(\frac{\rho_2 - \rho_1}{\rho_1}\right) \times 100$$

$$= \left(\frac{100\rho - 110\rho}{110\rho}\right) \times 100$$

$$= \frac{-10}{110} \times 100$$

$$= -9.09\% \approx -9.1\%$$

Where negative sign shows that on increasing temperature density decreases therefore percentage decrease in density is 9.1 %.

220. A flask containing air (open to atmosphere) is heated from 300 K to 500 K. The percentage of air escaped to the atmosphere is

(a) 66.6% (b) 16.6%
(c) 33.3% (d) 40%

J & K CET-(1999)

Ans. (d) : Given, $V_1 = V$

$T_1 = 300K$, $T_2 = 500K$

$V_2 = ?$

From ideal gas equation,

$$PV = nRT$$

At constant pressure, $V \propto T$

$$\frac{V}{T} = \text{constant}$$

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$V_2 = \frac{500}{300} V$$

$$= \frac{5}{3} V$$

$$\text{Percentage of air escaped} = \left(\frac{V_2 - V_1}{V_2}\right) \times 100$$

$$= \left(\frac{\frac{5}{3}V - V}{\frac{5}{3}V}\right) \times 100$$

$$= \frac{2V}{3} \times \frac{3}{5V} \times 100$$

$$= 40\%$$

221. A sample of methane gas occupying 0.50 m^3 volume is kept at 2.0×10^2 kPa pressure and 300 K temperature. The amount of methane will be

(a) 20 mol (b) 25 mol
(c) 30 mol (d) 40 mol.

J & K CET-(1998)

Ans. (d) : Given $V = 0.5m^3$, $P = 2\times10^2$ kPa$=2\times10^5$Pa , $T = 300K$

$n = ?$

From ideal gas equation,

$$PV = nRT$$

$$n = \frac{PV}{RT} = \frac{2\times10^5 \times 0.5}{300 \times 8.314}$$

$$= 40 \text{ mol}$$

222. Equal masses of SO_2 and O_2 are mixed in an empty container at 27°C. The total pressure exerted by the gaseous mixture is 1 atm. The partial pressure exerted by SO_2 gas is

(a) 0.20 atm (b) 0.33 atm
(c) 0.67 atm (d) 1 atm

J & K CET-(1997)

Ans. (b) :

Partial pressure of gas = Mole fraction × Total pressure

$$P = X \times P_T$$

mass of of SO_2 = mass of O_2 = w

$$\text{mole fraction of } SO_2 = \frac{w/64}{\frac{w}{64} + \frac{w}{32}} = \frac{1}{3}$$

$$P_{SO_2} = X_{SO_2} \times P_T$$

$$P_{SO_2} = \frac{1}{3} \times 1 \text{ atm} = 0.33 \text{ atm}$$

223. An ideal gas expands in volume from 1×10^{-3} m^3 to 1×10^{-2} m^3 at 300 K against a constant pressure of 1×10^5 Nm^{-2}. The work done is

(a) – 900 J (b) – 900 kJ
(c) 270 kJ (d) 900 kJ

JCECE - 2010

Ans. (a) : Work done due to change in volume against constant pressure.

$W = -P (V_2 - V_1)$

$= -1 \times 10^5 \text{ Nm}^{-2} (1 \times 10^{-2} - 1 \times 10^{-3})m^3$

$= -900$ Nm $= -900$ J (1 Nm = 1 J)

224. 1L oxygen gas at STP will weigh

(a) 1.43 g (b) 2.24 g
(c) 11.2 g (d) 22.4 g

JCECE - 2010

@apna_pdf

Ans. (a) : Given, volume of O_2 = 1L

$\because$ 22.4 L of O_2 at STP = 32 g

$$\therefore \quad 1 \text{ L of } O_2 \text{ at STP} = \frac{32}{22.4} \text{g} = 1.43 \text{ g}$$

225. At constant temperature, in a given mass of an ideal gas

(a) the ratio of pressure and volume always remains constant
(b) volume always remains constant
(c) pressure always remains constant
(d) the product of pressure and volume always remains constant

JCECE - 2011

Ans. (d) : At constant temperature, the product of pressure and volume of a given mass of an ideal gas is always constant. This is the statement of Boyle's law.

PV = constant (at T = constant)

226. For an ideal binary liquid solution with $p_x^0 > p_y^0$ in which relation between X_x (mole fraction of X in liquid phase) and Y_x (mole fraction of X in vapour phase) is correct, X_y and Y_y are mole fraction of Y in liquid and vapour phase respectively

(a) $X_x > Y_x$
(b) $X_x = Y_x$
(c) $\frac{X_x}{X_y} < \frac{Y_x}{Y_y}$
(d) X_x , Y_x, X_y and Y_y cannot be correlated

JIPMER-2015

Ans. (c) : Given :- $P_x^0 > P_y^0$

According to Raoult's law

$P_x = P_x^0 X_x = P_T V_x$ ....(i)

$P_y = P_y^0 X_y = P_T V_y$ ....(ii)

Where P_x^0 and P_y^0 are pressure in pure form of x and y respectively.

$$P_T = \frac{P_x^0 X_x}{Y_x}$$

$$P_T = \frac{P_y^0 X_y}{Y_y}$$

$$\therefore \quad \frac{P_x^0 X_x}{Y_x} = \frac{P_y^0 X_y}{Y_y}$$

$$\frac{P_x^0}{P_y^0} = \frac{X_y Y_x}{X_x Y_y}$$

$$\frac{P_x^0}{P_y^0} > 1 \Rightarrow \frac{X_y Y_x}{X_x Y_y} > 1$$

Therefore, $\frac{X_x}{X_y} < \frac{Y_x}{Y_y}$

227. 56 g of nitrogen and 96 g of oxygen are mixed isothermally and at a total pressure of 10 atm. The partial pressures of oxygen and nitrogen (in atm) are respectively

(a) 4, 6 (b) 5, 5
(c) 2. 8 (d) 6, 4

JIPMER-2011

Ans. (d) : Partial Pressure = Mole fraction × Total Pressure

$$\text{Mole fraction of oxygen } (X_O) = \frac{\frac{96}{16}}{\frac{96}{16}+\frac{56}{14}} = \frac{6}{10}$$

$$\text{Mole fraction of nitrogen } (X_N) = \frac{\frac{56}{14}}{\frac{56}{14}+\frac{96}{16}} = \frac{4}{10}$$

Partial pressure of Oxygen = $X_O \times P_T$

$$= \frac{6}{10} \times 10 = 6 \text{atm}$$

Partial pressure of nitrogen = $X_N \times P_T$

$$= \frac{4}{10} \times 10 = 4 \text{atm}$$

228. The volume of a gas measured at 27 °C and 1 atm pressure is 10L. To reduce the volume to 2L at 1 atm pressure, the temperature required is

(a) 60 K (b) 75 K
(c) 150 K (d) 225 K

JIPMER-2008

Ans. (a) : Given, $T_1 = 27^oC = 300K$, P_1 = 1 atm

V_1 = 10L, V_2 = 2L, P_2 = 1 atm , T_2 = ?

From ideal gas equation, PV = nRT

At constant pressure,

$$\frac{V}{T} = \text{constant}$$

Or
$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$\frac{10}{300} = \frac{2}{T_2}$$

T_2 = 60 K

229. In an ideal gas equation which is constant?

(a) Temperature
(b) Pressure
(c) Volume
(d) Universal gas constant

JIPMER-2019

Ans. (d) : Ideal gas equation is PV = nRT

Where,

P is pressure,
V is Volume,
n is number of moles of gas,
T is temperature and
R is Universal gas constant.

P,V,T and n are variables i.e., its values is changed but R is constant for all gases in ideal gas equation.

@apna_pdf

230. What is the value of γ for mono atomic gas (ideal gas)?

(a) $\frac{7}{5}$ (b) $\frac{4}{3}$

(c) $\frac{5}{2}$ (d) None of these

JIPMER-2019

Ans. (d) : $\gamma = \frac{C_p}{C_v}$

$$C_v = \left(\frac{\delta U}{\delta T}\right), \quad C_p = C_v + R$$

For monoatomic gas, $U = \frac{3}{2}RT$

$$C_v = \frac{\delta}{\delta T}\left(\frac{3}{2}RT\right) = \frac{3}{2}R$$

$$C_p = \frac{3}{2}R + R = \frac{5}{2}R$$

Now, $\gamma = \frac{C_p}{C_v} = \frac{(5/2)R}{(3/2)R} = \frac{5}{3}$

231. 11.2 L of gas at STP weight 14g. The gas would be

(a) H_2 (b) CO

(c) B_2H_6 (d) All of these

JIPMER-2016

Ans. (b) : $\text{Moles} = \frac{\text{volume}}{22.4\,L}$ at STP and NTP

$$= \frac{11.2\,L}{22.4\,L} = 0.5\,\text{mol}$$

$$\text{Mole} = \frac{\text{weight}}{\text{Molar mass}}$$

$$\text{Molar} = \frac{\text{weight}}{\text{mole}}$$

$$= \frac{14}{0.5} = 28$$

Then, CO having molar mass 28.

232. At 27°C, one mole of an ideal gas is compressed isothermally and reversibly from a pressure of 2atm to 10atm.

Choose the correct option from the following

(a) Change in internal energy is positive

(b) Heat is negative

(c) Work done is – 965.84 cal

(d) All are incorrect

JIPMER-2016

Ans. (b) : For isothermal process,

$$\Delta u = 0$$

Work done, $w = -2.303nRT \log_{10}\frac{P_1}{P_2}$

n = 1 mole , T = 27°C = 300 K

$P_1 = 2$ atm , $P_2 = 10$ atm , $R = 2\text{ Cal K}^{-1}\text{ mol}^{-1}$

$w = -2.303 \times 1 \times 2 \times 300 \log_{10}\frac{2}{10}$

$= +965.84$ cal

According to the first law of thermodynamics,

$q = \Delta U - W = 0 - 965.84$ cal

$q = -965.84$ cal

∴ Heat is negative.

233. Temperature of a gas is t K. What would be the temperature at which volume and pressure, both will reduced to half of the initial values?

(a) t/2 (b) t/4

(c) t/3 (d) t/8

JIPMER-2016

Ans. (b) : Given $T_1 = tK$, $P_1 = p$, $V_1 = v$, $P_2 = \frac{p}{2}$,

$V_2 = \frac{v}{2}$, $T_2 = ?$

From ideal gas equation,

$$PV = nRT$$

$$\frac{PV}{T} = \text{constant}$$

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\frac{pv}{t} = \frac{p/2 \times v/2}{T_2}$$

$$T_2 = \frac{t}{4}K$$

234. For an ideal gas, compressibility factor is

(a) 0 (b) 1

(c) –1 (d) +2

Karnataka-CET-2018

Ans. (b) : Deviation of real gases from ideal gas behaviour is mathematically denoted by compressibility factor (z).

For ideal gas.

$$PV = nRT$$

$$\frac{PV}{nRT} = 1$$

$$z = \frac{PV}{nRT} = 1$$

Compressibility factor (z) = 1 for ideal gas.

235. In which one of the following, does the given amount of chlorine exert the least pressure in a vessel of capacity 1 dm^3 at 273 K?

(a) 0.03555 g (b) 0.071g

(c) 6.023×10^{21} molecules (d) 0.02 mol

KARNATAKA-CET, 2010

Ans. (a) : Ideal gas equation is

$$PV = nRT$$

When V and T are same,

$$P \propto n$$

Thus, when number of moles, i.e., n is least, it will exert least pressure.

(a) $n = \frac{\text{wt}}{\text{mol.wt}} = \frac{0.0355}{35.5} = 1\times10^{-3}$ mole

(b) $n = \frac{0.071}{35.5} = 2\times10^{-3}$ mol

@apna_pdf

(c) $n = \dfrac{\text{number of molecules}}{N_A}$

$$= \frac{6.023\times10^{21}}{6.023\times10^{23}} = 0.01\,\text{mol}$$

Thus, 0.0355 g chlorine have the least no. of moles that's why this will exert the least pressure.

236. For one mole of an ideal gas, increasing the temperature from 10°C to 20°C.

(a) increases the average kinetic energy by two times

(b) increases the rms velocity by $\sqrt{2}$ times

(c) increases the rms velocity by two times

(d) increases both the average kinetic energy and rms velocity, but not significantly

KARNATAKA-CET, 2010

Ans. (d) : Given, $T_1 = 273 + 10 = 283$ K

$T_2 = 273 + 20 = 293$ K

Average Kinetic energy $(KE) = \dfrac{3}{2}KT$

$$\frac{(KE_1)}{(KE_2)} = \frac{283}{293} = 0.96$$

Root mean square (rms) velocity,

$$v_{rms} = \sqrt{\frac{3RT}{M}}$$

$$\frac{v_{(rms)_1}}{v_{(rms)2}} = \sqrt{\frac{T_1}{T_2}}$$

$$= \sqrt{\frac{283}{293}} = 0.98$$

Thus, both average kinetic energy and root mean square velocity increase but not significantly when temperature is increased from 10°C to 20°C.

237. A gas deviates from ideal behavior at a high pressure because its molecules

(a) attract one another

(b) show the Tyndall effect

(c) have kinetic energy

(d) are bound by covalent bonds

KARNATAKA-CET, 2008

Ans. (a) : At high pressure, the volume is decreased appreciably, so the attractive forces become large and the molecules are crowded together. Thus, pressure correction is necessary and the gas deviates more from ideal behaviour.

238. When the absolute temperature of ideal gas is doubled and pressure is halved the volume of gas

(a) will be half at original volume

(b) will be 4 times the original volume

(c) will be 2 times the original volume

(d) will be 1/4th times the original volume

Kerala-CEE-29.08.2021
Karnataka-CET-2021
Kerala-CEE-2005

Ans. (b) : Given that, $T_2 = 2T$, $P_2 = 0.5P$, $V_2 = ?$

$T_1 = T$, $P_1 = P$, $V_1 = V$

By using ideal gas equation–

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\therefore \quad \frac{PV}{T} = \frac{0.5P\times V_2}{2T}$$

$$V = \frac{0.5\times V_2}{2}$$

$$2V = \frac{1}{2}\times V_2$$

$$\boxed{4V = V_2}$$

or $\quad V_2 = 4V$

239. When a sample of gas is compressed at constant temperature from 15 atm to 60 atm, its volume changes from 76 cm³ to 20.50 m³. Which of the following statements are possible explanations of this behavior?

1. The gas behaves non-ideally

2. The gas dimerises

3. The gas is adsorbed into the vassel walls

(a) 1, 2 and 3 (b) 1 and 2 only

(c) 2 and 3 only (d) 1 only

(e) 3 only

Kerala-CEE-2009

Ans. (d) : The given sample of gas have;

$P_1 = 15$ atm

$P_2 = 60$ atm

$V_1 = 76\text{ cm}^3 = 76\times10^{-6}\text{ m}^3$

$V_2 = 20.50\text{ m}^3$

From ideal gas equation,

$PV = nRT$

At constant temperature,

$PV = \text{Constant}$

$\Rightarrow \quad P_1V_1 = P_2V_2 = \text{Constant}$

Now, $\quad P_1V_1 = 15\times76\times10^{-6}\text{ m}^3$

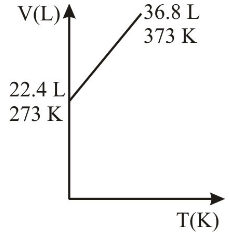
$P_2P_2 = 60\times20.50\text{ m}^3$

Here, $\quad P_1V_1 \neq P_2V_2$

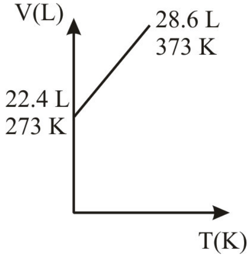
∴ The gas behaves non-ideally.

240. Which one of the following volume (V) temperature (T) plots represents the behavior of one mole of an ideal gas at one atmospheric pressure?

(a)

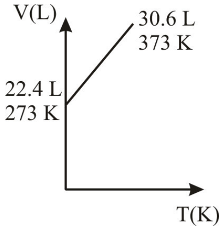


(b)

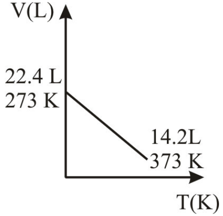


@apna_pdf

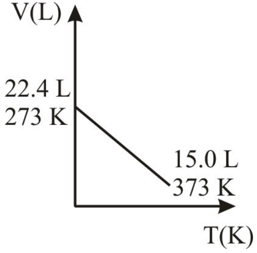
(c)



(d)



(e)



Kerala-CEE-2007

Ans. (c) : At STP, 1 mole of gas occupies 22.4 L volume at 1 atm pressure and 273 K temperature.

From ideal gas equation

$$PV = nRT$$

If n = 1 mole and at constant pressure

$$\frac{V}{T} = \text{constant}$$

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$V_1 = 22.4$ L $\qquad T_1 = 273$ K

$V_2 = 30.6$ L $\qquad T_2 = ?$

Then, $T_2 = \frac{30.6 \times 273}{22.4} \approx 373K$

According to Charle's law $V \propto T$

$\therefore$ Slope of V vs. T is linear.

241. To what temperature must a neon gas sample be heated to double its pressure, if the initial volume of gas at 75ºC is decreased by 15.0%?

(a) 319º C (b) 592º C
(c) 128º C (d) 60º C
(e) 90º C

Kerala-CEE-2005

Ans. (a) : Given, $T_1 = 75°C = 348$ K

$P_1 = P \quad P_2 = 2P$

Let, $V_1 = 100$ ml then $V_2 = 85$ mL

$T_2 = ?$

From ideal gas equation,

$$\frac{PV}{T} = \text{constant}$$

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$T_2 = \frac{2P \times 85 \times 348}{P \times 100} = 591.6K \approx 319°C$$

242. Two vessels of volumes 16.4 L and 5 L contains two ideal gases of molecular existence at the respective temperature of 27 °C and 227 °C and exert 1.5 and 4.1 atm. respectively. The ratio of the number of molecules of the former to that to the later is

(a) 2 (b) 1
(c) $\frac{1}{2}$ (d) $\frac{1}{3}$
(e) 3

Kerala-CEE-2013

Ans. (a) :

	I vessel	II vessel
Volume	$V_I = 16.4L$	$V_{II} = 5$ L
Temperature	$T_I = 27^oC = 300K$	$T_{II} = 227^o = 500$ K
Pressure	$P_I = 1.5$ atm	$P_{II} = 4.1$ atm

From ideal gas equation.

$$PV = nRT \quad \Rightarrow n = \frac{PV}{RT}$$

$$\frac{n_I}{n_{II}} = \frac{P_IV_I}{T_I} \times \frac{T_{II}}{P_{II}V_{II}}$$

$$= \frac{1.5 \times 16.4}{300} \times \frac{500}{4.1 \times 5}$$

$$\frac{n_I}{n_{II}} = 2$$

243. When 4 g of an ideal gas A is introduced into an evacuated flask kept at 25 °C, the pressure is found to be one atmosphere. If 6 g of another ideal gas B is then added to the same flask, the pressure becomes 2 atm at the same temperature. The ratio of molecular weight (M_A: M_B) of the two gases would be

(a) 1 : 2 (b) 2 : 1
(c) 2 : 3 (d) 3 : 2
(e) 1 : 4

Kerala-CEE-2013

Ans. (c) : Given, $W_A = 4g \qquad W_B = 6g$

$P_1 = 1atm \qquad P_2 = 2$ atm

Number of moles of A = $\frac{4}{M_A}$

Number of moles of B = $\frac{6}{M_B}$

Total number of moles (A + B) = $\frac{4}{M_A} + \frac{6}{M_B}$

From ideal gas equation, at constant temperature and volume-

$$\frac{P}{n} = \text{constant}$$

$$\frac{P_1}{n_A} = \frac{P_2}{n_T} \qquad \Rightarrow \frac{1}{\frac{4}{M_A}} = \frac{2}{\frac{4}{M_A} + \frac{6}{M_B}}$$

@apna_pdf

$$\frac{4}{M_A}+\frac{6}{M_B}=\frac{8}{M_A}\Rightarrow\frac{8}{M_A}-\frac{4}{M_A}=\frac{6}{M_B}$$

$$\frac{4}{M_A}=\frac{6}{M_B}\qquad\Rightarrow\frac{M_A}{M_B}=\frac{4}{6}=\frac{2}{3}$$

$M_A : M_B = 2 : 3$

244. If two moles of an ideal gas at 500 K occupies a volume of 41 L, the pressure of the gas is (R = 0.082 L atm K^{-1} mol^{-1})

(a) 2 atm (b) 3 atm
(c) 4 atm (d) 5 atm
(e) 1 atm

Kerala-CEE-2014

Ans. (a) : Given:- n = 2 mole, T= 500 K, V = 41 L, R = 0.082 L atm K^{-1} mol^{-1} P = ?
From ideal gas equation,

$$PV = nRT \Rightarrow P = \frac{nRT}{V} = \frac{2\times0.082\times500}{41}$$

P = 2 atm

245. Mixing of N_2 and H_2 from an ideal gas mixture at room temperature in a container. For this process, which of the following statement is true?

(a) $\Delta H = 0, \Delta S_{Surrounding} = 0, \Delta S_{System} = 0$ and $\Delta G = -ve$
(b) $\Delta H = 0, \Delta S_{Surrounding} = 0, \Delta S_{System} > 0$ and $\Delta G = -ve$
(c) $\Delta H >= 0$, $\Delta S_{Surrounding} = 0$, $\Delta S_{System} > 0$ and $\Delta G = -ve$
(d) $\Delta H < 0$, $\Delta S_{Surrounding} > 0$, $\Delta S_{System} < 0$ and $\Delta G = -ve$
(e) $\Delta H = 0, \Delta S_{Surrounding} = 0, \Delta S_{System} < 0$ and $\Delta G = -ve$

Kerala-CEE-2017

Ans. (d) : Mixing of N_2 and H_2 is an exothermic reaction so–
$\Delta H = -ve$
Favourable condition – Low temperature
And, $\Delta n = 2 - 4 = -2$
Since, $\Delta S_{(uni.)} = \Delta S_{(surrounding)} + \Delta S_{(system)}$
And for ΔG to be negative (–ve) i.e. it is spontaneous at room temperature.
$\therefore$ $\Delta H < 0$
$\Delta S_{(surrounding)} > 0$
$\Delta S_{(system)} < 0$
$\Delta S_{(uni.)} > 0$

246. Pressure of ideal and real gases at 0K are

(a) > 0 and 0 (b) < 0 and 0
(c) 0 and 0 (d) > 0 and > 0
(e) 0 and > 0

Kerala-CEE-2017

Ans. (e) : We know the compressibility factor–

$$Z = \frac{PV}{nRT}$$

Z = 1 for ideal gas
$\therefore$ PV = nRT
At 0 K temperature (T = 0)
PV = 0
P = 0
For real gas, Z > 1 which means it is less compressible than ideal gas At 0 K temperature.
P > 0 for real gas.

247. An ideal gas "A" having volume of 1L at 27ºC is kept in a container having movable piston and adiabatic walls in ambient condition. If 1.33 L amt of energy is supplied inside the system, find out the final temperature of the system?

(a) 399 K (b) 499 K
(c) 599 K (d) 299 K
(e) 450 K

Kerala-CEE-2019

Ans. (a) : Given V_1 = 1 litre, T_1 = 27 + 273 = 300K
V_2 = 1.33 litre, T_2 = ?
∵ Piston is movable and having adiabatic walls
∴ Pressure is constant

At constant pressure, $\frac{V_1}{T_1} = \frac{V_2}{T_2}$

$\Rightarrow \quad \frac{1}{300} = \frac{1.33}{T_2}$

$\Rightarrow \quad T_2 = 1.33 \times 300 = 399$ K.

248. Two moles of an ideal gas are allowed to expand from a volume of 10 dm^3 to 2 m^3 at 300 K against a pressure of 101.325 kPa. Calculate the work done

(a) –201.6 kJ (b) 13.22 kJ
(c) –810.6 J (d) –18.96 kJ

MHT CET-2018

Ans. (a) : Given, n = 2 T = 300 K
P = 101.325 kPa, $V_1 = 10\ dm^3 = 0.01\ m^3$
$V_2 = 2\ m^3$
W = ?
Work done (W) = –PΔV
$= -101.325 \times 10^3\ (2 - 0.01)$
$= -101.325 \times 10^3 \times 1.99$
= –201.63 kJ

249. 4 L-atm is equal to

(a) 40.50 cal (b) 78.75 cal
(c) 95.23 cal (d) 96 cal

MHT CET-2010

Ans. (d) : Given, Energy = 4L- atm
Find energy in cal.
The value of R = 2 cal K^{-1} mol^{-1}
or R = 0.0821 L atm K^{-1} mol^{-1}

$$\text{Energy (cal)} = \frac{\text{Energy}(L-atm)\times R\,(cal)}{R_{(L-atm)}}$$

$$= \frac{4\times2}{0.0821} = 96\,cal$$

250. For an ideal gas, the heat of reaction at constant pressure and constant volume are related as

(a) H + E = pV (b) E = H + pΔV
(c) $q_p = q_v + \Delta nRT$ (d) None of these

MHT CET-2007

@apna_pdf

Ans. (c) : From 1st law of thermodynamics

$$\Delta u = q + w = q - P\Delta V$$

At constant volume, $\Delta V = 0$ then

$$w = 0$$

$\therefore$ $\Delta u = q_v$ (heat absorbed at constant volume

At constant pressure,

$$\Delta U = q_p - P\Delta V$$

$$q_P = (u_2 + PV_2) - (u_1 + PV_1)$$

$$H = U + PV$$

$$q_P = \Delta H$$

Where q_p is heat absorbed at constant pressure.

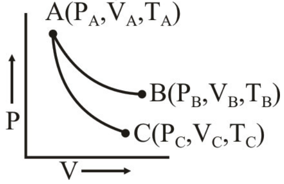
As we know that,

$$\Delta H = \Delta U + \Delta n_g RT$$

Put the value of ΔH and Δu in above equation,

$$q_P = q_V + \Delta n_g RT$$

251. Reversible expansion of an ideal gas under isothermal and adiabatic conditions are as shown on in the figure.



AB $\rightarrow$ Isothermal expansion

AC $\rightarrow$ Adiabatic expansion

Which of the following options is not correct?

(a) $\Delta S_{isothermal} > \Delta S_{adiabatic}$

(b) $T_A = T_B$

(c) $W_{isothermal} > W_{adiabatic}$

(d) $T_c > T_A$

NEET-Odisha 2019

Ans. (d) : In adiabatic expansion q = 0

In isothermal expansion T = constant

Hence, $T_A = T_B$

Work done in isothermal expansion is greater that work done in adiabatic expansion

$\therefore$ $W_{isothermal} > W_{adiabatic}$

In case of adiabatic expansion, cooling effect is observed. Therefore, $T_C < T_A$

Hence, option (d) is not correct.

252. When a deviation more in the behaviour of a gas from the ideal gas equation PV = nRT?

(a) At high temperature and low pressure

(b) At low temperature and high pressure

(c) At high temperature and high pressure

(d) At low temperature and low pressure

NEET-1993

Ans. (b) : Real gas shows deviation from ideal gas behaviour. Ideal gases have no intermolecular force of attraction between molecules and volume occupied by them are negligible. But real gases having intermolecular force of attraction between molecules and its volume is not neglected. At high temperature and low pressure real gas behaves like ideal gas because at low pressure intermolecular force of attraction between molecules are neglected. At high pressure and low temperature real gases shows maximum deviation from ideal gas behaviour because at high pressure, molecules experienced large intermolecular force of attraction.

253. A gas is said to behave like an ideal gas when the relation PV/T = constant. When do you expect a real gas to behave like an ideal gas?

(a) When the temperature is low.

(b) When both the temperature and pressure are low

(c) When both the temperature and pressure are high

(d) When the temperature is high and pressure is low.

NEET-1991

Ans. (d) : For real gas, van der Waal's equation is,

$$\left(P + \frac{an^2}{V^2}\right)(V - nb) = nRT$$

At high temperature and low pressure real gas behaves like ideal gas because at low pressure, volume increases. Due to this both correction terms of van der Waal's equation is negligible because intermolecular force of attraction is neglected on increasing volume.

Then at low pressure and high temperature van der Waal's equation converted into ideal gas equation.

$$PV = nRT$$

254. A gas such as carbon monoxide would be most likely to obey the ideal gas law at

(a) low temperature and high pressures

(b) high temperature and high pressures

(c) low temperature and low pressure

(d) high temperature and low pressure

NEET-2013

Ans. (d) : At high temperature and low pressure real gas behaves like ideal gas because at low pressure, volume increases. Due to this intermolecular, force of attraction between gas molecules is negligible and both correction terms of van der Waal's equation is also neglected. Hence, real gas follow kinetic theory of gases at low pressure and high temperature. Carbon monoxide is real gas but at high temperature and low pressure it behave like ideal gas.

255. Maximum deviation from ideal gas is expected from

(a) $CH_{4(g)}$ (b) $NH_{3(g)}$

(c) $H_{2(g)}$ (d) $N_{2(g)}$

NEET-2013

Ans. (b) : NH_3 show maximum deviation from ideal gas. In ideal gases no intermolecular force of attraction present. But in case of NH_3, it shows maximum force of attraction because of hydrogen bonding. That's why, NH_3 shows maximum deviation from ideal gas.

256. Which is not true in case of an ideal gas?

(a) It cannot be converted into a liquid

(b) There is no interaction between the molecules.

(c) All molecules of the gas move with same speed.

(d) At a given temperature, PV is proportional to the amount of the gas

NEET-1992

@apna_pdf

Ans. (c) : According to kinetic theory of gases there is no interaction between ideal gas molecules. Gas molecules collide with each other and move in different directions i.e. random motion. Due to the collision, molecules show different speed in different directions.
According to ideal gas equation

$$PV = nRT$$

At constant temperature, $PV \propto n$. Ideal gases cannot be liquefied.

257. Under what conditions will a pure sample of an ideal gas not only exhibit a pressure of 1 atm but also a concentration of 1 mole litre^{-1}? (R = 0.082 liter atm mol^{-1} deg^{-1})

(a) At STP
(b) When V = 22.4 litres
(c) When T =12 K
(d) Impossible under any condition

NEET-1993

Ans. (c) : From ideal gas equation

$$PV = nRT$$

$$P = \frac{n}{V}RT \qquad \left(\frac{n}{v} = \text{concentration}\right)$$

$$P = CRT$$

$$T = \frac{P}{CR}$$

$$T = \frac{1}{1 \times 0.082}$$

$$T = 12\text{ K}$$

258. The correct value of the gas constant 'R' is close to

(a) 0.082 litre-atmosphere K
(b) 0.082 litre-atmosphere K^{-1} mol^{-1}
(c) 0.082 litre-atmosphere^{-1} K mol^{-1}
(d) 0.082 litre^{-1} atmosphere^{-1} K mol

NEET-1992

Ans. (b) : From ideal gas equation

$$PV = nRT$$

$$R = \frac{PV}{nT}$$

For 1 mole of gas at STP, T=273K, P = 1 atm, V = 22.4L

$$R = \frac{1\text{atm} \times 22.4\text{L}}{1\text{mole} \times 273\text{K}}$$

$$= 0.0821\text{ L atm K}^{-1}\text{ mol}^{-1}$$

259. Select one correct statement. In the gas equation, PV = nRT

(a) n is the number of molecular of a gas
(b) V denotes volume of one mole of the gas
(c) n moles of the gas have a volume V
(d) P is the pressure of the gas when only one mole of gas is present

NEET-1992

Ans. (c) : According to ideal gas equation ,

$$PV = nRT$$

Where, P is pressure exerted by n moles of gas
V is Volume occupied by n moles of gas.
n is the number of moles of a gas
So, option (c) is correct, n moles of the gas have volume V.

260. At constant temperature, in a given mass of an ideal gas

(a) the ratio of pressure and volume always remains constant
(b) volume always remains constant
(c) pressure always remains constant
(d) the product of pressure and volume always remains constant

NEET-1991

Ans. (d) : From ideal gas equation,

$$PV = nRT$$

At constant temperature, and mass

$$PV = \text{constant}$$

$$P \propto \frac{1}{V} \qquad \text{(Boyle's law)}$$

261. If P, V, M, T and R are pressure, volume, molar mass, temperature and gas constant respectively, then for an ideal gas, the density is given by

(a) $\frac{RT}{PM}$ (b) $\frac{P}{RT}$
(c) $\frac{M}{V}$ (d) $\frac{PM}{RT}$

NEET-1989

Ans. (d) : From ideal gas equation

$$PV = nRT$$

$$\text{Density}(\rho) = \frac{\text{Mass}(m)}{\text{Volume}(V)}$$

And, $$\text{mole} = \frac{\text{mass}(m)}{\text{molar mass}(M)}$$

$\therefore$ $$PV = \frac{m}{M}RT$$

$$\rho = \frac{m}{V} = \frac{PM}{RT}$$

262. At 0 °C, a balloon is expanded with an ideal gas up to 490 mL which is the $\frac{7}{8}$th of its maximum expansion volume. Now, if the temperature is being gradually raised, predict at what temperature it will burst.

(a) 29 °C (b) 30 °C
(c) 39 °C (d) 312 °C

Tripura JEE-2022

Ans. (c): Given:- $T_1 = 0°C = 273K$, $V_1 = 490mL$

Volume V_1 is $\frac{7}{8}$th of its maximum expansion

Volume i.e. V_2. Then

$$\frac{V_1}{V_2} = \frac{7}{8} \qquad \Rightarrow V_2 = 490 \times \frac{8}{7}$$

$$T_2 = ? \qquad V_2 = 560\,\text{mL}$$

From ideal gas equation at constant pressure

$$\frac{V}{T} = \text{constant}$$

@apna_pdf

$$\frac{V_1}{T_1}=\frac{V_2}{T_2}$$

$$T_2=V_2\times\frac{T_1}{V_1}=560\times\frac{273}{490}$$

$$T_2=312\text{K}=39°\text{C}$$

263. Under adiabatic process, one mole of an ideal gas is compressed to its $\frac{1}{5}$th volume at 350 K temperature. Determine the final temperature [C_v=12.55JK^{-1}mol^{-1}].

(a) 738.5 K (b) 1011.5 K
(c) 1284.5 K (d) 1750 K

Tripura JEE-2019

Ans. (b) : Given : $\frac{V_2}{V_1}=\frac{1}{5}$

T_1 = 350K , n = 1 , Cv = 12.55 JK^{-1} mol^{-1}, T_2 = ?

$C_p - C_v = R \Rightarrow C_p = R + C_v$

C_p = 12.55 + 8.314 = 20.864 JK^{-1} mol^{-1}

For adiabatic and reversible compression,

$$TV^{\gamma-1}=\text{constant}$$

$$\gamma=\frac{Cp}{Cv}=\frac{20.864}{12.55}=1.66$$

$$T_1V_1^{\gamma-1}=T_2V_1^{\gamma-1}$$

$$\frac{T_2}{T_1}=\left(\frac{V_1}{V_2}\right)^{\gamma-1}=(5)^{1.66-1}$$

$$\frac{T_2}{350}=(5)^{0.66}$$

$$T_2=350\times(5)^{0.66}\quad=1011.5\text{K}$$

264. 5 moles of a gas in a closed vessel was heated from 300 K to 600 K. The pressure of the gas is doubled. The number of moles of the gas at 600 K is

(a) 5 (b) 2.5
(c) 10 (d) 20

UP CPMT-2013

Ans. (a) : Given, n_1 = 5 moles, T_1 = 300 K, T_2 = 600 K
P_1 = P, P_2 = 2P, n_2 = ?

From gas equation,

$$PV = nRT$$

$$P_1V_1 = n_1RT_1$$

$$PV_1 = n_1RT_1 \quad \text{........(i)}$$

$$P_2V_2 = n_2RT_2 \quad \text{.......(ii)}$$

$$2PV_2 = n_2RT_2$$

$$\therefore V_1 = V_1$$

Dividing eq^n. (i) by (ii)

$$\frac{PV_1=n_1RT_1}{2PV_1=n_2RT_2}$$

$$\frac{1}{2}=\frac{n_1T_1}{n_2T_2}$$

$$\frac{1}{2}=\frac{5\times300}{n_2\times600}$$

$$n_2=\frac{5\times2\times300}{600}$$

$$\boxed{n_2=5}$$

or $$n_1=\frac{PV}{RT}$$

$$\therefore\quad 5=\frac{P\times V}{R\times300}$$

$$n_2=\frac{2P\times V}{R\times600}$$

$\therefore$ n_2 = 5 mol

265. Which of the following expression is true regarding gas laws? (w = weight; M = molecular mass)

(a) $\frac{T_1}{T_2}=\frac{M_1w_2}{M_2w_1}$ (b) $\frac{T_1}{T_2}=\frac{M_2w_1}{M_1w_2}$

(c) $\frac{T_1}{T_2}=\frac{M_1w_1}{M_2w_2}$ (d) $\frac{T_1}{T_2}=\frac{M_1w_1}{M_2w_2}$

UP CPMT-2010

Ans. (a): Ideal gas equation is,

$$PV = nRT$$

$$T\propto\frac{1}{n}$$

Where, number of moles (n) = $\frac{\text{weight}\,(w)}{\text{mol.mass}\,(M)}$

$$\Rightarrow\ \frac{T_1}{T_2}=\frac{n_2}{n_1}=\frac{w_2\times M_1}{M_2\times w_1}$$

266. A certain mass of the oxygen gas ocupies 7 L volume under a presure of 380 mm Hg. The volume of the same mass of the gas at standard pressure, with temperature remaining constant, shall be

(a) 26.60 L (b) 54.28 L
(c) 3.5 L (d) 7 L

UP CPMT-2009

Ans. (c): Given, V_1 = 7 L, P_1 = 380 mm Hg

We know standard pressure = 760 mm Hg = P_2

At constant temperature,

$$p_1V_1=p_2V_2$$

$$380\times7=760\times V_2$$

$$\therefore\quad V_2=\frac{380\times7}{760}$$

$$=3.5\text{L}$$

267. Graph between P and V at constant temperature is

(a) straight
(b) curved increasing
(c) straight line with slope
(d) None of the above

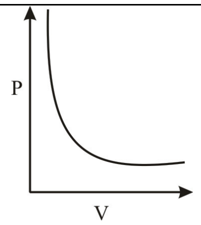
UP CPMT-2007

Ans. (d) : According to Boyle's law, for a fixed amount of a gas at constant temperature, the gas volume is inversely proportional to the gas pressure.

$$P\propto\frac{1}{V}$$

$$PV = \text{constant}$$

@apna_pdf



Graph between P and V at constant temperature is called isotherm and is an equilateral hyperbola.

268. Rate of diffusion of NH_3 is twice that of X. What is the molecular mass of X?

(a) 68 (b) 48

(c) 12 (d) 8

UP CPMT-2007

Ans. (a) : According to Graham law,

$$\frac{r_1}{r_2}=\sqrt{\frac{d_2}{d_1}}=\sqrt{\frac{M_2}{M_1}}$$

Rate of diffusion, $r_X=\left(\frac{r_{NH_3}}{2}\right)$ given

Molecular mass of NH_3=17

Molecular mass of X, (M_x)=?

By Graham's law of diffusion,

$$\frac{r_{NH_3}}{r_X}=\sqrt{\frac{M_X}{M_{NH_3}}} \text{or } 2=\sqrt{\frac{M_X}{M_{NH_3}}}$$

$$4\times M_{NH_3}=M_X \Rightarrow M_X=4\times17=68$$

269. If two molecules of A and B having mass 100 kg and 64 kg and rate of diffusion of A is 12×10^{-3}, then what will be the rate of diffusion of B?

(a) 15×10^{-3} (b) 64×10^{-3}

(c) 5×10^{-3} (d) 46×10^{-3}

UP CPMT-2007

Ans. (a) : According to Graham's law of diffusion, At constant pressure and temperature, the rate of diffusion of a gas is inversely proportional to the square root of its vapour density.

Rate of diffusion (r) $\propto\frac{1}{\sqrt{d}}$

Molecular weight (M) = 2×vapour density

$$\frac{r_1}{r_2}=\sqrt{\frac{M_2}{M_1}}$$

$$M_A=\left(\frac{100}{2}\right)\text{kg/molecule}$$

$$M_B=\left(\frac{64}{2}\right)\text{kg/molecule}$$

$r_A=12\times10^{-3}$ and r_B=?

$$\frac{r_A}{r_B}=\sqrt{\frac{d_B}{d_A}}=\sqrt{\frac{M_B}{M_A}}$$

$$\frac{12\times10^{-3}}{r_B}=\sqrt{\frac{64/2}{100/2}}=\sqrt{\frac{64}{100}}=\frac{8}{10}$$

$$r_B=\frac{12\times10^{-3}\times10}{8}$$

$$=15\times10^{-3}$$

270. If a mixture of CO and N_2 in equal amount have total 1 atm pressure, find out partial pressure of N_2 in mixture.

(a) 1 atm (b) 0.50 atm

(c) 2 atm (d) 3 atm

UP CPMT-2006

Ans.(b): According to Dalton law of partial pressure

total pressure (P) = 1

P = XP

$$P_{N_2}=X_{N_2}P$$

$$X_{N_2}=\frac{n_{N_2}}{n_{N_2}+n_{Co}}$$

Molecular Mass (N_2) = 28 g/mol

Molecular Mass (CO) = 28 g/mol

$$X_{N_2}=\frac{\frac{W}{28}}{\frac{W}{28}+\frac{W}{28}}$$

$$X_{N_2}=\frac{\frac{W}{28}}{\frac{W+W}{28}}$$

$$X_{N_2}=\frac{\frac{W}{28}}{\frac{2W}{28}}$$

$$X_{N_2}=\frac{28W}{28\times2W}$$

$$X_{N_2}=\frac{1}{2}$$

$$P_{N_2}=X_{N_2}P$$

$$P_{N_2}=\frac{1}{2}\times1$$

$$\boxed{P_{N_2}=0.5\text{atm}}$$

271. The compressibility factor of an ideal gas is

(a) 1 (b) 2

(c) 4 (d) 0

UP CPMT-2003

Ans. (a) Compressibility factor (z) = $\frac{PV}{nRT}$

$\because$ for ideal gas PV= nRT

$\therefore$ compressibility factor (Z)= 1

272. For an ideal gas, Joule-Thomson coefficient is

(a) zero

(b) negative

(c) positive

(d) depend on molecular weight

UP CPMT-2001

Ans. (a) : Joule-Thomson effect: When a real gas is allowed to expand adiabatically from region of high pressure to region of low pressure through a fine hole, it cools (except H_2 which warms up). The actual change in temperature on expansion of gas is expressed in terms of Joule-Thomson coefficient (μ).

@apna_pdf

$$\mu = \left(\frac{\partial T}{\partial P}\right)_H$$

It is temperature change in degrees by a drop of one atmospheric pressure when the gas expands under constant enthalpy. Its value is zero for ideal gas because ideal gas has no or negligible van dar Waals' forces of attraction.

273. Which one of the following is not correct for an ideal solution?

(a) It must obey Raoult's law
(b) $\Delta H = 0$
(c) $\Delta C = 0$
(d) $\Delta H = \Delta V \neq 0$

UPTU/UPSEE-2005

Ans.(d): Ideal gases must obey Raoult's law which state when two volatile liquids are mixed to prepare a solution then vapour pressure of a particular liquid in solution is directly proportional to its mole fraction.

In ideal mixing.

Δ H mix = 0

Δ V mix = 0

274. Van der Waals' real gas, acts as an ideal gas at which condition?

(a) High temperature, low pressure
(b) Low temperature, high pressure
(c) High temperature, high pressure
(d) Low temperature, low pressure

UPTU/UPSEE-2015
BCECE-2012
NEET-2002

Ans. (a) : At low pressure and high temperature real gas behaves like ideal gas. Ideal gas having no intermolecular forces of attraction between molecules. Therefore at low pressure, intermolecular force of attraction of real gas is neglected. Hence at low pressure and high temperature real gas behave like ideal gas.

Vander waal's equation

$$\left(P + \frac{an^2}{V^2}\right)(V - nb) = nRT$$

At low pressure and high temperature,

$$P >> \frac{an^2}{V} \quad \text{and} \quad V >> nb$$

Then PV = nRT

i.e., real gas behaves as ideal gas.

275. Avogadro's law is valid for

(a) all gases
(b) ideal gas
(c) Van der Waals gas
(d) real gas

WB-JEE-30.04.2022

Ans. (b) : Avogadro's law is used to determine the molecular formula of gaseous molecules. Avogadro's law is only applicable for ideal gases. At low pressure and high temperature Avogadro's law is applicable to real gas.

276. Equal weights of CH_4 and H_2 are mixed in an empty container at 25°C the fraction of the total pressure exerted by H_2 is

(a) 1/9
(b) 1/2
(c) 8/9
(d) 16/17

WB-JEE-2012

Ans. (c) : Weight of CH_4 (w) = Weigh of H_2 (w)

Molar Mass of CH_4 = 16

Molar Mass of H_2 = 2

$$\text{Mole fraction of } H_2 = \frac{W/2}{\frac{W}{2} + \frac{W}{16}} = \frac{8}{9}$$

Partial pressure = Mole fraction × Total pressure

$$\text{Fraction of the total pressure} = \frac{\text{Partial pressure}}{\text{Total pressure}}$$

$$= \text{Mole fraction}$$

∴ Fraction of the total pressure

$$\text{exerted by } H_2 = X_{H_2} = \frac{8}{9}$$

277. Mixing of two different ideal gases under isothermal reversible condition will lead to

(a) increase Gibbs free energy of the system
(b) no change of entropy of the system
(c) increase of entropy of the system
(d) increase of enthalpy of the system

WB-JEE-2013

Ans. (c) : Mixing of two different ideal gas under isothermal reversible condition are

$$\Delta H_{mix.} = 0, \Delta V_{mix.} = 0, \Delta U_{mix.} = 0$$

$$\Delta S_{mix} = \text{Positive}$$

$$\Delta Y_{mix} = \text{negative}$$

Hence, entropy of mixture increases
enthalpy of mixture decreases.

278. For one mole of an ideal gas, the slope of V vs. T curve at constant pressure of 2 atm is X L mol^{-1} K^{-1}. The value of the ideal universal gas constant 'R' in terms of X is

(a) X L atm mol^{-1} K^{-1}
(b) $\frac{X}{2}$ L atm mol^{-1} K^{-1}
(c) 2X L atm mol^{-1} K^{-1}
(d) 2X atm L^{-1} mol^{-1} K^{-1}

WB-JEE-2014

Ans. (c) : From ideal gas equation

PV = nRT

For n = 1

PV = RT

At constant pressure

$$\frac{V}{T} = \frac{R}{P} = \text{constant}$$

If graph is plotted for V vs T then slope of the V vs T curve is $\frac{R}{P}$

$$\text{Slope} = \frac{R}{P} = X \text{ L mol}^{-1} \text{ K}^{-1}$$

But, P = 2 atm

Then R = Slop × P

= 2X L mol^{-1} K^{-1}

279. At a certain temperature the time required for the complete diffusion of 200 mL of H_2 gas is 30 min. The time required for the complete diffusion of 50 mL of O_2 gas at the same temperature will be

@apna_pdf

(a) 60 min (b) 30 min
(c) 45 min (d) 15 min

WB-JEE-2014

Ans. (b) : According to Graham's law of diffusion, rate of diffusion $(r_d) = \frac{\text{Volume}}{\text{time}}$

$$\gamma_d \propto \frac{1}{\sqrt{\text{Molar mass}}}$$

$$= \frac{(r_d)H_2}{(r_d)O_2} = \frac{V_{H_2}/t_{H_2}}{V_{O_2}/t_{O_2}} = \sqrt{\frac{(M.M)_{O_2}}{(M.M)_{H_2}}}$$

But given, $V_{H_2} = 200\text{ mL}$, $t_{H_2} = 30\text{min}$

$V_{O_2} = 50\text{ mL}$, $t_{O_2} = ?$

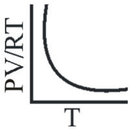
$$\frac{\frac{200}{30}}{\frac{50}{t_{O_2}}} = \sqrt{\frac{32}{2}}$$

$$\frac{200 \times t_{O_2}}{50 \times 30} = \sqrt{16} = 4$$

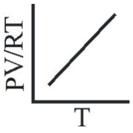
$$t_{O_2} = \frac{30 \times 4}{4} = 30\text{min.}$$

280. For an ideal gas, a plot of PV/RT versus T will look like

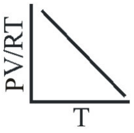
(a)



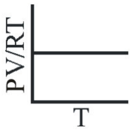
(b)



(c)



(d)



A-P EAMCET 1995

Ans. (d) : According to ideal gas equation

PV = nRT

$\frac{PV}{RT} = \text{Constant}$

$\therefore \frac{PV}{RT}$ remains constant with respect to T.

281. At STP, the density of a gas (molecular weight 45) in g/L is

(a) 2 (b) 22.4
(c) 11.2 (d) 1000

A-P EAMCET 1996

Ans. (a) : Given that, Molecular mass = 45

We know that

$$\text{Density} = \frac{\text{Weight}(\text{mass})}{\text{Volume}}$$

$$= \frac{45}{22.4} = 2\text{g}/\text{L}$$

3. Real Gases

282. Real gases show ideal behaviour at

(a) high pressure and high temperature
(b) low pressure and high temperature
(c) low pressure and low temperature
(d) high pressure and low temperature

A-P EAMCET 1996

Ans. (b) : For real gases equation,

$$\left(P + \frac{a}{V^2}\right)(V - b) = RT$$

Real gas behaves like ideal gas at high temperature and low pressure.

Then, $P \gg \frac{a}{V^2}$ and $V \gg b$

Hence, the equation becomes

PV = RT

i.e. the gases behave as ideal gas equation (ideally)

283. The rms velocity of an ideal gas at 300K is 12240 cms^{-1}, what is the most probable velocity at that temperature?

(a) 10000 cm s^{-1} (b) 11280 cm s^{-1}
(c) 13250 cm s^{-1} (d) 12240 cm s^{-1}

A-P EAMCET 2000

Ans. (a) : Given that,

$V_{rms} = 12240\text{ cms}^{-1}$

$$V_{rms} = \sqrt{\frac{3RT}{M}}$$

$$V_{mp} = \sqrt{\frac{2RT}{M}}$$

$$\frac{V_{rms}}{V_{mp}} = \sqrt{\frac{3}{2}}$$

$$\frac{V_{rms}^2}{V_{mp}^2} = \frac{3}{2}$$

$$V_{mp} = \sqrt{\frac{2 \times (12240)^2}{3}}$$

$$\boxed{V_{mp} \approx 10000\,\text{cm}\,\text{s}^{-1}}$$

284. A gaseous mixture of three gases A, B and C has a pressure of 10 atm. The total number of moles of all the gases is 10. If the partial pressures of A and B are 3.0 and 1.0 atm respectively and if 'C' has mol. Wt. of 2.0, what is the weight of 'C' in grams present in the mixture?

(a) 6 (b) 3
(c) 12 (d) 8

AP EAMCET (Medical) -1998

Ans. (c): Given that,

Total pressure of gases A, B and C = 10 atm.

Total number of moles $(n_A + n_B + n_C) = 10$

Partial pressure of A $(P_A) = 3$ atm.

Partial pressure of B $(P_B) = 1$ atm.

@apna_pdf

Molecular weight of C = 2.0

Now,

Partial pressure of A (P_A) = Total pressure × mole fraction of gas A

or $P_A = 10 \times \frac{n_A}{\text{Total moles}}$

or $3 = 10 \times \frac{n_A}{10}$

or $n_A = 3$

Similarly, for gas B–

$P_B = \text{Total pressure} \times \frac{n_B}{10}$

or $1 = 10 \times \frac{n_B}{10}$

or $n_B = 1$

$\because$ $n_A + n_B + n_C = 10$

or $3 + 1 + n_C = 10$

or $n_C = 6$

$\because$ $\text{Mole} = \frac{\text{Weight of solute}}{\text{Molecular weight}}$

$\therefore$ $6 = \frac{w_C}{2}$

or $w_C = 12$ g

285. Among the following gases, the order of liquefiability is

a) SO_2
b) CO_2
c) CH_4
d) NH_3

(a) $CH_4 > CO_2 > NH_3 > SO_2$
(b) $NH_3 > SO_2 > CH_4 > CO_2$
(c) $CO_2 > NH_3 > SO_2 > CH_4$
(d) $SO_2 > NH_3 > CO_2 > CH_4$

TS EAMCET 10.08.2021, Shift-II

Ans.(d): We know that greater the force of intermolecular attraction, easier is its liquefication therefore order of liquefication is

$SO_2 > NH_3 > CO_2 > CH_4$

286. The compressibility factor (Z) of a gas is < 1 at STP. Therefore

(a) $V_m < 22.4L$
(b) $V_m = 44.8L$
(c) $V_m > 22.4L$
(d) $V_m = 11.2L$

TS EAMCET 10.08.2021, Shift-II

Ans. (a) : Compression factor $Z = \frac{V_{real}}{V_{ideal}}$

Now $Z < 1$

Then $V_{real} < V_{ideal}$

So, the gas will have a volume < 22.4 litre or

Vm < 22.4 L.

287. A real gas would be most likely to obey the ideal gas laws at ———

(a) low temperature and low pressure
(b) high temperature and low pressure
(c) high temperature and high pressure
(d) low temperature and high pressures

AP EAPCET 25.08.2021, Shift-II

Ans. (b) : A real gas would be most likely to obey the ideal gas laws at high temperature and low pressure.

Ideal gas equation –

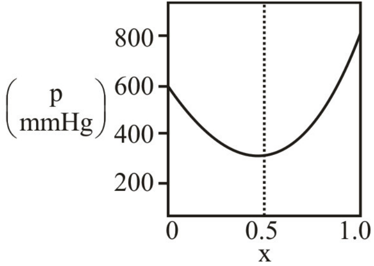
$$\boxed{PV = nRT}$$

Real gas equation

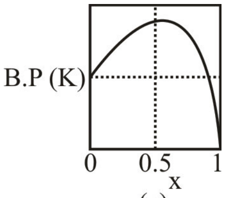
$$\boxed{\left(P + \frac{an^2}{V^2}\right)(V - nb) = nRT}$$

Where n = no. of moles.

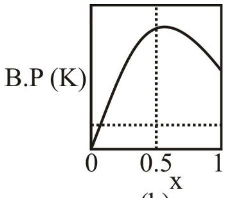
288. The vapour pressure of a non-ideal two component solution is given below



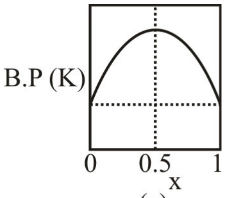
Identify the correct T-X curve for the same mixture.



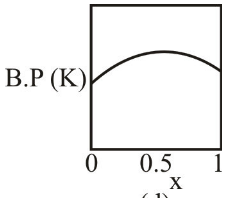
(a)



(b)



(c)



(d)

TS EAMCET-2017

Ans. (a) : The vapour pressure of a non-ideal component solution. The correct T-X curve of the same mixture.

Hence option (a) is correct.

289. Which among the following statements is/are incorrect regarding real gases?

(i) Their compressibility factor is never equal to unity ($Z \neq 1$)
(ii) The deviations from ideal behavior are less at low pressures and high temperatures
(iii) Intermolecular forces among gas molecules are equal to zero
(iv) The obey Vander Waals equation PV = nRT

(a) (i), (ii), (iv) only
(b) (ii), (iv only
(c) (ii) only
(d) (iii), (iv) only

AP EAPCET 20.08.2021 Shift-I

Ans. (d) :

Van der Waal equation $\left(P + \frac{an^2}{V^2}\right)$ (V – nb) = nRT

Where n = no. of moles.

@apna_pdf

Real gas obey's Van der Waal equation and intermolecular forces among gas molecules are not equal to zero. Ideal gas equation

$$PV = nRT$$

290. Which of the following sets consists of gases with the same rate of diffusion at identical temperature and pressure?

(a) H_2, D_2, He	(b) CO_2, NO_2, C_3H_8
(c) CO_2, N_2O, C_3H_8	(d) N_2, CO_2, C_2H_4

SRMJEEE – 2013

Ans. (c) : As we know, the diffusion of gas depends upon the molecular mass. i.e $\frac{r_1}{r_2} = \sqrt{\frac{M_2}{M_1}}$.

CO_2, N_2O and C_3H_8 have same molecular mass i.e 44. Hence, the rate of diffusion will be similar at identical temperature and pressure.

291. Assertion (A) van der Waals' forces are responsible for chemisorptions.
Reason (R) High temperature is fovourable for chemisorptions.
The correct answer is

(a) (A) is false, but (R) is true
(b) Both (A) and (R) are correct and (R) is the correct explanation of A
(c) Both (A) and (R) are correct and (R) is not the correct explanation of (A)
(d) (A) is true, but (R) is false

AP-EAMCET (Engg.) - 2014

Ans. (a) : Van der Waal's forces are responsible for chemisorptions, force that lead to formation of a chemical bond (covalent bond) are responsible for chemisorptions. **High temperature** is favorable for chemisorptions. Hence, statement of assertion (A) is false but the statement of reason is true.

292. What is the ratio of kinetic energies of 3g of hydrogen and 4g of oxygen at T(K) ?

(a) 12 : 1	(b) 6 : 1
(c) 1 : 6	(d) 24 : 1

AP-EAMCET (Engg.)-2005

Ans. (a) : At same temperature-

$$\frac{K_{E_1}}{K_{E_2}} = \frac{n_1}{n_2}$$

No. of moles of hydrogen $= \frac{3}{2} = 1.5$ moles

Number of moles of oxygen $= \frac{4}{32} = 0.125$ moles

Thus,

$$\frac{K_{E_1}}{K_{E_2}} = \frac{1.5}{0.125}$$

or $$\frac{K_{E_1}}{K_{E_2}} = 12:1$$

293. A low pressure, the van der Waal's equation is reduced to

(a) $Z = \frac{PV_m}{RT} = 1 - \frac{a}{VRT}$

(b) $Z = \frac{PV_m}{RT} = 1 + \frac{b}{RT}P$

(c) $PV_m = RT$

(d) $Z = \frac{PV_m}{RT} = 1 - \frac{a}{RT}$

VITEEE-2019

Ans. (a) : Van der Waal's equation-

$$\left[p + \frac{a}{V^2}\right](V - b) = RT$$

$$PV - Pb + \frac{a}{V} - \frac{ab}{V^2} = RT$$

$$PV = RT + Pb - \frac{a}{V} + \frac{ab}{V^2}$$

Given, at low pressure Pb = O

$$PV = RT - \frac{a}{V} + \frac{ab}{V^2}$$

$$\frac{PV}{RT} = 1 - \frac{a}{VRT} + \frac{ab}{V^2RT}$$

$$Z = \frac{PV_m}{RT} = 1 - \frac{a}{VRT} \qquad \left(\because Z = \frac{PV_m}{RT}\right)$$

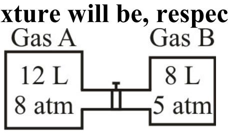
294. It V is the volume of one molecule of gas under given conditions, the van der Waal's constant b is

(a) 4V	(b) $\frac{4V}{N_0}$
(c) $\frac{N_0}{4V}$	(d) $4VN_0$

BITSAT 2018

Ans. (d) : Van der Waals's constant b = 4 times the actual volume of 1 mole molecules.
B is equal to 4× the volume of molecules is one mole of a gas (N_o molecules)
Volumes of one molecule = V
Volume of N_o molecule = V N_o
Hence b = $4VN_o$

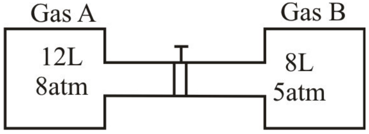
295. Two vessels containing gases A and B are interconnected as shown in the figure. The stopper is opened, the gases are allowed to mix homogeneously. The partial pressures of A and B in the mixture will be, respectively



(a) 8 and 5 atm	(b) 9.6 and 4 atm
(c) 4.8 and 2 atm	(d) 6.4 and 4 atm

CG PET -2009

Ans. (c) : Given that,



@apna_pdf

$V_A = 12$ L $\quad V_B = 8$ L

$P_A = 8$ atm $\quad P_B = 5$ atm

We know

$Pv = nRT$

Now,

Moles of A, $n_A = \frac{P_A V_A}{RT} = \frac{12 \times 8}{RT} = \frac{96}{RT}$

Moles of B, $n_B = \frac{P_B V_B}{RT} = \frac{8 \times 5}{RT} = \frac{40}{RT}$

Moles fraction of A,(X_A) = $\frac{\text{Mole of A}}{\text{Total Mole}} = \frac{\frac{96}{RT}}{\frac{96+40}{RT}} = \frac{96}{136}$

Moles fraction of B,(X_B) =

$$\frac{\text{Mole of B}}{\text{Total Mole}} = \frac{\frac{40}{RT}}{\frac{96+40}{RT}} = \frac{40}{136}$$

Total pressure X total volume = (n_A+n_B)× RT

$P \times (12+8) = \frac{1}{RT}(96+40)RT$

Total Pressure (P)= 6.8 atm

Partial Pressure =Total Pressure × mole fraction

Partial pressure of A = Total pressure ×X_A

$= 6.8 \times \frac{96}{136} = 4.8\text{atm}$

Partial pressure of B = $6.8 \times \frac{40}{136} = 2\,\text{atm}$

296. In Van der Waals' equation of state of the gas law, the constant 'b' is a measure of

(a) Intermolecular repulsions

(b) Intermolecular attraction

(c) Volume occupied by the molecules

(d) Intermolecular collisions per unit volume

[AIEEE 2004]

Ans. (c) : Van der Waal's Equation

$$\left(P + \frac{an^2}{V^2}\right)(v - nb) = nRT$$

Where a = Van der Waal's constant that measure attractive force between the molecules.

b = Volume occupied by the molecule.

297. The compressibility factor for a real gas at high pressure is

(a) $1 + \frac{RT}{pb}$ $\qquad$ (b) 1

(c) $1 + \frac{pb}{RT}$ $\qquad$ (d) $1 - \frac{pb}{RT}$

AIEEE-2012

Ans. (c) : Compressibility factor (z):- It is the factor which decides the extent of deviation of real gases from the ideal gas behavior.

As we know $\left(p + \frac{a}{v^2}\right)(v - b) = RT$

When pressure is high $p >> \frac{a}{V^2}$

$\left(p + \frac{a}{V^2}\right) \approx P$

$p(v - b) = RT$

$pV - pb = RT$

$pV = RT + pb$

$\frac{pV}{RT} = 1 + \frac{pb}{RT}$

$\boxed{Z = 1 + \frac{pb}{RT}}$

Z > 1 at high pressure

298. a and b are van der Waals' constants for gases. Chlorine is more easily liquefied than ethane because

(a) a and b for Cl_2 > a and b for C_2H_6

(b) a and b for Cl_2 < a and b for C_2H_6

(c) a for Cl_2 > a for C_2H_6 but b for Cl_2 > b for C_2H_6

(d) a for Cl_2 > a for C_2H_6 but b for Cl_2 < b for C_2H_6

[AIEEE 2011]

Ans. (d) : In a Van der Waal's gas equation, the constant a gives the idea of the magnitude of attractive forces between the molecules of the gas while b is the measure of effective volume occupied by the gas molecules or effective size of gas molecules.

Greater the value of 'a' larger the attractive intermolecular force between the gas molecules. It means, the gases with higher value of a and lower value of b are more liquefiable.

Hence, Cl_2 is more easily liquefied than ethane.

So, a for Cl_2> a for C_2H_6 but b for Cl_2 < b for C_2H_6

299. If Z is a compressibility factor, van der Waals' equation at low pressure can be written as

(a) $Z = 1 + \frac{RT}{pb}$ $\qquad$ (b) $Z = 1 - \frac{a}{VRT}$

(c) $Z = 1 - \frac{pb}{RT}$ $\qquad$ (d) $Z = 1 + \frac{pb}{RT}$

[JEE Main 2014]

Ans. (b) : From Van der Waal's equation

$$\left(p + \frac{a}{V^2}\right)(V - b) = RT$$

At low pressure, V decreases. Tuus, $\frac{a}{V^2}$ increases.

So, b can be neglected.

$\left(p + \frac{a}{V^2}\right)V = RT$, $pV + \frac{a}{V} = RT$

$\frac{pV}{RT} + \frac{a}{VRT} = 1$, $\boxed{\frac{pV}{RT} = 1 - \frac{a}{VRT}}$

$\boxed{Z = 1 - \frac{a}{VRT}}$

Where Z = compressibility factor

@apna_pdf

300. Consider the following table.

Gas	a/(k Pa dm^6)	b/(dm^3 mol^{-1})
A	642.32	0.05196
B	155.21	0.04136
C	431.91	0.05196
D	155.21	0.4382

a and b are van der Waals' constants. The correct statement about the gases is

(a) Gas C will occupy lesser volume than gas A; gas B will be lesser compressible than gas D.
(b) Gas C will occupy more volume than gas A; gas B will be more compressible than gas D.
(c) Gas C will occupy more volume than gas A; gas B will be lesser compressible than gas D
(d) Gas C will occupy more volume than gas A; gas B will be lesser compressible than gas D

[JEE Main 2019, 10 April Shift-I]

Ans. (b) : As we know from the Van der Waal's gas equation. The value of a gives the idea of the magnitude of attractive force and value of b give the idea of effective volume occupied by the gas molecules.

From the above given table.

It is clear that, gas A and C have same value of b but different value of a. It means gas having higher value of 'a' have more force of attraction.

So occupy less volume because molecules are more closer.

Gas B and D have same value of 'a' but different value of 'b' so gas having laser value of b will be more compressible.

301. The behavior of real gas approaches ideal behavior at

(a) low temperature, low pressure
(b) high temperature, high pressure
(c) low temperature, high pressure
(d) high temperature, low pressure

COMEDK 2016

Ans. (d) : Real gases are found to obey the gas laws fairly well at low pressure and high temperature.

302. A mixture of one mole each of H_2, He and O_2 each are enclosed in a cylinder of volume, V at temperature T. If the partial pressure of H_2 is 2 atm, the total pressure of the gasses in the cylinder is

(a) 14 atm (b) 38 atm
(c) 22 atm (d) 6 atm

[JEE Main 2020, 3 Sep Shift-II]

Ans. (d) : Given that,

Mole of H_2, He, O_2= 1

Partial Pressure of H_2=2 atm

As we know

$\boxed{\text{Partial pressure} = \text{Total Pressure} \times \text{Mole Fraction}}$

For mole fraction of H_2

$$X_{H_2} = \frac{\text{Mole of } H_2}{\text{Mole of } H_2 + \text{Mole of He} + \text{Mole of } O_2}$$

$$X_{H_2} = \frac{1}{1+1+1} = \frac{1}{3}$$

Then,

$$2 = \frac{1}{3} \times \text{Total Pressure}$$

Total pressure = 6 atm

303. The unit of the Van der Waals' gas equation parameter 'a in

$$p\left(\frac{an^2}{V^2}\right)(V-nb) = nRT \text{ is}$$

(a) kg ms^{-2} (b) dm^3 mol^{-1}
(c) kg ms^{-1} (d) atm dm^6 mol^{-2}

[JEE Main 2021, 27 Aug Shift-I]

Ans. (d) : Van der Waal's gas Equation

$$\left(p + \frac{an^2}{V^2}\right)(V-nb) = nRT$$

$$\frac{an^2}{V^2} = \text{atm}$$

$$a = \text{atm} \times \frac{\text{dm}^6}{\text{mol}^2}$$

a = atm dm^6 mole^{-2}

304. The behavior of real gas approaches ideal behavior at

(a) low temperature, low pressure
(b) high temperature, high pressure
(c) low temperature, high pressure
(d) high temperature, low pressure

J & K CET-(2013, 2003, 2000)

Ans. (d) : At high temperature and low pressure, the real gas most closely approaches the behavior of an ideal gas because at high temperature gas molecules have less potential energy and high kinetic energy due to this intermolecular force is less.

This reason makes them ideal.

305. The Van der waals constants for four gases P, Q, R and S are 4.17, 3.59, 6.71 and 3.8 atm. L^2 mol^{-2} Therefore, the ascending order of their liquefaction is

(a) $R < P < S < Q$ (b) $Q < S < R < P$
(c) $Q < S < P < R$ (d) $R < P < Q < S$

J & K CET-(2009)

Ans. (c) : As we know, from Van der Waal's gas equation, greater the value of 'a' larger the attractive intermolecular force between the gas molecules. It means, the gas with higher value of 'a' and lower value of b are more liquefiable.

Then, $Q(3.59) < S(3.8) < P(4.17) < R(6.71)$

306. The units of van der Waals constants a and b respectively are

(a) L atm^2 mol^{-1} and mol L^{-1}
(b) L atm mol^2 and mol L.
(c) L^2 atm mol^{-2} and mol^{-1} L.
(d) L^{-2} atm^{-1} mol^{-1} and L mol^{-2}

J & K CET-(2008)

Ans. (c) : We know Van der Waal's gas equation

$$\left(p + \frac{a}{V^2}\right)(V-b) = RT$$

$$\frac{a}{V^2} = \text{atm}$$

a = L^{2}atm mol^{-2}

and

b =L/mol

b= L mol^{-1}

@apna_pdf

307. Which one among the following, is the van der waals equation, describing the behavior of one mole of a real gas over wide ranges of temperature and pressure?

(a) $\left(P+\frac{a}{V^2}\right)(V-b)=RT$

(b) $\left(P-\frac{a}{V^2}\right)(V-b)=RT$

(c) $\left(P+\frac{a}{V^2}\right)(V-b)=\frac{R}{T}$

(d) $\left(P+\frac{a}{V^2}\right)(V+b)=RT$

J & K CET-(2007)

Ans. (a) : We know Van der Waal's gas equation

$$\left(p+\frac{a}{V^2}\right)(V-b)=RT$$

Where,

p = Pressure

V = Molar volume of the gas

T = Temperature

R =Universal gas constant

And a, b are the constant

308. The Van der Waals' equation for a real gas is given by the formula $\left(P+\frac{n^2a}{V^2}\right)(V-nb)=nRT$ Where P, V, T and n are the pressure, volume, temperature and the number of moles of the gas. Which one is the correct interpretation for the parameter a?

(a) The parameter a accounts for the finite size of the molecule, not included temperature in the ideal gas law

(b) The parameter a accounts for the shape of gas phase molecules

(c) The parameter a accounts for intermolecular interaction's present in the molecule

(d) The parameter a has no physical significance and van der Waals' introduced it as a numerical correction factor only

JCECE - 2005

Ans. (c) : From the Van der Waal's gas equation

$$\left(p+\frac{n^2a}{V^2}\right)(V-nb)=nRT$$

Where,

p = pressure

V = volume

n = number of moles

T = temperature

R = ideal gas constant

The constant 'a' is the measure of the magnitude of intermolecular attractive forces between the particles.

b = measures the volume of a gas molecule.

309. In Van der Waals' equation of state of the gas law, the constant 'b' is a measure of

(a) intermolecular repulsions

(b) intermolecular attractions

(c) volume occupied by the molecules

(d) intermolecular collisions per unit volume

JCECE – 2008

Manipal-2016

JCECE - 2010

Ans. (c) : In Van der Waal's gas equation, the constant a and b measure.

a = It is measure the magnitude of intermolecular attractive forcers between them.

b = It is measure the volume of gas molecule.

$$\boxed{\left(p+\frac{a}{V^2}\right)(V-b)=RT}$$

310. Consider the van der Waals constants, a and b, for the following gases,

Gas	Ar	Ne	Kr	Xe
a/(atm dm^6 mol^{-2})	1.3	0.2	5.1	4.1
b(10^{-2} dm^3 mol^{-1})	3.2	1.7	1.0	5.0

Which gas is expected to have the highest critical temperature?

(a) Kr (b) Ne

(c) Xe (d) Ar

[JEE Main 2019, 9 April Shift-I]

AIIMS 25 May 2019 (Morning)

Ans. (a): Critical Temperature:- It is temperature at which a substance exist in a liquid form.

We know

$$\text{Critical temperature } (T_c)=\frac{8a}{27Rb}----(i)$$

For Ar, a = 1.3 and b = 3.2

From equation (i)

$$T_{c(Ar)}=\frac{8}{27R}\left(\frac{1.3}{3.2}\right)$$

For Ne, a =0.2, b=1.7

$$T_{c(Ne)}=\frac{8}{27R}\left(\frac{0.2}{1.7}\right)$$

For Kr , a = 5.1, b=1

$$T_{c(Kr)}=\frac{8}{27R}\left(\frac{5.1}{.1}\right)$$

For Xe , a = 4.1, b=5.0

$$T_{c(Xe)}=\frac{8}{27R}\left(\frac{4.1}{5}\right)$$

It is clear from the above expression. Kr has a highest critical temperature value.

$\therefore T_c$ has order – Kr > Xe > Ar > Ne

311. If a gas expands at constant temperature, it indicates that

(a) kinetic energy of molecules decreases

(b) pressure of the gas increases

(c) kinetic energy of molecules remains same

(d) number of the molecules of gas increases

JCECE - 2013

@apna_pdf

Ans. (c) : A gas expands at a constant temperature it indicate that the kinetic energy of molecules remains the same.

$KE = \frac{3}{2}RT$ or $KE \propto T$

Here, the temperature of gas remains constant. Hence, kinetic energy of molecules remains the same.

312. The compressibility of a gas is less than unity at STP, therefore

(a) $V_m > 22.4$ L
(b) $V_m < 22.4$ L
(c) $V_m = 22.4$ L
(d) $V_m = 44.8$ L

JIPMER-2017

Ans. (b) : We know that,

Compressibility factor $(Z) = \frac{PV}{nRT}$

Given, compressibility factor less than 1 at STP.

Then

$$Z<1$$

$$Z = \frac{PV}{nRT} < 1$$

As we know

At STP, P = 1 atm, T=273K, R= 0.08210 L atm k^{-1}

Then,

$$V < \frac{nRT}{P} = \frac{0.821 \times 273 \times 1}{1}$$

V< 22.4L

313. A certain sample of gas has a volume of 0.2L measured at 1 atm pressure and 0°C. At the same pressure but 273°C, its volume will be:

(a) 0.4 L
(b) 0.8 L
(c) 27.8 L
(d) 55.6 L

JIPMER-2006

Ans. (a) : Given that,

V_1= 0.2L V_2= ?
P_1=1 atm P_2 = 1 atm
T = 0ºC = 273K T = 273ºC +273 = 546 K

When pressure is constant, Ideal gas equation

$$\frac{V_1}{T_1} = \frac{V_2}{T_2}$$

$$V_2 = \frac{T_2 \times V_1}{T_1}$$

$$V_2 = \frac{0.2 \times 546}{273}$$

V_2= 0.42L

314. a/V^2 given in Van der Waal's equation is for

(a) internal pressure
(b) inter molecular attraction
(c) both (1) and (2)
(d) temperature correction

JIPMER-2005

Ans. (b) : Van der Waals equation

$$\underbrace{\left(P + \frac{an^2}{V^2}\right)}_{\substack{\downarrow \\ \text{Pressure} \\ \text{correction}}} \underbrace{(V - nb)}_{\substack{\downarrow \\ \text{Volume} \\ \text{Correction}}} = nRT$$

Here $\frac{a}{V^2}$ showes intermolecular attraction.

Where a = Van der Waals constant for gases.

315. The pressure of real gases is less than that of ideal gas because of

(a) increases in the kinetic energy of the molecules
(b) increases in the number of collisions
(c) Intermolecular attraction
(d) finite size of particles

Karnataka-CET-2017

Ans. (c) : The pressure of the gas is developed due to the wall collision of the gas molecules. But due to intermolecular attraction the colliding molecules will experience an inward pull.

Therefore, the pressure exerted by the molecules in real gas will be less than the ideal gas. Since ideal gas have no intermolecular attraction.

316. The statement that is not correct is

(a) Compressibility factor measure the deviation of real gas from ideal behaviour
(b) Van der Waals constant 'a' measure extent of intermolecular attractive forces for real gases
(c) Critical temperature is the lowest temperature at which liquefaction of a gas first occurs
(d) Boyle point depends on the nature of real gas

Karnataka-CET-2014

Ans. (c) : • Compressibility factor measure the deviation of real gas from ideal gas behavior

$$\boxed{Z = \frac{PV}{nRT}}$$

- Van der Walls constant 'a' measure extent of intermolecular attractive forces for real gases.
- Critical temperate is the highest temperature at which liquefaction of a gas first occurs.
- Boyle's temperature is the temperature at which real gas obeys the gas laws over an appreciable range of pressure is called Boyle point.

317. The correct arrangement for the ions in the increasing order of their radii is

(a) Na^+, Cl^-, Ca^{2+}
(b) Ca^{2+}, K^+, S^{2-}
(c) Na^+, Al^{3+}, Be^{2+}
(d) Cl^-, F^-, S^{2-}

Karnataka-CET-2014

Ans. (b) : Atomic Radii:- It is radius of atom. This is the distance between an atom's nucleus and outer electron shell.

Increasing order of radii

Ca^{2+}, K^+, S^{2-}

318. 25g of each of the following gasses are taken at 27°C and 600 mm pressure. Which of these will have the least volume?

(a) HCl
(b) HBr
(c) HI
(d) HF

Karnataka-CET-2011

Ans. (c) : Given that,

Mass (M)=25g

Temperature (T) = 27ºC = 273+27=300K

Pressure = 600mm

We know

@apna_pdf

$$PV = nRT \Rightarrow \frac{m}{M}RT ----(i)$$

Where M = Molecular Mass

M= Mass

Note:- Pressure, Temperature and gas constant same for all

For HCl

M = 1+35 =36 g/mol

From eq^n (i)

$$P \times V = \frac{25}{36} \times RT$$

$$V = \frac{25}{36} \times \frac{RT}{P}$$

Similarly, for HBr

M = 1+79 =80

$$V = \frac{25}{80} \times \frac{RT}{P}$$

For HI

M = 1+126 = 127

$$V = \frac{25}{127} \times \frac{RT}{P}$$

For HF

M = 1+18 =19

$$V = \frac{25}{19} \times \frac{RT}{P}$$

From the above expressions, It is clear that HI has the least volume.

319. Gases X, Y, Z, P and Q have the van der Waals' constants a and b (in CGS units) as shown below:

	X	**Y**	**Z**	**P**	**Q**
a	**6**	**6**	**20**	**0.05**	**30**
b	**0.025**	**0.15**	**0.1**	**0.02**	**0.2**

The gas with the highest critical temperature is:

(a) P (b) Q

(c) Y (d) Z

(e) X

Kerala-CEE-2006

Ans. (b) : As we know

$$\text{Critical temperature } (T_c) = \frac{8a}{27Rb}$$

Note:- $\frac{8}{27Rb}$ is constant for all

For

a = 6, b = 0.025

$$T_c = \frac{8 \times 6}{27R(0.025)} = \frac{6000}{25}\left(\frac{8}{27R}\right)$$

For Y

a = 6, b = 0.15

$$T_c = \frac{6}{.15}\left(\frac{8}{27R}\right) = \frac{600}{15}\left(\frac{8}{27R}\right)$$

For Z

a = 20, b = 0.1

$$T_c = \frac{20}{.1}\left(\frac{8}{27R}\right) = \frac{200}{1}\left(\frac{8}{27R}\right)$$

For = P

a = 0.05, b = 0.02

$$T_c = \frac{0.05}{0.02}\left(\frac{8}{27R}\right) = \frac{5}{2}\left(\frac{8}{27R}\right)$$

For = Q

a = 30, b = 0. 2

$$T_c = \frac{30}{0.2}\left(\frac{8}{27R}\right) = \frac{300}{2}\left(\frac{8}{27R}\right)$$

It is clear from the above expression gas x has the highest critical temperature.

Note:- official answer given by commission 'b'.

320. The gas with the highest critical temperature is

(a) H_2 (b) He

(c) N_2 (d) O_2

(e) CO_2

Kerala-CEE-2012

Ans. (e) :

Gas	**Critical Temperature**
H_2	33.2k
O_2	154.3k
He	5.2k
CO_2	304.2k
N_2	126.2k

It is clear from the above table that CO_2 gas has maximum critical temperature 304.2K.

321. The type of attractive forces that operate between gaseous HCl molecules is

(a) dipole-dipole forces

(b) dispersion forces

(c) ion-dipole forces

(d) dipole-induced dipole forces

(e) electrostatic forces

Kerala-CEE-2020

Ans. (a) : Hydrogen chloride has dipole moment because hydrogen has a slight positive charge and Cl atom has slight negative charge and due to attractive forces between unlike charges HCl molecule has dipole-dipole forces. So, option (a) is correct.

322. In van der Waals' equation of state for a non-ideal gas, the term that accounts for intermolecular forces is

(a) V– b (b) $(RT)^{-1}$

(c) $\left(P + \frac{a}{V^2}\right)$ (d) RT

NEET-1990

Ans. (c) : Van der Waal's gas equation

$$\left(P + \frac{a}{V^2}\right)(V - b) = RT$$

$\left(P + \frac{a}{V^2}\right)$ = It shows intermolecular forces.

323. Given van der Waals' constant for NH_3, H_2, O_2 and CO_2 are respectively 4.17, 0.244, 1.36 and 3.59, which one of the following gases is most easily liquefied?

(a) NH_3 (b) H_2

(c) O_2 (d) CO_2

NEET-2018

@apna_pdf

Ans. (a) : The gas which has highest Van der Waal's gas constant value those gas liquefied first.

As we know

Critical temperature (T_c) $\propto$ Van der Waal's gas constant.

Given that,

$NH_3 = 4.17$

$H_2 = 0.244$

$O_2 = 1.36$

$CO_2 = 3.59$

It is clear from the above value, NH_3 will liquefied first.

324. For real gases van der Waals' equation is written as $\left[P+\frac{an^2}{V^2}\right](V-nb)=nRT$ where a and b are van der waals' constants. Two sets of gases are

(I) O_2, CO_2, H_2 and He

(II) CH_4, O_2 and H_2

The gases given in set-I in increasing order of b and gases given in set-II in decreasing order of a, are arranged below. Select the correct order from the following :

(a) (I) $He < H_2 < CO_2 < O_2$ (II) $CH_4 > H_2 > O_2$

(b) (I) $O_2 < He < H_2 < CO_2$ (II) $H_2 > O_2 > CH_4$

(c) (I) $H_2 < He < O_2 < CO_2$ (II) $CH_4 > O_2 > H_2$

(d) (I) $H_2 < O_2 < He < CO_2$ (II) $O_2 > CH_4 > H_2$

NEET-2012

Ans. (b) : $\left(P+\frac{an^2}{V^2}\right)(V-nb)=nRT$

Here 'a' shows intermolecular attraction force and b shows excess volume.

As we know

$b \propto r^3$

Where r^3 is atomic radius. It means, the compound which has more radius then their value of b is more.

(I) O_2, Co_2, H_2 and He

$Co_2 > O_2 > H_2 > He$

(II) CH_4, O_2 and H_2

It is clear that Van der Waal's force of

$CH_4 > O_2 > H_2$

325. Which of the following equation is not correct?

(a) $\left(p+\frac{an^2}{V^2}\right)(V-b)=nRT$

(b) $\left(p+\frac{a}{V^2}\right)(V-b)=RT$

(c) $\left(p+\frac{an^2}{V^2}\right)(V-nb)=nRT$

(d) $p=\frac{RT}{(V-b)}-\frac{a}{V^2}$

UP CPMT-2014

Ans. (a) : Van der Waals' equation is

$$\left(p+\frac{an^2}{V^2}\right)(V-nb)=nRT$$

For 1 mol, n=1

$$\left(p+\frac{a}{V^2}\right)(V-b)=RT$$

or $$p=\frac{RT}{(V-b)}-\frac{a}{V^2}$$

326. At low pressure and high temperature, the van der waal's equation is finally reduced (simplified) to

(a) $\left(p+\frac{a}{V_m^2}\right)(V_m-b)=RT$

(b) $p(V_m-b)=RT$

(c) $\left(p+\frac{a}{V_m^2}\right)V_m=RT$

(d) $pV_m=RT$

UPTU/UPSEE-2017

Ans. (d) : As we know, at low pressure and high temperature gas behave as ideal gas.

So, The ideal gas equation

$\boxed{PV_m=RT}$

327. A Van der Waals' gas may behave ideally when

(a) the volume is very low

(b) the temperature is very high

(c) the pressure is very low

(d) the temperature, pressure and volume all are very high

WB-JEE-2013

Ans. (c) : Van der Waal's gas behave as ideal gas at low pressure and very high temperature. At these conditions there will be large intermolecular distance between gas molecules so negligible intermolecular force.

328. The compressibility factor (Z) of one mole of a van der Waals' gas of negligible 'a' value is

(a) 1

(b) $\frac{bp}{RT}$

(c) $1+\frac{bp}{RT}$

(d) $1-\frac{bp}{RT}$

WB-JEE-2014

Ans. (c) : We know Van der Waal's gas equation

$$\left(P+\frac{n^2a}{V^2}\right)(V-nb)=nRT$$

For 1 mole (i.e. n =1)

$$\left(P+\frac{a}{V^2}\right)(V-b)=RT$$

If a is negligible

$$P+\frac{a}{V^2}\simeq P$$

$P(V-b)=RT$, $PV-Pb=RT$

$$\frac{PV}{RT}-\frac{Pb}{RT}=1$$

$$\boxed{\frac{PV}{RT}=1+\frac{Pb}{RT}}$$

@apna_pdf

329. Four gases P, Q, R and S have almost same values of 'b' but their 'a' values (a, b are van del waals' constants) are in the order Q < R < S < P. At a particular temperature among the four gases, the most easily liquefiable one is

(a) P (b) Q

(c) R (d) S

WB-JEE-2014

Ans. (a) : If the values of b is same for all the gases. Then, the gas which has high value of a then those gas will be liquefied first.

Given, Q < R < S < P

From the above, it is clear that P liquefied first among them.

330. For a van der Waals' gas, the term $\left(\frac{ab}{V^2}\right)$ represents some

(a) pressure (b) energy

(c) critical density (d) molar mass

WB-JEE-2019

Ans. (b) : Given,

$$\frac{ab}{V^2}$$

We know,

$$a = \text{atm}L^2\,\text{mol}^{-2}$$

$$b = \text{L mol}^{-1}$$

$$V = \left(\frac{L}{\text{mol}}\right)^2 = L^2\text{mol}^{-2}$$

Then

$$\frac{ab}{V^2} = \frac{\text{atm. }L^2\text{mol}^{-2} \times \text{L mol}^{-1}}{L^2\text{mol}^{-2}}$$

$$= \text{atm L mole}^{-1}$$

$$= \frac{\text{atm. L}}{\text{Mole}}$$

This represent unit of energy.

4. Kinetics Molecular Theory of Gases and Molecular Collisions

331. The factor by which the kinetic energy of 8 g of H_2 at 27ºC is greater than the kinetic energy of 8g of O_2 at the same temperature, is

(a) 4 (b) 8

(c) 16 (d) 32

A-P EAMCET 1991

Ans. (c) : We know that,

$$\text{Kinetic energy (K.E.)} = \frac{3}{2}nRT$$

Where R = constant

$T_1 = 27ºC = 27 + 273 = 300$ K

$T_2 = 300$ K

$$\therefore \frac{K.E_1}{K.E_2} = \frac{n_1 \times T_1}{n_2 \times T_2}$$

$$\frac{K.E_1}{K.E_2} = \frac{4 \times 300}{\frac{1}{4} \times 300}$$

$$\frac{K.E_1}{K.E_2} = 16$$

332. Assertion (A) : At 300 K, kinetic energy of 16 g of methane is equal to the kinetic energy of 32 g of oxygen.

Reason (R) : At constant temperature, kinetic energy of one mole of all gases is equal.

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)

(b) Both (A) and (R) are true and (R) is not the correct explanation of (A)

(c) (A) is true but (R) is not true

(d) (A) is not true but (R) is true

A-P EAMCET 2004

Ans. (a) : Kinetic energy for 'n' moles of gas is given as–

$$K.E. = \frac{3}{2}nRT$$

Where, R = Universal gas constant.

T = Temperature

$\therefore$ $E \propto T$

Thus, at constant temperature kinetic energy of one mole of any gas is equal.

333. What is temperature at which the kinetic energy of 0.3 moles of helium is equal to the kinetic energy of 0.4 moles of argon at 400 K?

(a) 400 K (b) 873 K

(c) 533 K (d) 300 K

A-P EAMCET 2008

Ans. (c) : Given that,

No. of moles of helium = 0.3 moles

No. of moles of argon = 0.4 moles

We know that, $K.E. = \frac{3}{2}nRT$

According to the question,

K.E. of helium = K.E. of argon

$$\frac{3}{2} \times 0.3 \times R \times T = \frac{3}{2} \times 0.4 \times R \times 400$$

$$\text{or} \quad T = \frac{0.4 \times 400}{0.3} = 533K$$

334. If the kinetic energy in J, of CH_4 (molar mass = 16 g mol^{-1}) at T(K) is X, the kinetic energy in J, of O_2 (molar mass = 32 g mol^{-1}) at the same temperature is

(a) X (b) 2X

(c) X^2 (d) $\frac{X}{2}$

TS-EAMCET-2016

Ans. (a) : The expression of kinetic energy is–

$$K.E. = \frac{3}{2}\frac{R}{N_A} \cdot T$$

Where, R = Gas constant

N_A = Avogadro's number

T = Absolute temperature

@apna_pdf

It is clear that from above equation, the K.E. is depend upon the temperature of the molecule. CH_4 molecule has X kinetic energy at T then O_2 is also have X kinetic energy at the same temperature. Hence, the correct option is (a).

335. A gaseous mixture of 3 gases A, B and C has a pressure 10 atm. The total number of moles are 10. If partial pressure of gases A and B are 3 atm and 1 atm respectively and if molar mass of gas C is 2. Calculate the weight of C in the mixture.

(a) 12 g (b) 24 g
(c) 8 g (d) 2 g

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (a) : Given: P = 10 atm

Total numbers of moles. $n_A + n_B + n_c = 10$

$P_a = 3$atm, $P_B = 1$ atm

$\therefore\ P_A = X_A \times P_{total}$

$$= \frac{n_A}{n_A + n_B + n_c} \times 10 = \frac{n_A}{10} \times 10 = 3$$

Similary,

$P_B = X_B \times P_{total}$

$$1 = \frac{n_B}{n_A + n_B + n_C} \times 10$$

So $n_B = 1$

$\therefore\ n_c = 10 - (3 + 1) = 6$

Weight of C = 6 × 2 = 12g

336. Which of the following statement is/are true

(a) The pressure of a fixed amount of an ideal gas is proportional to its temperature only
(b) Frequency of collisions increases in proportion to the square root of temperature
(c) The value of van der Waal's constant 'a' is smaller for ammonia than for nitrogen
(d) If a gas is expanded at constant temperature, the kinetic energy of the molecules decrease

TS EAMCET-2017

Ans. (b) : Frequency of collisions increases in proportion to the square root of temperature.

337. Electrons with a kinetic energy of 6.023 × 10^4 J/mol are evolved from the surface of a metal, when it is exposed to radiation of wavelength of 600 nm. The minimum amount of energy required to remove an electron from the metal atom is

(a) 2.3125×10^{-19} J (b) 3×10^{-19} J
(c) 6.02×10^{-19} J (d) 6.62×10^{-19} J

AP EAMCET (Engg.)-2009

Ans. (a): Given

$\lambda = 600\text{nm} = 6\times10^{-7}$m

$m_e = 9.109\times10^{-31}$ kg

Kinetic energy of 1 mole = 6.023×10^4 J/mole

1 mole atom contain = 6.023×10^{23} atom

$$\text{Kinetic energy of 1 atom} = \frac{\text{KE of 1mole}}{\text{No. of atom in1 mole}}$$

$$= \frac{6.023\times10^4}{6.023\times10^{23}}$$

$= 1.0\times10^{-19}$ Jule

As we know

$$\frac{1}{2}mv^2 = \frac{hc}{\lambda} - h\nu_0$$

Where $h\nu_0$ = Minimum energy required for remove an electron

h = Plank constant= 6.626×10^{-34}

c = Speed of light = 3×10^8

$$\frac{1}{2}mv^2 = \text{KE of atom}$$

$$h\nu_0 = \frac{hc}{\lambda} - \frac{1}{2}mv^2$$

$$h\nu_0 = \frac{6.626\times10^{-34}\times3\times10^8}{6\times10^{-7}} - 1\times10^{-19}$$

$$h\nu_0 = 3.313\times10^{19} - 1\times10^{-19}$$

$$h\nu_0 = 2.313\times10^{-19}\,\text{Jule}$$

338. The Kinetic energy of one mole of any gas depends upon ______

(a) pressure of the gas
(b) volume of the gas
(c) nature of the gas
(d) absolute temperature of the gas

AP EAPCET 24.08.2021, Shift-I

Ans. (d) : The expression of kinetic energy can be written as –

$$E_K = \frac{3}{2}\eta RT$$

For n = 1 mol

$$\therefore\quad E_K = \frac{3}{2}RT \text{ where R = Gas constant}$$

The given equation shows T = Absolute temperature thus kinetic energy is directly proportional to the absolute temperature of the gas molecule.

339. Three flasks of equal volumes contain CH_4, CO_2 & Cl_2 gases respectively. They will contain equal number of molecules if_______

(a) The mass of all the gases is same
(b) The mass of the gases is same but Temperature is different
(c) Temperature & Pressure of all the flasks are same
(d) Temperature, Pressure & Masses same in the flasks

AP EAPCET 20.08.2021 Shift-II

Ans. (c): Three flasks of equal volume contain CH_4, CO_2 and Cl_2 gases of equal number of molecule if temperature and pressure of all flasks are same.

340. The mole fraction of dioxygen in a neon-dioxygen mixture is 0.18. If the total pressure of the mixture is 25 bar, the partial pressure, of neon in the mixture would be

(a) 25.18 bar (b) 25.82 bar
(c) 4.5 bar (d) 20.5 bar

COMEDK 2014

Ans. (d) : Given P_{total}= 25 bar, $x_{O_2} = 0.18$

$\therefore x_{Ne} = 1 - 0.18 = 0.82$

$P_{Ne} = x_{Ne} \times P_{total} = 0.82 \times 25 = 20.5\text{bar}$

@apna_pdf

341. The kinetic energy of 4 moles of nitrogen gas at 127°C is….. cals. $\left(\mathbf{R = 2cal\ mol^{-1}K^{-1}}\right)$

(a) 4400 (b) 3200
(c) 4800 (d) 1524

AP-EAMCET (Medical), 2003

Ans. (c) : The expression of kinetic energy for a gas is–

$$E_k = \frac{3}{2}nRT$$

Where- E_k = Kinetic energy
n = Number of moles
R= Gas constant
T = Temperature (in K)

Given data: n = 4
T = 127 + 273 = 400K
E_k = ?
R = 2 cal $mol^{-1}K^{-1}$

Now, $E = \frac{3}{2} \times 4 \times 2 \times 400$

E = 4800 calorie.

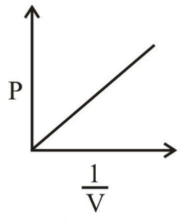
342. Assertion: The graph between $PV/s\frac{1}{V}$ is a straight line.

Reason: For adiabatic process $P \propto \frac{1}{V}$.

(a) If both Assertion and Reason are correct and Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS 25 May 2019 (Morning)

Ans. (c): From Boyle's law $P \propto \frac{1}{V}$ and graph between the P and $\frac{1}{V}$ is straight line.



And, For adiabatic process

$Pr^{\gamma} = C$

$P = \frac{C}{V^{\gamma}}$

$P \propto \frac{1}{V^{\gamma}}$

Hence, assertion is correct while reason is incorrect.

343. Assertion: Compressibility factor (Z) for non-ideal gases can be greater than 1.
Reason: Non- ideal gases always exert higher pressure than expected.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-26 May, 2018 (E)
AIIMS-2015

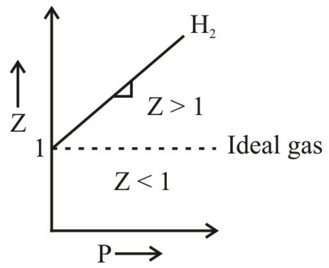
Ans. (d): Compressibility factor can be less than 1 or more than 1 depending upon the nature of the non ideal gas.

344. Assertion: Compressibility factor for hydrogen varies with pressure with positive slope at all pressures.
Reason : Even at low pressure, repulsive forces dominate hydrogen gas.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2005

Ans. (a):



Compressibility factor for hydrogen (H) varies with pressure with positive slope at all pressure. As we can see from the graph this statement is true and even at low pressure repulsive force dominate in hydrogen gas.

Hence, option (a) is correct

345. Assertion: The molecules of the dissolved gas present in a liquid gain kinetic energy as temperature is raised.
Reason: Gases tends to be more soluble in liquids as the temperature is raised.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2009

@apna_pdf

Ans. (c): When dissolved gas molecule present in liquid, If we raised the temperature of the gas molecule kinetic energy increases and they escape from the liquid.

Hence, Molecule of gas will not be soluble in liquid when increased the temperature

So, Assertion is correct but reason is incorrect.

346. Assertion: Gases do not settle to the bottom of container.

Reason : Gases have high kinetic energy.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.

(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.

(c) If the Assertion is correct but Reason is incorrect.

(d) If both the Assertion and Reason are incorrect.

(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-1997

Ans. (a): Gases do not settle down to the bottom of the container because their intermolecular force of attraction is very low. So they can move very fast in any specified region because of it they has high kinetic energy.

347. At critical state, the compressibility factor (Z) for a real gas is equal to

(a) $\frac{3}{8}$ (b) $\frac{8}{3}$

(c) $\frac{4}{3}$ (d) $\frac{3}{4}$

AIIMS-26 May, 2018 (M)

Ans. (a): We know compressibility factor (z)

$$\boxed{Z = \frac{PV}{RT}} \text{——— (i)}$$

At critical point

$$P = \frac{a}{27b^2}$$

$$V = 3b$$

And

$$T = \frac{8a}{27Rb}$$

Putting these all value in equation (i)

$$Z = \frac{\frac{a}{27b^2} \times 3b}{R \times \frac{8a}{27Rb}}$$

$$Z = \frac{3}{8}$$

348. Dominance of strong repulsive forces among the molecules of the gas (Z=compressibility factor

(a) Depends on Z and indicated by Z=1

(b) Depends on Z and indicated by Z>1

(c) Depends on Z and indicated by Z<1

(d) Is independent of Z.

AIIMS-2006

Ans. (b): If Z > 1

It means, gas is less compressible than ideal gas i.e. if we compress the gas, the decrease in volume is less than expected. This is because of the dominance of strong repulsive forces between the molecules preventing them to come closer.

349. The compressibility factor of an ideal gas is:

(a) 0 (b) 2

(c) 1 (d) 4

AIIMS-1997

Ans. (c): The deviation of real gases from ideal behaviour is measured in terms of a ratio of PV to nRT. This is termed as compressibility factor (Z)

$$Z = \frac{PV}{nRT}$$

For ideal gas PV = nRT, hence the compressibility factor, Z = 1 at all temperature and pressure.

350. The ratio of rates of diffusion of gases X and Y is 1 : 5 and that of Y and Z is 1 : 6. The ratio of rates of diffusion of Z and X is

(a) 1 : 30 (b) 1 : 6

(c) 30 : 1 (d) 6 : 1

AP-EAMCET (Engg.) - 2014

Ans. (c) : According to Graham's law of diffusion.

$$\frac{r_X}{r_Y} = \frac{1}{5} \text{\_\_\_\_\_(I)}$$

$$\frac{r_Y}{r_Z} = \frac{1}{6} \text{\_\_\_\_\_(II)}$$

Multiply equation (I) and (II) we get

$$\frac{r_X}{r_Z} = \frac{1}{5} \times \frac{1}{6} = \frac{1}{30}$$

or $\frac{r_Z}{r_X} = \frac{30}{1}$

or $r_Z : r_X = 30 : 1$

351. Which one of the following is the kinetic energy of a gaseous mixture containing 3g of hydrogen and 80 g of oxygen at temperature T(K)?

(a) 3RT (b) 6RT

(c) 4RT (d) 8RT

AP-EAMCET – 2016

Ans. (b) : Number of moles of hydrogen

$$= \frac{\text{mass of } H_2}{\text{M. weight of } H_2}$$

$$= \frac{3}{2} = 1.5$$

Number of moles of oxygen = $= \frac{80}{32} = 2.5$

$\therefore$ Total number of moles in gaseous mixture of hydrogen and oxygen = 1.5 + 2.5 = 4

Therefore, K.E. = $\frac{3}{2}$nRT

$$= \frac{3}{2} \times 4 \times RT$$

$$= 6RT$$

@apna_pdf

352. At T (K), the ratio of kinetic energies of 4 g of H_2(g) and 8 g of O_2 (g) is

(a) 1: 4 (b) 4: 1

(c) 2: 1 (d) 8: 1

AP-EAMCET (Engg.) 2013

Ans. (d) :
We know that K.E. = 3/2 nRT

∵ 4 gm of H_2 gas has 2 moles of H_2.

and 8 gm of O_2 gas has 1/4 moles of O_2.
Hence, ratio of K.E of H_2 and O_2

$$K.E_{H_2} : K.E_{O_2} = 2 : \frac{1}{4} = 8 : 1$$

353. The average kinetic energy of one molecule of an ideal gas at 27°C and 1 atm pressure is

(a) 900 cal $K^{-1}mol^{-1}$

(b) 6.21×10^{-21} JK^{-1} $molecule^{-1}$

(c) 336.7 JK^{-1} $molecules^{-1}$

(d) 3741.3 JK^{-1} mol^{-1}

VITEEE- 2009

Ans. (b) : Average kinetic energy per molecule

$$= \frac{3}{2}kT$$

$$\text{or } = \frac{3}{2}\frac{R}{N_0}T = \frac{3}{2} \times \frac{8.314}{6.023 \times 10^{23}} \times 300$$

$$= 6.21 \times 10^{-21}\ JK^{-1}\ molecule^{-1}$$

354. Above the Boyle temperature, the compressibility factor of the real gases, Z is

(a) 1 (b) < 1

(c) > 1 (d) ≤ 1

AMU-2013

Ans. (c) : Boyle's Temperature:- It is the temperature at which the real gas behaves as an ideal gas over a wide range of pressure is known as Boyle temperature. At this temperature the attractive and repulsive forces acting on the gas particle are balance.
Above the Boyle temperature (Z > 1), the real gases show positive deviation from ideality and Z value are greater than 0 (Z > 1).

355. The kinetic energy of one mole of a gas is

(a) $\frac{3}{2}KT$ (b) $\frac{1}{2}KT$

(c) $\frac{3}{2}RT$ (d) $\frac{1}{2}RT$

AMU 2002

Ans. (c) : According to the Kinetic theory of gases, the mathematical expression of Kinetic energy for one mole is:

$$K.E. = \frac{3}{2}RT$$

Where R = Gas constant (8.314J $mol^{-1}K$)
T = Temperature (measured in Kelvin).

356. 4.4 g of a gas at STP occupies a volume of 2.24 L, the gas is

(a) O_2 (b) CO

(c) CO_2 (d) NO_2

Assam CEE-2014

Ans. (c) : $\left.\begin{array}{l}\text{Given mass} = 4.4\text{g} \\ \text{Volume} = 2.24\text{ L}\end{array}\right] \text{at STP}$

$$\text{No. of Moles} = \frac{\text{Mass}}{\text{Molecular Mass}} \text{ or } \frac{\text{Volume}}{22.4}$$

Let molecular mass is x

$$\frac{4.4}{x} = \frac{2.24}{22.4}$$

$$x = \frac{4.4}{0.1}$$

$$\boxed{x = 44}$$

Molecular Mass = 44
$CO_2 = 12 + 32 = 44$
$O_2 = 16 + 16 = 32$
$CO = 12 + 16 = 28$
$NO_2 = 14 + 32 = 46$
Hence, CO_2 is correct option.

357. Magnitude of kinetic energy in an orbit is equal to :

(a) half of the potential energy

(b) twice of the potential energy

(c) one fourth of the potential energy

(d) none of the above

BCECE-2005

Ans. (a) : Kinetic energy of e^- moving in an orbit

$$K.E = \frac{Z\varepsilon^2}{8\pi\varepsilon r}$$

And

$$P.E = \frac{-2e^2}{4\pi\varepsilon r}$$

$$P.E = -2KE$$

$$\boxed{KE = \frac{-1}{2}P.E}$$

358. When hydrogen molecules decomposed into it's atoms which conditions gives maximum yield of H atoms?

(a) High temperature and low pressure

(b) Low temperature and high pressure

(c) High temperature and high pressure

(d) Low temperature and low pressure

BCECE-2008

Ans. (a) : $H_2 \rightleftharpoons 2H - \text{Heat}$

According to Le Chatelier's principle-
Increase the rate of forward reaction, temperature should be increased and pressure should be decreased.

359. The velocity of a moving electron having 4.55×10^{-25}J of kinetic energy is

(a) 10^3 ms^{-1} (b) 10^5 cms^{-1}

(c) 10^2 ms^{-1} (d) 10^4 cms^{-1}

CG PET- 2015

Ans. (a) : Given,
Mass of electron = 9.1×10^{-31} kg
Kinetic energy of electron (K.E.) = 4.55×10^{-25}
We know

$$K.E. = \frac{1}{2}MV^2$$

@apna_pdf

$$4.55 \times 10^{-25} = \frac{1}{2} 9.1 \times 10^{-31} \times V^2$$

$$V^2 = \frac{4.55 \times 10^{-25} \times 2}{9.1 \times 10^{-31}}$$

$$V^2 = \frac{9.1 \times 10^6}{9.1}$$

$$V^2 = 10^6$$

$$\boxed{V = 10^3 \text{m/sec}}$$

360. According to the kinetic theory of gases, in an ideal gas, between two successive collisions a gas molecule travels

(a) In a circular path
(b) In a wavy path
(c) In a straight line path
(d) With an accelerated velocity

[AIEEE 2003]

Ans. (c) : As we know, assumption of kinetic energy theory of gases. The gas molecules are in constant, rapic, straight line motion (It means that gas molecules have kinetic energy $KE = \frac{1}{2}MV^2$).

361. As the temperature is raised from 20ºC to 40ºC the average kinetic energy of neon atoms changes by a factor of which of the following?

(a) $1/2$
(b) $\sqrt{313/293}$
(c) 313/293
(d) 2

[AIEEE 2004]

Ans. (c) : Given,

$T_1 = 20°C + 273 = 293K$

$T_2 = 40°C + 273 = 313K$

We know average kinetic energy

Then, $E = \frac{3}{2}KT$

$$E1 = \frac{3}{2}K(293) \text{———} (i)$$

$$E1 = \frac{3}{2}K(313) \text{———} (ii)$$

Equation (ii / i)

$$\frac{E_2}{E_1} = \frac{\frac{3}{2}K(313)}{\frac{3}{2}K(293)}$$

$$\boxed{\frac{E_2}{E_1} = \frac{313}{293}}$$

362. Which of the following is not the postulate of the kinetic theory gases?

(a) Gas molecules are in an permanent state of random motion.
(b) Pressure of gas is due to molecular impacts on the walls.
(c) The molecules are perfectly elastic.
(d) The molecular collisions are elastic.

J & K CET-(2013)

Ans. (c) : Postulate of the kinetic theory of gases.

(i) Gas molecules are in a permanent state of random motion
(ii) The collisions between molecules are completely elastic (i.e. when molecules collide, there is no exchange of energy)
(iii) Pressure of gas is due to molecular impact on the walls.
(iv) Each molecules in a gas has different velocity

363. According to kinetic theory of gases

(a) the absolute temperature is a measure of kinetic energy of molecules
(b) molecules attract each other
(c) energy is lost during molecular collision
(d) molecules possess appreciable volume

J & K CET-(2001)

Ans. (a) : According to kinetic theory of gases the absolute temperature is a measure of kinetic energy of molecules.

364. Which one of the following statement is not an assumption of the kinetic theory of gases?

(a) There are attractive forces between the particles.
(b) The particles of a gas are in a state of continuous motion.
(c) The actual volume of molecules is negligible compared to the empty space between them.
(d) At any particular time, different particles in a gas have the same kinetic energy.

J & K CET-(1997)

Ans. (a) : Assumption in Kinetic Theory of Gases

(1) Molecules obey Newton's Laws of motion
(2) The particles of a gas are in a state of continuous motion
(3) The actual volume of molecules is negligible compared the empty space between them.
(4) At any particular time, different particles in a gas have the same kinetic energy.
(5) The molecules of gas have no attraction or repulsion for each other.

365. The density of a gas is 1.964 g dm^{-3} at 273 K and 76 cm Hg. The gas is

(a) CH_4
(b) C_2H_6
(c) CO_2
(d) Xe

JCECE - 2009

Ans. (c) : Given,

Density (ρ) = 1.964 g/dm^{-3} = 1.964 × 10^{-3} g/cc

Pressure (P) = 76 cm = 760 mm Hg = 1 atm

Universal Gas Constant (R) = 0.08212 atm/k mol

= 88.1 cc atm/k mol

Temperature (T) = 273 K

We know, from Ideal Gas equation

$$PV = nRT$$

$$PV = \frac{m}{M}RT$$

$$\frac{PV}{m} = \frac{RT}{M}$$

$$P\frac{1}{\rho} = \frac{RT}{M}$$

@apna_pdf

$$M = \frac{\rho RT}{P} \text{ ———(i)}$$

Putting all value

$$M = \frac{1.964\times10^{-3}\times82.1\times273}{1}$$

$$M = 44$$

Hence, from the above given option CO_2 has molecules weight 44.

366. For three gases A,B and C, the values of their critical temperatures (T_C) are such that $T_C(A) > T_C(B) > T_C(C)$ assuming identical value of 'b'. Which gas can be most easily liquefied?

(a) A (b) B

(c) C (d) All at same temperature

JCECE - 2016

Ans. (a) : Relation used

$$T_C = \frac{8a}{27Rb}$$

where, a and b are van der Waals' constant. Keeping value of b constant, we have,

$$T_C \propto a$$

As we know, more be the value of 'a', more easily we can liquefied the gas.

Hence, more be the value of T_C, more easily that gas will be liquefied i.e. A.

367. Which of the following ideal gases has higher value of average kinetic energy per mole at given temperature — N_2, CO_2, O_2?

(a) N_2

(b) CO_2

(c) O_2

(d) All have equal value of KE

JCECE - 2016

Ans. (d) : Average kinetic energy per mole of gas is independent of nature of gas and is as,

$$KE_{av} = \frac{3}{2}RT(\text{per mole})$$

and $KE_{av} \propto T$

Since, T = constant

thus, value of KE also same for all gases.

368. The average kinetic energy of an ideal gas per molecule in SI units at 25°C will be

(a) 6.17×10^{-21} kJ (b) 6.17×10^{-21}J

(c) 6.17×10^{-20}J (d) 6.16×10^{-20}J

JIPMER-2013, NEET-1996

Ans. (b) : kinetic energy of an ideal gas is,

$$\text{Average KE} = \frac{3}{2}kT$$

Boltzmann constant is given as k

The temperature is represented as T.

The value of Boltzmann constant is

1.38×10^{-23}J/K

$$\text{Average KE} = \frac{3}{2}kT$$

$$= \frac{3}{2}\times1.38\times10^{-23}\times300\text{J} = 6.17\times10^{-21}\text{ J.}$$

369. The kinetic energy of a gas molecule is .... temperature.

(a) independent of

(b) directly proportional to

(c) inversely proportional to

(d) directly proportional to square root of

Manipal-2019

Ans. (b) As we know, the average kinetic energy of gas

$$\text{K.E (E)} = \frac{3}{2}kT$$

$$E \propto T$$

Here kinetic energy proportional to Temperature.

370. What is the kinetic energy of 1 g of O_2 at 47°C?

(a) 2.17×10^2 J (b) 2.24×10^2 J

(c) 1.24×10^2 J (d) None of these

Manipal-2017

Ans. (c) : Given, Temperature (T) = 47°C + 273 = 320K K

Mass = 1 g

Molecular weight of O_2 = 32 g/mol

$$\text{Mole} = \frac{\text{Mass}}{\text{Molecular weight}}$$

$$\text{Mole} = \frac{1}{32}$$

As we know, K.E. of n mole

$$= \frac{3}{2}\times(nRT)$$

$$= \frac{3\times\frac{1}{32}\times8.314\times320}{2}$$

$$= 1.24 \times 10^2 \text{ Joule.}$$

371. Internal energy and pressure of a gas per unit volume are related as

(a) $P = \frac{2}{3}E$ (b) $P = \frac{3}{2}E$

(c) $P = \frac{1}{2}E$ (d) $P = 2E$

NEET-1993

Ans. (a) : We know,

$$\text{Kinetic Energy of Gas} = \frac{3}{2}nRT \text{ ——(i) (for n moles)}$$

$$\text{and} \quad PV = nRT \text{ ———(ii)}$$

From (i) and (ii)

$$\text{K.E.} = \frac{3}{2}PV$$

Here, in question given for unit volume (i.e. V = 1)

$$P = \frac{2}{3}E$$

372. A closed flask contains water in all its three states solid, liquid and vapour at 0°C. In this situation, the average kinetic energy of water molecules will be

(a) the greatest in all the three states

(b) the greatest in vapour state

(c) the greatest in the liquid state

(d) the greatest in the solid state

NEET-1992

@apna_pdf

Ans. (b) : As we know, the intermolecular attraction force between the molecule is more as compare to gas and liquid has intermolecular attraction force in between solid and gas.
Hence, Particle has maximum collision in gas because it has maximum velocity.
As we know, K.E. is the function of temperature. So, maximum kinetic energy is in vapour state.

373. The energy absorbed by each molecule (A_2) of a substance is 4.4×10^{-19} J and bond energy per molecule is 4.0×10^{-19} J. The kinetic energy of the molecule per atom will be

(a) 2.2×10^{-19} J (b) 2.0×10^{-19} J
(c) 4.0×10^{-19} J (d) 2.0×10^{-20} J

NEET-2009

Ans. (d) : Given, molecule is diatomic (A_2) = 2 atom
Energy is absorbed by each molecule = 4.4×10^{-19} Joule
Bond energy absorbed by per molecule = 4×10^{-19} Joule

$$\text{K.E.} = \text{Energy absorbed} - \text{Bond Energy}$$
$$\text{K.E.} = 4.4 \times 10^{-19} - 4 \times 10^{-19}$$
$$= 0.4 \times 10^{-19} \text{ Joule}$$

$$\text{Energy absorbed by per atom} = \frac{\text{K.E.}}{2}$$
$$= \frac{0.4\times10^{-19}}{2}$$
$$= 0.2 \times 10^{-19} \text{ Joule}$$
$$= 2 \times 10^{-20} \text{ Joule}$$

374. If a gas expands at constant temperature, it indicates that

(a) Kinetic energy of molecules remains the same
(b) Number of the molecules of gas increase
(c) Kinetic energy of molecules decreases
(d) Pressure of the gas increases

NEET-2008

Ans. (a) : As we know,

$$\text{K.E.} = \frac{3}{2}\text{KT} \qquad \text{Where K} = \text{nR}$$

Here,

$$\text{K.E.} \propto \text{T}$$

Given, temperature is constant hence Kinetic energy s also constant. Then Kinetic energy of molecules remain the same.

375. Average molar kinetic energy of CO and N_2 at same temperature is

(a) $KE_1 = KE_2$
(b) $KE_1 > KE_2$
(c) $KE_1 < KE_2$
(d) can't say anything. Both volumes are not given

NEET-2000

Ans. (a) : Given,
CO and N_2
Molecular mass of CO = 12 + 16 = 28 g/mol
Molecular mass of N_2 = 14 + 14 = 28 g/mol

$$\text{Moles} = \frac{\text{mass}}{\text{molecular mass}}$$

$$(\text{Moles})_{\text{CO}} = \frac{\text{mass}}{28}$$

$$(\text{Moles})_{\text{N2}} = \frac{\text{mass}}{28}$$

$$\text{K.E.} = \frac{3}{2}\text{nRT}$$

As we seen above, number of mole are same and R and T is also same as given question-
Hence,

$$(\text{K.E.})_{\text{CO}} = (\text{K.E.})_{\text{N}_2}$$

376. 50 mL of hydrogen diffuses out through a small hole of a vessel, in 20 minutes. The time taken by 40 mL of oxygen to diffuse out is

(a) 32 minutes (b) 64 minutes
(c) 8 minutes (d) 12 minutes

NEET-1994
J & K CET-(2003)

Ans. (B) : Rate of diffusion of Hydrogen (H_2) = $\frac{50}{20}$ = 2.5 and Rate of diffusion of Oxygen (O_2) = $\frac{40}{t}$

According to Graham's law of diffusion,

$$\frac{r_{O_2}}{r_{H_2}} = \sqrt{\frac{M_{H_2}}{M_{O_2}}}$$

Where M = molecular mass
$H_2 = 2$
$O_2 = 32$

$$\frac{\frac{40}{t}}{2.5} = \sqrt{\frac{2}{32}} = \sqrt{\frac{1}{16}} = \frac{1}{4}$$

$$\frac{40}{t} = \frac{1}{4} \times 2.5 \Rightarrow t = \frac{40\times4\times10}{25} = 64\,\text{min}$$

377. Which one of the following is the correct order of interactions?

(a) Covalent < Hydrogen bonding < Van der Waal's < Dipole-dipole
(b) Van der Waal's < Hydrogen bonding < Dipole-dipole < Covalent
(c) Van der Waal's < Dipole-dipole < Hydrogen bonding < Covalent
(d) Dipole-dipole < Van der Waal's < Hydrogen bonding < Covalent

NEET-1993

Ans:(b)

No.	Force	Aries Due to	Nature of force
1.	Van der Wall's	Temporary Dipole moment between atom	Weakest
2.	Dipole	2 atom having Dipole moment	less strong
3.	Covalent Bond	Sharing of Electron	Strongest
4.	Hydrogen Bond	attraction of forces that occurs between two atoms of two different molecules	less weak

Hence,
Vander Wall's < Hydrogen Bonding < Dipole - dipole < Covalent

@apna_pdf

378. Calculate the total pressure in a 10.0 L cylinder which contains 0.4 g helium, 1.6 g oxygen and 1.4 g nitrogen at $27^\circ C$.

(a) 0.492 atm (b) 49.2 atm
(c) 4.92 atm (d) 0.0492 atm

UPTU/UPSEE-2006

Ans. (a) : Given,

V = 10.0L
Mass of Helium (He) = 0.4 g
Mass of Oxygen (O) = 1.6 g
and Mass of Nitrogen (N_2) = 1.4 g
Temperature = 27°C + 273 = 300 K.

We know,
Universal Gas constant (R) = 0.082L atm mol^{-1} k^{-1}
Then,

$$\text{Moles of He} = \frac{\text{Mass}}{\text{Molecular mass}} = \frac{0.4}{4} = 0.1$$

$$\text{Moles of O} = \frac{1.6}{32} = 0.05$$

$$\text{Moles of } N_2 = \frac{1.4}{28} = 0.05$$

Total moles in 10.0L cylinder at 27°C

= 0.1 + 0.05 + 0.05
= 0.2 mol

We know,

$$PV = nRT$$

$$P = \frac{nRT}{V} = \frac{0.2 \times 0.082 \times 300}{10}$$

P = 0.492 atm

379. Equal weights of ethane and hydrogen are mixed in an empty container at 25 °C. The fraction of total pressure exerted by hydrogen is

(a) 1 : 2 (b) 1 : 1
(c) 1 : 16 (d) 15 : 16

WB-JEE-2018

Ans. (d) : Let x gm. of each gas is mixed.

$$\text{mole of ethane } (C_2H_6) = \frac{x}{30}$$

$$\text{mole of hydrogen } (H_2) = \frac{x}{2}$$

$$\text{mole of fraction of } H_2 = \frac{x/2}{\frac{x}{30} + \frac{x}{2}} = \frac{15}{16}$$

5. Molecular Speeds

380. The r.m.s. velocity of a gas at a particular temperature is found to be 12240 cm.sec^{-1}. What is its most probable velocity (in cm.sec^{-1}) at the same temperature?

(a) 10^5 (b) 10^4
(c) 11280 (d) 1128

AP-EAMCET (Med.)-1999

Ans. (b) : Given data: V_{rms} = 12240 cm.sec^{-1}

$$V_{rms} = \sqrt{\frac{3RT}{M}} \quad -\text{(I)}$$

$$\text{and } V_{mp} = \sqrt{\frac{2RT}{M}} \quad -\text{(II)}$$

Dividing the equation (I) from (II) – we get

$$\frac{V_{rms}}{V_{mp}} = \sqrt{\frac{3RT}{M}} \times \sqrt{\frac{M}{2RT}}$$

$$\text{or} \quad \frac{12240}{V_{mp}} = \sqrt{\frac{3}{2}}$$

$$\text{or} \quad V_{mp} \approx 10^4 \text{ cm.sec}^{-1}$$

381. The rms velocity of an ideal gas at 27ºC is 0.3 m/s. Its rms velocity at 927ºC (in m/s) is

(a) 3.0 (b) 2.4
(c) 0.9 (d) 0.6

A-P EAMCET 1991

Ans. (d) : $V_{rms} = \sqrt{\frac{3RT}{M}}$

$V_{rms(1)} = 0.3$
T_1 = 27ºC = 27 + 273 = 300 K
$V_{rms(2)}$ = ?
T_2 = 927º C = 927 + 273 = 1200

$$\frac{V_{rms_1}}{V_{rms_2}} = \sqrt{\frac{T_1}{T_2}}$$

$$\frac{0.3}{V_{rms(2)}} = 0.3 \times 2 = 0.6 \text{ ms}^{-1}$$

382. The rate of diffusion of a gas in a diffusion tube is $\frac{1}{2\sqrt{7}}$. Molecular weight of the gas (in g mol^{-1})

(a) 12 (b) 28
(c) 24 (d) 44

A-P EAMCET 1992

Ans. (b) : Given that,

Rate of diffusion of a gas in a diffusion tube (r) = $\frac{1}{2\sqrt{7}}$

Molecular weight (M) = ?

Graham's law states that the rate of diffusion or effusion of a gas is inversely proportional to the square root of its molecular weight.

$$\therefore \quad r = \frac{1}{\sqrt{M}}$$

squaring both side, we get

$$r^2 = \frac{1}{M}$$

$$\left(\frac{1}{2\sqrt{7}}\right)^2 = \frac{1}{M}$$

$$M = \left(2\sqrt{7}\right)^2 = 4 \times 7$$

or M = 28 g mol^{-1}

@apna_pdf

383. At 27ºC, the ratio of root mean square velocities of ozone to oxygen is

(a) $\sqrt{\frac{3}{5}}$ (b) $\sqrt{\frac{4}{5}}$

(c) $\sqrt{\frac{2}{3}}$ (d) 0.25

A-P EAMCET 1992

Ans. (c) : We know that,

$$V_{rms} = \sqrt{\frac{3RT}{M}}$$

Where, R = Gas constant
T = Temperature
M = Molar mass of gas

$$\frac{V_{rms}(O_3)}{V_{rms}(O_2)} = \sqrt{\frac{3RT/M.(\text{weight of } O_3)}{3RT/M.(\text{weight of } O_2)}}$$

$$\frac{V_{rms}(O_3)}{V_{rms}(O_2)} = \sqrt{\frac{32}{48}} = \sqrt{\frac{2}{3}}$$

384. The root mean square velocity of a gas is doubled when the temperature is

(a) reduced to half
(b) reduced to one-fourth
(c) increased four times
(d) increased two times

AP – EAMCET - (Medical)-1997
A-P EAMCET 1996

Ans. (c) : $U_{rms} = \sqrt{\frac{3RT}{M}}$

Where, R = Gas constant
T = Temperature
M = Molar mass

$\because$ $U_{rms} \propto \sqrt{T}$

Then, $\frac{U_{rms_1}}{U_{rms_2}} = \sqrt{\frac{T_1}{T_2}}$

Squaring both side we get

$$\left(\frac{1}{2}\right)^2 = \frac{T_1}{T_2}$$

$$\frac{1}{4} = \frac{T_1}{T_2}$$

or $\boxed{T_2 = 4T_1}$

385. The rms velocity of CO_2 at a temperature, T (in Kelvin) is x cm s^{-1}. At what temperature (in Kelvin), the rms velocity of nitrous oxide would be 4x cm s^{-1} ? (Atomic weights of C, N and O are respectively 12, 14 and 16)

(a) 16 T (b) 2 T
(c) 4 T (d) 32 T

A-P EAMCET (Engg.)-2001

Ans. (a) : Given that,

$$V_{rms}(CO_2) = x = \sqrt{\frac{3RT_{CO_2}}{M_{CO_2}}} \quad .....(i)$$

$$V_{rms}(N_2O) = 4x = \sqrt{\frac{3RT_{N_2O}}{M_{N_2O}}} \quad .....(ii)$$

$\therefore$ Molecular weight of CO_2 = 44
and molecular weight of N_2O = 44
Dividing equation (i) from (ii) we get.

$$\frac{x}{4x} = \sqrt{\frac{T_{CO_2}}{M_{CO_2}} \times \frac{M_{N_2O}}{T_{N_2O}}}$$

Square both side, we get

$$\frac{x^2}{16x^2} = \frac{T_{CO_2}}{44} \times \frac{44}{T_{N_2O}}$$

$$T_{N_2O} = 16\,T_{CO_2}$$

Hence, the option (a) is correct.

386. If gas contains only three molecules that move with velocities of 100, 200, 500 ms^{-1}. What is the rms velocity of that gas in ms^{-1}?

(a) $100\frac{\sqrt{8}}{3}$ (b) $100\sqrt{30}$

(c) $100\sqrt{10}$ (d) $\frac{800}{3}$

A-P EAMCET 2003

Ans. (c) : Given that,
$V_1 = 100\ ms^{-1}$, $V_2 = 200\ ms^{-1}$, $V_3 = 500\ ms^{-1}$ and n = 3

$$\text{rms velocity (V)} = \sqrt{\frac{V_1^2 + V_2^2 + V_3^2}{n}}$$

$$= \sqrt{\frac{(100)^2 + (200)^2 + (500)^2}{3}}$$

$$= \sqrt{1,00,000}$$

$$= 100\sqrt{10}\ ms^{-1}$$

387. At 27ºC, 500 mL of helium diffuses in 30 min. What is the time (in hours) taken for 1000 mL of SO_2 to diffuse under same experimental conditions?

(a) 240 (b) 3 (c) 2 (d) 4

A-P EAMCET 2004

Ans. (d) : Given that,

$$\gamma_{He} = \frac{500}{30}\text{mL/min},\ \gamma_{SO_2} = \frac{1000}{t}\text{mL/min}$$

$M_{He} = 4$, $M_{SO_2} = 64$

From Graham's law –

$$\frac{\gamma_{He}}{\gamma_{SO_2}} = \sqrt{\frac{M_{SO_2}}{M_{He}}}$$

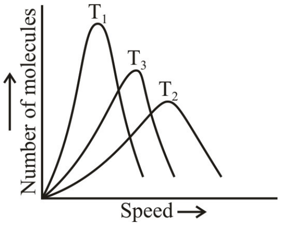
$$\frac{500}{30} \times \frac{t}{1000} = \sqrt{\frac{64}{4}}$$

$$\frac{t}{60} = 4$$

t = 240 min = 4 hr.

388. The given figure shows the Maxwell distribution of molecular speeds of a gas at three different temperatures T_1, T_2 and T_3. The correct order of temperature is

@apna_pdf



(a) $T_1 > T_2 > T_3$ (b) $T_1 > T_3 > T_2$
(c) $T_3 > T_2 > T_1$ (d) $T_2 > T_3 > T_1$

TS-EAMCET-2016

Ans. (d) : At lower temperature, the molecules have less energy. So, the molecular speeds are lower and distribution of molecules has smaller range. But as the temperature increases, distribution range flatters. So that correct order of temperature is : $T_2 > T_3 > T_1$.

389. How many times the volume of a diatomic gas should be increased reversibly and adiabatically in order to reduce its RMS velocity to half of its initial value.

(a) 4 (b) 8
(c) 16 (d) 32

TS-EAMCET (Engg.), 15.08.2021 Shift-II

Ans. (d) : $\Rightarrow V_{RMS} = \sqrt{\frac{3RT}{M}}$ or $V_{rms} \propto \sqrt{T}$

$T \propto V_{RMS}^2$, $\left(\frac{T_2}{T_1}\right) = \left(\frac{1}{2}\right)^2 \Rightarrow \frac{1}{4}$ .....(i)

Reversible adiabatic expansion –

$TV^{\gamma-1}$ = constant

$$\left(\frac{T_2}{T_1}\right) = \left(\frac{V_1}{V_2}\right)^{\gamma-1}$$

$$\frac{V_2}{V_1} = \left(\frac{T_1}{T_2}\right)^{\frac{1}{\gamma-1}}$$

Diatomic gas – $\gamma = \frac{7}{5} \Rightarrow \gamma - 1 \Rightarrow \frac{2}{5} \Rightarrow \frac{1}{\gamma-1} \Rightarrow \frac{5}{2}$ .....(ii)

$\Rightarrow \left(\frac{V_2}{V_1}\right) = \left(\frac{T_1}{T_2}\right)^{\frac{1}{\gamma-1}}$ [Putting the value of T_1/T_2 from equation (i)]

$$\Rightarrow \left(\frac{V_2}{V_1}\right) = (4)^{5/2}$$

$$\Rightarrow \boxed{\frac{V_2}{V_1} = 32}$$

Hence, gas should be expanded 32 times adiabatically.

390. Two gases of molecular masses M_A and M_B are at temperatures T_A and T_B respectively. If $T_AM_B = T_BM_A$, which one of the following properties has the same value for both the gases?

(a) Pressure (b) Kinetic energy
(c) RMS velocity (d) Density

AP EAMCET (Medical) - 2013

Ans. (c) : For gas-A
molecular mass = M_A
temperature = T_A

for gas-B
molecular mass M_B
temperature = T_B

Given- $T_AM_B = T_BM_A$

Now, from the root mean square velocity-

$$V_{rms} = \sqrt{\frac{3RT}{M}}$$

For gas - A

$$(V_{rms})_A = \sqrt{\frac{3RT_A}{M_A}} \text{ \_\_\_\_(I)}$$

and for gas-B

$$(V_{rms})_B = \sqrt{\frac{3RT_B}{M_B}} \text{ \_\_\_\_(II)}$$

From equation (I) and (II) - we get

$$\frac{(V_{rms})_A}{(V_{rms})_B}\sqrt{\frac{3RT_A}{M_A} \times \frac{M_B}{3RT_B}}$$

or $$\frac{(V_{rms})_A}{(V_{rms})_B} = \sqrt{\frac{T_AM_B}{M_AT_B}} \left(\because T_AM_B = M_AT_B\right)$$

$$\therefore \frac{(V_{rms})_A}{(V_{rms})_B} = 1$$

or $(V_{rms})_A = (V_{rms})_B$

391. Among the following identify the gas which has the greatest average speed of its molecules?

(a) 0.5 mol of O_2 at 500K
(b) 0.2 mol of CO_2 at 400K
(c) 1.0 mol of He at 200K
(d) 0.4 mol of NH_3 at 300K

AP EAPCET 25.08.2021, Shift-II

Ans. (c) :

Average speed ($V_{ag.}$) = $\sqrt{\frac{8RT}{\pi M}}$

Where M = Molar mass
T = Temperature
R = Gas Constant

(i) Molar mass of $O_2 = \frac{\text{mass}}{\text{moles}} = \frac{32}{0.5} = 64$

$$V_{ag} = \sqrt{\frac{8RT}{\pi M}} \quad \left\{\because \sqrt{\frac{8R}{\pi}} = \sqrt{21.18}\right\}$$

$$V_{ag} = \sqrt{\frac{21.18 \times 500}{64}} = 12.86 \text{ m/sec.}$$

(ii) Molar mass of $CO_2 = \frac{44}{0.2} = 220$

$$V_{ag} = \sqrt{\frac{21.18 \times 400}{200}} = 6.21 \text{ m/sec.}$$

(iii) Molar mass of He $= \frac{4}{1} = 4$

$$V_{ag} = \sqrt{\frac{21.18 \times 200}{4}} = 32.54$$

@apna_pdf

(iv) Molar mass of $NH_3 = \frac{17}{0.4} = 42.5$

$$V_{ag} = \sqrt{\frac{21.18\times300}{42.5}} = 12.22$$

So, the $V_{ag.}$ of molecule is maximum in option (c).

392. The R.M.S. velocity of CH_4, He and SO_2 are in the ratio of

(a) 16:4:64 (b) 2:1:4
(c) 2:4:1 (d) 1:4:2

COMEDK 2012

Ans. (c) : R.M.S.velocity $= \sqrt{\frac{3RT}{M}}$

$\therefore$ The ratio of R.M.S. velocities of CH_4, He and SO_2 will be

$$\sqrt{\frac{3RT}{16}} : \sqrt{\frac{3RT}{4}} : \sqrt{\frac{3RT}{64}} = \frac{1}{4} : \frac{1}{2} : \frac{1}{8} = 2:4:1$$

393. The most probable velocity (in cm/sec) of hydrogen molecule at 27°C, will be:

(a) 19.3×10^4 (b) 17.8×10^4
(c) 24.93×10^9 (d) 17.8×10^8

AP-EAMCET (Medical), 2006

Ans. (b) : $\because$ Most probable velocity $= \sqrt{\frac{8RT}{\pi M}}$

Temperature (T) = 27 + 273 = 300K

Molecular mass of $H_2 = 2 g mol^{-1}$

Most probable velocity of (H_2)

$$= \sqrt{\frac{8\times8.314\times10^7\times300}{3.14\times2}}$$

$= 17.8 \times 10^4$ cm/s

394. If the r.m.s. velocity of a gas at 100K is 10^4cm. sec^{-1}, what is the temperature (in °C) at which the r.m.s velocity will be 3×10^4 cm. sec^{-1}?

(a) 900 (b) 627
(c) 327 (d) 1217

AP-EAMCET (Medical), 2002

Ans. (b) : Given

$(V_{rms})_1 = 10^4$ cm sec^{-1} $(V_{rms})_2 = 3 \times 10^4$ cm sec^{-1}

$T_1 = 100$ K $T_2 = ?$ (°C)

Now, relation between root mean square velocity and temperature –

$$V_{rms} = \sqrt{\frac{3RT}{M}}$$

Where, V_{rms} = root mean square velocity

R = gas constant

T = temperature

M = molecular weight

$$\therefore \quad (V_{rms})_1 = \sqrt{\frac{3RT_1}{M}} \quad \text{……….. (i)}$$

$$\text{and} \quad (V_{rms})_2 = \sqrt{\frac{3RT_2}{M}} \quad \text{……….. (ii)}$$

from equation (i) and (ii) we get

$$\frac{10^4 \text{cm sec}^{-1}}{3\times10^4 \text{cm sec}^{-1}} = \sqrt{\frac{3RT_1}{M}\times\frac{M}{3RT_2}}$$

or $\frac{1}{3} = \sqrt{\frac{100}{T_2}}$

or $\frac{1}{9} = \frac{100}{T_2}$

or $T_2 = 900$K

or $T_2 = 900 - 273$

or $T_2 = 627^\circ$C

395. The most probable velocity of a gas at 7200 K is equal to the RMS velocity of He gas at 27°C. The gas is

(a) O_2 (b) CO (c) N_2 (d) SO_2

TS EAMCET 04.08.2021, Shift-I

Ans. (d) : Given that T_{mp} = 7200K, T_{rms} = 27°C = 300K, $M_{rms} = 4$

We know that,

Most probable velocity $(v_{mp}) = \sqrt{\frac{2RT}{M}}$

and RMS velocity $(v_{rms}) = \sqrt{\frac{3RT}{M}}$

According to the question,

$$\therefore \quad \sqrt{\frac{2RT}{M}} = \sqrt{\frac{3RT}{M}}$$

Putting the value of these, we get–

$$\sqrt{\frac{2R\times7200}{M}} = \sqrt{\frac{3R\times300}{4}}$$

Squaring both side, we get–

$$\frac{2R\times7200}{M} = \frac{3R\times300}{4}$$

or $M = \frac{2\times7200\times4}{3\times300}$

$M = 64$

Hence, the gas is SO_2.

396. If the density ratio of O_2 and H_2 is 16:1, then ration of their V_{rms} will be

(a) 1 : 1 (b) 1 : 4
(c) 16 : 1 (d) 1 : 16

Assam CEE-2014
AIIMS-1994
BITSAT 2008

Ans. (b): Given that,

density of $O_2 = 16$

density of $H_2 = 1$

$\therefore$ We know that

$$V_{rms} = \sqrt{\frac{3KT}{M}}$$

Root mean speed is inversely proportional to the square root of density.

$$\frac{V_{rmsO_2}}{V_{rmsH_2}} = \sqrt{\frac{\text{density of } H_2}{\text{density of } O_2}}$$

$$\frac{V_{rmsO_2}}{V_{rmsH_2}} = \sqrt{\frac{1}{16}}$$

$$= \frac{1}{4}$$

@apna_pdf

397. Which of the following gas molecules have equal total kinetic energy and translational kinetic energy?

(a) O_2 (b) He (c) CH_4 (d) N_2

AIIMS-1996

Ans. (b): Total kinetic energy = Translational K.E. + Rotational + Vibrational K.E.
For the monoatomic molecule do not posses vibrational and rotational kinetic energies but have only translational motion. Therefore the noble gas (He, Ne, Ar, Kr, etc) fulfill the criteria.

398. Assertion: All molecules in a gas have same speed.
Reason: Gas contains molecules of different size and shape.

(a) If both Assertion and Reason are correct and the Reason is a correct explanation of the Assertion.
(b) If both Assertion and Reason are correct but Reason is not a correct explanation of the Assertion.
(c) If the Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.
(e) If the Assertion is incorrect but the Reason is correct.

AIIMS-2001

Ans. (d): All molecules of a gas are identical in shape and size, but have different energies due to which they have different speeds. It not all of the molecules of a particular gas at a given temperatures move at exactly the same speed.

399. The inversion temperature T_i(K) of hydrogen is (given van der Waals constants a and b are 0.244 atm L^2mol^{-2} and 0.027 $Lmol^{-1}$ respectively)

(a) 440 (b) 220
(c) 110 (d) 330

AIIMS-2010

Ans. (b): Given that,
a = 0.244 atm L^2 mol^{-2}
b = 0.027 L mol^{-1}
The inversion temperature is characteristic of each gas and is given as

$$Ti = \frac{2a}{bR}$$
$$= \frac{2\times 0.244}{0.027\times 0.0821}$$
$$= 220K$$

400. Amongst the following statements, the correct one is :

(a) The gas can not be compressed below the critical temperature.
(b) Below critical temperature, thermal motion of the molecules is slow enough for the intermolecular forces to come into play leading to condensation of the gas.
(c) At critical temperature liquid and gaseous phase can be distinguished.
(d) An ideal gas has a characteristic critical temperature.

AIIMS-2011

Ans. (b): If the temperature is below critical temperature and the pressure is also below its critical value then there is a possibility that we see an equilibrium between the liquid and gaseous states. Critical temperature of a gas is given by-

$$Tc = \frac{8a}{27Rb}$$

Where, a = Vander Waal's forces of attraction.
R = Gas constant.

401. Critical temperatures for A,B,C and D gases are 25ºC, 10ºC, –80ºC and 15ºC respectively. Which gas will be liquified more easily?

(a) A (b) B
(c) C (d) D

AIIMS-2007

Ans. (a): The gas with higher critical temperatures liquifies first.
Hence, 'A' will be liquified more easily.

402. For the diffusion of a gas at pressure P, the rate of diffusion is expressed by:

(a) $r \propto \frac{1}{\sqrt{M}}$ (b) $r = \frac{P}{M}$
(c) $r \propto \frac{M}{\sqrt{P}}$ (d) $r = \frac{P}{\sqrt{M}}$

AIIMS-1998

Ans. (a): According to the Graham's law of diffusion under similar conditions of temperature and pressure, rate of diffusion is inversely proportional to square root of molecular weight.

$$\gamma \propto \frac{1}{\sqrt{M}}$$

Where, M = Molar mass

403. A gas cylinder containing cooling gas can withstand a pressure of 14.9 atmosphere. The pressure gauge of cylinder indicates 12 atmosphere at 27ºC. Due to sudden fire in the building the temperature starts rising. The temperature at which cylinder explodes is:

(a) 87.5ºC (b) 99.5ºC
(c) 115.5ºC (d) 135.5ºC

AIIMS-1997

Ans. (b): Given that,
P_1 = 12 bar, P_2 = 14.9 bar
T_1= 27ºC = 27+273 = 300K, T_2 = ?

According to the pressure temperature law- $\frac{P_1}{P_2} = \frac{T_1}{T_2}$

or

$$T_2 = \frac{T_1 \times P_2}{P_1}$$

Putting the given values, we get-

$$T_2 = 300\times\frac{14.9}{12}$$
$$= 300 \times 1.2416$$
$$= 372.5K.$$

Hence, the temperature in centigrade
= 372.5–273
= 99.5ºC

@apna_pdf

404. Two flasks A and B have equal volumes. A is maintained at 300K and B at 600K. Equal masses of H_2 and CO_2 are taken in flasks A and B respectively. Find the ratio of total K.E. of gases in flask A to that of B

(a) 1 : 2 (b) 11: 1

(c) 33 : 2 (d) 55:7

AP EAPCET 19-08-2021, Shift-II

Ans. (b) : Given

For Flask A -	For Flask B -
$T_A = 300K$	$T_B = 600$ K
Molar mass of $(H_2)_A = 2$	Molar mass of $(CO_2)_B = 44$

$$\text{Kinetic energy} - V_{rms} = \sqrt{\frac{3RT}{M}}$$

For Flask A -

$$\left(V_{rms}\right)_A = \sqrt{\frac{3R \times 300K}{2}} \quad ...(i)$$

For Flask B -

$$\left(V_{rms}\right)_B = \sqrt{\frac{3R \times 600K}{44}} \quad ...(ii)$$

From (i) and (ii)

$$\frac{\left(V_{rms}\right)_A}{\left(V_{rms}\right)_B} = \sqrt{\frac{300K}{2} \times \frac{44}{600K}} = \frac{\sqrt{11}}{1}$$

$$\therefore \frac{(KE)_A}{(KE)_B} = \frac{\frac{1}{2}m\left(v_{rms}^2\right)_A}{\frac{1}{2}m\left(v_{rms}^2\right)_B} = \left(\frac{\sqrt{11}}{1}\right)^2 = \frac{11}{1}$$

405. The root mean square velocity of hydrogen at STP is 1.83×10^5 cm sec^{-1} and its mean free path is 1.78×10^{-3} cm. What will be the collision number at STP?

(a) 9.476×10^9 sec^{-1} (b) 9.746×10^{-9} sec^{-1}

(c) 9.746×10^9 sec^{-1} (d) 9.647×10^9 sec^{-1}

AMU-2016

Ans. (a) : Given that, $V_{rms} = 1.83 \times 10^5$ cm sec^{-1}

Mean free path $(\lambda) = 1.78 \times 10^{-5}$ cm

$\therefore$ we know that,

$$\text{Collision number (Z)} = \frac{V_{rms}}{\lambda}$$

Substituting the given value, we get-

$$Z = \frac{1.83 \times 10^5}{1.78 \times 10^{-5}}$$

$= 1.026 \times 10^{10}$

406. The root mean square velocity of an ideal gas at constant pressure varies with density (d) as

(a) d^2 (b) d

(c) $\sqrt{d}$ (d) $\sqrt{\frac{1}{d}}$

AMU-2015

WB-JEE-2008

Ans. (d) : The root mean square velocity is directly proportional to the square root of temperature and inversely proportional to the square root of molar mass.

$$\therefore V_{rms} = \sqrt{\frac{3RT}{M}}$$

Where, T = temperature

M = Molar mass

$$\text{We know that, density} = \frac{\text{mass}}{\text{volume}}$$

$\therefore$ density $\propto$ mass

$$\text{Hence, } V_{rms} = \sqrt{\frac{1}{\text{density}}}$$

$$V_{rms} \propto \sqrt{\frac{1}{d}}$$

407. The temperature of a gas is raised from 27°C to 927°C, the root mean square velocity is

(a) $\sqrt{\frac{927}{27}}$ times the earlier value

(b) same as before

(c) halved

(d) doubled

Assam CEE-2020

AP EAPCET 20.08.2021 Shift-II

Ans. (d) : Given,

$T_1 = 27^oC = 27 + 273 = 300$ K

$T_2 = 927^oC = 927 + 273 = 1200$ K

$$V_{rms} = \sqrt{\frac{3KT}{M}}$$

$$V_{rms} \propto \sqrt{T}$$

$$\frac{V_{rms_1}}{V_{rms_2}} = \sqrt{\frac{T_1}{T_2}}$$

$$\frac{V_{rms_1}}{V_{rms_2}} = \sqrt{\frac{300}{1200}}$$

$$\boxed{V_{rms_1} = 2V_{rms_2}}$$

408. The average kinetic energy of an ideal gas per molecule in SI unit at 25^0C will be

(a) 6.17×10^{-21} kJ (b) 6.17×10^{-21} J

(c) 6.17×10^{-20} J (d) 7.16×10^{-20} J

BITSAT 2016

NEET-1996

Ans. (b) : $\overline{KE} = \frac{3}{2}kT = \frac{3}{2} \times \frac{8.313}{6.023 \times 10^{23}} \times 298$

$= 6.17 \times 10^{-21}$ J.

(Average Kinetic energy $\overline{KE} = \frac{3}{2}kT = \frac{3}{2}\frac{R}{N}T$)

409. Increasing order of rms velocities of H_2, O_2, N_2 and HBr is

(a) $H_2 > O_2 > N_2 > HBr$ (b) $HBr < O_2 < N_2 < H_2$

(c) $H_2 > N_2 < O_2 > HBr$ (d) $HBr > N_2 < O_2 < H_2$

BITSAT 2013

AMU – 2008

NEET-1991

@apna_pdf

Ans. (b) : RMS velocity (V_{rms}) of molecules depends on mass. When Mol.wt. increases then rms velocity of melocules decreases.

$$\text{rms} \propto \frac{1}{\sqrt{\text{mol.wt}}}$$

The order of increasing mol.wt. :–

$H_2 < N_2 < O_2 < HBr$

Increasing order of rms velocity of molecules

$HBr < O_2 < N_2 < H_2$.

410. Which one of the following statements is not true about the effect of an increase in temperature on the distribution of molecular speeds in a gas?

(a) The area under the distribution curve remains the same as under the lower temperature

(b) The distribution becomes broader

(c) The fraction of the molecules with the most probable speed increases

(d) The most probable speed increases

[AIEEE 2005]

Ans. (c) : On increasing the temperature, the motion of gas molecule become rapid so the value of most probable speed also increase.

The most probable speed is directly proportional to the square root of temperature. The area under the distribution curve remains the same as under the lower temperature and distribution curve represents the total number of molecules.

411. The molecular velocity of any gas is

(a) Inversely proportional to the square root of temperature

(b) Inversely proportional to absolute temperature

(c) Directly proportional to square of temperature

(d) Directly proportional to square root of temperature

[AIEEE 2011]

Ans. (d) : The molecular speed of gas is directly proportional to the square root of temperature.

We know that,

$$\text{Average velocity} = \sqrt{\frac{8RT}{\pi M}}$$

$$\text{Root mean square velocity} = \sqrt{\frac{3RT}{M}}$$

$$\text{Most Probable velocity} = \sqrt{\frac{2RT}{M}}$$

Hence, in all cases molecular velocity $\propto \sqrt{T}$

412. For gaseous state, if most probable speed is denoted by C*, average speed by C and mean square speed by C, then for a large number of molecules, the ratios of these speeds are

(a) $C^* : \bar{C} : C = 1.225 : 1.128 : 1$

(b) $C^* : \bar{C} : C = 1.128 : 1.225 : 1$

(c) $C^* : \bar{C} : C = 1 : 1.128 : 1.1225$

(d) $C^* : \bar{C} : C = 1 : 1.225 : 1.128$

[JEE Main 2013]

Ans. (c) : We know that,

$$C^* = \text{Most probable speed} = \sqrt{\frac{2RT}{M}}$$

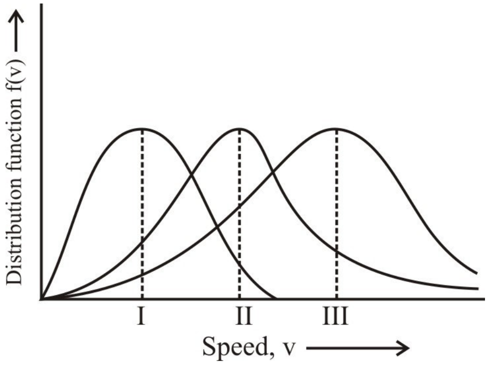
$$\bar{C} = \text{Average speed} = \sqrt{\frac{8RT}{\pi M}}$$

$$C = \text{Root square speed} = \sqrt{\frac{3RT}{M}}$$

Therefore, the ratio of speed are-

$C^* : \bar{C} : C = 1 : 1.128 : 1.225$

413. Points I, II and III in the following plot respectively correspond to (Vmp : most probable velocity)



(a) V_{mp} of H_2 (300 K); V_{mp} of N_2 (300 K); V_{mp} of O_2 (400 K)

(b) V_{mp} of O_2 (400 K); V_{mp} of N_2 (300 K); V_{mp} of H_2 (300 K)

(c) V_{mp} of N_2 (300 K); V_{mp} of O_2 (400 K); V_{mp} of H_2 (300 K)

(d) V_{mp} of N_2 (300 K); V_{mp} of H_2 (300 K); V_{mp} of O_2 (400 K)

[JEE Main 2019, 10 April Shift-II]

Ans. (c) : We know that, the most probable speed

$$(V_{mp}) = \sqrt{\frac{2RT}{M}}$$

$$\text{or } V_{mp} \propto \sqrt{\frac{T}{M}}$$

For N_2, O_2 and H_2

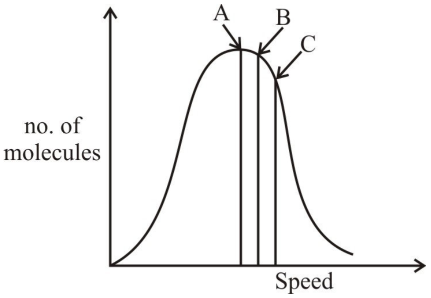
$$V_{mp}N_2 = \sqrt{\frac{300}{28}}, V_{mp}O_2 = \sqrt{\frac{400}{32}}$$

$$V_{mp}H_2 = \sqrt{\frac{300}{2}}$$

Hence, V_{mp} of N_2 (300K) < V_{mp} of O_2(400K) < V_{mp} of H_2 (300K)

414. Identify the correct labels of A, B and C in the following graph from the options given below:

@apna_pdf



Root mean square speed (V_{rms});
Most probable speed (V_{mp});
Average speed (V_{av});

(a) A-v_{rms};B-v_{mp};C-v_{av}
(b) A-v_{mp};B-v_{rms};C-v_{av}
(c) A-v_{mp};B-v_{av};C-v_{rms}
(d) A-v_{av};B-v_{rms};C-v_{mp}

[JEE Main 2020, 7 Jan Shift-II]

Ans. (c) : We know that,

$$V_{rms} = \sqrt{\frac{3RT}{M}}$$

$$V_{av\cdot} = \sqrt{\frac{8RT}{\pi M}}$$

$$V_{mps} = \sqrt{\frac{2RT}{M}}$$

Therefore, $V_{rms} > V_{av} > V_{mps}$

$$\sqrt{3} > \sqrt{\frac{8}{\pi}} > \sqrt{2}$$

Hence, A = $V_{rms,}$ B= V_{av} and C = V_{mps}

415. What will be the relation between the T_1 of gas 1 with M_1 = 56 and T_2 of gas 2 with M_2 = 44 if the average speed of gas 1 is equal to most probable speed of gas 2?

(a) $T_1=T_2^2$
(b) $T_1=T_2$
(c) $T_1= (T_2)^{1/2}$
(d) $T_1=l/T_2$

J & K CET-(2018)

Ans. (b) : Given that, M_1 = 56, M_2 = 44

We know that,

$$C_{av} = \sqrt{\frac{8RT}{\pi M}}$$

$$\text{and } C_{mp} = \sqrt{\frac{2RT}{M}}$$

According to the equation

$$\sqrt{\frac{8RT_1}{\pi M_1}} = \sqrt{\frac{2RT_2}{M_2}}$$

$$\frac{8T_1}{\pi M} = \frac{2T_2}{M_2}$$

$$\frac{4T_1}{\pi \times 56} = \frac{T_2}{44}$$

$$\frac{T_1}{T_2} = \frac{56 \times \pi}{44 \times 4} = 1$$

Or $T_1 = T_2$.

416. Which of the following gas molecules has the longest mean-free path?

(a) H_2
(b) N_2
(c) O_2
(d) Cl_2

J & K CET-(1998)

Ans. (a) : The average distance travelled by a moving particle between successive collisions is known as mean free path. The smaller the molar mass, the higher the mean free path.

Hence, Hydrogen has smallest molar mass it has largest mean free path.

417. The volume of a gas is reduced to 1.0 L at 25ºC and 1 atm pressure. Its pressure at 35º C would be:

(a) 0.96 atm
(b) 1.03 atm
(c) 2.04 atm
(d) 3.08 atm

JCECE - 2003

Ans. (b): Given that,

V = 1 lit , T = 25°C = 298 K

P = 1 atm.

∴ PV = nRT

1 × 1 = n × 298 × 8.321

$$n = \frac{1}{298 \times 8.321}$$

At T = 35°C = 308 k

$$P \times 1 = \frac{1}{298 \times 8.321} \times 8.34 \times 308$$

$$P = \frac{308}{298}$$

= 1.03 atm.

418. At what temperature, the rms velocity of SO_2 be same as that of O_2 at 303 K?

(a) 273 K
(b) 606 K
(c) 303 K
(d) 403 K

JCECE - 2014

Ans. (b) : $\frac{(V_{rms})_{SO_2}}{(V_{rms})_{O_2}} = \sqrt{\frac{T_{SO_2}}{M_{SO_2}} \times \frac{M_{O_2}}{T_{O_2}}}$

i.e., $1 = \sqrt{\frac{T_{SO_2}}{64} \times \frac{32}{303}}$

or $T_{SO_2} = 606$ K

419. Given that the reduced temperature, $\theta = \frac{T}{T_C}$

The reduced pressure, $\pi = \frac{F}{F_C}$

The reduced volume, $\phi = \frac{V}{V_C}$

Thus, it can be said that the reduced equation of state may be given as

(a) $\left(\frac{\pi}{3} + \frac{1}{\varphi}\right)(3\phi - 1) = \frac{8}{3}\theta$

(b) $\left(\frac{\pi}{4} + \frac{1}{\varphi}\right)(3\theta - 1) = \frac{3}{8}\varphi$

@apna_pdf

(c) $\left(\frac{\pi}{3}+\frac{1}{\varphi}\right)(\phi-1)=\frac{3}{8}\theta$

(d) $\left(\frac{\pi}{3}+\frac{1}{\varphi^2}\right)(3\phi-1)=\frac{8}{3}\theta$

JIPMER-2015

Ans. (d) : According to the Vander Waal's equation –

$$\left(P+\frac{a}{v^2}\right)(v-b)=RT$$

Reduced temperature $(\theta)=\frac{T}{T_c}$

Reduced pressure $(\pi)=\frac{T}{P_c}$

and Reduced volume $(\phi)=\frac{v}{v_c}$

Substituting the value of these in equation by Vander Waal's constant –

$$\left(\pi\frac{a}{27b^2}+\frac{a}{\phi^2 9b^2}\right)(\phi 3b-b)=r\theta\frac{8a}{27Rb}$$

$$\left(\pi a+\frac{3a}{\phi^2}\right)(3b\phi-b)=8ab\theta$$

$$\left(\pi+\frac{3}{\phi^2}\right)(3\phi-1)=8\theta$$

Hence, the reduced equation of state is –

$$\left(\frac{\pi}{3}+\frac{1}{4^2}\right)(3\phi-1)=\frac{8}{3}\theta$$

420. The average velocity (in cm/s) of hydrogen molecule at $27^\circ C$ will be

(a) 19.3×10^4 (b) 17.6×10^4

(c) 24.93×10^9 (d) 17.8×10^8

JIPMER-2009

Ans. (b) : average velocity $=\sqrt{\frac{8RT}{\pi m}}$

$T=(27+273)=300K$

Molecular mass of $H_2=2\ g\ mol^{-1}$

=

$$\sqrt{\frac{8\times8.314\times300}{3.14\times2\times10^3}}=1782.5\,m/s=17.8\times10^4\,cm/sec$$

421. The rms velocity of hydrogen is $\sqrt{7}$ times the rms velocity of nitrogen. If T is the temperature of the gas, which of the following is true?

(a) $T_{H_2}=\sqrt{7}\,T_{N_2}$ (b) $T_{N_2}=T_{H_2}$

(c) $T_{N_2}=\sqrt{7}\,T_{H_2}$ (d) $T_{N_2}=2T_{H_2}$

Karnataka-CET-2011

Ans. (d) :

$$(V_{rms})_{H_2}=\sqrt{7}\,(V_{rms})_{N_2}$$

$$(V_{rms})=\sqrt{\frac{3RT}{M}}$$

$$(V_{rms})_{N_2}=\sqrt{\frac{3RT_{N_2}}{28}}$$

$$(V_{rms})_{H_2}=\sqrt{\frac{3RT_{H_2}}{2}}$$

$$\sqrt{\frac{3RT_{H_2}}{2}}=\sqrt{7}\sqrt{\frac{3RT_{H_2}}{28}}$$

Squiring both side,

$$\frac{3RT_{H_2}}{2}=7\times\frac{3RT_{N_2}}{28}$$

$$2T_{H_2}=T_{N_2}\Rightarrow\boxed{T_{N_2}=2T_{H_2}}$$

422. The rms velocity of molecules of a gas of density 4 kg m^{-3} and pressure 1.2×10^5 Nm^{-2} is

(a) 300 ms^{-1} (b) 900 ms^{-1}

(c) 120 ms^{-1} (d) 600 ms^{-1}

KARNATAKA-CET, 2009

Ans. (a) : $V_{rms}=\sqrt{\frac{3RT}{M}}=\sqrt{\frac{3PV}{M}}=\sqrt{\frac{3P}{\rho}}$

$$=\sqrt{\frac{3\times1.2\times10^5}{4}}=300ms^{-1}$$

423. The temperature of a gas is raised from 27°C to 927°C. The root mean square speed of the gas

(a) remains same (b) gets $\sqrt{\frac{927}{27}}$ times

(c) gets halved (d) gets doubled

NEET-1994

Ans. (d) :

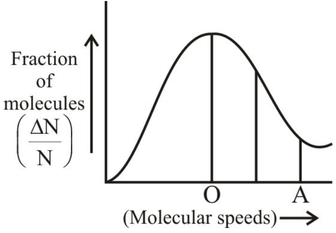
$$V_{rms}=\sqrt{\frac{3RT}{M}}\Rightarrow V_{rms}\propto\sqrt{T}$$

$$\frac{(V_{rms})_1}{(V_{rms})_2}=\sqrt{\frac{T_1}{T_2}}=\sqrt{\frac{300}{1200}}=\frac{1}{2}$$

$$\boxed{(V_{rms})_2=2(V_{rms})_1}$$

Final velocity is doubled the initial velocity.

424. The Maxwell-Boltzmann distribution law of molecular speeds is graphically represented as



This curve has which of the following characteristics?

(1) It has symmetrical distribution

(2) The point on axis represents the most probable speed

(3) The area under the curve gives the total number of molecules

(4) The maximum shifts to the right as the temperature increases

@apna_pdf

Choose the correct answer using the codes given below

(a) 1, 2 and 3 (b) 1, 3 and 4
(c) 3 and 4 (d) only 4

UP CPMT-2013

Ans. (c) : According to Maxwell-Boltzmann's distribution curve

1. At a particular temperature, the different molecules of gas posses different speeds and their speeds keep on changing due to continuous ________ ______ _______ _______ _______ collisions, though some molecules are speeded up. Some others are slowed down and hence the fraction of molecules possessing particular speed remains constant at constant temperature.
2. The point A on X-axis does not represent the most probable speed, however, it represents threshold speed, i.e., the minimum speed which the colloiding molecules must have in order that the collision between them may be effective.
3. The area under the curve gives the total number of molecules. As velocity increases, distribution of molecules increases and it is maximum at most probable speed after which distribution of molecules decreases. Fraction of molecules with too high and too low velocities is very small but no molecule has zero velocity.
4. The peak of the curve corresponds to a speed possessed by the maximum fraction of molecules and is called the most probable speed. As temperature increases, the most probable speed also increases, however, the fraction of molecules possessing most probable speed decreases with increase in temperature. Thus, the maximum shift to right as the temperature increases.

425. The most probable velocity (in cm/s) of hydrogen molecule at 27°C will be

(a) 19.3×10^4 (b) 15.8×10^4
(c) 24.93×10^9 (d) 17.8×10^5

UP CPMT-2008

Ans. (b): Most probable velocity

$$(V_m) = \sqrt{\frac{2RT}{M}} = \sqrt{\frac{2\times8.314\times300}{2\times10^{-3}}} = 1579.3\,m/s$$

$$= 15.79\times10^4\,cm/sec$$

6. Liquefaction of Gases

426. Which one of the following processes does not produce dinitrogen?

(a) Thermal decomposition of ammonium dichromatic
(b) Thermal decomposition of barium azide
(c) Treating an aqueous solution of ammonium chloride with sodium nitrite
(d) Thermal decomposition of sodium azide
(e) Thermal decomposition of ammonium nitrate

Kerala CEE -03.07.2022

Ans. (e) : Thermal decomposition of ammonium nitrate does not produce dinitrogen.

427. Assertion: Solubility of gases increases with increase in pressure
Reason: Dissolution of gas in liquid is exothermic.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-27 May, 2018 (E)

Ans. (b): Difference in pressure is independent of thermodynamic of the process.
Hence, if both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.

428. Assertion: Greater the value of van der Waal's constant'a'. greater is the liquefaction of gas.
Reason:'a' indirectly measures the magnitude of attractive forces between the molecules.

(a) If both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.
(b) If both Assertion and Reason are correct, but Reason is not the correct explanation of Assertion.
(c) If Assertion is correct but Reason is incorrect.
(d) If both the Assertion and Reason are incorrect.

AIIMS-2014

Ans. (a): Considering the attractive force, pressure in the ideal gas equation (PV = nRT) is corrected by introducing a factor of $\frac{an^2}{V^2}$, where a is vander wall's constant.
Hence, if both Assertion and Reason are correct and the Reason is the correct explanation of Assertion.

429. Under which one of the following conditions do real gases approach the ideal gas behaviour?

(a) Low temperature and high pressure
(b) High temperature and high pressure
(c) High temperature and low pressure
(d) Low temperature and low pressure

AP-EAMCET- (Engg.)-2011

Ans. (c) : Real gases approach the ideal gas behaviour at high temperature and low pressure.

430. A, B, C and D are four different gases with critical temperatures 304.1, 154.3, 405.5 and 126.0 K respectively. While cooling the gas, which gets liquefied first?

(a) B (b) A
(c) D (d) C

AP-EAMCET – 2016

@apna_pdf

Ans. (d) : Given that,

$$T_A = 304.1K$$
$$T_B = 154.3K$$
$$T_C = 405.5K$$
$$T_D = 126.0K$$

The critical temperature signifies the force of attraction between the molecules. The higher the critical temperature, higher is the intermolecular force of attraction and easier is the liquefaction of the gas.

In the given four different gases, C has highest critical temperature i.e. = 405.5K.

Hence, it gets liquefied first.

431. An ideal gas can't be liquefied because

(a) its critical temperature is always above 0^0C

(b) its molecule are relatively smaller in size

(c) it solidifies before becoming a liquid

(d) forces operated between its molecules are negligible

BITSAT 2012
BCECE-2010

Ans. (d) : In an ideal gas, the intermolecular forces of attraction are negligible and hence it cannot be liquefied.

432. When the temperature is raised, the viscosity of liquid decreases this is because

(a) decreased volume of the solution

(b) increased attraction between molecules

(c) decreased covalent and hydrogen bond forces

(d) increase in temperature increase the average kinetic energy of molecules which overcomes the attractive force between them

BITSAT 2010

Ans. (b) : When the temperature is raised, the viscosity of liquid decrease, this is because increasing in temperature increases the kinetic energy of molecules which overcome the affricative force between them.

433. A gas at high temperature is cooled. The highest temperature at which liquefaction of gas first occurs is called.

(a) Boyle temperature (b) critical temperature

(c) boiling temperature (d) freezing temperature.

J & K CET-(2015)

Ans. (b) : The highest temperature at which liquefaction of gas is first is called critical temperature.

434. The following is a method to determine the surface tension of liquids

(a) single capillary method

(b) refractometric method

(c) polarimetric method

(d) boiling point method

J & K CET-(2007)

Ans. (a) : The capillary rise methods is test conducted to determine the surface tension of a liquid or the contact angel. of liquid. Capillary rise takes place due to the combined effect of cohesive and adhesive force.

435. A gas can be liquefied

(a) at its critical temperature

(b) above its critical temperature

(c) below its critical temperature

(d) at $0^\circ C$

UP CPMT-2009

Ans. (c): A gas can be liquefied only when its temperature is below its critical temperature. This is because at critical temperature no distinction exists between the gaseous and liquid state and hence, no separate phase is formed.

436. A gas can be liquefied at temperature T and pressure p provided

(a) $T = T_C$ and $P < P_c$ (b) $T < T_C$ and $P > P_c$

(c) $T > T_C$ and $P > P_c$ (d) $T > T_C$ and $P < P_c$

WB-JEE-2015

Ans. (b) : A gas can be liquefied below critical temperature and above the critical pressure.

7. Intermolecular Forces

437. Dipole-induced dipole interactions are present in which of the following pairs?

(a) HCl and He atoms (b) SiF_4 and He atoms

(c) H_2O and alcohol (d) Cl_2 and CCl_4

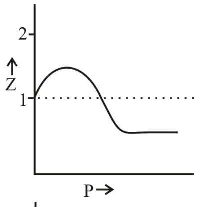
NEET-2013

Ans. (a) : Dipole induced dipole interaction is present in the pair in which first species polar and the other is non polar (HCl and He atoms).

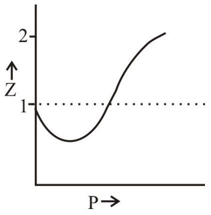
8. Behavior of Real Gases: Deviation From Ideal Gas Behavior

438. Which of the following indicates a plot of compressibility factor (Z) Vs P at room temperature for helium

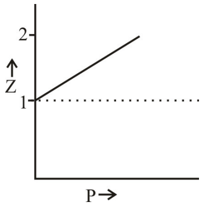
(a)



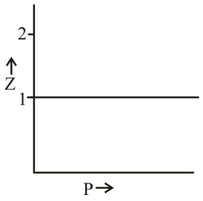
(b)



(c)

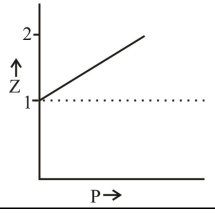


(d)



TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (c) : A graph of the compressibility factor (Z) vs. pressure (P) shows that gases can exhibit significant deviations from the behavior predicted by the ideal gas law. The graph of Z vs. P is given below–



@apna_pdf

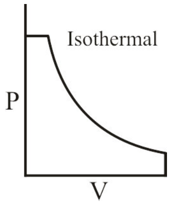
06.

Thermodynamics

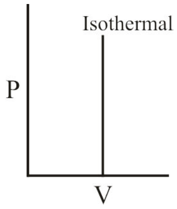
1. Thermodynamics terms

1. Which of the following p-V curve represents maximum work done?

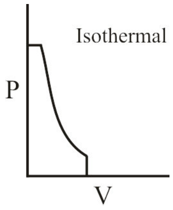
(a)



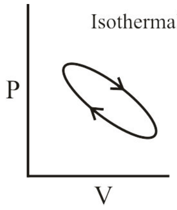
(b)



(c)

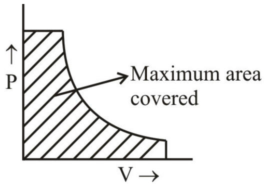


(d)



NEET-17.07.2022

Ans. (a) : Work done under any thermodynamics process can be determined by area under the P-V curve. Therefore the maximum area covered is–



2. $N_2(g)+3H_2(g) \rightleftharpoons 2NH_3(g)$

[ΔH = –93.6kJ]

The yield of ammonia does not increase when:

(a) Pressure is increased
(b) Pressure is decreased
(c) Temperature is lowered
(d) Volume of reaction vessel is decreased

CG PET-22.05.2022

Ans. (b) : In the reation,

$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g) \qquad [\Delta H = -93.6kJ]$

The yield of ammonia will increase when pressure is decreased because the decreasing of pressure will result in an increase in volume which shifts the equilibrium in the direction of increased volume i.e. backward.

3. Match List - I with List – II

List – I	List – II
(A) Spontaneous process	(I) $\Delta H < 0$
(B) Process with $\Delta P = 0, \Delta T = 0$	(II) $\Delta G_{T,P} < 0$
(C) $\Delta H_{reaction}$	(III) Isothermal and Isobaric process
(D) Exothermic Process	(IV) [Bond energies of molecules in reactants]-[Bond energies of product molecules]

Choose the correct answer from the option Given below:

(a) (A)-(III), (B)-(II), (C)-(IV), (D)-(I)
(b) (A)-(II), (B)-(III), (C)-(IV), (D)-(I)
(c) (A)-(II), (B)-(III), (C)-(I), (D)-(IV)
(d) (A)-(II), (B)-(I), (C)-(III), (D)-(IV)

JEE Main-27.06.2022, Shift-I

Ans. (b): Spontaneous process → $\Delta G < 0$
Process with $\Delta P = 0$, $\Delta T = 0$ → isobaric and isothermal process
$\Delta H_{reaction}$ → B.E. of reactants – B.E. of products
Exothermic → $\Delta H < 0$

4. Solubility of a gas in a liquid increases with

(a) increase of P and decrease of T
(b) decrease of P and decrease of T
(c) increase of P and increase of T
(d) decrease of P and increase of T

Karnataka CET-17.06.2022, Shift-II

Ans. (a) : The solubility of gases in liquids are affected by both temperature and pressure.
As temperature decrease and pressure increase solubility increases.
• The higher the pressure above a liquid, the more gas that can be dissolved in that liquid, to a limit of course.

5. The volume of 2.8g of CO at 27°C and 0.821 atm, pressure is $\left(R - 0.08210\ \text{lit.atm.K}^{-1}\text{mol}^{-1}\right)$

(a) 3 litres (b) 30 litres
(c) 0.3 litres (d) 1.5 litres

Karnataka CET-17.06.2022, Shift-II

Ans. (a) : Given that,

$$T = 27°C = 27 + 273 = 300K$$
$$R = 0.0821 \text{atm} K^{-1} \text{mol}^{-1}$$
$$P = 0.821 \ \text{atm}$$

Molecular mass of CO(M_{co}) = 12 + 16 = 28 g/mol

$$\text{No. of mole } (n) = \frac{W}{M} = \frac{2.8}{28} = 0.1 \text{ moles}$$

According to gas equation–

$$PV = nRT$$
$$\therefore \quad V = \frac{nRT}{P} = \frac{0.1 \times 0.0821 \times 300}{0.821} = 3\,L$$

6. For spontaneity of a cell, which is correct?

(a) $\Delta G = +ve, \Delta E = +ve$ (b) $\Delta G = -ve$
(c) $\Delta G = 0, \Delta E = 0$ (d) $\Delta G = -ve, \Delta E = 0$

Karnataka CET-17.06.2022, Shift-II

@apna_pdf

Ans. (b) : The Gibbs free energy (G) related to the enthalpy and entropy of a system is given as–

$$\boxed{G = H - TS}$$

The free energy change (ΔG) is a measure of the spontaneity of a process and of the useful energy available from it.

$$\boxed{\Delta G_{Sys} = \Delta H_{Sys} - T\Delta S_{Sys}} \quad \boxed{\Delta G_{Sys} = -T\Delta S_{Univ.}}$$

$$\text{Therefore, } \Delta G < 0 \rightarrow \text{spontaneous process}$$

$$\Delta G > 0 \rightarrow \text{Non-spontaneous process}$$

$$\Delta G = 0 \rightarrow \text{Process at a equllibrium}$$

7. A rigid nitrogen tank stored inside a laboratory has a pressure of 30 atm at 06:00 am when the temperature is 27°C. At 03:00 pm, when the temperature is 45°C, the pressure in the tank will be — atm. [nearest integer]

JEE Main-25.06.2022, Shift-II

Ans. (32) : Given,

$$T_1 = 27°C = 27 + 273 = 300K$$

$$T_2 = 45 + 273 = 318K$$

$$P_1 = 30 \text{ atm}$$

At rigid nitrogen tank (Volume is constant)

$$\frac{P_1}{T_1} = \frac{P_2}{T_2}$$

$$\frac{30}{300} = \frac{P_2}{318}$$

$$P_2 = \frac{30 \times 318}{300} = 31.8 \text{ atm} \approx 32 \text{ atm}$$

8. At 25 °C 1 mole of butane upon heating forms CO_2 and H_2O. The work done is

(a) 75.6 L atm
(b) 85.6 L atm
(c) 50.3 L atm
(d) None of these

AIIMS 25 May 2019 (Morning)

Ans. (b): Given that,

$$C_4H_{10}(g) + \frac{13}{2}O_2(g) \rightarrow 4CO_2(g) + 5H_2O(l)$$

$$\because \quad \Delta n_g = 4 - \left(1 + \frac{13}{2}\right)$$

$$= 4 - 7.5$$

$$= -3.5$$

Work done, $W = -\Delta n_g RT$ .... (i)

Putting the value of Δn_g in equation (i)

$W = -(-3.5 \times 0.0821 \times 298)$

$W = 85.6$ L atm.

9. Consider the following statements:

Statement I : Mass, volume and pressure are extensive properties.

Statement II : Extensive properties depend upon the amount of the substance

Which one of the following is correct in respect of the above statements?

(a) Both the statements are true and statement II is the correct explanation of statement I
(b) Both the statement are true but statement II is not the correct explanation of statement I
(c) Statement I is true, but statement II is true
(d) Statement I is false, but statement II is true

SCRA-2015

Ans. (d): Extensive Properties– The properties depend on the mass of the system under consideration.

e.g. Mass, Internal energy, Enthalpy, Volume, Entropy etc.

Intensive Properties–These are the properties of the system which are independent of mass under consideration.

e.g. Pressure, Temperature, Density, Specific enthalpy etc.

10. Which of the following processes is associated with decrease in entropy?

(a) Vaporization of a mole of water into steam at its B.P.
(b) Dissociation of a mole of common salt in water at 300K
(c) Mixing of two partially miscible liquids
(d) Crystallization of a salt from its saturated solution

MPPET - 2012

Ans. (d) : Entropy is the measure of randomness. When randomness is more, entropy increases. Therefore when a liquid crystallises into solid, the molecules get arranged more orderly, hence randomness decreases. Thus the entropy also decreases.

11. At constant temperature and pressure, if ΔG < 0, the process is called

(a) isothermal
(b) non spontaneous
(c) spontaneous
(d) isobaric

(AP-EAMCET-1992)

Ans. (c) : ΔG gives a criteria for spontaneity at constant pressure and temperature.

(i) If ΔG is negative (< 0), the process is spontaneous.

(ii) If ΔG is positive (> 0), the process is non-spontaneous.

12. In which one of the following reactions does the heat change represent the heat of formation of water?

(a) $2H_2 + O_2 \rightarrow 2H_2O; \quad \Delta H = -116 \text{ kcal}$
(b) $H_2 + \frac{1}{2}O_2 \rightarrow H_2O; \quad \Delta H = -58 \text{ kcal}$
(c) $H^+ + OH^- \rightarrow H_2O; \Delta H = -13.7 \text{ kcal}$
(d) $C_2H_2 + 2\frac{1}{2}O_2 \rightarrow 2CO_2 + H_2O; \ \Delta H = -310 \text{kcal}$

(AP-EAMCET-1991)

Ans. (b) :

The reaction $H_2 + \frac{1}{2}O_2 \longrightarrow H_2O; \ \Delta H = -58 \text{ kcal}$

The above reaction represent the heat change of formation of water.

Heat of formation is the change in enthalpy, when one mole of a compound is formed from its constituent element in their standard state.

@apna_pdf

13. The reaction which proceeds with evolution of heat is called

(a) endothermic reaction
(b) exothermic reaction
(c) spontaneous reaction
(d) non spontaneous reaction

(AP-EAMCET-1993)

Ans. (b) : An exothermic reaction occurs when the temperature of a system increases due to the evolution of heat. An endothermic reaction occurs when the temperature of an isolated system decreases while the surroundings of a non-isolated system gains heat.

14. In the complete combustion of butanol $C_4H_9OH(l)$, if ΔH is enthalpy of combustion at constant pressure and ΔE is the heat of combustion at constant volume, then

(a) $\Delta H < \Delta E$
(b) $\Delta H = \Delta E$
(c) $\Delta H > \Delta E$
(d) $\Delta H, \Delta E$ relation cannot be predicted

(AP-EAMCET-1997)

Ans. (a) : The complete combustion of Butanol C_4H_9OH is–

$$C_4H_9OH(l) + 6O_2(g) \longrightarrow 4CO_2(g) + 5H_2O(l) + \text{Heat}$$

In the reaction, Δn_g(Δn_g = number of moles of gaseous product – no. of moles of gaseous reactant) is negative.

$\Delta n_g = 4 - 6 = -2$

$\Delta H = \Delta E + \Delta n_g RT$

$\Delta H = \Delta E - 2RT$

$\boxed{\Delta H + 2\,RT = \Delta E}$

$\therefore \boxed{\Delta E > \Delta H}$

15. Which of the following is an endothermic reaction?

(a) $N_2(g) + 3H_2(g) - 92\text{kJ} \rightarrow 2NH_3(g)$
(b) $N_2(g) + O_2(g) + 180.8\text{ kJ} \rightarrow 2NO(g)$
(c) $H_2(g) + Cl_2(g) \rightarrow 2HCl(g) + 184.6\text{ kJ}$
(d) $C_{(graphite)} + 2H_2(g) \rightarrow CH_4(g) + 74.8\text{kJ}$

AP-EAMCET-2004

Ans. (b): For the reaction-

$$N_2(g) + O_2(g) + 180.8\text{ kJ} \longrightarrow 2NO(g)$$

The endothermic reaction are those in which heat energy is absorbed. All the other reactions are exothermic as the heat is released during the process.

16. Which of the following options are correct?

Options	$\Delta H°$	$\Delta S°$	$\Delta G°$	Spontaneity of the reaction
A	+	+	+	Spontaneous at low T
B	+	+	–	Spontaneous at high T
C	–	–	–	Spontaneous at low T
D	+	–	+	Spontaneous at high T

(a) A,B,C only (b) B only
(c) B, C only (d) C, D only

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (c) :

$\Delta H°$	$\Delta S°$	$\Delta G°$	Spontaneity of the reaction
–	+	–	Reaction spontaneous at all temperature
–	–	–	Reaction spontaneous at low temperature
+	+	–	Reaction spontaneous at high temperature

17. Consider the following :

$$Mg(s) + 2HCl(aq) \rightarrow MgCl_2(aq) + H_2(g)$$
$$\Delta H = -467\ kJmol^{-1}$$
$$MgO(s) + 2HCl(aq) \rightarrow MgCl_2(aq) + H_2O(l)$$
$$\Delta H = -151\ kJmol^{-1}$$
$$H_2(g) + \frac{1}{2}O_2(g) \rightarrow H_2O(l)$$

and given that for water,

$\Delta H_f^o = -286\ kJmol^{-1}$

What is ΔH_f^o for MgO (s)?

(a) –904 kJmol^{-1} (b) –602 kJmol^{-1}
(c) –334 kJmol^{-1} (d) –30 kJmol^{-1}

SCRA-2014

Ans. (b): The given reaction are :

$Mg(s) + 2HCl(aq) \rightarrow MgCl_2(aq) + H_2(g)$
$\Delta H = -467\ kJmol^{-1}$

$Mg(s) + 2HCl(aq) \rightarrow + MgCl_2(aq) + H_2O(l)$
$\Delta H = -151 kJmol^{-1}$

And, $H_2(g) + \frac{1}{2}O_2 \rightarrow H_2O(l)$ $\Delta H_f = -286 kJmol^{-1}$

Reaction 1 and reaction 3 need to propagate in forward direction and reaction 2 need to progress in backward direction.

$Mg(s) + 2HCl(aq) \rightarrow MgCl_2(aq) + H_2(g)$
$\Delta H = -467\ kJmol^{-1}$ .....(i)

$MgCl_2(aq) + H_2O(l) \rightarrow Mg(s) + 2HCl(aq)$
$\Delta H = +151\ kJmol^{-1}$ .....(ii)

$H_2(g) + \frac{1}{2}O_2 \rightarrow H_2O(l)$ $\Delta H = -286\ kJmol^{-1}$ .....(iii)

The net reaction is :

$$Mg(s) + \frac{1}{2}O_2 \rightarrow MgO(s)$$

The overall heat would be:

Heat of reaction-(i) + Heat of reaction-(ii) + Heat of reaction-(iii)

$\Delta H = -467 + 151 + (-286)$

$\Delta H = -602\ kJmol^{-1}$

18. An ideal gas at initial pressure p_i and volume V_i undergoes reversible expansion to the same volume V_f either isothermally or adiabatically. Consider the following statements :

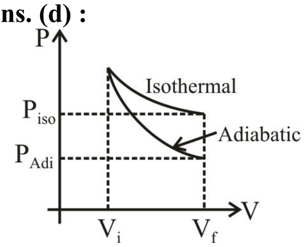
1. P_f (adiabatic) < P_f (isothermal)
2. $|W \text{ (adiabatic)}| < |W \text{ (isothermal)}|$
3. T_f (adiabatic) < T_f (isothermal)
4. $|q \text{ (adiabatic)}| < |q \text{ (isothermal)}|$

(a) Only one (b) Only two
(c) only three (d) All

SCRA-2014

@apna_pdf

Ans. (d) :



$$\left(\frac{dP}{dV}\right)_{Adia.} > \left(\frac{dP}{dV}\right)_{Iso}$$

Pressure : $(P_f)_{isothermal} > (P_f)_{adiabatic}$

Workdone : Area under the P-V diagram.

$W_{isothermal} > W_{adiabatic}$

Heat : $W \propto q$

$q_{isothermal} > q_{adiabatic}$

Temperature : $T \propto P$

$T_{isothermal} > T_{adiabatic}$

19. $CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$, ΔH = 110 kJ

The pressure of CO_2.

(a) Increases on adding catalyst
(b) Decreases if T is raised
(c) Increases if T is raised
(d) Increases if inert gas is passed keeping T constant

MPPET-2013

Ans. (c) : $CaCO_3(s) \rightleftharpoons CaO(s) + CO_2(g)$

ΔH = 110 kJ (Endothermic reaction)

Positive value of the enthalpy change indicates that the reaction is endothermic.

∴ The forward reaction is favour by increasing temperature.

Thus, when the temperature is increased, more carbon dioxide is formed which increases the pressure of carbon dioxide until it reaches a constant value.

20. For the formation of $NH_3(g)$ from its constituent elements, the favourable conditions for its formation are

(a) High pressure and low temperature
(b) High pressure and high temperature
(c) Low pressure and high temperature
(d) Low pressure and low temperature

TS-EAMCET (Engg.), 07.08.2021 Shift-II

Ans. (a) $N_2 + 3H_2 \rightleftharpoons 2NH_3$[exothermic reaction]

$\Delta n = \Sigma\Delta n_p - \Sigma\Delta n_r = 2-(1+3) = -2$

Reaction proceed in such direction where number of mole decreases so for above reaction pressure will be more for more yield of NH_3. Since reaction is exothermic at low temperature reaction proceed in forward direction.

21. Which of the following substances has highest value of standard molar enthalpy of formation at 298 K ?

(a) NaF(s) (b) NaCℓ(s)
(c) NaBr(s) (d) NaI(s)

JEE Main-2019

Ans. (a) : Higher the stability of a substance, higher will be its standard molar enthalpy of formation value, $|\Delta_f H^o|$

Among the halides, F^- is smallest and I^- is largest in size. So, according to Fajan's rule, NaF is mostly ionic in nature.

NaI < NaBr < NaCl < NaF
→ Ionic in nature
→ Thermal stability

So, NaF has highest value of $|\Delta_f H^o|$.

22. In the reaction,

$$4NO_2(g) + O_2(g) \rightarrow 2N_2O_5(g), \ \Delta H = -111kJ$$

If $N_2O_5(s)$ is formed instead of $N_2O_5(g)$, the ΔH value in kJ is

$(\Delta H_{sublimation} \text{ for } N_2O_5 = 54\,kJ\,mol^{-1})$

(a) –165 (b) –57
(c) +219 (d) –219

AP EAMCET (Medical) - 2013

Ans. (d): Given that,

(i) $4NO_2(g) + O_2(g) \rightarrow 2N_2O_5(g), \Delta H = -111kJ\ mol^{-1}$

(ii) $N_2O_5(s) \longrightarrow N_2O_5(g), \Delta H = 54kJ\ mol^{-1}$

Reverse the reaction and multiplied by 2–

(iii) $2N_2O_5(g) \longrightarrow 2N_2O_5(s), \Delta H = 108kJ\ mol^{-1}$

subtracting eq^n. (iii) from (i), we get

$4NO_2(g) + O_2(g) \longrightarrow 2N_2O_5(s)$

then, ΔH = – 111 – 108
= – 219 kJ mol^{-1}

23. If, ΔH > 0 and ΔS > 0, the reaction can proceed spontaneously at ....

(a) low temperature
(b) high temperature
(c) all temperature
(d) will never be spontaneous

AP EAMCET (Engg.) 21.09.2020, Shift-I

Ans. (b) :

ΔH°	ΔS°	ΔG°	Spontaneity of the reaction
–	+	–	Reaction spontaneous at all temperature
–	–	–	Reaction spontaneous at low temperature
+	+	–	Reaction spontaneous at high temperature

24. For the formation of $NH_3(g)$ from its constituent elements at constant temperature and pressure, which of the following options is correct

(a) ΔH = 0 (b) ΔH = ΔU
(c) ΔH > ΔU (d) ΔH < ΔU

TS EAMCET 10.08.2021, Shift-II

Ans. (d) : For formation of $NH_3(g)$ from its constituent elements.

At constant temperature & pressure $\boxed{\Delta H < \Delta U}$

25. The change in internal energy equals ———

(a) Isothermal work (b) Isochoric work
(c) Isobaric work (d) Adiabatic work

AP EAPCET 25.08.2021, Shift-II

Ans. (d) : The change in internal energy of the system equals to the net heat transfer into the system.

ΔU = Q – W

@apna_pdf

The change in internal energy equals to adiabatic work. Because for adiabatic process heat transfer equals to zero so, $\Delta U = -W$

26. Molar heat capacity (C_p) of water at constant pressure is 75 $JK^{-1}mol^{-1}$. The increase in temperature (in K) of 100 g of water when 1 kJ of heat is supplied to it is

(a) 2.4 (b) 0.24
(c) 1.3 (d) 0.13

AP EAMCET (Engg.) - 2012

Ans. (a): $Q = nC_P\Delta T$

$$n = \frac{\text{Mass in gram}}{\text{Molecular weight}}$$

$$n_{H_2O} = \frac{100}{18}$$

$$1000J = \frac{100}{18} \times 75 \times \Delta T$$

$$\frac{18000}{100 \times 75} = \Delta T$$

$$\frac{180}{75} = \Delta T$$

$2.4 = \Delta T$

27. Which one the following is not a state function

(a) Enthalpy (b) Entropy
(c) Work (d) Free energy

AP EAMCET (Engg.) 17.09.2020, Shift-II
MPPET-2008

Ans. (c): A state function is describes the equilibrium state of a system.

- Entropy and free energy is a state function while work and heat is a path function.

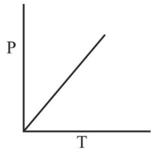
28. Isochores are drawn at ....

(a) constant volume, pressure vs temperature
(b) constant pressure, volume vs temperature
(c) constant temperature, pressure vs volume
(d) constant temperature, volume vs temperature

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (a) : Isochores are drawn at constant volume, $\Delta V=0$.

We get a plot of pressure (P) vs temperature (T in K) as;
For 1 mole of an ideal gas, PV = RT
Isochoric condition $P \propto T$



29. Which of the following is an extensive property?

(a) Temperature (b) Volume
(c) Density (d) Pressure

AP EAMCET (Engg.) 17.09.2020 Shift-I

Ans. (b) : Extensive properties are mass dependent, like volume, enthalpy etc.

Intensive properties are mass independent, like temperature, pressure and density.

30. What is the value of internal energy change (ΔE) at 27°C of a gaseous reaction $2A_2(g) + 5B_2(g) \rightarrow 2\ A_2B_5(g)$ (whose heat change at constant pressure is –50700 J) ? [$R = 8.314\ JK^{-1}\ mol^{-1}$]

(a) –50700 J (b) –63171 J
(c) –38229 J (d) +38229 J

SCRA - 2009

Ans. (c) : $2A_2(g) + 5B_2(g) \rightarrow 2A_2B_5(g)$

ΔH at $C_p = -50700\,J$

Gas constant (R) = 8.314 Joule $K^{-1}mol^{-1}$

We know that, $\boxed{\Delta H = \Delta E + \Delta n_g RT}$

$$\Delta E = \Delta H - \Delta n_g RT \qquad \left\{\begin{array}{l}\Delta n_g = 2-7 \\ \because \Delta n_g = -5\end{array}\right\}$$

$$\Delta E = -50700 - \{(-5) \times 8.314 \times 300\}$$

$$= -50,700 + 12,471 \qquad \left\{\begin{array}{l}T = 27°C \\ T = 27+273 \\ T = 300K\end{array}\right\}$$

$= -38,229\,J$

31. Among the following processes, for which process, the change in entropy (ΔS) is negative?

(a) Sublimation of iodine
(b) Freezing of water
(c) Burning of rocket fuel
(d) Dissolution of sugar

AP EAMCET (Engg.) 21.09.2020, Shift-II

Ans. (b) : When water freezes its entropy decreases. A negative change in entropy indicates that the disorder of an isolated system has decreased. When liquid water freezes into ice represents decrease in entropy because liquid particles are more disordered than solid particles. Hence, option (b) is correct.

32. Given ΔH_{f° for $CO_2(g)$, $CO(g)$ and $H_2O(g)$ are –393.5, –110.5 and –241.8 kJ mol^{-1}, respectively. The ΔH_{f° [in kJ mol^{-1}] for the reaction
$CO_2(g) + H_2(g) \rightarrow CO(g) + H_2O(g)$ is

(a) 524.1 (b) –262.5
(c) –41.7 (d) 41.2

TS EAMCET-2017

Ans. (d) : Given, $\Delta H^\circ_{f(CO_2)} = -393.5\,kJ/mole$

$$\Delta H^\circ_{f(CO)} = -110.5\,kJ/mole$$

$$\Delta H^\circ_{f(H_2O)} = -241.8\,kJ/mole$$

$$CO_2(g) + H_2(g) \rightarrow CO(g) + H_2O(g)$$

$$\therefore \Delta H^\circ_f = (\Delta H)_{products} - (\Delta H)_{reactunts}$$

$$= \left[\Delta H^\circ_{f(CO)} + \Delta H^\circ_{f(H_2O)}\right] - \left[\Delta H^\circ_{f(CO_2)}\right]$$

$$= -110.5 - 241.8 - (-393.5)$$

Or $\Delta H^\circ_f = 41.2\,kJ/mol^{-1}$

@apna_pdf

33. Calculate ΔH° for the reaction, $Na_2O(s)+SO_3(g)\rightarrow Na_2SO_4(g)$
Given the following:

(A) $Na(s)+H_2O(l)\rightarrow NaOH(s)+\frac{1}{2}H_2(g)$
$\Delta H^0=-146\,kJ$

(B) $Na_2SO_4(s)+H_2O(l)\rightarrow 2NaOH(s)+SO_3(g)$
$\Delta H^0=+418\,kJ$

(C) $2Na_2O(s)+2H_2(g)\rightarrow 4Na(s)+2H_2O(l)$
$\Delta H^0=+259\,kJ$

(a) + 823 kJ (b) – 581 kJ
(c) – 435 kJ (d) + 531 kJ

AP EAMCET (Engg.)-2009

Ans. (b):

$Na(s)+H_2O(l)\rightarrow NaOH(s)+\frac{1}{2}H_2(g);\ \Delta H_1^0=-146\,kJ$ ...(1)

$Na_2SO_4(s)+H_2O(l)\rightarrow 2NaOH(s)+SO_3(g);\ \Delta H_2^0=+418\,kJ$ ...(2)

$2Na_2O(s)+2H_2(g)\rightarrow 4Na(s)+2H_2O(g);\ \Delta H_3^0=+259\,kJ$ ...(3)

$Na_2O(s)+SO_3(g)\rightarrow Na_2SO_4(g)$ ... (4)

The required reaction equation can be obtained by

($\frac{1}{2}$ equation 3) + (equation 1× 2) – (equation 2)

$$\Delta H^o=\frac{+259}{2}+(-146)\times 2-(+418)=-580.5\approx -581\,kJ.$$

34. For strong acid and strong base neutralization net chemical change is
$H^++OH^-\rightarrow H_2O\ (l)\ \Delta H_r^0=-55.84\ kJ\ mol^{-1}$ If enthalpy of neutralization of CH_3COOH by NaOH is 49.86 kJ mol^{-1} then enthalpy of ionization of CH_3COOH is ___

(a) 5.98 kJ mol^{-1} (b) –5.98kJ mol^{-1}
(c) 105.7 kJ mol^{-1} (d) –59.8 kJ mol^{-1}

AP EAPCET 24.08.2021 Shift-II

Ans. (a) : The enthalpy of neutralization (ΔH_n) is the change in enthalpy that occurs when one equivalent of acid and base undergo neutralization reaction to form water and a salt given.

$H^++OH^-\longrightarrow H_2O(l)\quad \Delta H_r^o=-55.84\,kJ/mole$

$CH_3COOH+NaOH\longrightarrow CH_3COONa+H_2O$
$\Delta H_n=49.86\,kJ/mole$

So, enthalpy of ionization
$=-\Delta H_r^0-\Delta H_n$
= 55.84 – 49.86
= 5.98 kJ / mole

35. For the reaction $H_2O_{(l)}\longrightarrow H_2O_{(g)}$ at T = 100° and P = l atm. Choose the correct option:

(a) $\Delta S_{system}>0$ & $\Delta S_{surroundings}>0$
(b) $\Delta S_{system}>0$ & $\Delta S_{surroundings}<0$
(c) $\Delta S_{system}<0$ & $\Delta S_{surroundings}>0$
(d) $\Delta S_{system}<0$ & $\Delta S_{surroundings}<0$

AP EAPCET 20.08.2021 Shift-I

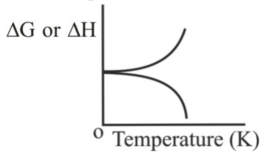
Ans. (b) : At 100° C and 1 atm.
$H_2O(l)\longrightarrow H_2O(g)$
For equilibrium.
$\Delta S_{total}=0$
And $\Delta S_{system}+\Delta S_{surrounding}=0$
$\Delta S_{system}>0$ and $\Delta S_{surrounding}<0$.

36. If a chemical reaction is known to be non-spontaneous at 298K but spontaneous at 350 k, then which among the following conditions is true for the reaction?

(a) ΔG = –ve, ΔH = –ve, ΔS = +ve
(b) ΔG = +ve, ΔH = +ve, ΔS = +ve
(c) ΔG = –ve, ΔH = +ve, ΔS = +ve
(d) ΔG = +ve, ΔH = +ve, ΔS = –ve

AP EAPCET 19-08-2021 Shift-I

Ans. (c) : ΔG = ΔH – TΔS —— (i)
ΔG must be – ve for a spontaneous reaction.



This graph depicted the value of ΔH is +ve
i.e. ΔG = –ve, ΔH = +ve putting these in equation— (i)
We get,

$\Delta S=\frac{1}{T}(\Delta H-\Delta G)=+ve$

So, the value of ΔS is also + ve.

37. When equal volumes of Helium and Neon at same temperature and pressure are mixed, the ratio $C_p:C_v$ of the mixture equals _____.

(a) 3 : 5 (b) 1 : 2
(c) 5 : 3 (d) 2 : 1

AP EAPCET 24.08.2021, Shift-I

Ans. (c) : Given, $V_{He}=V_{Ne}$
and $T_{He}=T_{Ne}$
then $C_p:C_v=?$
We can write the further relation –

$C_p=\frac{5}{2}nR$ and $C_v=\frac{3}{2}nR$

$$\therefore \frac{C_p}{C_v}=\frac{5}{2}nR\times\frac{2}{3nR}$$

$$\frac{C_p}{C_v}=\frac{5}{3}$$

38. Molar heat capacity (C_p) of water at constant pressure is 75 $J.K^{-1}$ mol^{-1}. The increase in temperature (in K) of 100 g of water when 1 kJ of heat is supplied to it is

(a) 2.4 (b) 0.24
(c) 1.3 (d) 0.13

AP EAMCET (Engg.) 2012

@apna_pdf

Ans. (a) : Given that,

$C_P = 75\ JK^{-1}mol^{-1}$

$\Delta H = 1000$

$n = \frac{100}{18}$

Molar heat capacity is the amount of heat required to raise the temperature of 1 mol of a substance by 1^o C.

$\therefore\ \Delta H = nC_p\Delta T$

$1000 = \frac{100}{18} \times 75 \times \Delta T$

$\Delta T = \frac{180}{75} = 2.4K$

39. An intensive property is

(a) boiling point (b) mass
(c) enthalpy (d) work.

COMEDK-2011

Ans. (a) : Boiling point does not depend upon the quantity of matter present in the system or size of the system.

40. The temperature of one mole of an ideal gas increases from 298 K when it absorbs 200 J of heat at constant volume. The change in the internal energy of the gas is

(a) 200 J (b) 140 J
(c) –200 J (d) –140 J

COMEDK-2012

Ans. (a) : Internal energy change is the heat evolved or absorbed at constant volume.

At constant volume, $\Delta V = 0$

Applying, $\Delta U = Q + W = Q + P\Delta V$

$\Delta U = Q + P \times 0 = Q$

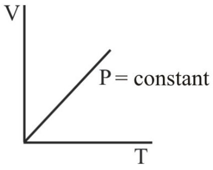
We get, $\Delta U = Q = 200J$

41. For all gases, at any given pressure, the graph of volume vs temperature (in celsius) is a straight line. This graph is called

(a) isomer (b) isochore
(c) isobar (d) isotherm

COMEDK-2014

Ans. (c) :



If, P = constant then process is called Isobar.

42. What will be the value of ΔG for ice at 8°C temperature?

(a) Zero (b) Positive
(c) Negative (d) One

GUJCET-2008

Ans. (b) : The value of ΔG for ice to 8°C temperature will be positive as at this temperature melting of ice is started. The melting of an ice is an equilibrium process, the value of ΔG for an equilibrium process is equal to zero (ΔG = 0).

43. For a chemical reaction $A + B \rightleftharpoons C + D$ ($\Delta_rH^o = 80\,kJ\,mol^{-1}$) the entropy change Δ_rS^o depends on the temperature T (in K) as ($\Delta_rS^o = 2T(JK^{-1}mol^{-1})$.

Minimum temperature at which it will become spontaneous is ______K. (Integer)

JEE Main 26.02.2021, Shift-I

Ans. (200) : Given, a chemical reaction

$A + B \rightleftharpoons C + D$

$\Delta_rH^o = 80kJ/mole$

$\Delta_rS^o = 2T(JK^{-1}mol^{-1})$

We know that,

$\Delta G° = \Delta H° - T\Delta S°$

$\Delta G° < 0$ (Spontaneous process)

$\Delta H° - T\Delta S° < 0$

$T > \frac{\Delta H°}{\Delta S°}$

$T > \frac{80 \times 10^3}{2T}$

$2T^2 > 80,000$

$T^2 > 40,000$

T>200

The minimum temperature to make it spontaneous is 200 K.

44. In conversion of lime-stone to lime, $CaCO_3(s) \rightarrow CaO(s) + CO_2\ (g)$ the values of ΔH^o and ΔS^o do not change with temperature, temperature are +179.1 kJmol^{-1} and 160.2 J/K respectively at 298K and 1 bar. Assuming that ΔH^o and ΔS^o above which conversion of limestone at lime will be spontaneous is

(a) 1118 K (b) 1008 K
(c) 1200 K (d) 845 K

AIIMS 25 May 2019 (Evening)

Ans. (a): $\Delta G^o = \Delta H^o - T\Delta S^o$

For spontaneous process, $\Delta G^o < 0$

$\therefore\ \Delta H^o - T\Delta S^o < 0$

$\therefore\ \frac{\Delta H^o}{\Delta S^o} < T$

$\therefore\ T > \frac{179.1 \times 1000}{160.2} K$

T > 1117.97 K

T = 1118 K

45. One mole of a non-ideal gas undergoes a change of state (2.0 atm, 3.0 L, 95 K) → (4.0 atm, 5.0 L, 245 K) with a change in internal energy, ΔU = 30.0 L atm. The change in enthalpy ΔH of the process in L atm is.

(a) 40.0
(b) 42.3
(c) 44.0
(d) Not defined because pressure is not constant

AIIMS 25 May 2019 (Evening)

@apna_pdf

Ans. (c): Given

(2 atm, 3.0 L, 95 K) → (4 atm, 5.0L, 245 K)

Therefore, $P_1 = 2$ atm, $P_2 = 4$ atm

$V_1 = 3$ L, $V_2 = 5$L

$T_1 = 95$ K, $T_2 = 245$ K

$\Delta U = 30$ L atm

As we know that

$$\Delta H = \Delta U + (P_2V_2 - P_1V_1)$$

$$\therefore \Delta H = 30 + (4 \times 5 - 2 \times 3)$$

$$\Rightarrow \quad \Delta H = 30 + 14 = 44 \text{ L atm}$$

46. 1 mole of a diatomic gas is heated through isochoric process from 300 K to 500 K. The entropy is:

(a) 10.61 (b) 38.26

(c) 20.05 (d) 30
